NATURE

A WEEKLY JOURNAL OF SCIENCE

"To the solid ground
Of nature trusts the Mind that builds for aye"—WORDSWORTH

158

Volume 159

JANUARY 4, 1947, to JUNE 28, 1947

LONDON
MACMILLAN AND CO., LTD.
NEW YORK: THE MACMILLAN COMPANY

NAME INDEX

ABBOT, Dr. C. G. : The Earth and the Stars, *review*, 862
Abdon, Dr. N.-O., and Borglin, N. E. : Curative Effects of a Complex Choline Compound on the Impaired Metabolism of Choline-deficient Rats, 272
Achaya, K. T. : Rancidity in Indian Butter Fat (Ghee), 274
Adam, W. B. : Application of Statistical Methods to Food Problems, 36
Adamson, Prof. R. S. : Elected president of the Royal Society of South Africa for 1947, 466
Addison, Dr. C. C. : Awarded the degree of D.Sc. of the University of Durham, 226
Adrian, Prof. E. D. : *Obituary* of Sir Joseph Barcroft, 565
  The Sense of Smell (Pedler Lecture of the British Association), 601
Adriani, Dr. John : The Chemistry of Anaesthesia, *review* by Prof. J. H. Gaddum, 588
Aeronautical Research Council : Terms of reference of the Civil Aircraft Research Committee, 803
Aeronautical Society, Royal : Congress on the Technical Aspects of Aviation, 634
  Awards, 669
  Election of Dr. H. Roxbee Cox as president for 1947–48, 836
African (Pan-) Congress on Prehistory, 216
  Proceedings of the, 547
Agarwala, B. K., and Singwi, K. S. : Nuclear Thermodynamics and Showers, 816
Agner, Kjell : Detoxicating Effect of Verdoperoxidase on Toxins, 271
Agricultural Research Council : Appointment of James Turner as a member, 398
  Appointment of Dr. C. S. Hanes as head of a unit of biochemistry at the University of Cambridge, 568
Agriculture and Fisheries, Ministry of : Bulletin No. 109, Commercial Flower Production, Part 2, Summer Flowers (Dr. H. V. Taylor and Dr. Katharine H. Johnstone), 431
  Bulletin No. 110, Commercial Flower Production, Part 3, Foliage and Foliage Plants (Dr. H. V. Taylor and Dr. Katharine H. Johnstone), 431
  Bulletin No. 112, Commercial Flower Production, Part 4, Flowering Plants in Pots (Dr. H. V. Taylor and Dr. Katharine H. Johnstone), 431
  Senior and junior Scholarships, 466
Ahier, Dr. G. : Les liquides dispersifs et leurs applications, *review* by G. J. Minkoff, 114
Ahmad, Dr. Bashir : National Chemical Laboratory of India, 219
Ahmed, N., and others : Effect of Mono- and Divalent Salts on Red Blood Cells, 169
Air Safety Board : Appointment of Prof. A. A. Hall as a member, 193
Aitchison, Prof. L. : Awarded the Simms Gold Medal of the Royal Aeronautical Society, 669
Akers, Sir Wallace : Metallurgical Problems Involved in the Generation of Useful Power from Atomic Energy, 534
  Industry and Research, 650
Akers, Sir William : Industry and Research, 650
Albert, Prof. A. Adrian : College Algebra, *review* by F. G. W. Brown, 6
Alberta, Research Council of : Offer of Fellowships, 398
Alexander, Dr. A. E. : The Application of Surface Chemistry to Colloidal Problems (Tilden Lecture of the Chemical Society), 160
  A Simple Film Balance for Demonstration and Research Purposes, 304
Alexanderson, Dr. E. F. W. : Awarded a Valdemar Poulsen Gold Medal of the Copenhagen Academy of Technical Sciences, 496
Allen, Dr. Clifford : Causal Factors in Schizophrenia, *review*, 725
Allen, Dr. J. F. : Appointed to the chair of natural philosophy in the United College, St. Andrews, 836
Allen, K. W., and others : Interaction of Fast Neutrons with Beryllium and Aluminium, 473
Aller, Lawrence H. (Goldberg, Leo, and) : Atoms, Stars and Nebulæ, *review*, 793
Alstead, Dr. Stanley : Resignation from the Department of Materia Medica in the University of Glasgow, 261
  Appointed medical consultant for the North of Scotland at Inverness, 261
Ambrose, E. J. (Elliott, A., and) : Polarization of Infra-Red Radiation, 641
American Association for Cancer Research and the Union Internationale contre le Cancer : Fourth International Cancer Research Congress, 398
American Association of Physical Anthropologists : First Viking Fund Medal and Prize in Physical Anthropology awarded to Dr. Franz Weidenreich, 193
American Association of Physics Teachers : Award of the Oersted Medal to Prof. Duane Roller, 54
American Chemical Society : Harrison Howe Lecture delivered to the Rochester Section (Prof. G. T. Seaborg), 21
  Twenty-first National Colloid Symposium to be held at Stanford University under the auspices of the Division of Colloid Chemistry, 432
American Institute of Physics : Change in the constitution of the, 803
American Philosophical Society : Grant to the Bermuda Biological Station for Research Fellowships, 465
American Social Hygiene Association : William Freeman Snow Medal for 1946 awarded to Colonel L. W. Harrison, 92
American Society for Testing Materials : Preparation of a second Supplement to the Index of X-Ray Diffraction Data, 465
American Telephone and Telegraph Co. : Frank B. Jewett Fellowship Awards for 1947–48, 397
Aminoff, Prof. Gregori : *Obituary* by Prof. G. Hägg, 597
Amoroso, Dr. E. C. : Appointed to the chair of veterinary physiology at the Royal Veterinary College, London, 671
Anderson, J. R. : Appointed lecturer in pathology in the University of Glasgow, 671
Anderson, Dr. W. F. : Appointed lecturer in materia medica in the University of Glasgow, 671
Andrade, Prof. E. N. da C. : Fluid Flow at a Small Hole due to Vibration, 132
  Awarded the Holweck Prize for 1947 of the Physical Society, and the Medaille Holweck of the Société Française de Physique, 534
Andrew, G. : At the Pan-African Congress on Prehistory, 216
Andrewes, Dr. C. H. : Nature of Virulence, 427, 428
Angwin, Sir Stanley : Telecommunications in War, 299, 397, 547
  Appointed chairman of the Radio Research Board, 497
Anscombe, F. J. : A Bibliography of Statistical Quality Control (Grant I. Butterbaugh), *review*, 387
Anthony, Lieut.-Colonel H. D. : Science and the History of Society, *review*, 351
  Astronomy and Human Thought, *review*, 521
Apothecaries, Society of : Gold Medal in Therapeutics awarded to Dr. F. H. S. Curd, Dr. D. G. Davey and Dr. F. L. Rose, 871
Appleton, Sir Edward : Appointed a member of the Advisory Council on Scientific Policy, 224
  The Investigation and Forecasting of Ionospheric Conditions, 397
  Radio-communication during the War, 548
  Industry and Research, 650
  Awarded the Medal for Merit by the Government of the United States, 684
  Science, Industry and Government, 735
  Research and the Progress of Industry in Scotland, 751
Appleton, Sir Edward, and Naismith, R. : The Giacobinid Meteor Shower 1946, 121
Applied Biologists, Association of : Discussion on the Significance of Trace Elements in Plants and Animals, 206
Applied Biologists, Association of, in conjunction with the British Leather Manufacturers' Research Association : Symposium on Applied Biology in the Leather Industry, 750
Applied Mechanics, International Congress for : Now known as the International Union of Theoretical and Applied Mechanics, 787
Arambourg, Prof. C. : At the Pan-African Congress on Prehistory, 216
Arkell, A. J. : At the Pan-African Congress on Prehistory, 216
Arkell, Dr. W. J. : Elected a Fellow of the Royal Society, 429
Armour and Co. : Appointment of Dr. Lawrence L. Lachat to be in charge of the development of new biochemicals with the Chemical Research and Development Department, 634
Arrol, Dr. William J., and Glascock, Raymond : Conversion of Carbon Dioxide to Acetylene on a Micro Scale, 810
Arthur, J. H. : Appointed by the Board of Greenkeeping Research as an additional advisory officer at the St. Ives Research Station, Bingley, 23
Aschner, Dr. M., and others : Synthesis of Cellulose by Resting Cells of *Acetobacter xylinum*, 64
Asdell, Prof. S. A. : Patterns of Mammalian Reproduction, *review* by Prof. S. Zuckerman, 520
ASLIB : Classified List of German Scientific and other Periodicals, 566
ASLIB (Northern Branch) : Conference on the Works Library, 771
Astbury, N. F. : Appointed director of research to the Guest, Keen and Nettlefolds group of companies, 398
Astbury, W. T. : High Polymers, 138
Astronomical Society, Royal : Discussion on the Giacobinid Meteor Shower, 1946, 119
  Gold Medal for 1947 awarded to Prof. M. G. J. Minnaert, 92, 121
  Election of officers, 298
  Geophysical discussion on Atmospheric Oscillations, 357
Astrup, Dr. Tage, and Permin, Per M. : Fibrinolysis in the Animal Organism, 681
Atkins, Dr. W. R. G. : Disappearance of *Zostera marina*, 477
  Size versus Colour in Air-Sea Rescue, 612
  Obituary of Prof. B. A. McSwiney, 668
  Electrical Conductivity of River, Rain and Snow Water, 674
Atkinson, R. J. C. : Field Archæology, *review* by C. F. C. Hawkes, 387
Atomic Energy Commission : First Report of the, 616
Atomic Energy Company : Formation proposed by the Swedish Atomic Committee, 703
Atomic Research Committee of the Indian Council of Scientific and Industrial Research : Survey of the thorium-bearing minerals in Travancore, and a survey of the uranium-bearing minerals of India, recommended by the, 192
Atomic Scientists, Emergency Committee of : Formation of the, 837
Atomic Scientists' Association : International Control of Atomic Energy, 47
  Appeal for associate members, 451
  Atomic Survey (Prof. P. B. Moon and Dr. E. H. S. Burhop), 533
  One-day School on Atomic Energy for Journalists, 534
  Travelling Atomic Energy Exhibition, 601
Attlee, Clement R. : Elected a fellow of the Royal Society, 704
Audus, Dr. L. J., and Quastel, Dr. J. H. : Coumarin as a Selective Phytocidal Agent, 320
Audy, Lieut.-Colonel J. R. : Scrub Typhus as a Study in Ecology, 295
Auluck, Dr. F. C. (Kothari, Prof. D. S., and) : Surface Tension of Nuclear Matter and the Enumeration of Eigenfunctions of an Enclosed Particle, 204

Aurora and the Night Sky : International Conference on the Emission from the (Royal Society), 671
Austin, Prof. Wesley : Appointed a member of the Advisory Council on Scientific Research and Technical Development to the Ministry of Supply, 671
Australia, Commonwealth of : Exhibition of Aboriginal Cave Paintings arranged by the News and Information Bureau at Australia House, 224
Australian Council for Scientific and Industrial Research : Annual Report for 1945, 103
Automobile Engineers, Institution of, and the Institution of Mechanical Engineers : Amalgamation of the, 599
Avebury, Alice Lady : *Obituary* by Sir Arthur Keith, 733
Awbery, J. H. : The Place of Thermodynamics in Education, 628
Ayliffe, S. H. : Degaussing, 56
Ayre, Sir William : Research and the Progress of Industry in Scotland, 751

BACHARACH, A. L. : Application of Statistical Methods to Food Problems, 37
Back, A., and others : Influence of the Medium on the Inactivation of Tetanus Toxin by X-Ray Irradiation, 715
Bacq, Prof. Z. M. : Travaux récents sur les toxiques de guerre, 617
Bacq, Prof. Z. M., and others : Action of Mustard Gas ($\beta\beta'$-Dichlorethylsulphide) on Thiol Groups of Proteins, 478
Badger, Dr. G. M. : Molecular Asymmetry and Biological Activity, 194
Baehr, Dr. George : At the Centenary celebration of the New York Academy of Medicine, 494
Baird, K. M. : An Ultra High-speed Motion-picture Camera, 225
Baker, Dr. Bruce E., and Michaelis, Dr. Moritz : A Correlation between Redox Potentials and Synergisms in Resting Bacteria, 197
Baker, Dr. H. G. : Sex in *Melandrium*, 34
  Criteria of Hybridity, 221, 546
Baker, J. N. L. : Explorers of Canada, *review*, 182
Baker, Dr. John R. (Mees, Dr. C. E. Kenneth, with the co-operation of) : The Path of Science, *review* by Lieut.-Colonel H. D. Anthony, 351
Baking Industries' Research Association, British : Appointment of Dr. John B. M. Coppock as director of research, 704
Bamford, Dr. C. H. : Chemistry and Light, *review*, 46
Banderet, A. : High Polymers, 138
Banga, I., and others : Nature of Myosin, 194
Bangham, Prof. D. H. : Dilatancy and Thixotropy, 71
Bannister, Flight-Lieut. R. C. : Appointed professional assistant, Royal Observatory, Hong Kong, 568
Banwell, C. J., and others : The Giacobinid Meteor Shower 1946, 120
Barber, N., and Ursell, F. : Study of Ocean Swell, 205
Barcroft, Sir Joseph : Researches on Pre-Natal Life, Vol. I, *review* by Dr. F. H. A. Marshall, 383
  Death of, 429 ; *obituary* by Prof. E. D. Adrian, 565
Barigozzi, Claudio, and Cusmano, Luigi : Chromosome Numbers in Cancer Cells, 505
Barlow, Sir Alan : Appointed a member of the Advisory Council on Scientific Policy, 224
Barnard, G. A. : Appointed to the University of London readership in mathematics at the Imperial College of Science and Technology, 160
Barnes, Miss E. : A Unified Course in Mathematics in Secondary Schools, 582
Barnes, J. W. : Appointed a senior principal scientific officer, 464
Barnes, Prof. T. Cunliffe, and Beutner, R. : Electrogenic Properties of Acetylcholine, 307
Barnicot, William : *Death* of, 19 ; *obituary*, 156
Barr, J. R., and others : Seasonal Variations in Vitamin C Content of Tomatoes grown in Great Britain, 171
Barr, W. : Research and the Progress of Industry in Scotland, 751
Barrer, R. M. : Molecular Sieve Action at Low Temperatures, 508
Barrett, B. Hilton : *Death* of, 835 ; *obituary* by Dr. A. E. Trueman, 868
Bartlett, Prof. F. C. : An Encyclopædia of Psychology, *review*, 5
Barton, Dr. D. H. R., and Cox, J. D. : Vicinal Action in Steroids, 470
Basu, S. : Elected a fellow of the National Institute of Sciences of India, 123
Basu, Dr. U. P. : Elected a fellow of the National Institute of Sciences of India, 123
Bate-Smith, Dr. E. C. : Appointed superintendent of the Low Temperature Research Station, 568
Batuecas, Prof. T. : Atomic Mass of Silicon, 705
Bauer, Dr. D. J. : Xanthine Oxidase and Virus Growth, 438
Baxter, Dr. Alan : *Obituary* by Dr. J. A. Carroll, 667
B.B.C. : Talks on Atomic Energy, 449
Beadle, Dr. L. C. : Society for Experimental Biology—Conference in Utrecht, 718
Beale, Dr. G. H. : Timiriazev, Founder of Soviet Genetics, 51
Bean, W. J. : *Death* of, 565 ; *obituary* by W. Dallimore, 667
Bečka, Prof. J. : *Obituary*, 19
Becker, Prof. Howard : German Youth, *review* by Maurice Bruce, 181
Bedford College : Title of professor emeritus of chemistry in the University of London conferred on Dr. James F. Spencer, 772
Beer, Prof. G. R. de : The Teaching of Taxonomy, 447
  Elected president of the Ray Society, 670
  Elected president of the Linnean Society for 1947–48, 734
  How Animals Hold their Heads, 734
Behaviour, an International Journal of Comparative Ethology, 329
Bell, A. E. : Annual Meeting of the Science Masters' Association, 106
Bell, Alexander Graham (1847–1922), 297
Bell (Alexander Graham) and the Invention of the Telephone (Prof. G. W. O. Howe), 455 ; (Capt. G. C. Wilson), 870
Bender, A. E. : Appointed an assistant lecturer in biochemistry in the University of Sheffield, 871
Bennett, Dr. G. M. : Elected a Fellow of the Royal Society, 429
Bennett, J. B. : Appointed secretary of Rothamsted Experimental Station, 124
Benoit, H. : High Polymers, 138
Berde, B. : New Aspects of the Action of Methylthiouracil, 748
Berenblum, Dr. I. : Science versus Cancer, *review* by Prof. J. A. Crowther, 4
Berenblum, Dr. I., and Halban, Prof. H. von : *Obituary* of Prof. Fritz Weigert, 733
Berenblum, Dr. I., and Schoental, Dr. R. : Action of Mustard Gas ($\beta\beta'$-Dichlorodiethylsulphide) on Nucleoproteins, 727
Berger, F. M. (Bradley, W., and) : Muscle-Relaxing Ethers of Glycerol, 813
Bermuda Biological Station : Grant from the American Philosophical Society for Research Fellowships, 465
Bernal, Prof. J. D. : Science and the Real Freedoms, 512
  The Chemistry of the Proteins, 581
  Pasteur, the Crystallographer, 601
  The Place of Universities in the Community, 698, 699
  Prof. Paul Langevin (1872–1946), 798
Bernhardt, F. W. (Whipp, H., and) : Particle Size Analysis, 717
Berry, A. J. : Modern Chemistry, some Sketches of its Historical Development, *review* by Prof. H. W. Melville, 3
Bertani, Dr. Giuseppe : Artificial 'Breaking' of the Diapause in *Drosophila nitens*, 309
Berthaume, Maurice : Les vibrations sur les avions, *review*, 214
Bertram, Dr. C. L. : Population Trends and the World's Resources, 396
Bertram, D. S., and others . Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Effects of Paludrine and other Antimalarials 885
Best, Dr. C. H. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Bett, Dr. W. R. : *Obituary* of Dr. Victor Robinson, 328
Beutner, R. (Barnes, Prof. T. Cunliffe, and) : Electrogenic Properties of Acetylcholine, 307
Beveridge, Dr. W. I. B., and Burnet, Dr. F. M. : Cultivation of Viruses and Rickettsiæ in the Chick Embryo, 277
Beverton, R. J. H., and others : Population Studies in Fisheries Biology, 714
Beyers, E. (Davies, Rees, and) : A Protozoal Disease of South African Trawled Fish and its Routine Detection by Fluorescence, 714
Bhagavantam, Prof. S., and Rao, B. Ramachandra : Diffraction of Light by High-Frequency Ultrasonic Waves, 267
  Hiedemann Patterns at Very High Frequencies, 742
Bhatnagar, Sir Shanti : National Research Laboratories of India—Introduction, 183
Bibby, Cyril : Social Biology for Sixth Forms, *review*, 147
Bichel, Dr. Jørgen : Awarded a Lady Tata Memorial Trust grant for research, 871
Bickley, Dr. W. G. : Title of University of London professor of mathematics conferred on, 567
Biggam, Sir Alexander : War-time Advances in Medicine which might be translated into Civil Practice, 854
Bikich, Dr. George (Góth, Dr. Andrew, and) : Effect of Proteins on Ketonæmia, 170
Bilham, E. G. : An Azimuthal Method of Measuring Cloud Height with a Searchlight, 677
Billingham, R. E., and Medawar, P. B. : 'Cytogenetics' of Black and White Guinea Pig Skin, 115
Billings, Dr. Bruce : A New Polarizing Light-Filter, 192
Bindon, Capt. P. C. : Appointed surveyor, Uganda, 160
Biologia, a new monthly News-Letter published as a supplement to *Chronica Botanica*, 298
Biological Sciences, International Union of : Fellowships, 737
Biology and Human Affairs, 55
Birch, Arthur J. : Colours of Jupiter, 478
Birch, Dr. A. J., and MacDonald, Dr. D. K. C. : Metal—Ammonia Solutions, 811
Bird, C. L. : Appointed editor of the *Journal of the Society of Dyers and Colourists*, 193
Bird, Dr. O. D. : Vitamin Content of Tubercle Bacilli, 33
Birkbeck College : Appointment of Dr. Reinhold Fürther to the University of London readership in Theoretical Physics, 23
Birkett, Betty (Bishop, Dr. Ann, and) : Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Acquired Resistance and Persistence after Passage through the Mosquito, 884
Birks, J. B. : Magnetic Dispersion of γ-Ferric Oxide, 775
Bisat, W. S. : Elected a fellow of the Royal Society, 429
Bishop, Dr. Ann, and Birkett, Betty : Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Acquired Resistance and Persistence after Passage through the Mosquito, 884
Bishop, H. : Radio-communication during the War, 548
Bishop, M. W. H. : Establishment of an Immigrant Barnacle in British Coastal Waters, 501
Bite, P., and others : Conversion of 2-Aceto-furan to Hexen-2-dion-4,5-acetal-1 and Pyrocatechol, 744
Black, Dr. William : Awarded the Makdougall-Brisbane Prize of the Royal Society of Edinburgh for 1944–46, 366
Blackburn, Dr. K. B. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 557
Blackett, Prof. P. M. S. : Elected a *Correspondant* for the Section of General Physics of the Paris Academy of Sciences, 534
  The Magnetic Field of Massive Rotating Bodies, 601, 658
  Awarded the Medal for Merit by the Government of the United States, 684
  The Place of Universities in the Community, 698, 699
Blackheath Film Unit : Industrial Film Service of the, 805
Blackie, W. J. : Appointed deputy director of agriculture, Fiji, 871
Blackman, Dr. F. F. : *Death* of, 191 ; *obituary* by G. E. Briggs and Prof. F. T. Brooks, 394
Blair, Dr. G. W. Scott : Dilatancy and Thixotropy, 71
Blaschko, Dr. H. : Inhibition of Catechol Bacteriostasis by Molybdates, 373
Blaxter, Dr. K. L. : Application of Statistical Methods to Food Problems, 36
Blayden, H. E., and others : Formation of Coking Coal by Thermal Treatment of a Cannel Coal, 536
Blood Group Reference Laboratory (Ministry of Health), 92
Blood Group Research Unit (Medical Research Council), 92
Bloom, H. : Evidence for the Formation of a Copper Carbonyl, 539
Blundell's School : Publication of No. 1 of the Magazine of the Science Society, 464
Boas, Dr. W. (Honeycombe, R. W. K., and) : Recrystallization of Duplex Brass, 847
Boas-Traube, Dr. S. (Skinner, Dr. D. G., and) : Particle Size Analysis, 717
Bockris, Dr. J. O'M. : Effect of the Solvent on Oxygen Overpotential, 401
  Hydrogen Overpotential and the Thermionic Work Function, 539
Bockris, Dr. J. O'M., and Conway, B.E. : Effect of Alkaloids on Hydrogen Overpotential, 711

Bode, Johann Elert : Bicentenary of the birth of, 89
Boerboom, A. J. H. : Crystallization of Supersaturated Solutions by means of Electric Current, 230
Bok, Bart J., and Bok, Priscilla F. : The Milky Way, second edition, *review* by the Rev. Dr. M. Davidson, 387 ; *erratum*, 568
Bond, C. E. : Appointed an assistant in the Department of Anatomy in the University of Glasgow, 261
Borglin, N. E. (Abdon, Dr. N.-O., and) : Curative Effects of a Complex Choline Compound on the Impaired Metabolism of Choline-deficient Rats, 272
Born, Prof. M. : Raman Spectrum of Rock-Salt under High Resolution, 266
  Obituary of Prof. V. M. Goldschmidt, 700
Born, Prof. Max, and Green, Herbert Sydney : A Kinetic Theory of Liquids, 251
  Quantum Theory of Liquids, 738
Bosazza, V. L. : The Desert Landscape, 478
Boschma, Prof. H. : The Teaching of Taxonomy, 447
Boscott, R. J. : Solvent-treated Cellulose Acetate as the Stationary Phase in Partition Chromatography, 342
Bose, Prof. S. R. : Antibacterial Titre in Wood-destroying Fungi, 33
  Hereditary (Seed-borne) Symbiosis in *Casuarina equisetifolia* Forst., 512
Bosley, S., and others: Measurement of Out-of-Phase Magnetic Fields in Betatrons, 229
Botanic Gardens, Buitenzorg : Dr. E. D. Merrill made an honorary staff member, 330
Boule, Prof. Marcellin : Les hommes fossiles, troisième édition par Henri V. Vallois, *review* by Prof. W. E. Le Gros Clark, 553
Bourne, E. J., and others : A New Indicator for Iodometric Analysis, 810
Bowden, Dr. F. P. : Chemical Thermodynamics (Dr. J. A. V. Butler), fourth edition, *review*, 114
  The Vienna Academy of Sciences (1847–1947), Centenary Celebrations, 833
Bowen, Prof. E. G. : Racial Pride and Prejudice (Eric John Dingwall), *review*, 555
Bowen, E. J. : The Chemical Aspects of Light, second edition, *review* by Dr. C. H. Bamford, 46
  Fluorimetric Analysis, 548
  Colour and Constitution (Mercer Lecture of the Society of Dyers and Colourists), 568
Bowen, E. J., and Mikiewicz, E. : Fluorescence of Solid Anthracene, 706
Bowen, W. : Gift to the British Scientific Instrument Manufacturers' Association for Prizes for Scientific Instrument Development, 432
Boyland, Dr. E. : Biology of Carcinogenesis by Chemical Compounds, *review*, 554
Bradbury, Prof. Fred : Elected to honorary life membership of the Textile Institute, 704
Bradfield, J. R. G. : Plant Carbonic Anhydrase, 467
Bradford, Dr. S. C. : Complete Documentation, 105
Bradish, C. J., and others : Vacuum Sublimation of Ice in Bulk, 28
Bradley, Dr. Stanley E. : Awarded an Edward N. Gibbs Memorial Prize of the New York Academy of Medicine, 786
Bradley, W., and Berger, F. M. : Muscle-Relaxing Ethers of Glycerol, 813
Brady, Dr. Thomas G. (Conway, Prof. Edward J., and) : Mechanism of High Acid Production by Yeast and its Bearing on Hydrochloric Acid Formation in the Stomach, 137
  Hydrochloric Acid Formation in the Gastric Mucosa, 876
Brain, C. M., and others : Vacuum Sublimation of Ice in Bulk, 28
Brand, Dr. J. C. D. : Appointed lecturer in chemistry in the University of Glasgow, 671
Branson, K. M. H., and others : Mechanical Recording of Information about Cancer Patients at the Royal Cancer Hospital, 261
Brasher, Miss D. M. (Wormwell, Dr. F., and) : Electrical Properties of Paint Films on Metals, 678
Braun-Menéndez, Dr. E. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Braunstein, Dr. A. E., and others : Labilization of the α-Hydrogen of Amino-acids in the Presence of Aminopherase, 67
Breuil, Abbé : At the Pan-African Congress on Prehistory, 216
Brian, Dr. P. W. (McGowan, J. C., and) : Inhibition of Catechol Bacteriostasis by Molybdates, 373
Brierley, Prof. W. B. : Agricultural Botany, *review*, 385
Briggs, G. E., and Brooks, Prof. F. T. : *Obituary* of Dr. F. F. Blackman, 394
Brightman, R. : Research in Canada, *review*, 589
  Reference Books for the Works Library, 771
Brimble, L. J. F. (Hawkins, Major T. H., and) : Adult Education, the Record of the British Army, *review* by Dr. Basil A. Yeaxlee, 790
Bristol, Clifton and West of England Zoological Society : To provide a research scholarship in vertebrate zoology tenable at the University of Bristol, 366
British Academy : Social Science in the Gap between the Royal Society and the (Dr. Lewis F. Richardson), 269
British Association for the Advancement of Science : Mathematical Tables, Part-Volume A, Legendre Polynomials, *review* by J. H. Pearce, 46
  Installation of Sir Henry Dale as president, 55
  Programme for the meeting in Dundee, 55
  Mathematical Tables, Part-Volume B, The Airy Integral (prepared by J. C. P. Miller), *review* by J. H. Pearce, 113
  Alexander Pedler Lecture (Prof. E. D. Adrian), 601
  Appointment of D. J. B. Copp as assistant secretary, 871
British Association for the Advancement of Science (Division for Social and International Relations of Science) : Conference on the Place of Universities in the Community, 601, 698
British Association of Chemists : Twenty-ninth Annual General Meeting, 21
British Baking Industries Research Association : Appointment of Dr. John B. M. Coppock as director of research, 704
British Broadcasting Corporation : Talks on Atomic Energy, 449
British Cast Iron Research Association : Silver Jubilee of the (J. G. Pearce), 49
British Coal Utilisation Research Association : Presidential Address (R. W. Foot), 208
British Commonwealth Scientific Office in Washington : Appointment of Dr. F. N. Woodward as director of the United Kingdom Scientific Office, 704
British Commonwealth Scientific Official Conference : Report of Proceedings, 257
British Council : Appointment of Dr. R. A. Silow as director of the Science Office in China, 21
  Scholarships for 1946–47, 124
British Drug Houses, Ltd. : Additions to the Board of the Company, 57
British Ecological Society : Discussion on the Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 556
British Herpetological Society : Suggested formation of a, 703
  Inaugural meeting, 871
British Industries, Federation of : Regional conferences on Industry and Research, 226
  Scottish Regional Conference at Glasgow on Research and the Progress of Industry in Scotland, 534, 751
  Report of the 1946 conference on Industry and Research, 634
  Regional Conference at Birmingham on Industry and Research, 649
  Regional Conference at Sheffield on Industry and Research, 852
British Iron and Steel Research Association : Appointment of W. C. F. Hessenberg as head of the Mechanical Working Division, 57, 534
  Appointment of S. S. Carlisle as head of the Instrument Section, 262
  Appointment of R. H. Myers as head of the Steel Making Division, 397
  Appointment of Dr. A. H. Leckie as deputy head of the Steel Making Division, 397
British Journal of Nutrition : To be published by the Nutrition Society, 55, 869
British Leather Manufacturers' Research Association, and the Association of Applied Biologists : Symposium on Applied Biology in the Leather Industry, 750
British Legation in Copenhagen : Appointment of Ronald Ede as agricultural attaché, 92
British Medical Association : Publication of two new journals, the *Abstracts of World Medicine* and the *Abstracts of World Surgery, Obstetrics and Gynaecology*, 261
British Medical Bulletin, Vol. 4, No. 4, on Chemotherapy, 91
British Medical Journal : Retirement of Dr. Gerald Horner from the editorship, 54
  Appointment of Dr. Hugh Clegg as editor, 55
British Museum : Election of Prof. A. V. Hill, Sir Jasper Ridley and G. M. Young as trustees, 160
British Non-Ferrous Metals Research Association : Appointment of W. L. Hall as chief officer of the Liaison Department, 534
British Rheologists' Club and the Faraday Society : Discussion on Dilatancy and Thixotropy, 70
British Rubber Producers' Research Association : Appointment of Dr. Geoffrey Gee as director of research, 568, 734
British Scientific Instrument Manufacturers' Association : Prizes for Scientific Instrument Development, 432
  Appointment of A. J. Philpot as director, 534
British Scientific Instrument Research Association : Information Bulletin, 91
British Social Hygiene Council : Summer School in Switzerland on Social Biology, 262
British Social Hygiene Council and the Town and Country Planning Association : Conference on the Family at Work and Play, 23
British Society for the History of Science : Formation of a, 298
  First Annual General Meeting, 703
  Election of Dr. Charles Singer as president, 703
British Standards Institution : British Standard 7, Cable Insulation, new edition, 262
British Welding Research Association : Appointment of F. A. Fox as assistant director of research, 23
British Zoologists, Association of : Election of officers, 366
  Discussion on Careers in Zoology, 378
Broad, Prof. C. D. : Appointed a trustee of the Arthur Stanley Eddington Foundation Trust, 498
Broda, Dr. E. : A German View of the Atom Bomb, *review*, 792
Bromberg, Y. M., and others : Treatment of Keratitis rosacea with Small Doses of Testosterone, 171
Bromley, E. N. (Ross, W., and) : Lateral Deviation of Radio Waves at Sunrise, 132
Bronowski, Dr. J. : Appointed a senior principal scientific officer, 464
Brookes, B. C. : The Incorporation of Statistics into a School Course, 582
Brooks, C. McC., and Eccles, Prof. J. C. : An Electrical Hypothesis of Central Inhibition, 760
Brooks, Prof. F. T. (Briggs, G. E., and) : *Obituary* of Dr. F. F. Blackman, 394
Broom, Dr. R. : At the Pan-African Congress on Prehistory, 216
  Elected an honorary fellow of the Royal Society of South Africa, 598 ; work of, 598
  The Upper Milk Molars of the Ape-man, *Plesianthropus*, 602
  Discovery of a New Skull of the South African Ape-man, *Plesianthropus*, 672
Broom, Dr. R., and Robinson, J. T. : Two features of the *Plesianthropus* Skull, 809
Brown, A. F., and Jones, Dr. W. M. : A Methyl Methacrylate-Silica Replica Technique for Electron Microscopy, 635
Brown, Dr. A. J. : Appointed professor of economics and head of the Department of Economics and Commerce in the University of Leeds, 299
Brown, B. R., and Hammick, D. Ll. : Resolution of Mepacrine, 612
Brown, Dr. E. S. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 559
Brown, F. G. W. : Unification of Algebra, *review*, 6
Brown, Dr. G. B. : Title of University of London reader in physics conferred on, 23
Brown, G. L. : *Obituary* of Prof. B. A. McSwiney, 596
Brown, Engineer Vice-Admiral Sir Harold : Appointed chairman of the Fuel Research Board, 497
Brown, Margaret B. (Cook, Dr. R. P., and) : Effect of the Source of Nitrogen in the Medium on the Formation of Penicillin by Surface Cultures of *Penicillium notatum*, 376
Brown, O. S. : Industry and Research in the Sheffield Area, 853
Brown, R. L. : Dilatancy and Thixotropy, 70
Browne, Sir Granville Orde : *Obituary* by Dr. Lucy Mair, 800
Browning, Prof. C. H. : Bacteriology and Immunity, *review*, 112
Brownlee, K. A. : Application of Statistical Methods to Food Problems, 37

Bruce, Dr. Chas. E. R. : Origin of Solar 'Static', 580
Bruce, Maurice : War and Nations, *review*, 181
  Philosophers and Historians, *review*, 248
  Analysis and Prophecy in Social Studies, *review*, 452
Brück, Dr. H. A. : Appointed a senior professor of the School of Cosmic Physics in the Dublin Institute of Advanced Studies, 567
Brumwell, J. R. M. : The Future of the Social Sciences, 173
Brundrett, F. : Appointed chief of the Royal Naval Scientific Service, 498, 631 ; work of, 631
Brunskill, L., and others : Seasonal Variations in Vitamin C Content of Tomatoes grown in Great Britain, 171
Brunt, Prof. David : To be presented with the Symons Medal of the Royal Meteorological Society, 92
Buckley, Dr. J. J. C. : Appointed to the William Julien Courtauld chair of helminthology at the London School of Hygiene and Tropical Medicine, 160
Bulgin, D. : Electrostatic Hazards in Industry, 514
Bullough, Dr. Helena F. : Epidermal Thickness following Oestrone Injections in the Mouse, 101
Bulmer, I. G. : Appointed assistant conservator of forests, Sierra Leone, 432
Bunak, Prof. A. : Recent Work on Soviet Anthropology, 218
Bunn, C. W., and Peiser, H. S. : Mixed Crystal Formation in High Polymers, 161
Burcham, W. E., and others : Interaction of Fast Neutrons with Beryllium and Aluminium, 473
Burgers, Prof. J. M. : *Obituary* of J. K. Lubanski, 19
Burgers, Prof. W. G. : Self-Recovery of Metals, 203
Burgers, Prof. W. G., and Tan Koen Hiok : Diffuse Bands on Laue Photographs of Silver Chloride Crystals, 845
Burges, Alan : Plant Tissue Culture, *review*, 80
Burhop, Dr. E. H. S. : Science and the Real Freedoms, 511
Burhop, Dr. E. H. S. (Moon, Prof. P. B., and) : Atomic Survey, 533
Burkitt, M. C. : *Obituary* of Dr. Hugo Obermaier, 18
Burnet, Dr. F. M. (Beveridge, Dr. W. I. B., and) : Cultivation of Viruses and Rickettsiæ in the Chick Embryo, 277
Burnett, G. A. : A Marine Bed in the Coal Measures of Northumberland, 69
Burns, P. F. : Astronomy in the Schools, 583
Burpee, Lawrence J. : The Discovery of Canada, *review* by J. N. L. Baker, 182
Burrows, Dr. Harold : Biological Actions of Sex Hormones, *review*, 182
Burrows, Miss H. B., and others : Disintegration of Nitrogen into Four α-Particles by Collision with Deuterons, 569
Bury, C. R. : The Place of Thermodynamics in Education, 627
Bush, Raymond : Fruit Growing Outdoors, *review* by Dr. H. B. S. Montgomery, 622
Bush, Dr. Vannevar : Endless Horizons, *review* by Prof. S. Zuckerman, 316
Bushell, W. F. : A Century of School Mathematics, 582
Butkow, Prof. K., and Wojciechowska, Ir. : Elementary Photochemical Process in Halides of Bivalent Metals, 570
Butler, C. C., and others : An Example of Meson Production in Lead, 227
Butler, Dr. J. A. V. : Chemical Thermodynamics, fourth edition, *review* by Dr. F. P. Bowden, 114
  The Chemistry of the Proteins, 581
Butterbaugh, Grant I. : A Bibliography of Statistical Quality Control, *review* by F. J. Anscombe, 387

CADY, Prof. Walter Gayton : Piezoelectricity, *review* by Dr. W. A. Wooster, 284
Calder, Ritchie : The Place of Universities in the Community, 698
Callisen, Dr. F. I. : An Optical-Acoustic Method of Gas Analysis, 167
Callow, H. J. : Action of Light upon Jute, 309
Calvet, M. : High Polymers, 138
Cambois, Maurice : Considérations sur la conduite et l'exploitation des essais de qualités de vol des avions, *review*, 214
Cameron, A. (Wood, W. L., and) : 'Thermal Wedge' Theory of the Parallel Surface Thrust Bearing, 61
Campi, Plinius, e Rusconi, Aldo : Fisica nucleare, *review* by Prof. R. E. Peierls, 79
Canada, Chemical Institute of : Research in Canada, *review* by R. Brightman, 589
Cancer Hospital (Free), Royal : Appointment of Dr. D. W. Smithers to the University of London chair of radiotherapy, 160
  Mechanical Recording of Information about Cancer Patients (Dr. D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
Cancer Research Congress : Fourth International, 398
Canning, Sir Ernest : Industry and Research, 649
Carey, Michael, and others : Coupling of Diazonium Complexes from an Aliphatic Base, 643
Carlene, P. : Single Fibre Testing, 379
Carlisle, S. S. : Appointed head of the Instrument Section of the British Iron and Steel Research Association, 262
Carnegie United Kingdom Trust : Thirty-second Annual Report, 55
Carrier, N. H. : Experimental Data and 'Sufficient' Accuracy, 167
Carroll, Dr. J. A. : *Obituary* of Dr. Alan Baxter and John H. Strong, 667
Cartan, Prof. E. J. : Elected a foreign member of the Royal Society, 631, 701 ; work of, 701
Carter, Dr. G. S. : The Teaching of Taxonomy, 447
Cartwright, Mary Lucy : Elected a Fellow of the Royal Society, 429
Casas, Dr. J. (Loriente, E., and) : Microdetermination of Copper in Biological Substances, 470
Case, Dr. R. A. M. : Scientific Expedition to the Antarctic Whaling Grounds 1946–47, 88
Cassels, J. M., and Latham, R. : Use of a Cyclotron to Detect Short-Period Activities, 367
Cast Iron Research Association, British : Silver Jubilee of the (J. G. Pearce), 49
Catch, J. R., and others : Synthesis of Methionine and similar Amino-Acids, 578, *erratum*, 634
Caullery, Prof. Maurice : Awarded the Gold Medal for 1947 of the Linnean Society of London, 226, 734
Cave, W. T., and others : Infra-Red and Raman Spectrum of *Cyclo*-octatetraene, 739
Cavendish Laboratory, Cambridge : Summer School in Metal Physics, 330
Cazal, Dr. Pierre : Awarded a Lady Tata Memorial Trust grant for research, 871
Ceramic Research Institute of India : Central Glass and (Y. P. Varshney), 290
Chadwick, Sir James : Atomic Energy and its Applications, 421
Chain, Dr. E. B. : Pasteur, the Biochemist, 601
  Elected a corresponding fellow of the New York Academy of Medicine, 786
Chak, I. M., and Giri, K. V. : Effect of Ultra-Filtration and Carbon Dioxide on the Prothrombin Activity of Plasma, 878
Chakravarti, S. C. (Sen, Dr. B., and) : Vernalization of Excised Mustard Embryo, 783
Challenger Society : Joint meetings with staffs of Marine Biological Laboratories, 225
  Grants in aid of research in marine biology or oceanography, 299
Challinor, John : *Obituary* of Prof. H. P. Lewis, 223
Chalmers, C. H. (Morgan, G. F. V., and) : A Proposed Test for 'Sterilized' Milk, 510
Champetier, G. : High Polymers, 138
Champion, Dr. F. C. : Title of University of London reader in experiment physics conferred on, 23
Champion, Dr. F. C., and Roy, R. R. : Angular Distribution of Protons Ejected in the Disintegration of Nitrogen by α-Particles, 127
Chance Bros., Ltd. : Production of a new Heat-absorbing and Heat-resisting Glass, 298
Chang, Dr. Min-Chueh : Normal Development of Fertilized Rabbit Ova Stored at Low Temperature for Several Days, 602
Chantrenne, H., and others : Volume Change accompanying the Splitting of Ribonucleic Acid by Ribonuclease, 877
Chapman, Dennis : The Future of the Social Sciences, 174
Chapman, Prof. S. : Atmospheric Oscillations, 357
  Appointed a trustee of the Arthur Stanley Eddington Foundation Trust, 498
Chastel, R., and others : Ternary and Quaternary Fission of Uranium Nuclei, 773
Chatton, Prof. Edouard : *Death* of, 668 ; *obituary* by Dr. André Lwoff, 868
Chatwin, C. P. : The Story of Fossils, 225
Chaudhri, Prof. Rafi Mohammed, and Khan, Abdul Wahid : Emission of Secondary Electrons from Nickel and Molybdenum by Neutral Atoms of Mercury and Potassium, 202
Chedin, J. : High Polymers, 138
Cheeseman, E. E. : Degree of D.Sc. of the University of London conferred on, 23
Cheetham, Major-General G. : *Obituary* of Brigadier H. St. J. L. Winterbotham, 362
Chemical Engineers, Institution of, and the Society of Chemical Industry : Conference on Particle Size Analysis, 717
Chemical Industry, Society of : Brotherton Lecture of the (Dr. D. T. A. Townend), 71
  Reports of the Progress of Applied Chemistry, Vol. 29 (1944), *review*, 522
Chemical Industry, Society of, and the Institution of Chemical Engineers : Conference on Particle Size Analysis, 717
Chemical Industry, Society of (Food Group of the), and the Society of Public Analysts and other Analytical Chemists : Conference on the Application of Statistical Methods to Food Problems, 36
Chemical Institute of Canada : Research in Canada, *review* by R. Brightman, 589
Chemical Laboratory of India : National (Dr. Bashir Ahmad), 219
Chemical Manufacturers, Association of : British Chemicals and their Manufacturers, 466
Chemical Society : Tilden Lecture (Dr. A. E. Alexander), 160
  Joint meeting with the Royal Society of Arts to commemorate the centenary of the, 193
  Discussion on the Chemistry of the Proteins, 581
Chemistry, Royal Institute of : Anniversary Meeting, 600
  Election of G. Roche Lynch as president, 600
Chemistry, Royal Institute of (Dublin Section), and the Irish Chemical Association : Colloquium on Industrial Utilization of Agricultural Products and of Seaweed, 671
Chemistry, Royal Institute of (Scottish Sections) : Symposium on Coal, Petroleum and their Newer Derivatives, 193
Chemistry, Tenth International Congress of : *Proceedings* of the, 805
Chemists, British Association of : Twenty-ninth Annual General Meeting, 21
Cheng Te-k'un, and Sullivan, D. Michael : Tibetan Culture, 22
Chesney, Prof. Alan M. : The Johns Hopkins Hospital and the Johns Hopkins University School of Medicine, Vol. 1, Early Years, 1867–1893, *review* by Dr. E. Ashworth Underwood, 759
Chevalier, Prof. A. : Elected a foreign member of the Linnean Society, 734
Chidambaram, K., and Unny, M. Mukandan : Preliminary Study of the Chank Marking Experiments at Tuticorin, 651
Child, Prof. C. M. : Elected a foreign member of the Linnean Society, 734
Childe, Prof. V. G. : Appointed Mason Lecturer for 1947–48 in the University of Birmingham, 838
  Elected a member of the Royal Netherlands Academy of Sciences of Amsterdam, 838
Chinese Fisheries Research Institute : Formation of a, 736
Chinoy, Dr. J. J. : Correlation between Yield of Wheat and Temperature during Ripening of Grain, 442
Christopherson, D. G. : Relaxation Methods applied to Engineering Problems, 345
Chronica Botanica Co. : To publish a new monthly News-Letter, *Biologia*, as a supplement to *Chronica Botanica*, 298
Civil Aircraft Research Committee : Terms of reference of the, 803
Civil Engineers, Institution of : Election of Princess Elizabeth as an honorary member, 160
  James Alfred Ewing Medal for 1946 awarded to Sir Clifford Paterson, 66
  Election of the Very Rev. Alan Campbell Don and Sir Robert Robinson as honorary members, 737
Civil Service, Scientific : Promotion of Individual Research Workers, 464
Clack, B. N., and Harris, N. L. : Spiral Cracks in Glass Tubing, 541
Claesson, Stig : A New Method for the Observation of Zones of Colourles Substances on a Chromatographic Column, 708
Clancey, Vernon J. : Statistical Methods in Chemical Analyses, 339

Clapham, Prof. A. R. : The Teaching of Taxonomy, 447
Clarendon Laboratory : Conference on Liquid Helium, 772
Clark, A. M. : The Place of Thermodynamics in Education, 627
Clark, Desmond : At the Pan-African Congress on Prehistory, 216
Clark, Prof. W. E. Le Gros : At the Pan-African Congress on Prehistory, 216
  The Premaxilla and the Ancestry of Man, 546
  Fossil Man, *review*, 553
  Origin of Erythrocytes, 579
Clarke, Dr. W. A. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 559
Clayson, —. : Application of Statistical Methods to Food Problems, 37
Clegg, Dr. Hugh : Appointed editor of the *British Medical Journal*, 55
Clegg, J. A., and others : The Giacobinid Meteor Shower 1946, 120
Clemmesen, Dr. Johannes : Awarded a Lady Tata Memorial Trust grant for research, 871
Clemo, Prof. G. R., and Weiss, Dr. J. : Constitution of Melanin, 339
Cleveland Museum of Natural History : Appointment of Kenneth B. Disher as director, 23
Clews, Dr. C. J. B., and Cochran, Dr. W. : Crystal Structures of 2-Amino-4-Methyl-6-Chloropyrimidine and 2-Amino-4,6-Dichloropyrimidine, 264
Clibbens, Dr. D. A. : Awarded a Warner Memorial Medal for 1947 of the Textile Institute, 737
Clifford, Dr. M. H. : Science in Adult Education, 560
Clifford, William Kingdon : The Common Sense of the Exact Sciences, *review* by Sir Edmund Whittaker, 248
Clow, Archibald, and Clow, Nan L. : Dr. James Hutton and the Manufacture of Sal Ammoniac, 425
Coal Utilisation Research Association, British : Presidential Address (R. W. Foot), 208
Coates, J. : Elected a fellow of the National Institute of Sciences of India, 123
Cobbet, Prof. Louis : *Death* of, 396
Coblans, Dr. H. : The University Library, its Function and Potentialities, 277
Cochran, Dr. W. (Clews, Dr. C. J. B., and) : Crystal Structures of 2-Amino-4-Methyl-6-Chloropyrimidine and 2-Amino-4,6-Dichloropyrimidine, 264
Cochrane, E. R. : The Milch Cow in England, *review* by Prof. J. E. Nichols, 78
Cockburn, Dr. Robert : Awarded the Medal for Merit by the Government of the United States, 684
Coconut Research Scheme of Ceylon : Appointment of Dr. T. S. Raghavan as botanist, 737
Codrington, K. de B. : Indian Folk-Tales, *review*, 215
Cohen, Dr. John : The Future of the Social Sciences, 173
  Human Nature, War and Society, *review* by Maurice Bruce, 181
  Population, Psychology and Peace (J. C. Flugel), *review*, 793
Cole, Prof. F. J. : New Light on Vesalius, *review*, 655
Cole, L. W. L., and Heeley, W. : Prevention of Oil Shock in the Orchard, 32
Collar, Prof. A. R. : Awarded the George Taylor Gold Medal of the Royal Aeronautical Society, 669
Collings, Audrey J. (Embleton, Joan, and) : Transference of Vitamin D from the Female Rat to her Young, 340
Collins, G. E. : Single Fibre Testing, 379
Collins, Prof. H. J. : Some Aspects of Structural Engineering, 343
Collins, Comdr. K. St. B. : Awarded the Gill Memorial for 1947 of the Royal Geographical Society, 532
Collip, Dr. J. B. : Elected an honorary fellow of the New York Academy of Medicine, 786
Colonial Medical Research Committee : First Annual Report of the, 614
  Research Studentships, 704
Colonial Office : Appointments and promotions, 160, 226, 432, 567, 601, 871
Colonial Products Research Council : Third Annual Report of the, 614
Colonial Research Committee : Third Annual Report of the, 614
Colonial Social Science Research Council : Second Annual Report of the, 614
Colonial University Grants Advisory Committee : Appointed by the Secretary of State for the Colonies, 329
  Appointment of members, 329
Colonial, Agricultural, Animal Health and Forestry Research, Committee for : First Annual Report of the, 614
Comfort, Dr. Alex. : Dart of an Extinct Mollusc, 270
Commonwealth Fund : Fellowships Awards, 838
Commonwealth Scientific Office in Washington, British : Appointment of Dr. F. N. Woodward as director of the United Kingdom Scientific Office, 704
Commonwealth Scientific Official Conference, British : Report of Proceedings, 257
Comrie, Dr. L. J. : Tables of the Modified Hankel Functions of Order One-Third and of their Derivatives (Staff of the Computation Laboratory of Harvard University), *review*, 590
Congdon, J. L. : Appointed agricultural officer, Aden, 226
Connolly, Major M. W. K. : *Death* of, 396 ; *obituary* by Dr. A. T. Hopwood, 531
Contractor, Dr. G. P. : National Metallurgical Laboratory of India, 219
Conway, B. E. (Bockris, Dr. J. O'M., and) : Effect of Alkaloids on Hydrogen Overpotential, 711
Conway, Prof. Edward J. : Elected a Fellow of the Royal Society, 429
Conway, Prof. Edward J., and Brady, Dr. Thomas G. : Mechanism of High Acid Production by Yeast and its Bearing on Hydrochloric Acid Formation in the Stomach, 137
  Hydrochloric Acid Formation in the Gastric Mucosa, 876
Cook, Dr. A. H., and others : Synthesis of Methionine and similar Amino-Acids, 578; *erratum*, 634
Cook, Dr. B. S. : At the Pan-African Congress on Prehistory, 216
Cook, Dr. R. P., and Brown, Margaret B. : Effect of the Source of Nitrogen in the Medium on the Formation of Penicillin by Surface Cultures of *Penicillium notatum*, 376
Coombes, Capt. C. N. : Appointed agricultural economist, Gold Coast, 567
Coope, Dr. Robert : *Obituary* of Prof. Walter Ramsden, 801
Cooper, Dr. : Fluorimetric Analysis, 549
Cooper, Fordham : Electrostatic Hazards in Industry, 514
Cooper, L. H. N. : Internal Waves and Upwelling of Oceanic Water from Mid-depths on to a Continental Shelf, 579
Copeman, Dr. S. A. Monckton : *Death* of, 597 ; *obituary* by Sir Arthur MacNalty, 767
Copenhagen Academy of Technical Sciences : Awards of the Valdemar Poulsen Gold Medal to Dr. E. F. W. Alexanderson and Sir Robert Watson-Watt, 496
Copp, D. J. B. : Appointed assistant secretary of the British Association, 871
Coppock, Dr. John B. M. : Appointed director of research of the British Baking Industries' Research Association, 704
Corbett, G. : Appointed superintendent of agriculture, Cyprus, 160
Corson, D. R., and others : Astatine, the Element of Atomic Number 85, 24
Corte, M. Della, and others : The Meson Spectrum near Sea-Level, 845
Coster, Prof. D., and others : Neutron Experiments of the Physical Laboratory of Groningen, 569
Cotton Trade War Memorial Fund : Scholarship awarded by the Textile Institute to George H. Ewins, 366
Cottrell, Miss H. J. : Tetrazolium Salt as a Seed Germination Indicator, 748
Coulson, Dr. C. A. : Energy Bands in Graphite, 265
  Appointed to the University of London chair of theoretical physics at King's College, 466, 632 ; work of, 632
Covington, A. E. : Micro-Wave Solar Noise Observations during the Partial Eclipse of November 23, 1946, 405
Cowan, Dr. S. T. : Appointed director of the National Collection of Type Cultures of Micro-organisms, 124
Cowburn, J. O. : Awarded the Herbert Jackson Prize for 1946 of the London, Midland and Scottish Railway, 330
Cowley, J. M., and Paterson, M. S. : X-Ray Diffraction Studies of Yielding in Mild Steel, 846
Cowling, Prof. T. G. : Elected a Fellow of the Royal Society, 429
Cox, Prof. E. G., and others : Use of Punched Card Tabulating Machines for Crystallographic Fourier Syntheses, 433
Cox, H. L. : Appointed a senior principal scientific officer, 464
Cox, Dr. H. Roxbee : Elected president of the Royal Aeronautical Society for 1947–48, 836 ; work of, 836
Cox, J. D. (Barton, Dr. D. H. R., and) : Vicinal Action in Steroids, 470
Cox, J. W. (Tremellan, K. W., and) : Radio-communication during the War, 548
Cox, S. M., and Kirby, P. L. : Rate of Crystal Growth in Glass, 162
Coyne, Dr. F. P. : Careers in Zoology, 378
Cragg, J. B., and Davies, Lewis : Sweating in Sheep, 34
Craggs, Dr. J. D., and Jaffe, A. A. : Spread of Discharge in Geiger Counters, 369
Craggs, Dr. J. D., and others : Measurement of Out-of-Phase Magnetic Fields in Betatrons, 229
Craigie, J. : Elected a Fellow of the Royal Society, 429
Cramér, Prof. Harald : Mathematical Methods of Statistics, *review* by Prof. Godfrey Thomson, 826
Crane, E. E., and others : Elaboration of Hydrochloric Acid by Gastric Mucosa, 468
Crane, M. B. : Elected a Fellow of the Royal Society, 429
Creasey, C. H. : *Obituary*, 802
Crewe, W. : Helminth Parasites of Limpets, 238
Croce, Benedetto : Politics and Morals, translated from the Italian by Salvatore J. Castiglione, *review* by Maurice Bruce, 248
Croft, Lieut.-Colonel Andrew : Awarded a Back Grant of the Royal Geographical Society, 532
Crooke, A. C., and Mandl, Anita M. : A Rapid Supra-vital Staining Method for Assessing the Viability of Human Spermatozoa, 749
Crosby Hall, London : Re-opening of, 481
Cross, Dr. E. J., and Speakman, Prof. J. B. : *Obituary* of Prof. F. M. Rowe, 53
Crow, Capt. A. T. : Appointed geologist, Gold Coast, 432
Crowe, Dr. P. R. : Appointed to the University of London readership in geography at Queen Mary College, 567
Crowther, Prof. J. A. : Introducing Science, *review*, 4
Crowther, J. G. : Appointed secretary-general designate of the World Federation of Scientific Workers, 365
Cuckow, F. W. : Phase-Contrast in the Photomicrography of Metals, 639, *erratum*, 671
Cuer, P., and others : Range-Energy Relation for Protons and α-Particles in the New Ilford 'Nuclear Research' Emulsions, 301
Cullumbine, Dr. H. : Medical Aspects of Mustard Gas Poisoning, 151
  Appointed professor of physiology in the University of Ceylon, 568
  Leukotaxine and Histamine, 841
Cullumbine, Dr. H., and Simpson, M. : Thio-thymine (2-Thio-5-Methyl-Uracil), 680
  Pulmonary Œdema and the Spleen, 781
Culpin, Dr. Millais : *Obituary* of Prof. Pierre Janet, 495
Cumming, Mrs. Florence (Exors. of the late) : Robert Gordon's Astrolabe given to the Royal Scottish Museum, 533
Cummings, Dr. W. M. : Research and the Progress of Industry in Scotland, 752
Curd, Dr. F. H. S. : Awarded the Gold Medal in Therapeutics of the Society of Apothecaries, 871
Curran, C. H. : Insects of the Pacific World, *review*, 420
Curry, W. J. J., and others : Disintegration of Nitrogen into Four α-Particles by Collision with Deuterons, 569
Curtis, Lionel : Ethical Aspects of the Development of Atomic Energy, 125
Curtis, Prof. W. E. : Appointed a member of the Advisory Council on Scientific Research and Technical Development to the Ministry of Supply, 671
Cusmano, Luigi (Barigozzi, Claudio, and) : Chromosome Numbers in Cancer Cells, 505
Czechoslovak Chemical Communications, Collection of : Resumption of publication, 600

DAILY EXPRESS : Exhibition of Atomic Energy, 157
Dain, J. (Goward, F. K., and) : Optimum Disturbing Field for Synchrotron Beam Ejection, 636
Dakshinamurti, Dr. C. : Triatomic Hydrogen and Doppler Effect in Hydrogen Positive Rays, 27
Dale, Alan : An Introduction to Social Biology, *review* by Cyril Bibby, 147
Dale, Sir Henry : Installed as president of the British Association for the Advancement of Science, 55
  The Place of Universities in the Community, 698

Dallemagne, Prof. Marcel J. : Données récentes sur la nature et le métabolisme de l'Os, 617

Dallimore, W. : *Obituary* of A. B. Jackson, 156

Obituary of W. J. Bean, 667

Daniell, Prof. P. J. : *Obituary*, 364

Daniels, H. E. : Single Fibre Testing, 379

Darmstadt Technische Hochschule : To be rebuilt by Prof. Richard Vieweg and Prof. Alwin Walther, 704

Dart, Prof. R. : At the Pan-African Congress on Prehistory, 216

Darwin, Sir Charles : The Indian Science Congress, Delhi Meeting, 353

The Place of Thermodynamics in Education, 626

Darwin in Uruguay : A Monument to, 90

Das, Dr. S. M. : British Folliculinidæ (Ciliata, Heterotricha), 502

Das Gupta, M. K., and others : Location of Thunderstorm Centres from Directional Observations of Atmospherics during Sunrise and Sunset, 572

Das Gupta, S. : Single Fibre Testing, 379

Daudel, P. and R., and others : Exchange between Chromium Ions and the Szilard Effect, 538

Daunt, Dr. J. G. : Electrons in Action, *review* by Prof. J. A. Crowther, 4

Dauvillier, Prof. A. : Elected a *Correspondant* for the Section of Astronomy of the Paris Academy of Sciences, 534

Davenport, Prof. H. : The Geometry of Numbers, 104, 582

Davey, Dr. D. G. : Awarded the Gold Medal in Therapeutics of the Society of Apothecaries, 871

David, Prof. W. T. : Latent Energy and After-Glow in Flame Gases, 407

Davidson, Rev. Dr. M. : The Milky Way (Bart J. Bok and Priscilla F. Bok), second edition, *review*, 387, *erratum*, 568

Sun, Moon and Stars (Prof. William T. Skilling and Robert S. Richardson), *review*, 420

The Stars and the Mind, *review* by Lieut.-Colonel H. D. Anthony, 521

Earth, Moon and Planets (Fred L. Whipple), *review*, 522

Davies, C. N. : Particle Size Analysis, 717

Davies, C. W. : Degree of D.Sc. of the University of London conferred on, 23

Davies, Prof. C. W. (Thomas, G. Garrod, and) : Ion Exchange Resins as Catalysts, 372

Davies, Dr. E. T. : Title of University of London reader in mathematics conferred on, 23

Davies, Lewis (Cragg, J. B., and) : Sweating in Sheep, 34

Davies, Rees, and Beyers, E. : A Protozoal Disease of South African Trawled Fish and its Routine Detection by Fluorescence, 714

Davies, R. E., and others : Elaboration of Hydrochloric Acid by Gastric Mucosa, 468

Davies, Prof. S. J. : King's College Engineering Society 1847–1947, 515

Davison, Dr. D. W. : Appointed a senior research officer in the Research School of Metallurgy at the University of Melbourne, 805

Davison, G. H. : Pages from the Diary of a Steel Works Librarian, 771

Davy, M. J. B. : Origins of Water Transport, *review*, 419

Dawes, Dr. Benjamin : Title of University of London reader in zoology conferred on, 23

The Trematoda, *review* by Dr. G. Lapage, 250

Dawes, E. A., and others : Preparation of Cell-free Tryptophanase, 99

Nature of the Tryptophanase Complex, 644

Dawson, J., and others : Preparation of Cell-free Tryptophanase, 99

Nature of the Tryptophanase Complex, 644

Day, T. D. : Connective Tissue Cementing Substance, 100

De, Dr. S. S., and Ganguly, J. : Heat Treatment and the Biological Value of Soya-bean Protein, 341

De Meillon, Dr. Botha, and Golberg, Dr. Leon : Development of *Ornithodorus moubata* on Normal and Thiamin-deficient Rats, 171

Deacon, Dr. G. E. R. : Appointed a senior principal scientific officer, 464

Dean, Prof. H. R. : Elected a corresponding fellow of the New York Academy of Medicine, 786

Debré, Dr. Robert : Elected an honorary fellow of the New York Academy of Medicine, 786

Defence, Scientific Advisory Department for : To be formed in Australia under A. P. Rowe, 869

Deffner, Dr. M., and Issidoridis, A. : Influence of Cations in the Production of Citric Acid by Yeast, 879

Delacour, Jean, and Mayr, Ernst : Birds of the Philippines, *review* by N. B. Kinnear, 386

Delporte, Dr. E. : Elected a *Correspondant* of the Section of Astronomy of the Paris Academy of Sciences, 466

Demerec, M. : Mutations in *Drosophila* induced by a Carcinogen, 604

Dempsey, Miss M. : Applied Biology in the Leather Industry, 750, 751

Deraniyagala, Prof. P. : At the Pan-African Congress on Prehistory, 216

Derrett-Smith, D. A. : Awarded a Warner Memorial Medal for 1947 of the Textile Institute, 737

Desch, Dr. C. H. : The Place of Universities in the Community, 699

Désirant, M., and Shoenberg, Dr. D. : Penetration of Magnetic Field into Superconducting Mercury, 201

Desreux, V., and others : Action of Mustard Gas ($\beta\beta'$-Dichlorethylsulphide) on Thiol Groups of Proteins, 478

Deuel, H., and Neukom, H. : Derivatives of Pectic Acid as Models of Proteins, 882

Dey, Dr. Arun K. : Existence of Cupric Hexammino Sulphate, 339

Dhar, Prof. N. R. : Nitrogen Fixation by Farmyard Manure, 65

Dickens, Prof. F. : Aromatization of *cyclo*Hexane Carboxylate in Liver Slices, 839

Dickinson, Dr. Löis : Effect of Calciferol and of Penicillin on Experimental Tuberculosis of Guinea Pigs, 681

Dingwall, Eric John : Racial Pride and Prejudice, *review* by Prof. E. G. Bowen, 555

Disher, Kenneth B. : Appointed director of the Cleveland Museum of Natural History, 23

Ditchburn, Prof. R. W. : The International Union of Physics—Activities of the Union, 1923–39, 562

Dixey, Dr. F. : *Obituary* of Dr. J. D. Falconer, 733

Dobb, Maurice : Studies in the Development of Capitalism, *review* by Maurice Bruce, 452

Dobbert, N. N., and others : Labilization of the α-Hydrogen of Amino-acids in the Presence of Aminopherase, 67

Dobell, Dr. Clifford : *Obituary* of Prof. H. S. Jennings, 834

Dobry, Mme. A. : High Polymers, 138

Dobson, Dr. G. M. B. : Elected president of the Royal Meteorological Society, 193

Dolbear, D. W. N., and Elliot, H. : Cosmic Ray Intensity at Manchester and Solar Disturbances of July 25, 1946, 58

Dolivet, Louis : The United Nations, a Handbook on the New World Organisation, *review*, 114

Dollar, Dr. A. T. J. : The Inverness-shire Earthquake of December 25, 1946, 648

Don, Very Rev. Alan Campbell : Elected an honorary member of the Institution of Civil Engineers, 737

Donald, M. B. : Title of University of London reader in chemical engineering conferred on, 23

Donaldson, Dr. W. K., and Khamsavi, Dr. A. : Interferometric Determination of Apparent Thickness of Coatings, 228

Doty, P. : High Polymers, 138

Dougall, H. W. : Appointed agricultural chemist, Sierra Leone/Gambia, 871

Douglas, Prof. J. A. : *Obituary* of Dr. C. T. Madigan, 363

Downie, Prof. A. W. : Nature of Virulence, 428

Downing College, Cambridge : Election of Sir Lionel Whitby as master, 772

Drew, R. (La Cour, Dr. L. F., and) : Partition-Chromatography and Living Cells, 307

Druce, Dr. Gerald : Elements of Atomic Numbers 43 and 75, 205

Obituary of Prof. J. Velišek, 835

Drummond, W. J. : Appointed honorary secretary of the British National Committee of the World Power Conference, 92

Dublin Institute for Advanced Studies : Inaugural meeting of the School of Cosmic Physics, 567

Appointment of Dr. H. A. Brück as a senior professor of the School of Cosmic Physics, 567

Appointment of Dr. L. Jánossy as a senior professor of the School of Cosmic Physics, 567

Appointment of Dr. L. W. Pollak as a senior professor of the School of Cosmic Physics, 567

Dubos, Prof. Rene J. : The Bacterial Cell in its relation to Problems of Virulence, Immunity and Chemotherapy, *review*, 859

Duchateau, Ghislaine : Méthodes nouvelles d'analyse biochimique et clinique, 617

Duchesne, Dr. Jules : Hybridization in the Methyl Radical of CH_2X Molecules, 62

Duchesne, Dr. Jules, and others : Heat of Atomization of Carbon, 130

Duckworth, Dr. W. L. H. : Palæolithic Human Remains in Asia, 218

Duff, C. E. : Appointed conservator of forests, Northern Rhodesia, 871

Duff, Prof. G. Lyman, and others : The Renal Factor in Alloxan Diabetes, 575

Dufrenoy, Dr. Jean (Pratt, Dr. Robertson, and) : Practical Three-Hour and Two-Hour Cylinder-Plate Assays for Penicillin, 576

Duncan, Dr. J. T. : Nature of Virulence, 427

Duncan, Prof. W. J. : Elected a Fellow of the Royal Society, 429

Dunsdon, Miss I. M. : A Survey of the Fields of Employment of Psychologists, 481

Dunworth, J. V. : Radioactivity of Radio-aluminium, 436

Duran-Jorda, Dr. Frederic : Secretion of Red Blood Corpuscles, 293

Durban Museum and Art Gallery : Annual Report for 1945, 262

Durell, Clement V. : General Mathematics, *review*, 114

A Unified Course of Mathematics in Secondary Schools, 583

Durham Colleges : Appointment of Leonard Slater as reader in geography, 498

Dustin, Dr. Pierre : Some New Aspects of Mitotic Poisoning, 794

Awarded a Lady Tata Memorial Trust grant for research, 871

Dutta, Ajit Kumar : Electrical Conductivity of Molybdenite Crystals, 477

Duvdevani, S. : An Optical Method of Estimation of Dew, 515

Dyatkina, M. E. (Syrkin, Ya. K., and) : The Chemical Bond and the Structure of Molecules, *review* by G. Stanley Smith, 386

Dyers and Colourists, Society of : Appointment of C. L. Bird as editor o the *Journal*, 193

Mercer Lecture (E. J. Bowen), 568

ECCLES, Prof. J. C. (Brooks, C. McC., and) : An Electrical Hypothesis o Central Inhibition, 760

Ecological Society, British : Discussion on the Survival and Extinction o Flora and Fauna in Glacial and Post-glacial Times, 556

Eddington, Sir A. S. : Fundamental Theory, *review* by Prof. E. A. Milne, 48

Eddington Foundation Fund : Appointment of trustees, 498

Ede, A. J. : Effect of Shape of Operating Chamber in the Freeze-dryin Process, 610

Ede, Ronald : Appointed agricultural attaché to the British Legation i Copenhagen, 92

Edisbury, Dr. J. R., and others : Units in Photo-Electric Absorptiometr 777

Edison, Thomas Alva (1847–1931), 191

Edlén, Prof. Bengt : Heat of Atomization of Carbon, 129

Education, Ministry of : Further Education, 552

New regulations for the Whitworth Scholarships, 599

Education for England, Central Advisory Council for : School to Lif 857

Education, Further : Publication of No. 1, 464, 669

Efrati, E., and others : Influence of the Medium on the Inactivation Tetanus Toxin by X-Ray Irradiation, 715

Egerton, Sir Alfred : The Place of Thermodynamics in Education, 626

Eggleston, L. V., and others : Urea Synthesis in Mammalian Liver, 808

Egyptian Academy of Sciences (Dr. E. Hindle), 787

Ehrensvärd, Dr. G. C. H. : Phenyl-thio-carbonyl Chloride as a Grou protecting Agent, 500

Eire Emergency Scientific Research Bureau : Report for 1941–1945, 311

El-Katib, M. Taha : Value of Adding Cotton-Seed, Okra and Fenugreek Maize Flour, 716

El-Katib, M. Taha, and others : Chemical Composition of Egyptian Cov Milk in relation to Milk Laws, 506

El-Katib, M. Taha (Ghoneim, Prof. Ahmed, and) : Digestibility of Cov and Buffalo's Milk, 273

El-Toubi, Dr. M. R. : Sacral Ribs of Lacertilia, 342

El Wafa, M. Hassan Abou (Hassan, Dr. Ali, and) : An Oestrogenic Substance in Pollen-grains of Date Palm Tree *Phoenix dactylifera* L., Palmæ, 409
Electrical Engineers, Institution of : Election of Sir John Macfarlane Kennedy as an honorary member, 122
  Faraday Medal awarded to Sir Standen Leonard Pearce, 122
  Conference on Radiolocation, 174
  Offer of Research and Student Scholarships, 299
  Radiocommunication Convention, 299, 397, 547
  Convention on Automatic Regulators and Servo-mechanisms, 330
  Publication of the Radiolocation Conference papers, 804
Electrodepositors' Technical Society : Progress and Development of the, 139
  First E.T.S. Medal awarded to Samuel Field, 140
Electronics, Institution of (North Western Branch) : Second Annual Electronics Exhibition, 871
Eliezer, Dr. C. Jayaratnam : Allocated a Charles L. Mayer Award of the United States National Academy of Sciences, 20
  Relativistic Wave Equations, 60
Elizabeth, Princess : Elected an honorary member of the Institution of Civil Engineers, 160
  Elected a Royal Fellow of the Royal Society, 193
Ellenby, Dr. C. : A Copepod Parasite of the Mussel New to the British Fauna, 645
Ellinger, Dr. : Fluorimetric Analysis, 549
Elliot, H. (Dolbear, D. W. N., and) : Cosmic Ray Intensity at Manchester and Solar Disturbances of July 25, 1946, 58
Elliott, A., and Ambrose, E. J. : Polarization of Infra-Red Radiation, 641
Elliott Brothers (London), Ltd. : Transfer of the research laboratory from Lewisham to Borehamwood, 226
Elton, C. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 559
Elwin, Dr. Verrier : Folk-Tales of Mahakoshal, *review* by K. de B. Codrington, 215
Embleton, Joan, and Collings, Audrey J. : Transference of Vitamin D from the Female Rat to her Young, 340
Endocrinology, Society for : Discussion on the Adrenal Cortex, 765
  Election of officers, 772
Engel, A. von (Gill, E. W. B., and) : Low-Pressure Electrical Discharges, 404
Engineering Education, International Congress on, 704
Ennor, A. H., and Stocken, L. A. : Metabolism of Fatty Livers, 308
Enogat, John (edited by Peierls, Prof. R. E., and) : Science News, 2, Atomic Energy Number, *review* by S. Weintroub, 488
Erickson, Dr. Ralph O. : Respiration of Developing Anthers, 275
Eros in Piccadilly Circus, London : Statue of, 870
Essen, Dr. L. : Velocity of Electromagnetic Waves, 611
Ettlinger, Dr. Martin G. : Awarded a Frank B. Jewett Fellowship, 397
Evans, Dr. Alwyn G. : Reactions of Organic Halides in Solution, 166
Evans, Dr. Alwyn G., and Weinberger, M. A. : The Boron-Trifluoride Catalysed Reaction of Di-isobutene, 437, 498
Evans, Dr. B. J. Lloyd : Title of University of London reader in mechanical engineering conferred on, 466
Evans, Dr. David S. : Frontiers of Astronomy, *review* by Prof. J. A. Crowther, 4
Evans, G. R., and Griffiths, T. C. : Slow Cosmic Ray Mesons at Sea-Level, 879
Evans, Prof. M. G. : Elected a Fellow of the Royal Society, 429
Evans, Percy : Awarded the Murchison Medal of the Geological Society, 123
Ewins, George H. : Awarded a scholarship by the Textile Institute from the Cotton Trade War Memorial Fund, 366
Exhibition of 1851, Commissioners for the : Awards of senior studentships for 1947, 838
Experimental Biology, Society for : To hold a meeting at Utrecht, 330
  Conference in Utrecht (Dr. L. C. Beadle), 718
Experimental Cytology, Sixth International Congress of : To meet in Stockholm, 634
Eyles, V. A. : Edward Lhwyd, Geologist, Botanist and Philologist (1660–1709), 154
Eysenck, Dr. H. J. : Facilities for Training Psychologists, 481

FAEGRI, Prof. K. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 557, 559
Fagraeus, Astrid : Plasma Cellular Reaction and its relation to the Formation of Antibodies *in vitro*, 499, *erratum*, 601
Fairley, Dr. N. Hamilton : Elected a corresponding fellow of the New York Academy of Medicine, 786
Falconer, Dr. J. D. : *Death* of, 565 ; *obituary* by Dr. F. Dixey, 733
Falmouth, Viscount : Re-elected president of the Gas Research Board, 601
Fantl, Dr. P., and Nance, Margaret H. : Influence of 2,3-Dimercaptopropanol (*BAL*) on Blood Coagulation, 777
Faraday, Dr. Joseph Escott (compiled by) : Encyclopedia of Hydrocarbon Compounds, 1945 Replacement-Addition of C_1-C_3, 159 ; Replacement-Addition of C_6 and C_7, 159
  Encyclopedia of Hydrocarbon Compounds, Vol. 3, C_8, *review*, 862
Faraday Society and the British Rheologists' Club : Discussion on Dilatancy and Thixotropy, 70
Farmer, H. O. : Free-Piston Compressor-Engines, 413
Farrant, J. L., and others : Structure of Fibrous Keratin, 535
Farrington, Dr. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 559
Faure, Prof. J. C. : A Plea for Brevity—and Sanity—in Zoological Nomenclature, 225
Fazzini, T. F., and others : The Meson Spectrum near Sea-Level, 845
Feather, Prof. N. : The Number of the Elements (Ritchie Lecture for 1945 of the Royal Society of Edinburgh), 242
  Emission of Secondary Charged Particles in Fission, 607
Federation of British Industries : Regional conferences on Industry and Research, 226
  Scottish Regional conference at Glasgow on Research and the Progress of Industry in Scotland, 534, 751
  Report of the 1946 conference on Industry and Research, 634
  Regional conference at Birmingham on Industry and Research, 649
  Regional conference at Sheffield on Industry and Research, 852
Feigenbaum, Dr. Jacob, and Israelashvili, Shalom : Gaseous Sulphur Dioxide and Sodium Bisulphite as Preservatives of Citrus Concentrates, 32
Feldberg, Dr. W. S. : Elected a Fellow of the Royal Society, 429
Felsing, Prof. William A., and others : General Chemistry, *review*, 590
Ference, Jr., Assoc. Prof. Michael (Lemon, Prof. Harvey Brace, and) : Analytical Experimental Physics, revised edition, *review* by G. R. Noakes, 283
Fertiliser Society : Formation of the, 365
Field, Samuel : Awarded the first E.T.S. Medal of the Electrodepositors' Technical Society, 140
Finch, Prof. G. I. : Elected president of the Physical Society for 1947–48, 670
Findlay, J. W. : Measurements of Changes of the Phase-Paths of Radio Waves in the Ionosphere, 58
Finer, Prof. Herman : The Future of Government, 246
Finlayson, A. : Single Fibre Testing, 379
Finney, D. J. : Application of Statistical Methods to Food Problems, 36, 37
Firth, Dr. J. B., and Stuckey, Dr. R. E. : Spontaneous Combustion of Hay, 624
Fischer-Piette, Prof. E. : Elected a foreign member of the Linnean Society, 734
Fishbein, Dr. William I., and others : D.D.T. and the Insect Problem, *review* by Dr. Kenneth Mellanby, 488
Fisher, J. W., and Flint, Prof. H. T. : X-Ray Spectra of Trans-Uranic Elements, 741
Fisher, Dr. M. S. : Title of University of London reader in metallurgy conferred on, 23
Flammarion, Camille : Annuaire astronomique et météorologique pour 1947, *review*, 590
Fleming, Sir Alexander : Chemotherapy, Yesterday, Today and Tomorrow, 208
  Elected a corresponding fellow of the New York Academy of Medicine, 786
Fleming, Dr. Charlotte M. : Title of University of London reader in education conferred on, 466
Flett, Sir John : *Death* of, 156 ; *obituary* by Dr. W. F. P. McLintock, 326
Flett, M. St. C., and others : Infra-Red and Raman Spectrum of *Cyclo*-octatetraene, 739
Fleure, Prof. H. J. : *Obituary* of Prof. P. M. Roxby, 462
Flint, Prof. H. T. (Fisher, J. W., and) : X-Ray Spectra of Trans-Uranic Elements, 741
Florence, Prof. P. Sarjant : The Economics and Dis-economics of Industrial Concentration—the War-time Experience of Coventry, 91
Florey, Sir Howard : Appointed a member of the Advisory Council on Scientific Policy, 224
  Elected a corresponding fellow of the New York Academy of Medicine, 786
Florkin, Prof. Marcel : L'Évolution du métabolisme des substances azotées chez les animaux, 617
  Aperçus sur les progrès de la biochimie dans les Pays Anglo-Saxons depuis 1940, 617
Flörschutz, Prof. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 559
Flugel, J. C. : Population, Psychology and Peace, *review* by Dr. John Cohen, 793
Fodor, Dr. P. J. : Co-existence of Two Different Esterases in Liver Juice, 375
Food and Agriculture Organisation of the United Nations : First Annual Report of the Director-General, 211
  World Food Survey, 211
  Proposals for a World Food Board, 211
  Dr. G. Scott Robertson seconded to take up the post of director of agricultural production and research, 632
Foot, R. W. : Coal Utilisation Research in Great Britain, 208
Forest Products Research Laboratory : Leaflet No. 39, Timber Decay and its Control, 72
Forest Research Board : Appointment of Sir Edward Salisbury as chairman, 497
Foresters of Great Britain, Society of : Presentation of a medal to Sir Roy Lister Robinson, 466
Forestry Commission : Retirement of Sir Roy Lister Robinson as director-general, 532
  The New Position of the (Prof. E. P. Stebbing), 785
Forssberg, Dr. A. : Mechanism of the Action of X-Rays on Enzymes in Water-Solution, 308
Forster-Cooper, Sir Clive : The Teaching of Taxonomy, 446
Foster, H. G., and others : Gyro Interaction of Radio Waves, 300
Foster, J. F. : Appointed secretary of the Universities Bureau of the British Empire, 398
Founders, Worshipful Company of : Award of a Fellowship, 226
Fowler, P. H., and others : Range-Energy Relation for Protons and α-Particles in the New Ilford 'Nuclear Research' Emulsions, 301
  Disintegration of Nitrogen into Four α-Particles by Collision with Deuterons, 569
Fox, F. A. : Appointed assistant director of research to the British Welding Research Association, 23
Fox, Prof. H. Munro : *Obituary* of Prof. Fred Vlès, 597
  Obituary of Prof. Paul Reiss, 769
  The Zoological Survey of India, 865
Foxon, G. E. H. : Circulation in the Frog, 236
Franchetti, S. A., and others : The Meson Spectrum near Sea-Level, 845
Franklin, Cyril H. H. : The Harmonic Cord, 848
Fraser, I. S., and others : Degaussing, 56
Fraser, Sir John : Elected an honorary fellow of the New York Academy of Medicine, 786
Frechkop, S., en collaboration avec Witte, G. F. de, Harroy, J.-P., et Hubert, E. : Animaux protégés au Congo Belge et dans le territoire sous mandat du Ruanda-Urundi, *review* by Dr. W. H. Thorpe, 520
Fredericq, Pierre : Données récentes sur la coagulation du sang, 617
Freer Gallery of Art (Staff of the) : A Descriptive and Illustrative Catalogue of Chinese Bronzes acquired during the Administration of John Ellerton Lodge, *review* by Basil Gray, 282
French, K. H. V. (Gerrard, Dr. W., and) : Influence of Tertiary Bases on the Interaction of Thionyl Chloride and Hydroxy Compounds, 263
French Association for the Advancement of Science : Sixty-fifth Meeting of the (Dr. E. Hindle), 37

Frenkel, J. : Kinetic Theory of Liquids, *review* by H. N. V. Temperley, 317
Friedenwald, Prof. Harry : Jewish Luminaries in Medical History, *review* by Dr. W. Pagel, 521
Fries, Dr. Nils : Experiments with Different Methods of Isolating Physiological Mutations of Filamentous Fungi, 199
Frisch, Dr. O. R. : Appointed to the Jacksonian professorship of natural philpsophy in the University of Cambridge, 836 ; work of, 836
Froome, K. D. : Rate of Growth of Current in Arc Discharges, 129
Fry, D. W. : Fundamental Problems in Modern Physics, 117
Fryer, Sir John : Appointed a member of the Advisory Council on Scientific Policy, 224
Fuel, Institute of : Conference on Pulverized Fuel, 22, 465
  Melchett Lecture (Sir James Chadwick), 421
  New building of the, 803
Fuel Research Board : Appointment of Engineer Vice-Admiral Sir Harold Brown as chairman, 497
Fuel Research Institute of India (Dr. J. W. Whitaker), 288
Funke, Prof. George L. : *Obituary* by Prof. P. van Oye, 327
Fürth, Dr. R. : Appointed to the University of London readership in theoretical physics at Birkbeck College, 23
  X-Ray and Electron Diffraction in Fluids, *review*, 45
  Quantum Theory of Liquids, 739
Fürth, Dr. R., and MacDonald, Dr. D. K. C. : Spontaneous Fluctuations of Current in a Photo-Electric Cell, 608
Further Education : Publication of No. 1, 464, 669
Fussell, G. E. : Mount Hope and its Dairy Cattle, 719

GABOR, Dr. D. : Stabilizing Linear Particle Accelerators by means of Grid Lenses, 303
  Acoustical Quanta and the Theory of Hearing, 591
Gaddum, Prof. J. H. : A Text-Book for Anæsthetists, *review*, 588
Gaddum, Prof. J. H., and Wilson, A. : Treatment of Myasthenia gravis with Di-isopropylfluorophosphonate, 680
Galdston, Dr. Iago : Social Medicine and Social Pathology, 494
Ganguli, D. K., and others : Location of Thunderstorm Centres from Directional Observations of Atmospherics during Sunrise and Sunset, 572
Ganguly, J. (De, Dr. S. S., and) : Heat Treatment and the Biological Value of Soya-bean Protein, 341
Gardikas, C., and others : Serum Bilirubin and the Van den Bergh Reaction, 842
Garland, C. S. : Awarded the Hinchley Medal of the British Association of Chemists, 21
Garner, Prof. F. H., and others : Set Time and Particle Size, 708
Garrod, Miss M. E. : Applied Biology in the Leather Industry, 750
Garter, W. G. : Awarded the Silver Medal of the Royal Aeronautical Society, 669
Gas Research Board : Re-election of Viscount Falmouth as president, 601
  Appointment of Dr. Harold Hollings as chairman, 601
Gates, S. B. : Appointed a senior principal scientific officer, 464
Gauld, William Alexander : Man, Nature and Time, 246
Gäumann, Prof. E. : Nature of Virulence, 427
Gautheret, R.-J. : Une voie nouvelle en biologie végétale, *review* by Alan Burges, 80
Gee, Dr. Geoffrey : High Polymers, 138
  Appointed director of research of the British Rubber Producers' Research Association, 568, 734 ; work of, 734
General Microbiology, Society for : To publish the *Journal of General Microbiology*, 55
Geographic Society, National : News Bulletin on Experiments on Cosmic Rays in High-flying Aircraft (Dr. Gilbert Grosvenor and Dr. W. F. G. Swann), 329
Geographical Society, Royal : Exhibition of Polar Exploration, 22
  Glossaries of Geographical Termsl n Different Languages, 431
  Awards, 532
Geological Congress, International : 18th Session to be held in Great Britain, 600
Geological Society of London : Medal and Fund Awards, 123
George, Miss Mariam, and Pandalai, K. M. : Synergic Action of Penicillin and Bacteriostatic Dyes, *erratum*, 56
George, Dr. Philip : Appointed Brother research lecturer in physical chemistry in the University of Leeds, 432
Georgia State College for Women : Herty Medal awarded to Dr. E. Emmet Reid by the Chemistry Club of the, 737
Gerendás, M. (Matoltsy, A. G., and) : Isotropy in the *J* Striation of Striated Muscle, 502
Gernandt, Dr. Bo : Colour Sensitivity, Contrast and Polarity of the Retinal Elements, 806
Gernandt, Dr. Bo, and Granit, Prof. Ragnar : Inhibition and the Polarity of the Retinal Elements, 806
Gerrard, Dr. W., and French, K. H. V. : Influence of Tertiary Bases on the Interaction of Thionyl Chloride and Hydroxy Compounds, 263
Gerrard, Dr. W., and Nechvatal, A. : *Neo*-pentyl Alcohol and Steric Hindrance, 812
Ghoneim, Prof. Ahmed, and El-Katib, M. Taha : Digestibility of Cow's and Buffalo's Milk, 273
Ghoneim, Prof. Ahmed, and others : Chemical Composition of Egyptian Cow's Milk in relation to Milk Laws, 506
Ghosh, B. N. (Sircar, Dr. S. M., and) : Effects of High Temperature and Short Days on Vernalization Response of Summer Varieties of Rice, 605
Gibb, Sir Claude : Appointed a member of the Advisory Council on Scientific Policy, 224
Gibert, M. : High Polymers, 138
Gibson, J., and others : Formation of Coking Coal by Thermal Treatment of a Cannel Coal, 536
Gibson-Gill, C. A. : Appointed assistant curator, Raffles Museum, Singapore, 432
Gilbert, C., and others : Cytosiderosis and the Genesis of Arteriosclerosis and other Fibrous-Tissue Reactions, 875
Gill, E. W. B., and Engel, A. von : Low-Pressure Electrical Discharges, 404
Gillman, Dr. J., and others : Cytosiderosis and the Genesis of Arteriosclerosis and other Fibrous-Tissue Reactions, 875
Gilmour, J. R. : Appointed to the University of London readership in morbid anatomy at London Hospital Medical College, 567
Giri, K. V. (Chak, I. M., and) : Effect of Ultra-Filtration and Carbon Dioxide on the Prothrombin Activity of Plasma, 878
Glaciology, Journal of : Publication of the, 736
Glagoleva-Arkadieva, Prof. A. A. : *Obituary* by Academicians S. Vavilov and A. Ioffé, 296
Glascock, Raymond (Arrol, Dr. William J., and) : Conversion of Carbon Dioxide to Acetylene on a Micro Scale, 810
Glass and Ceramic Research Institute of India : Central (Y. P. Varshney), 290
Glassford, D. G. : Appointed surveyor, Sierra Leone, 160
Glentworth, Dr. R. : Distribution of the Total and Acetic Acid-Soluble Phosphate in Soil Profiles having Naturally Free and Impeded Drainage, 441
Goffart, M., and others : Action of Mustard Gas (*ββ′*-Dichlorethylsulphide) on Thiol Groups of Proteins, 478
Golberg, Dr. Leon (De Meillon, Dr. Botha, and) : Development of *Ornithodorus moubata* on Normal and Thiamin-deficient Rats, 171
Gold, Dr. Allen : Alloxan Diabetes and the Kidney in the Rat, 574
Gold, Lieut.-Colonel E. : *Obituary* of J. W. Sandström, 395
Goldberg, Leo, and Aller, Lawrence H. : Atoms, Stars and Nebulæ, *review*, 793
Goldblum, N. (Mer, G. G., and) : A Hæmosporidian of Bats, 444
Goldfinger, P., and others : Heat of Atomization of Carbon, 130
Goldpasture, Dr. E. W. : Elected an honorary fellow of the New York Academy of Medicine, 786
Goldschmidt, K. : Conductivity Hysteresis of Dust Deposits, 815
Goldschmidt, Prof. V. M. : *Death* of, 463 ; *obituaries* by Prof. C. E. Tilley and Prof. M. Born, 700
Gooden, J. S. : Fundamental Problems in Modern Physics, 117
Goodeve, Sir Charles : Dilatancy and Thixotropy, 70
  Industry and Research in the Sheffield Area, 853
Goodey, T. : Elected a Fellow of the Royal Society, 429
Goodstein, Dr. R. L. : Proof by *reductio ad absurdum*, 582
Gordon, Dr. : The Place of Universities in the Community, 699
Gordon, Dr. A. H. : The Chemistry of the Proteins, 581
Gordon, Lord Dudley : Industry and Research in the Sheffield Area, 852, 853
Gordon, Dr. J. J., and Quastel, Dr. J. H. : Effects of Organic Arsenic Compounds on Tissue Enzymes and Proteins and on Tissue Metabolism, 97
Gordon, Robert : Astrolabe belonging to, given to the Royal Scottish Museum by the Exors. of the late Mrs. Florence Cumming, 533
Gordon, Seton : Triumphs of the Bird Photographer, *review*, 757
Gorer, Dr. Peter A. : Awarded a Lady Tata Memorial Trust grant for research, 871
Gorter, Dr. Evert : Elected an honorary fellow of the New York Academy of Medicine, 786
Goscombe, E. G. (Greenslade, R. M., and) : Addition of Dinitro Compounds to D.D.T. to prevent Outbreak of Spider Mites, 843
Gossage, R. J. : Degaussing, 56
Göteborgs Högskola : Award of the Heyman Prize to Börje Kullenberg, 805
Góth, Dr. Andrew, and Bikich, Dr. George : Effect of Proteins on Ketonæmia, 170
Goudsmit, Prof. S. : Heat of Atomization of Carbon, 742
Gourlay, J. S. : Shift of Aromatic Band in Substituted Benzene, 129
Government Museum, Trivandrum : Administration Report for 1944–45, 57
Goward, F. K., and Dain, J. : Optimum Disturbing Field for Synchrotron Beam Ejection, 636
Grabar, P. : High Polymers, 138
Graham, A. R., and others : Synthesis of Methionine and similar Amino-Acids, 578, *erratum*, 634
Graham, Michael : Careers in Zoology, 378
Grainger, Dr. J. : Hormones and Fruit-Fall, 617
Granit, Prof. Ragnar : Mechanism of Colour Vision, *review*, 417
Granit, Prof. Ragnar (Gernandt, Dr. Bo, and) ; Inhibition and the Polarity of the Retinal Elements, 806
Grant, Prof. Eugene L. : Statistical Quality Control, *review* by Maurice Kendall, 454
Grantham, Dr. D. R. : At the Pan-African Congress on Prehistory, 216
Gray, Basil : The Bronze Art of Ancient China, *review*, 282
Gray, Prof. J. : Careers in Zoology, 378
  The Teaching of Taxonomy, 446
Greaves, Prof. W. M. H. : Elected president of the Royal Astronomical Society, 298
Green, Dr. H. H. : Significance of Trace Elements in Plants and Animals, 207
Green, Herbert Sydney (Born, Prof. Max, and) : A Kinetic Theory of Liquids, 251
  Quantum Theory of Liquids, 738
Green, L. L., and Livesey, D. L. : Emission of Light Charged Particles in the Fission of Uranium, 332
Greenkeeping Research, Board of : Appointment of J. H. Arthur as an additional advisory officer at the St. Ives Research Station, 23
Greenslade, R. M., and Goscombe, E. G. : Addition of Dinitro Compounds to D.D.T. to prevent Outbreak of Spider Mites, 843
Greenwood, M., and Posnette, A. F. : A Morphological Change induced in Leaves of *Theobroma cacao* by Mineral Deficiency, 542
Gregg, Dr. S. J. : Particle Size Analysis, 717
Gregory, Prof. F. G. : Significance of Trace Elements in Plants and Animals, 207
Gregory, Joshua C. : Astrology and Astronomy in the Seventeenth Century, 393
Gregory, J. N., and Spink, J. A. : Lubricating Properties of Molecular Layers of Stearic Acid and Calcium Stearate on Metal Surfaces, 403
Gridgeman, N. T., and others : Units in Photo-Electric Absorptiometry, 777
Griffin, Francis J. : Present State of some German Museums, 140
Griffiths, Dr. : Fluorimetric Analysis, 549
Griffiths, Hugh : Particle Size Analysis, 717
Griffiths, Dr. J. G. A. : Application of Statistical Methods to Food Problems, 37

Griffiths, T. C. (Evans, G. R., and) : Slow Cosmic Ray Mesons at Sea-Level 879
Groendijk, H., and others : Neutron Experiments of the Physical Laboratory of Groningen, 569
Grönwall, Dr. Anders : Changes in the Electrophoretic Pattern of Cow's Milk during Early Lactation, 376
Gross, Prof. E., and Stehanov, A. : Born's Theory and the Spectrum of Light Scattering of Crystals, 474
Gross, L., and others : Use of Punched Card Tabulating Machines for Crystallographic Fourier Syntheses, 433
Grosvenor, Dr. Gilbert, and Swann, Dr. W. F. G. : Experiments on Cosmic Rays in High-flying Aircraft, 329
Grüneberg, Dr. H. : Appointed to the University of London readership in genetics at University College, 466
Guba, F., and others : Nature of Myosin, 194
Guérin, Dr. Maurice : Awarded a Lady Tata Memorial Trust grant for research, 871
Guest, Keen and Nettlefold Companies : Appointment of N. F. Astbury as director of research, 398
Guggenheim, Prof. E. A. : The Place of Thermodynamics in Education, 626
Guibaut, André : Awarded the Cuthbert Peek Grant for 1947 of the Royal Geographical Society, 532
Guillemot, E. (Le Grand, Y., and) : Measurement of Visual Acuity with Blurred Tests, 132
Guinier, André : Radiocristallographie, *review* by Dr. W. A. Wooster, 348
Gullerson, Dr. : Fluorimetric Analysis, 549
Gunther, Dr. R. T. : Early Science in Oxford, Vol. 14, Life and Letters of Edward Lhwyd, 154
Gupta, M. K. Das, and others : Location of Thunderstorm Centres from Directional Observations of Atmospherics during Sunrise and Sunset, 572
Gupta, S. Das : Single Fibre Testing, 379
Guthrie, Dr. Douglas : Course of lectures in the University of Edinburgh on the History of Medicine, 498
Gutkind, Dr. E. A. : Revolution of Environment, *review* by Maurice Bruce, 452
Guy's Hospital Medical School : Appointment of Dr. R. N. S. Thompson to the University of London chair of chemical pathology, 466, 566

HAAS, F., and others : Mutations Induced by Irradiation of the Substrate, 837
Haas, Prof. W. J. de : Elected a foreign associate of the Paris Academy of Sciences, 398
Hadwen, Dr. I. Seymour, A. : *Death* of, 597 ; *obituary* by W. A. Pool, 801
Hagedoorn, Dr. A. L. : Animal Breeding, second edition, *review* by Prof. E. L. Nichols, 78
Hägg, Prof. G. : *Obituary* of Prof. Gregori Aminoff, 597
Haines, Miss B. M. : Applied Biology in the Leather Industry, 751
Haines, Dr. R. W. : Title of reader in anatomy in the University of London conferred on, 160
Haissinsky, M. : Électrochimie des substances radioactives et des solutions extrêmement diluées, *review* by F. Morgan, 690
Haissinsky, M., and others : Exchange between Chromium Ions and the Szilard Effect, 538
Halban, Prof. H. von (Berenblum, Dr. I., and) : *Obituary* of Prof. Fritz Weigert, 733
Halberstaedter, Prof. L., and others : Influence of the Medium on the Inactivation of Tetanus Toxin by X-Ray Irradiation, 715
Halifax House, Oxford : Opened by Lord Halifax as a Graduate Centre, 158
Hall, Prof. A. A. : Appointed a member of the Air Safety Board, 193
Hall, Sir James : Library of, sold by Hodgson and Co., 364
Hall, W. L. : Appointed chief officer of the Liaison Department of the British Non-Ferrous Metals Research Association, 534
Hallimond, Dr. A. F. : Production of Contrast in the Microscope Image by means of Opaque Diaphragms, 851
Halliwell, G. : Stability of Penicillin in Aqueous Solutions, 747
Hallowell, John H. : The Decline of Liberalism as an Ideology, *review* by Maurice Bruce, 181
Halsall, T. G., and others : Structure of Starch and Cellulose, 97
Hamilton, Stanley B. : Aspects of Structural Engineering, 343
Hammarsten, Prof. Einar : Elected an honorary fellow of the New York Academy of Medicine, 786
Hammick, D. Ll. (Brown, B. R., and) : Resolution of Mepacrine, 612
Hamor, Dr. William A. : Awarded the honorary degree of doctor of laws of the University of Miami, 366
Hanes, Dr. C. S. : Appointed head of a unit of biochemistry at the University of Cambridge, 568
Hankey, Lord : Appointed a member of the Advisory Council on Scientific Research and Technical Development to the Ministry of Supply, 671
Hankins, Dr. G. A. : Appointed director of mechanical engineering research of the special organisation of the Department of Scientific and Industrial Research, 769
Happey, Dr. F. : Single Fibre Testing, 379
Happold, Prof. F. C., and others : Preparation of Cell-free Tryptophanase, 99
Nature of the Tryptophanase Complex, 644
Hardwick, Rev. J. C. : Diagnosis of a Failure, *review*, 145
From Aquinas to Einstein, *review*, 418
Hardy, D. V. N., and Wood, W. A. : Structure of 'Terylene', 673
Hardy, J. K. : Awarded the R.38 Memorial Prize of the Royal Aeronautical Society, 669
Harington, Dr. C. R. : The Body's Chemical Mechanisms of Defence, 319
Harkin, D. A. : Appointed geologist, Tanganyika, 160
Harley, J. L. : Scientific Basis for Sylviculture, *review*, 44
Harley-Mason, J. : Constitution of Melanin, 338
Harriman, Philip Lawrence (edited by) : Encyclopedia of Psychology, *review* by Prof. F. C. Bartlett, 5
Harris, Dr. G. W. : The Hypophysial Portal Vessels of the Porpoise (*Phocaena phocaena*), 874
Harris, Ivan, and others : Free Radicals from Benzyl Hyponitrite, 843
Harris, Prof. J. E. : Careers in Zoology, 378
Harris, N. L. (Clack, B. N., and) : Spiral Cracks in Glass Tubing, 541
Harrison, Prof. J. W. Heslop : Retirement from the chair of botany in King's College, Newcastle-upon-Tyne, 260 ; work of, 260
The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 558
Harrison, Colonel L. W. : Retirement as adviser on venereal diseases to the Ministry of Health, 92
Awarded the William Freeman Snow Medal for 1946 of the American Social Hygiene Association, 92
Hartley, Dr. F. : To join the Board of the British Drug Houses, Ltd., 57
Hartley, Sir Harold : A Century of Chemistry, 193
Hartley, H. O., and others : Mechanical Recording of Information about Cancer Patients at the Royal Cancer Hospital, 261
Hartley, W. G. : A Variable Phase-Contrast System for Microscopy, 880
Harvard University (Staff of the Computation Laboratory of) : Tables of the Modified Hankel Functions of Order One-Third and of their Derivatives, *review* by Dr. L. J. Comrie, 590
Hassan, Dr. Ali, and El Wafa, M. Hassan Abou : An Oestrogenic Substance in Pollen-grains of Date Palm Tree *Phoenix dactylifera* L., Palmæ, 409
Hast, Prof. Nils : Structure of Clay, 354
Preparation of Thin Specimen Films, 370
Hatton, J. (Rollin, B. V., and) : Nuclear Magnetic Resonance at Low Temperatures, 201
Havelock, Prof. T. H. : Elected a *Correspondant* for the Section of Geography and Navigation of the Paris Academy of Sciences, 160
Hawker, Dr. Lilian E. : Effect of Temperature of Storage on the Rate of Loss of Fertility of Stock Cultures of *Melanospora destruens*, 136
Hawkes, C. F. C. : Field Archæology (R. J. C. Atkinson), *review*, 387
Hawking, F. : Activation of Paludrine *in vitro*, 409
Hawkins, Major T. H., and Brimble, L. J. F. : Adult Education, the Record of the British Army, *review* by Dr. Basil A. Yeaxlee, 790
Haworth, Sir Walter : The Chemistry of the Polysaccharides (Mather Lecture of the Textile Institute), 299
Hay, Prof. R. : Research and the Progress of Industry in Scotland, 752
Hayes, Wallace D. : Awarded a Frank B. Jewett Fellowship, 397
Haythornthwaite, R. M. : Appointed lecturer in civil engineering in the University of Sheffield, 704
Haywood, Dr. F. W. : Appointed to the Board of Wild-Barfield Electric Furnaces, Ltd., as technical director, 299
Health, Ministry of : Blood Group Reference Laboratory of the, 92
Retirement of Colonel L. W. Harrison as adviser on venereal diseases, 92
Health Education, Scottish Council for : Summer schools in Health Education, 772
Heath, Sir Frank : Retirement as chairman of the Advisory Council on Scientific Research and Technical Development, Ministry of Supply, 466
Heath, Dr. O. V. S. : Role of Starch in Light-induced Stomatal Movement, and a New Reagent for Staining Stomatal Starch, 647
Title of D.Sc. of the University of London conferred on, 772
Hedén, C.-G. (Malmgren, B., and) : Nucleotide Metabolism of Bacteria and the Bacterial Nucleus, 577, *erratum*, 704
Heeley, W. (Cole, L. W. L., and) : Prevention of Oil Shock in the Orchard, 32
Heilbron, Sir Ian, and others : Synthesis of Methionine and similar Amino-Acids, 578, *erratum*, 634
Heilbronn, Dr. H. : The Geometry of Numbers, 104
Heitler, Prof. W., and Hu, N. : Interpretation of Complex Roots of the S-Matrix, 776
Heller, Dr. H., and Smith, B. : The Water-balance Principle of Crustacean Eye-stalk Extracts, 544
Hems, R., and others : Urea Synthesis in Mammalian Liver, 808
Henderson, Dr. D. W. : Nature of Virulence, 427
Hendey, N. Ingram : Copper in Diatoms, 646
Henriot, Prof. Emile : Elected a *Correspondant* for the Section of General Physics of the Paris Academy of Sciences, 534
Henry, William : Awarded a Bowen-Brooks Scholarship of the New York Academy of Medicine, 786
Hepner, W. A. : Response of Photoconductive Lead Sulphide Cells, 96
Heredity : Publication of, 599
Herington, Dr. E. F. G., and Robertson, A. : Kinetics of Polymerization and Molecular Weight Distributions in Polymethyl Methacrylates, 745
Hermans, J. J. : High Polymers, 138
Hermans, P. H. : High Polymers, 138
Contribution to the Physics of Cellulose Fibres, *review* by H. J. Woods, 519
Hermitte, G. L. : Appointed lecturer in histology in the University of Sheffield, 704
Herpetological Society, British : Suggested formation of a, 703
Inaugural meeting, 871
Hessenberg, W. C. F. : Appointed head of the Mechanical Working Division of the British Iron and Steel Research Association, 57, 534
Hestrin, Dr. S., and others : Synthesis of Cellulose by Resting Cells of *Acetobacter xylinum*, 64
Hey, J. S. : The Giacobinid Meteor Shower 1946, 119
Heymans, Dr. C. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Heywood, Dr. Harold : Particle Size Analysis, 717
Hickinbottom, Dr. W. J. : Appointed to the University of London readership in organic chemistry at Queen Mary College, 772
Autoxidation of Olefins—Formation of Unsaturated Alcohols from Olefins by the Action of Organic Peracids, 844
Hieger, Dr. I. : Progress of Cancer Research, 527
Higginbotham, W. H. : The Works Library, 771
Higginson; John: Appointed an assistant in bacteriology in the University of Glasgow, 261
Hilger, Ltd., Adam : Preparation of 'Specpure' and 'H.S.' Elements and Chemicals transferred to Johnson, Matthey and Co., 600
Hill, A. Glendon : Oil Plants in East Africa, 650
Hill, Prof. A. V. : Elected a trustee of the British Museum, 160
Elected an honorary fellow of the New York Academy of Medicine, 786
Hill, M. N., and Willmore, P. L. : Marine Seismic Prospecting, 707
Hill, Dr. R. D. : An Electron Accelerator with an Air-cored Field, 774
Himus, Dr. G. W. : Title of University of London reader in fuel technology conferred on, 23
Hinckley, A. : Map Projections, *review*, 113

Hindle, Dr. E. : French Association for the Advancement of Science, 37
  Elected president of the Association of British Zoologists, 366
  Animal Biology, *review*, 453
  The Egyptian Academy of Sciences, 787
Hindman, Joseph F. : Awarded a Bowen-Brooks Scholarship of the New York Academy of Medicine, 786
Hiok, Tan Koen (Burgers, Prof. W. G., and) : Diffuse Bands on Laue Photographs of Silver Chloride Crystals, 845
Hirst, Prof. E. L. : Appointed to the Forbes chair of organic chemistry in the University of Edinburgh, 701 ; work of, 701
Hirst, Prof. E. L., and others : Structure of Starch and Cellulose, 97
Hirst, Dr. W. : Dimensional Changes accompanying Capillary Condensation, 267
Historia Naturalis : New journal issued by the Unione Italiana Naturalisti, 497
History of Science, British Society for the : Formation of a, 298
  First Annual General Meeting, 703
  Election of Dr. Charles Singer as president, 703
Ho Zah-Wei, and others : Ternary and Quaternary Fission of Uranium Nuclei, 773
Hobbes, Thomas : Leviathan or the Matter, Forme and Power of a Commonwealth, Ecclesiasticall and Civil, *review* by Maurice Bruce, 248
Hobley, C. W. : *Death* of, 496 ; *obituary* by Dr. G. F. Herbert Smith, 768
Hobson, P. T. : A New Method of Studying the Structure of Alloys by Magnetic Analysis, 436
  Developments in Magnetic Recording of Sound, 735
Hoch-Ligeti, Cornelia : Succinoxidase Activity of Hepatic Tumours produced in Rats by Feeding 2-Acetaminofluorene, 780
Hodgkin, Dorothy Crowfoot : Elected a Fellow of the Royal Society, 429
Hodsman, H. J. : Coal Utilisation Research in Great Britain, 208
Hoff-Jørgensen, E. : Yeast and Rickets, 99
Holland, Sir Thomas : *Death* of, 701
Holliman, F. G., and Mann, Dr. F. G. : An Optically Active Quaternary Phosphonium Salt, 438
Hollings, Dr. Harold : Appointed chairman of the Gas Research Board, 601
Holmes, Prof. Arthur : A Revised Estimate of the Age of the Earth, 127
Holmes, Dr. G. M. : Elected an honorary fellow of the New York Academy of Medicine, 786
Holmes, Prof. Harry N. : Introductory College Chemistry, fourth edition, *review*, 555
Holmes, P. E. B., and others : Relationship between Structure and Action in Drugs with Curariform Actions, 86
Holt, S. J., and others : Population Studies in Fisheries Biology, 714
Honeycombe, R. W. K., and Boas, Dr. W. : Recrystallization of Duplex Brass, 847
Hooper, Dr. David : *Death* of, 223
Hopkins, Sir Frederick Gowland : *Death* of, 701
Hopkins, H. H. : An Optical Magnification for Finite Objects, 573
Hopwood, Dr. A. Tindell : *Obituary* of Major M. Connolly, 532
  The Royal Academy 1947, 764
  Painter and Writer, *review*, 860
Horder, Lord : The Place of Science in Teaching (Presidential Address to the Science Masters' Association), 106
Hornell, James : Water Transport—Origins and Early Evolution, *review* by M. J. B. Davy, 419
Horner, Dr. Gerald : Retirement from the editorship of the *British Medical Journal*, 54 ; work of, 54
Horning, Dr. E. S. : Appointed to the University of London readership in experimental pathology at the Royal Cancer Hospital (Free), 772
Horton, Prof. Frank : Retirement from the University of London chair of physics at Royal Holloway College, 122 ; work of, 122
  Obituary of Dame Margaret Tuke, 461
Hoselitz, K., and McCaig, M. : 'Spoiling' of Tungsten Steel, 710
Hosking, Eric, and Lowes, Harold (edited by) : Masterpieces of Bird Photography, *review* by Seton Gordon, 757
Hoskins, Dr. R. G. : The Biology of Schizophrenia, *review* by Dr. Clifford Allen, 725
Hotine, Brigadier Martin : Awarded a Founder's Medal of the Royal Geographical Society, 532
Houssay, Dr. B. A. : Elected an honorary fellow of the New York Academy of Medicine, 786
Howard, Dr. H. W. : Chromosome Numbers of British Species of the Genus *Rorippa* Scop. (part of the Genus *Nasturtium* R. Br.), 66
  Genetics of Red Body Colour in *Armadillidium vulgare*, 683
Howard, Margaret : The Bathe, an Ecstasy (Marie Carmichael Stopes), *review*, 522
Howe, Prof. G. W. O. : Alexander Graham Bell and the Invention of the Telephone, 455
Howell, P. A. de G. : Effect of the Moon on Radio Wave Propagation, 396
Hoyle, Dr. F. : Fundamental Problems in Modern Physics, 117
Hu, N. (Heitler, Prof. W., and) : Interpretation of Complex Roots of the S-Matrix, 776
Huggins, M. L. : High Polymers, 138
Hughes, Prof. E. D., and Ingold, Prof. C. K. : Reactions of Organic Halides in Solution, 166
Hughes, Dr. G. C., and Kiernan, R. A. : A Product of *Pseudomonas aeruginosa* Active *in vitro* against *M. tuberculosis*, 197
Hughes, G. K., and others : Polymerization of a Semiquinone Ion, 612
Hulme, H. R., and others : Population Studies in Fisheries Biology, 714
Hulten, Prof. E. : Elected a foreign member of the Linnean Society, 734
Hume-Rothery, Dr. William : Atomic Theory for Students of Metallurgy, *review* by Prof. E. C. Stoner, 78
Humphrey, Beverley A., and Humphrey, George F. : Succinic Dehydrogenase in Protozoa, 374
Hunt, A. J. : Appointed an assistant lecturer in geography in the University of Sheffield, 871
Hunt, Major John A. : Report on the Survey of British Somaliland, 366
Hurt, R. Lambert : Appointed an assistant in the Department of Anatomy in the University of Glasgow, 261
Hush, N., and others : Polymerization of a Semiquinone Ion, 612
Huson, Gordon : The Faroes in Pictures, *review*, 555
Hussenot, Francois : Les essais de performances en aéronautique, *review*, 214
Hutchinson, J. : Elected a Fellow of the Royal Society, 429
Hutchinson, Dr. S. A. : Appointed lecturer in botany in the University of Glasgow, 671
Hutchison, T. S., and Reekie, Prof. J. : Temperature-Dependence of Magnetic Susceptibility of Annealed and Cold-worked Copper, 537 ; *erratum*, 772
Hutton, C. Osborne : Richmondite, a Discredited Mineral Species, 817
Hutton, James : Memorial to, 737
Hutton (Dr. James) and the Manufacture of Sal Ammoniac (Archibald Clow and Nan L. Clow), 425
Hutton, Dr. J. H. : Caste in India, *review* by F. J. Richards, 621
Huxley, Dr. L. G. H., and others : Gyro Interaction of Radio Waves, 300
Huzayyin, Dr. S. A. : At the Pan-African Congress on Prehistory, 216
Hynes, H. B. N. : Use of 'Gammexane' Dust against Domestic Cockroaches, 200
Hyslop, Dr. J. M. : Resignation as lecturer in mathematics in the University of Glasgow, 261
  Appointed to the chair of mathematics in the University of the Witwatersrand, 261

IBALL, John : Crystal Structure of Copper Butyrate Monohydrate, 95
Ibrahim Pasha, Sir Ali : *Obituary*, 531
Imperial Chemical Industries, Ltd. : Appointment of four Fellowships in the University of Cambridge, 226
Imperial College of Science and Technology : Title of University of London reader in metallurgy conferred on Dr. M. S. Fisher, 23
  Title of University of London reader in fuel technology conferred on Dr. G. W. Himus, 23
  Title of University of London reader in metallurgy conferred on E. W. Yeoman, 23
  Appointment of G. A. Barnard to the University of London readership in mathematics, 160
  Title of University of London reader in palæontology conferred on Dr. Alan Wood, 160
  Course of lectures on Microscopy, 432
  Summer School in Relaxation Methods, 567
  Appointment of A. W. Skempton to the University of London readership in soil mechanics, 567
  Title of University of London professor of mathematics conferred on Dr. W. G. Bickley, 567
  Appointment of Dr. Harry Jones to the University of London chair of mathematics, 772
  Appointment of Dr. F. C. Tompkins to the University of London readership in physical chemistry, 772
India : Central Glass and Ceramic Research Institute of (Y. P. Varshney), 290
  Fuel Research Institute of (Dr. J. W. Whitaker), 288
  National Chemical Laboratory of (Dr. Bashir Ahmad), 219
  National Metallurgical Laboratory of (Dr. G. P. Contractor), 219
  National Physical Laboratory of (Dr. K. N. Mathur), 184
  National Research Laboratories of—Introduction (Sir Shanti Bhatnagar), 183
  Historical Records of the Survey of, Vol. 1, 18th Century (Colonel R. H. Phillimore), *review* by Major-General M. N. MacLeod, 213
  Zoological Survey of (Prof. H. Munro Fox), 865
Indian Council of Scientific and Industrial Research : Survey of the thorium-bearing minerals in Travancore, and a survey of the uranium-bearing minerals of India, recommended by the Atomic Research Committee, 192
Indian Phytopathological Society : Initiation of the, 805
Indian Science Congress : Delhi Meeting, 20 ; (Sir Charles Darwin), 353
Industrial Administration, Institute of : Summer School for Management Teachers, 567
Ingold, Prof. C. K., and Ingold, E. Hilda : Constitution of Dinitrogen Tetroxide and Trioxide 743
Ingold, Prof. C. K. (Hughes, Prof. E. D., and) : Reactions of Organic Halides in Solution, 166
Innes, R. : The Future of the Social Sciences, 173
Instituto de Investigación Médica para promoción de la Medicina Científica : To be organised in Córdoba, 634
Instrument Practice : Publication of No. 1, 91
International Association of Microbiologists : Fourth International Congress for Microbiology, 567
International Cancer Research Congress : Fourth, 398
International Commission on Zoological Nomenclature : Formation of an International Trust for Zoological Nomenclature, 328
International Committee of Weights and Measures : First Plenary Session since 1937, 325
International Conference on the Emission from the Aurora and the Night Sky (Royal Society), 671
International Congress for Applied Mechanics : Now known as the International Union of Theoretical and Applied Mechanics, 787
International Congress of Chemistry, Tenth : *Proceedings* of the, 805
International Congress on Engineering Education, 704
International Congress of Experimental Cytology, Sixth : To meet in Stockholm, 634
International Congress of Psychology : Twelfth, 601
International Congress on Short-Wave Therapeutics, 704
International Geological Congress : 18th Session to be held in Great Britain, 600
International Meeting on Radio Aids to Marine Navigation : Proceedings of the, 647
International Trust for Zoological Nomenclature : Formed by the International Commission on Zoological Nomenclature, 328
International Union of Biological Sciences : Fellowships, 737
International Union of Physics—Activities of the Union, 1923–39 (Prof. R. W. Ditchburn), 562
International Union of Theoretical and Applied Mechanics, 787
Ioffé, A. (Academicians Vavilov, S., and) : *Obituary* of Prof. A. A. Glagoleva-Arkadieva, 296
Iraq Natural History Museum : Formal opening of the, 703
Iredale, Dr. T. : Appointed to a newly created readership in chemistry at the University of Sydney, 224 ; work of, 224
Irish Chemical Association and the Dublin Section of the Royal Institute of Chemistry : Colloquium on Industrial Utilization of Agricultural Products and of Seaweed, 671

Iron and Steel Institute : Hatfield Memorial Lecture to be given by Dr. C. Sykes, 498
Symposium on the Hardenability of Steel, 853
Iron and Steel Research Association, British : Appointment of W. C. F. Hessenberg as head of the Mechanical Working Division, 57, 534
Appointment of S. S. Carlisle as head of the Instrument Section, 262
Appointment of R. H. Myers as head of the Steel Making Division, 397
Appointment of Dr. A. H. Leckie as deputy head of the Steel Making Division, 397
Israelashvili, Shalom (Feigenbaum, Dr. Jacob, and) : Gaseous Sulphur Dioxide and Sodium Bisulphite as Preservatives of Citrus Concentrates, 32
Issidoridis, A. (Deffner, Dr. M., and) : Influence of Cations in the Production of Citric Acid by Yeast, 879
Istituto Italiano di Idrobiologia de Marchi : French Water Biology at the, 803
Iversen, Dr. J. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 556
Iversen, Dr. Simon : Awarded a Lady Tata Memorial Trust Scholarship for research, 871

JACKSON, A. B. : *Obituary by* William Dallimore, 158
Jackson, Dr. D. A. : Elected a Fellow of the Royal Society, 430
Jackson, Prof. Willis : Appointed a member of the Advisory Council on Scientific Research and Technical Development to the Ministry of Supply, 671
Jacob, Dr. L. : Oil-drop Method for Electron Trajectories, 475
Jaffe, A. A. (Craggs, Dr. J. D., and) : Spread of Discharge in Geiger Counters, 369
Jagitsch, Dr. Robert : A Method of Using Marked Phase Boundaries, 166
Jalón, P. Ga. de, and West, G. B. : Use of Potassium in the Assay of Curare, 841
James, Dr. Eric : The Place of Universities in the Community, 698, 699
James, Dr. W. O. : Biosynthesis of the Belladonna Alkaloids, 196
Jameson, Sir William Wilson : Elected an honorary fellow of the New York Academy of Medicine, 786
Janet, Prof. Pierre : *Death* of, 429 ; *obituary* by Dr. Millais Culpin, 495
Jánossy, Dr. L. : Appointed a senior professor of the School of Cosmic Physics in the Dublin Institute of Advanced Studies, 567
Jánossy, Dr. L. (McConnell, J., and) : Detectability of the Negative Proton, 335
Japa, Dr. Jozef : Awarded a Lady Tata Memorial Trust grant for research, 871
Japolsky, Dr. N. S. : Relative Directions of the Electric and Magnetic Vectors in Electromagnetic Waves *in vacuo*, 580, 817
Jarrett, Kenneth Barry, and others : Free Radicals from Benzyl Hyponitrite, 843
Jay, Dr. A. H. : *Obituary* by Dr. H. Lipson, 496
Jeener, Prof. R. : Cytochemical Effects of Œstradiol, 578
Jefferies, Richard : A Classic of English Farming—Hodge and his Masters, edited by Henry Williamson, *review* by Sir E. John Russell, 588
Jefferson, Prof. G. : Elected a Fellow of the Royal Society, 430
Jeffery, Prof. G. B. : Elected president of the Mathematical Association, 583
Jeffery J. W. : Ethical Aspects of the Development of Atomic Energy, 410
Crystal Structure of $Co[Hg(CNS)_4]$, 610
Jeffrey, Dr. G. A., and others : Use of Punched Card Tabulating Machines for Crystallographic Fourier Syntheses, 433
Jenden, D. J., and others : Relationship Between Structure and Action in Drugs with Curariform Actions, 86
Jenkin, Dr. J. W. : Industry and Research, 650
Jenkins, Ivor : Controlled Atmospheres for the Heat Treatment of Metals, *review*, 759
Jennings, Prof. H. S. : *Death* of, 597 ; *obituary* by Dr. Clifford Dobell, 834
Jennings, Dr. M. A., and Sharp, A. E. : Antibacterial Activity of the Staphylococcus, 133
Jepson, Prof. W. L. : *Death* of, 156
Jespersen, Poul : The Breeding Birds of Denmark, *review* by N. B. Kinnear, 146
Jessen, Prof. K. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 556, 559
Johns Hopkins Hospital and the Johns Hopkins University School of Medicine (Prof. Alan M. Chesney), Vol. I, Early Years, 1867–1893, *review* by Dr. E. Ashworth Underwood, 759
Johnson and Sons, Ltd. : Test Papers for *p*H Values, 56
Johnson, Matthey and Co. : Preparation of 'Specpure' and 'H.S.' Elements and Chemicals transferred from Adam Hilger, Ltd., 600
Johnstone, Dr. Katharine H. (Taylor, Dr. H. V., and) : Commercial Flower Production ; Part 2, Summer Flowers ; Part 3, Foliage and Foliage Plants ; Part 4, Flowering Plants in Pots, 431
Jones, Prof. F. Wood : The Premaxilla and the Ancestry of Man, 439
The *Plesianthropus* Skull, 883
Jones, Dr. G. P. : The Historical Growth and Economic Development of Sheffield Industries, 852
Jones, Dr. Harry : Appointed to the University of London chair of mathematics at the Imperial College of Science and Technology, 772
Jones, Dr. Idris : Particle Size Analysis, 717
Jones, Dr. J. K. N., and others : Structure of Starch and Cellulose, 97
Jones, J. Pryce : Dilatancy and Thixotropy, 71
Jones, Martin : Appointed professor of agricultural botany at King's College, Newcastle-upon-Tyne, 498, 770 ; work of, 770
Jones, Neville : At the Pan-African Congress on Prehistory, 216
Jones, R. Norman, and others : Ultra-violet Absorption Spectrum of Anhydrous Nitric Acid, 163
Jones, Sir Walter Benton : Industry and Research in the Sheffield Area, 852
Jones, Dr. W. M. (Brown, A. F., and) : A Methyl Methacrylate-Silica Replica Technique for Electron Microscopy, 635
Jonker, Dr. G. H. (Santen, Dr. J. H. van, and) : Effect of Temperature on the Permittivity of Barium Titanate, 333
Jordan, Dr. L. A. : Whither Paint ?, 820
Joshi, G. D., and Nabar, Dr. G. M. : Accelerated Oxidation of Cotton Cellulose in Presence of Reduced Cibanone Orange R, 711
Joski, S. S. : Title of D.Sc. of the University of London conferred on, 772
Jost, Prof. Ludwig : *Obituary* by Prof. F. E. Weiss, 701
Journal of General Microbiology : To be published by the Society for General Microbiology, 55
Journal of Glaciology : Publication of the, 736
Journal of Research of the National Bureau of Standards : New format of the, 159
Jutisz, M., and Lederer, E. : Quantitative Chromatographic Separations of Synthetic Peptides, 445

KADAM, Dr. B. S. : Elected a fellow of the National Institute of Sciences of India, 123
Kaniowski, W. (Martin, Prof. L. C., and) : Flash Visual Acuity, 25
Kantorowicz, Dr. O. : Gas Discharge in Air of Atmospheric Pressure at Very Low Voltage, 675
Kaplan, Dr. Deborah (Koch, Dr. Walter, and) : A New Unit in Photoelectric Colorimetry, 273
Kaplan, Prof. J. : Active Oxygen, 673
Karlakin, A. (Terenin, Prof. A., and) : Proton Transfer between Organic Molecules caused by Light, 881
Karrer, Prof. P. : Elected a foreign member of the Royal Society, 631, 668
Elected a *Correspondant* for the Section of Chemistry of the Paris Academy of Sciences, 671
Kayser, Prof. Heinrich : *Obituary* by Prof. J. F. M. Stratton, 732
Kayser, Rudolf : Spinoza, Portrait of a Spiritual Hero, translated by Amy Allen and Maxim Newmark, *review* by Prof. A. D. Ritchie, 147
Keeble, Sir Frederick, and Rawes, A. N. : Hardy Fruit Growing, second edition, *review* by Prof. R. H. Stoughton, 249
Keeping, G. S. : Appointed agricultural officer, Malaya, 160
Keilin, Prof. D., and Smith, J. D. : Hæmoglobin and Nitrogen Fixation in the Root Nodules of Leguminous Plants, 692
Keith, Sir Arthur : Australopithecinæ or Dartians, 377
Obituary of Alice Lady Avebury, 733
Kekwick, Dr. Alan : Appointed to the University of London chair of medicine at Middlesex Hospital Medical School, 772
Kekwick, Dr. R. A. : The Chemistry of the Proteins, 581
Kellaway, George P. : Map Projections, *review* by A. Hinckley, 113
Kelly, H. W. K. : Degaussing, 56
Kemp, A. D. : Action of Phosphorus Pentachloride on *p*-Sulphonamido Benzoic Acid, 509
Kemp, Dr. Tage : Awarded a Lady Tata Memorial Trust grant for research, 871
Kench, Dr. J. E., and others : Serum Bilirubin and the Van den Bergh Reaction, 842
Kendall, Prof. James : The First Chemical Journal, 867
Kendall, Maurice G. : The Advanced Theory of Statistics, Vol. 2, *review* by Prof. Godfrey Thomson, 148
Statistical Quality Control, *review*, 454
Kennedy, Alexander : Appointed professor of psychological medicine at King's College, Newcastle-upon-Tyne, 498
Kennedy, Sir John Macfarlane : Elected an honorary member of the Institution of Electrical Engineers, 122 ; work of, 122
Kent, Dr. Andrew : A Chemical Bicentenary at the University of Glasgow, 591
Kermack, Dr. W. O. : Choice of a 'Reality Index' for Suspected Cyclic Variations, 305
Kesteven, G. L. : Population Studies in Fisheries Biology, 10
Kew Bulletin : Publication resumed after five years, 192
Keys, Prof. David A. : Appointed vice-president of the National Research Council of Canada, 297
Keyston, Dr. J. E. : British Universities and 'Secret' Theses for Degrees, 24
Khamsavi, Dr. A. (Donaldson, Dr. W. K., and) : Interferometric Determination of Apparent Thickness of Coatings, 228
Khan, Abdul Wahid (Chaudhri, Prof. Rafi Mohammed, and) : Emission of Secondary Electrons from Nickel and Molybdenum by Neutral Atoms of Mercury and Potassium, 202
Khanolkar, V. : Elected a fellow of the National Institute of Sciences of India, 123
Khastgir, Dr. S. R., and others : Location of Thunderstorm Centres from Directional Observations of Atmospherics during Sunrise and Sunset, 572
Kidd, Dr. Franklin : Appointed director of food investigation, Department of Scientific and Industrial Research, 568
Kiernan, R. A. (Hughes, Dr. G. C., and) : A Product of *Pseudomonas aeruginosa* Active *in vitro* against *M. tuberculosis*,' 197
Kieser, Margaret E., and Pollard, Dr. A. : Vitamin C in English Apples, 65
Kinell, P. : High Polymers, 138
King, H. M. the : New Year Honours List, 26
Birthday Honours List, 836
King, F. G. W. : Industry and Research, 650
King, H. C. : Appointed senior assistant conservator of forests, Sierra Leone, 432
King, Dr. T. W. (1809–47), 365
King's College, London : Title of University of London reader in experimental physics conferred on Dr. F. C. Champion, 23
Title of University of London reader in mathematics conferred on Dr. E. T. Davies, 23
Title of University of London reader in zoology conferred on Dr. Benjamin Dawes, 23
Title of University reader in chemistry conferred on Dr. D. W. G. Style, 466
Appointment of Dr. C. A. Coulson to the University of London chair of theoretical physics, 466, 632
Centenary of the Engineering Society, 515
Appointment of Prof. S. W. Wooldridge to the University of London chair of geography, 567
King's College (London) Engineering Society : Centenary of, 515
King's College, Newcastle-upon-Tyne : Retirement of Prof. J. W. Heslop Harrison from the chair of botany, 260
Appointment of Martin Jones as professor of agricultural botany, 498, 770
Appointment of Lieut.-Colonel Ewen McEwen as professor of engineering in the Faculty of Agriculture, 498, 770
Appointment of Alexander Kennedy as professor of psychological medicine, 498

Kinnear, N. B. : Breeding Birds of Denmark, *review*, 146
  Philippine Birds, *review*, 386
Kirby, P. L. (Cox, S. M., and) : Rate of Crystal Growth in Glass, 162
Kirkaldy, Dr. J. F. : Appointed to the University of London readership in geology at Queen Mary College, 466
Kirke, H. L. : Frequency-Modulation in Broadcasting, 15
  Elected chairman of the Acoustics Group of the Physical Society, 534
Knight, Rex : Appointed to the chair of psychology at the University of Aberdeen, 261 ; work of, 261
Koch, Dr. Walter, and Kaplan, Dr. Deborah : A New Unit in Photoelectric Colorimetry, 273
Kodak, Ltd. : Exhibition of Applied Photography, 601, 633
Kodicek, Dr. E. : Fluorimetric Analysis, 548
Koenigsberger, Prof. J. G. : *Obituary* by L. F. B., 19
Kohn, Prof. Hans : The Idea of Nationalism, *review* by Maurice Bruce, 181
  Prophets and Peoples, *review* by Maurice Bruce, 248
Konikova, A. S., and others : Labilization of the α-Hydrogen of Aminoacids in the Presence of Aminopherase, 67
Kosambi, Prof. D. D. : Elected a fellow of the National Institute of Sciences of India, 123
Koschtojanz, Prof. Ch. S., and Turpajew, T. M. : Role of Sulphydryl Groups in the Action of Acetylcholine and Inhibition of the Vagus Nerve, *erratum*, 330
Kosswig, Prof. Curt : Selective Mating as a Factor for Speciation in Cichlid Fish of East African Lakes, 604
Kothari, Prof. D. S., and Auluck, Dr. F. C. : Surface Tension of Nuclear Matter and the Enumeration of Eigenfunctions of an Enclosed Particle, 204
Kraus, E. B., and Squires, P. : Experiments on the Stimulation of Clouds to Produce Rain, 489
Krebs, Prof. H. A. : Elected a Fellow of the Royal Society, 430
Krebs, Prof. H. A., and others : Urea Synthesis in Mammalian Liver, 808
Krishnamurti, Dr. G. : Elected a fellow of the National Institute of Sciences of India, 123
Krishnan, Dr. R. S. : Raman Spectrum of Diamond under High Resolution, 60
  Raman Spectrum of Rock-Salt under High Resolution, 266
  Thermal Scattering of Light in Diamond, 740
Kröger, Dr. F. A. : Fluorescence of Tungstates and Molybdates, 674
  Tetravalent Manganese as an Activator in Luminescence, 706
Kullenberg, Börje : Awarded the Heyman Prize of the Göteborgs Högskola, 805
Kurti, Dr. N. : The Place of Thermodynamics in Education, 628

LA COUR, Dr. L. F., and Drew, R. : Partition-Chromatography and Living Cells, 307
Lacassagne, Prof. Antoine : Les cancers produits par des substances chimiques exogènes, *review* by Dr. E. Boyland, 554
  Elected a corresponding fellow of the New York Academy of Medicine, 786
Lacey, Gerald : Turbulent Flow in Alluvium, 407
Lachat, Dr. Lawrence L. : Appointed to be in charge of the development of new biochemicals with the Chemical Research and Development Department of Armour and Co., 634
Lal, Dr. M. B. : Acanthocephala of Trout and Anthelmintics—Behaviour *in vitro*, 545
Lambert, Pierre (Lavoipierre, Michel, and) : A Sandfly described in 1691, 444
Lambert, W. D. : Elected a *Correspondant* for the Section of Geography and Navigation of the Paris Academy of Sciences, 160
Lambot, H. J. : Determination of the 'Loading' in Paper by Microradiography, 676
Lampitt, Dr. L. H. : Particle Size Analysis, 717
Land, Edwin H. : A New Form of Camera, 497
Landau, J., and others : Treatment of Keratitis rosacea with Small Doses of Testosterone, 171
Lang, A., and others : Crystal Structure of a Crossed-Chain Potassium Soap, 507
Langevin, Prof. Paul : *Death* of, 19
  Memorial meeting at Beaver Hall, 634
Langevin (1872–1946), Prof. Paul (Prof. J. D. Bernal), 798
Lankester, Sir Edwin Ray (1847–1929), 734
Lapage, Dr. G. : Chemotherapy, 208
  Biology of the Trematoda, *review*, 250
  Antibiotics, 344
  Social Value of War-time Medical Research, 854
Larke, Sir William : Industrial Research and the National Economy, 649
  Research and National Recovery, 852
Larsen, Dr. Poul : Neutral Auxins, 842
Latham, A. M. : Textile Design and Colour (William Watson), fifth edition, *review*, 7
Latham, R. (Cassels, J. M., and) : Use of a Cyclotron to Detect Short-Period Activities, 367
Lattes, Dr. C. M. G., and Occhialini, Dr. G. P. S. : Determination of the Energy and Momentum of Fast Neutrons in Cosmic Rays, 331
Lattes, Dr. C. M. G., and others : Range-Energy Relation for Protons and α-Particles in the New Ilford 'Nuclear Research' Emulsions, 301
  Processes Involving Charged Mesons, 694
Laurie, M. V. : Trees used for Animal Fodder in India, third edition, 124
Lauwerys, Dr. J. A. : Title of professor of comparative education in the University of London conferred on, 772
Lavoipierre, Michel, and Lambert, Pierre : A Sandfly described in 1691, 444
Lawrence, Dr. A. S. C. : Dilatancy and Thixotropy, 71
Lawrence, N. : Appointed professional assistant in the Royal Observatory, Hong Kong, 871
Lawrie, Dr. J. P. : Chemicals from Methane, 670
Laws, Capt. J. O., and others : Effect of Mono- and Divalent Salts on Red Blood Cells, 169
Lawson, Dr. Robert W. : Fluid Flow at a Small Hole due to Vibration, 168
  The Vienna Academy of Sciences (1847–1947), 831
Lazar, O. (Roubaux, Jean de, and) : Vernalization of Sugar Beet, 442
Le Fanu, W. R. : A List of Medical Libraries and Information Bureaux in the British Isles, 837
Le Grand, Y., and Guillemot, E. : Measurement of Visual Acuity with Blurred Tests, 132
Lea, A. J. : Serum Chlorides in Pregnant Mice, 469
  Molecular Weight of Melanin, 843
Lea, Dr. D. E. : *Death* of, 835
Lea, Dr. F. C. : The Smaller Firm and its Application of Research, 853
Lea, Dr. F. M., and Nurse, R. W. : Particle Size Analysis, 717
Leakey, Dr. L. S. B. : At the Pan-African Congress on Prehistory, 216
  Casts of the mandible of the Lower Miocene Ape *Proconsul* available for distribution, 871
Leary, James C., and others : D.D.T. and the Insect Problem, *review* by Dr. Kenneth Mellanby, 488
Leather Manufacturers' Research Association, British, and the Association of Applied Biologists : Symposium on Applied Biology in the Leather Industry, 750
Leckie, Dr. A. H. : Appointed deputy head of the Steel Making Division of the British Iron and Steel Research Association, 397
Lederer, E. (Jutisz, M., and) : Quantitative Chromatographic Separations of Synthetic Peptides, 445
Leet, L. Don : Earth Motion from the Atomic Bomb Test, 86
Legget, Prof. R. F. : Appointed head of the Division of Building Research under the National Research Council of Canada, 598
Lehmann, Prof. F. E. : Einführung in die physiologische Embryologie, *review* by Prof. C. H. Waddington, 657
Lehmann, Major H., and others : Effect of Mono- and Divalent Salts on Red Blood Cells, 169
Leibmann, —. : Application of Statistical Methods to Food Problems, 37
Leitch, Dr. Duncan : Awarded a Murchison Fund of the Geological Society, 123
  Appointed professor of geology at University College, Swansea, 329 ; work of, 329
Lemon, Prof. Harvey Brace, and Ference, Jr., Assoc. Prof. Michael : Analytical Experimental Physics, revised edition, *review* by G. R. Noakes, 283
Lennard-Jones, Sir John : Appointed chairman of the Advisory Council on Scientific Research and Technical Development, Ministry of Supply, 466
  The Place of Universities in the Community, 698
Lespieau, Prof. P. L. R. : *Death* of, 668
Leuba, Prof. James H. : *Death* of, 191
Levelling, Prof. R. B. : Submarine Tubes for Levelling, 408
Levy, Dr. David Mordecai : Growth of Modern Psychiatry, 38
Lewis, Prof. H. P. : *Death* of, 156 ; *obituary* by John Challinor, 223
Lewis, W. E. (Turner, C. H. M., and) : Electrical Conductivity in Insulating Amorphous Solids, 334
Lhwyd (Edward) : Life and Letters of (Dr. R. T. Gunther), (Early Science in Oxford, Vol. 14), 154
Lhwyd (Edward), Geologist, Botanist and Philologist, 1660–1709 (V. A. Eyles), 154
Liébecq, Claude : Conception actuelle du catabolisme de l'hémoglobine, 618
Liebman, Dr. : On Trephocytes and Trephycytosis, 413
Liljestrand, Dr. G. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Lindegren, Dr. Carl C. : Function of Volutin (Metaphosphate) in Mitosis, 63
Linderstrøm-Lang, Prof. K., and others : Volume Change accompanying the Splitting of Ribonucleic Acid by Ribonuclease, 877
Linderstrøm-Lang, Prof. K., and Ottesen, M. : A New Protein from Ovalbumin, 807
Lindsay of Birker, Lord : Philosophy and its Background, *review*, 723
Lindsay, Dr. E. M. : An Armagh–Dunsink–Harvard Telescope, 324
Lindsay, Monica : Appointed an assistant lecturer in biochemistry in the University of Sheffield, 871
Linen Industry Research Association : Annual Report, 685
Lines, L. E. : Industry and Research, 650
Link, Edwin : Awarded the Wakefield Gold Medal of the Royal Aeronautical Society, 669
Linnean Society of London : Gold Medal for 1947 awarded to Prof. Maurice Caullery, 226, 734
  Anniversary Meeting, 734
  Election of officers for 1947–48, 734
  Election of foreign members, 734
Linnean Society of London and the Systematics Association : Joint discussion on the Teaching of Taxonomy, 446
Lions, Dr. F. : Appointed to a newly created readership in chemistry at the University of Sydney, 224 ; work of, 224
Lipson, Dr. H. : *Obituary* of Dr. A. H. Jay, 496
Lister, C. A. : Appointed plant pathologist, Gold Coast, 226
Livesey, D. L. (Green, L. L., and) : Emission of Light Charged Particles in the Fission of Uranium, 332
Llewellyn, Dr. F. J. : Electrostatic Hazards in Industry, 514
Lloyd, Dr. D. Jordan : *Obituary* by Sir Robert Pickard, 190
Lloyd, Dr. Ll. : Unco-ordinated Growth in *Paramecium* induced by 'Gammexane', 135
Locke, John : The Second Treatise of Civil Government, and a Letter concerning Toleration, *review* by Maurice Bruce, 248
Lockley, G. J. : Appointed fishery officer, Tanganyika, 568
Lockspeiser, Sir Ben : Appointed chief scientist to the Ministry of Supply, 20 ; work of, 20
Lodge, John Ellerton : A Descriptive and Illustrative Catalogue of Chinese Bronzes acquired during the Administration of (Staff of the Freer Gallery of Art), *review* by Basil Gray, 282
Loewi, Dr. Otto : Elected an honorary fellow of the New York Academy of Medicine, 786
Logan, W. E. M. : Appointed assistant conservator of forests, Kenya, 226
Lombard, Dr. René : Products résineux, *review*, 215
Lomer, T. R., and others : Crystal Structure of a Crossed-Chain Potassium Soap, 507
London Hospital Medical College : Appointment of J. R. Gilmour to the University of London readership in morbid anatomy, 567
London Mathematical Society : Symposium on the Geometry of Numbers, 104

London, Midland and Scottish Railway : Herbert Jackson Prize for 1946 awarded to J. O. Cowburn, 330
  Appointment of G. E. Wilson as chemist, Scientific Research Department, Crewe, 226
  Appointment of E. A. Morris as chemist, Scientific Research Department, Glasgow, 226
London School of Economics : Appointment of R. S. Sayers to the Sir Ernest Cassel chair of economics, 772
London School of Hygiene and Tropical Medicine : Appointment of Dr. B. S. Platt as University of London professor of human nutrition, 122
  Appointment of Dr. J. J. C. Buckley to the William Julien Courtauld chair of helminthology, 160
  Appointment of Dr. E. T. C. Spooner to the University of London chair of bacteriology and immunology, 466, 496
  Annual course on Malaria Control for Planters, Miners and others, 568
Long, L. H. (Norrish, Prof. R. G. W., and) : Heat of Atomization of Carbon, 131
Longmuir, N. M., and others : Elaboration of Hydrochloric Acid by Gastric Mucosa, 468
Lonsdale, Dr. Kathleen : What Chemistry Owes to X-Rays, 285
  Appointed a trustee of the Arthur Stanley Eddington Foundation Trust, 498
Lord, E. : Single Fibre Testing, 379
Loriente, E., and Casas, Dr. J. : Microdetermination of Copper in Biological Substances, 470
Lourie, Dr. E. M., and others : Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Effects of Paludrine and other Antimalarials, 885
Love, H. M. (Sloane, Dr. R. H., and) : Surface Formation of Lithium Negative Ions, 302
Lovell, Dr. A. C. B., and others : The Giacobinid Meteor Shower 1946, 120
Lovern, Dr. J. A. : Appointed a senior principal scientific officer, 464
Low Temperature Research Station : Appointment of Dr. E. C. Bate-Smith as superintendent, 568
Lowe, Prof. C. Van Riet : At the Pan-African Congress on Prehistory, 216
Lowes, Harold (edited by Hosking, Eric, and) : Masterpieces of Bird Photography, *review* by Seton Gordon, 757
Lubanski, J. K. : *Obituary* by Prof. J. M. Burgers, 19
Ludford, Dr. J. R. : Elected president of the Royal Microscopical Society, 193
Lundquist, Frank : Splitting of Phosphocreatine, 98
Lushington, H. E. C. : Appointed conservator of forests, Ceylon, 568
Lwoff, Dr. André : *Obituary* of Prof. Edouard Chatton, 868
Lyde, Prof. L. W. : *Death* of, 191 ; *obituary* by Prof. L. Dudley Stamp, 260
Lyle, P. : Application of Statistical Methods to Food Problems, 37
Lynch, G. Roche : Elected president of the Royal Institute of Chemistry, 600
Lyne, M., and others : Ultra-violet Absorption Spectrum of Anhydrous Nitric Acid, 163

MACAN, Dr. T. T. : Taxonomy of Aquatic Insect Nymphs and Larvæ, 595
McCaig, M. (Hoselitz, K., and) : 'Spoiling' of Tungsten Steel, 710
McCarthy, E. F., and Popják, G. : Osmotic Pressure of Fœtal Sheep Hæmoglobin, 198
McCombie, Dr. H., and Saunders, Dr. B. C. : Toxic Organo-Lead Compounds, 491
McConnell, J., and Jánossy, Dr. L. : Detectability of the Negative Proton, 335
McDavid, Dr. J. W. : Research and the Progress of Industry in Scotland, 752
MacDonald, Dr. D. K. C. (Birch, Dr. A. J., and) : Metal–Ammonia Solutions, 811
MacDonald, Dr. D. K. C. (Fürth, Dr. R., and) : Spontaneous Fluctuations of Current in a Photo-Electric Cell, 608
McDowell, C. A. : Structures of Ethylene Oxide and Cyclopropane, 508
McEwan, D. H., and others : Measurement of Out-of-Phase Magnetic Fields in Betatrons, 229
McEwen, Lieut.-Colonel Ewen : Appointed professor of engineering in the Faculty of Agriculture at King's College, Newcastle-upon-Tyne, 498, 770 ; work of, 770
McFarlane, A. S., and others : Vacuum Sublimation of Ice in Bulk, 28
Macfarlane, Dr. R. G., and Pilling, J. : Fibrinolytic Activity of Normal Urine, 779
McGill University : Appointment of Dr. J. H. Quastel to a professorship in the Department of Biochemistry, 737, 802
McGowan, J. C. : Relationships between some Dissociation Constants, 644
McGowan, J. C., and Brian, Dr. P. W. : Inhibition of Catechol Bacteriostasis by Molybdates, 373
MacKay, D. M. : A High-Speed Electronic Function Generator, 406
Mackay-Mure, J. : The Mission of the Universities, 392
Mackenzie, Dr. C. J. : *Obituary* of Dr. H. M. Tory, 630
Mackenzie, K. R., and others : Astatine, the Element of Atomic Number 85, 24
Mackenzie, W. G. : Elected an associate *honoris causa* of the Linnean Society, 734
Mackey, S. : Appointed lecturer in civil engineering in the University of Leeds, 871
Mackinder, Sir Halford : *Death* of, 463 ; *obituary* by Prof. L. Dudley Stamp, 530
Mackintosh, Dr. J. M. : Elected a corresponding fellow of the New York Academy of Medicine, 786
MacLeod, Major-General M. N. : Early Surveys in India, *review*, 213
McLintock, Dr. W. F. P. : *Obituary* of Sir John Flett, 326
McMillan, Gardner C., and others : The Renal Factor in Alloxan Diabetes, 575
MacNalty, Sir Arthur : The Clinical Aspect of Preventive Medicine, *review*, 758
  Obituary of Dr. S. Monckton Copeman, 767
McSwiney, Prof. B. A. : *Death* of, 463 ; *obituary* by G. L. Brown, 596 ; *obituary* by Dr. W. R. G. Atkins, 663
Maddocks, Dr. : Industry and Research in the Sheffield Area, 853
Madge, W. E. : Electrostatic Hazards in Industry, 514
Madigan, Dr. C. T. : *Death* of, 156 ; *obituary* by Prof. J. A. Douglas, 363
Madsen, Dr. T. : Elected an honorary fellow of the New York Academy of Medicine, 786
Magat, M. : High Polymers, 138
Mager, J., and others : Synthesis of Cellulose by Resting Cells of *Acetobacter xylinum*, 64
Mahdihassan, Prof. S. : A Mistaken Symbiont of *Oliarus cuspidatus*, 237
  Two Symbiotes of *Psylla mali*, 749
Mair, Dr. Lucy : *Obituary* of Sir Granville Orde Browne, 800
Malan, Dr. B. D. : At the Pan-African Congress on Prehistory, 216
Maley, L. (Mellor, Dr. D. P., and) : Stability Constants of Internal Complexes, 370
Malhotra, Dr. D. R. : Elected a fellow of the National Institute of Sciences of India, 123
Mallowan, M. E. L. : Appointed to the University of London chair of western Asiatic archæology at the University of London Institute of Archæology, 772
Malmgren, B., and Hedén, C.-G. : Nucleotide Metabolism of Bacteria and the Bacterial Nucleus, 577 ; *erratum*, 704
Manchester College of Technology : Summer School in X-Ray Crystallography, 398, 568
Manchester Joint Research Council : Publication of the Report of the Conference on Research and the Smaller Firm, 805
Mandelstam, J., and others : Cytosiderosis and the Genesis of Arteriosclerosis and other Fibrous-Tissue Reactions, 875
Mandl, Anita M. (Crooke, A. C., and) : A Rapid Supra-vital Staining Method for Assessing the Viability of Human Spermatozoa, 749
Manley, G. : The Geographer's Contribution to Meteorology, 92
  Awarded a Murchison Grant of the Royal Geographical Society, 532
Mann, Dr. F. G. : Elected a Fellow of the Royal Society, 430
Mann, Dr. F. G. (Holliman, F. G., and) : An Optically Active Quaternary Phosphonium Salt, 438
Mannheim, Prof. Karl : *Death* of, 156 ; *obituary*, 259
Manton, Prof. I. : Polyploidy in *Polypodium vulgare*, 136
  The Teaching of Taxonomy, 447
March, E. W. : Appointed conservator of forests, Jamaica, 568
Marchionatto, Prof. J. B. : Plant Health in the Argentine, 57
Marconi : Jubilee and Exhibition, 598
Mardles, Dr. E. W. J. : Dilatancy and Thixotropy, 70
Marine Biological Station, Millport : Joint Meeting of the Challenger Society and the staff of the, 225
Mark, Prof. Edward L. : *Death* of, 19
Mark, Dr. Herman F. : Invited to the Chair Francqui at the University of Liège, 737
Markham, Dr. Roy, and others : Electron Microscopy of Tobacco Necrosis Virus Crystals, 574
Marsden, Dr. E. : Elected president of the Royal Society of New Zealand, 869
Marshall, Dr. F. H. A. : Pre-Natal Physiology, *review*, 383
Marshall, Ian, and others : Free Radicals from Benzyl Hyponitrite, 843
Marshall, Dr. James (translated by) : Antibiotic Action of an Extract of *Galleria mellonella* (Prof. H. R. Olivier), 685
Marshall, W. G. : Research and the Progress of Industry in Scotland, 751
Martin, Dr. A. E. : Hydrogen Bonding in Ice, 403
Martin, Dr. A. E. (Wain, Dr. R. L., and) : Dehydrohalogenation of *p,p'*-D.D.T., 68
Martin, Prof. L. C. : Defective Colour Vision in Industry, 460
  Phase-Contrast Methods in Microscopy, 827
Martin, Prof. L. C., and Kaniowski, W. : Flash Visual Acuity, 25
Martin, Thomas : Scientific Equipment in Europe—Present Needs, 523
Martinez-Báez, Dr. M. : Elected an honorary fellow of the New York Academy of Medicine, 786
Martyn, Dr. D. F. : Origin of Radio Emissions from the Disturbed Sun, 26
Massart, Prof. L. : Acquisitions récentes dans le domaine de l'enzymologie, 618
Masters, Dexter, and Way, Katharine (edited by) : One World or None, *review* by Prof. M. L. Oliphant, 247
Mathematical Association : Annual General Meeting, 466, 582
  Discussion on a Unified Course in Mathematics in Secondary Schools, 582
  Election of Prof. G. B. Jeffery as president, 583
Mathematical Society, London : Symposium on the Geometry of Numbers, 104
Mather, Dr. K. : Statistical Analysis in Biology, second edition, *review*, 522
Mathieu, M. : High Polymers, 138
Mathur, Dr. K. N. : The National Physical Laboratory of India, 184
Matoltsy, A. G., and Gerendás, M. : Isotropy in the *J* Striation of Striated Muscle, 502
Matthew, Dr. T. U. : Appointed to the chair of production engineering in the University of Birmingham, 838
Matthews, R. E. F. : Status of Potato Virus B, 713
Maughan, Capt. M. : Appointed computer, Lands, Mines and Surveys Department, Uganda, 432
Maulik, Dr. S. : Relationships between the Assemblages of Plants Fed upon by Different Insects, and between the Assemblages of Insects that Feed upon Different Plants, 269
Mauritius-Seychelles Fishery Survey : Appointment of Dr. F. D. Ommanney as marine biologist, 601
Mayo, Prof. Elton : The Social Problems of an Industrial Civilization, 313
Mayo, F., and others : Set Time and Particle Size, 708
Mayr, Ernst (Delacour, Jean, and) : Birds of the Philippines, *review* by N. B. Kinnear, 386
Mechanical Engineers, Institution of : James Watt International Medal for 1947 awarded to Prof. S. Timoshenko, 498
  Centenary Exhibitions, 771
  Centenary of the (R. H. Parsons), 799
Mechanical Engineers, Institution of, and the Institution of Automobile Engineers : Amalgamation of the, 599
Mechanics (Theoretical and Applied) : International Union of, 787
Medawar, P. B. : Appointed to the chair of zoology in the University of Birmingham, 838
Medawar, P. B. (Billingham, R. E., and) : 'Cytogenetics' of Black and White Guinea Pig Skin, 115
Medical Research Committee, Colonial : First Annual Report of the, 614
  Research Studentships, 704

Medical Research Council : Blood Group Research Unit of the, 92
  Appointment of Dr. S. T. Cowan as director of the National Collection of Type Cultures of Micro-organisms, 124
Medicina, Recenti Progressi in : Publication of the first issue, 123
Medicina Científica, Instituto de Investigación Médica para promoción de la : To be organised in Córdoba, 634
Mees, Dr. C. E. Kenneth, with the co-operation of Baker, Dr. John R. : The Path of Science, *review* by Lieut.-Colonel H. D. Anthony, 351
Melin, Prof. Elias, and others : Antibiotic Agents in the Substrates from Cultures of the Genus *Marasmius*, 840.
Mellanby, Sir Edward : Appointed a member of the Advisory Council on Scientific Policy, 224
  Honorary degree of Sc.D. in the University of Cambridge conferred on, 838
Mellanby, Dr. Kenneth : D.D.T. from an American Point of View, *review*, 488
  Appointed principal designate of the University College in Nigeria, 702 ; work of, 702
Mellor, Dr. D. P. : Appointed to a newly created readership in chemistry at the University of Sydney, 224 ; work of, 224
Mellor, Dr. D. P., and Maley, L. : Stability Constants of Internal Complexes, 370
Mellor, Dr. D. P., and others : Polymerization of a Semiquinone Ion, 612
Melmore, Sidney : Densest Packing of Equal Spheres, 817
Melville, Prof. H. W. : History of Modern Chemistry, *review*, 3
  Catalysis, *review*, 791
Mendelssohn, Dr. K. : The Place of Thermodynamics in Education, 627
Menkart, J., and Speakman, Prof. J. B. : Felting of Animal Fibres, 640
Mer, G. G., and Goldblum, N. : A Hæmosporidian of Bats, 444
Mercer, E. H., and others : Structure of Fibrous Keratin, 535
Meredith, G. Patrick : The Place of Visual Aids in the Teaching of Mathematics, 582
  Appointed lecturer in educational psychology in the University of Leeds, 871
Meredith, R. : Single Fibre Testing, 379
Merrill, Prof. Elmer Drew : Merrilleana, a Selection from the General Writings of, *review* by Dr. W. B. Turrill, 283
  Made an honorary staff member of the Botanic Gardens at Buitenzorg, 330
Merry, Dr. E. W. : Applied Biology in the Leather Industry, 750
Métadier, Prof. Jacques : La théorie de la catalyse vue d'ensemble et essai de synthèse, *review* by Prof. H. W. Melville, 791
Metallurgical Laboratory of India : National (Dr. G. P. Contractor), 219
Metals, Institute of : Vol. 71 (1945) of the *Journal*, 56
  Vol. 12 of Metallurgical Abstracts, 56
  May Lecture (Sir Wallace Akers), 534
Metcalfe, Dr. C. R. : *Obituary* of Dr. Leopold von Portheim, 835
Meteorological Service in Portugal, National : Establishment of a, 772
Meteorological Society, Royal : Presidential Address (G. Manley), 92
  Presentation of the Symons Medal to Prof. David Brunt, 92
  Election of officers, 193
Méthodes Spectrographiques, Groupement pour l'Avancement des : General meeting on Spectroscopy, 634
Metro-Goldwyn-Mayer : Film on the development of the Atomic Bomb in the United States (The Beginning or the End ?), 583
Meulen, Colonel Daniel van der : Awarded a Patron's Medal of the Royal Geographical Society, 532
Mhatre, S. H., and Nabar, Dr. G. M. : Reduction Potentials of Ferrous Hydroxide, 372
Michaelis, Dr. Moritz (Baker, Dr. Bruce E., and) : A Correlation between Redox Potentials and Synergisms of Resting Bacteria, 197
Microbiologists, International Association of : Fourth International Congress for Microbiology, 567
Microbiology, Society for : Discussion on the Nature of Virulence, 427
Microscopical Society, Royal : Election of officers, 193
Middlemiss, Prof. Ross R. : Differential and Integral Calculus, second edition, *review*, 7
Middlesex Hospital Medical School : Appointment of Dr. J. E. Roberts to the Joel chair of physics, 23, 54
  Retirement of Prof. Sidney Russ from the Joel chair of physics, 54
  Appointment of Dr. Alan Kekwick to the University of London chair of medicine, 772
Midland Agricultural College : To become the University College of Nottingham School of Agriculture, 566
Mikiewicz, E. (Bowen, E. J., and) : Fluorescence of Solid Anthracene, 706
Miles, Dr. H. W. : Appointed to the University of London chair of horticulture at Wye College, 772
Mill, J. S. : On Liberty and Considerations on Representative Government, *review* by Maurice Bruce, 248
Miller, Dr. James Alexander : Awarded the Medal of the New York Academy of Medicine, 786
Miller, J. C. P. (prepared by) : British Association for the Advancement of Science Mathematical Tables, Part-Volume B, The Airy Integral, *review* by J. H. Pearce, 113
Miller, R. G. : Appointed senior assistant conservator of forests, Northern Rhodesia, 871
Milne, Prof. E. A. : Last Testament of a Physicist, *review*, 486
Milsum, J. N. : Appointed chief field officer, Malaya, 432
Mineralogical Society of Great Britain : Formation of a Clay Minerals Group, 158
Mining and Metallurgy, Institution of : Sir Julius Wernher Memorial Lecture (Major-General A. J. Orenstein), 365
Mining and Metallurgy, Institution of, and the Institution of Mining Engineers : Conference on Silicosis, Pneumokoniosis and Dust Suppression in Mines, 365
Minkoff, G. J. : Les liquides dispersifs et leurs applications (Dr. G. Ahler), *review*, 114
Minnaert, Prof. M. G. J. : Awarded the Gold Medal for 1947 of the Royal Astronomical Society, 92, 121 ; work of, 121
Miranda, Dr. F. de P. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Missan, Alfred H., and others : Set Time and Particle Size, 708
Mitchell, Dr. F. : The Survival and Extinction of Flora and Fauna in Glacial and Post-Glacial Times, 557
Mitchell, Dr. George Hoole : Awarded the Bigsby Medal of the Geological Society, 123
Mitchell, Sir Philip : At the Pan-African Congress on Prehistory, 216
Mitchell, Wm. : Biosynthesis of the Belladonna Alkaloids, 196
Mongar, J. L., and Wassermann, A. : Ionic Exchange and Fibre Contraction 746
Monier-Williams, Dr. G. W. : Application of Statistical Methods to Food Problems, 36
Monrad-Krohn, Dr. G. H. : *Homo sapiens* and the Peace Problem, 246
Monroy, Dr. A., and Ruffo, A. : Hyaluronidase in Sea-Urchin Sperm, 603
Montalenti, G. : Physiology of Pattern Formation in Male and Female Feathers of Barred Plymouth Rock Fowls, 886
Montgomery, Dr. H. B. S. : Practical Fruit-Growing, *review*, 622
Montgomery, Prof. R. B. : Submarine Tubes for Levelling, 408
Montreal General Hospital : Appointment of Dr. J. H. Quastel as director of the Enzyme Research Division of the Institute of Special Research and Cell Metabolism, 802
Moon, Prof. P. B. : Elected a Fellow of the Royal Society, 430
  La conquête de l'énergie atomique (Gerard de Vaucouleurs), *review*, 862
Moon, Prof. P. B., and Burhop, Dr. E. H. S. : Atomic Survey, 533
Moore, Prof. : Industry and Research in the Sheffield Area, 853
Moore, Dr. Leslie Rowsell : Awarded a moiety of the Lyell Fund of the Geological Society, 123
Mordell, Prof. L. J. : The Geometry of Numbers, 105
Morgan, F.: Electrochemistry of Radioactive Substances, *review*, 693
Morgan, G. F. V., and Chalmers, C. H. : A Proposed Test for 'Sterilized' Milk, 510
Morris, E. A. : Appointed chemist in the Scientific Research Department, London, Midland and Scottish Railway, Glasgow, 226
Morris, G. : Electrostatic Hazards in Industry, 514
Morris, J. : Appointed a senior principal scientific officer, 464
Morris, Muriel (Thaysen, Dr. A. C., and) : Medium Suitable for the Cultivation of Meredith's Actinomycete, 100
Morton, J. A., and Pickles, M. M. : Use of Trypsin in the Detection of Incomplete Anti-*Rh* Antibodies, 779
Morton, Prof. R. A., and others : Retinene$_2$ and Vitamin A$_2$, 744
Morton, W. E. : Single Fibre Testing, 379
Moss, T. S. : Spectral Sensitivity of Lead Sulphide Layers, 476
Muirhead, H., and others : Processes Involving Charged Mesons, 694
Mumford, Dr. F. B. : *Death* of, 191
Mummery, Dr. R. T. : *Obituary* of Sir Almroth Wright, 731
Mundel, Dr. E. : Appointed lecturer in electrical engineering in the University of Leeds, 871
Mundkur, Dr. B. : Elected a fellow of the National Institute of Sciences of India, 123
Mura, Dr A., and others : Presence of a Penetrating Component in Extensive Showers in the Atmosphere, 367
Muralt, Dr. A. L. v. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Murphy Chemical Co., Ltd. : Pamphlet on Insecticides and Fungicides, 871
Murray, Walter J. C. : Nature's Undiscovered Kingdom, *review* by Frances Pitt, 862
Museum of the History of Science, Oxford : Reopening of the, 870
Musgrave, A. J. : Applied Biology in the Leather Industry, 751
Muxart, R., and others : Exchange between Chromium Ions and the Szilard Effect, 538
Myers, R. H. : Appointed head of the Steel Making Division of the British Iron and Steel Research Association, 397
Mynall, D. J. : Electronic Function Generator, 743

NABAR, Dr. G. M. (Joshi, G. D., and) : Accelerated Oxidation of Cotton Cellulose in Presence of Reduced Cibanone Orange R, 711
Nabar, Dr. G. M. (Mhatre, S. H., and) : Reduction Potentials of Ferrous Hydroxide, 372
Naismith, R. (Appleton, Sir Edward, and) : The Giacobinid Meteor Shower 1946, 121
Nance, Margaret H. (Fantl, Dr. P., and) : Influence of 2,3-Dimercaptopropanol (*BAL*) on Blood Coagulation, 777
Narayana, Dr. B. : Elected a fellow of the National Institute of Sciences of India, 123
Narlikar, Prof. V. V., and Vaidya, P. C. : A Spherically Symmetrical Non-Static Electromagnetic Field, 642
National Bureau of Standards : New Format of the *Journal of Research*, 159
National Chemical Laboratory of India (Dr. Bashir Ahmad), 219
National Geographic Society : News Bulletin on Experiments on Cosmic Rays in High-flying Aircraft (Dr. Gilbert Grosvenor and Dr. W. F. G. Swann), 329
National Institute of Sciences of India : Election of fellows, 123
National Metallurgical Laboratory of India (Dr. G. P. Contractor), 219
National Meteorological Service in Portugal : Establishment of a, 772
National Museum of Wales : Report for 1946, 804
National Physical Laboratory of India (Dr. K. N. Mathur), 184
National Research Council of Canada : Annual Report for 1945–46, 276
  Appointment of Prof. David A. Keys as vice-president, 297
  Re-organisation of the Associate Committee on Geodesy and Geophysics, 344
  Appointment of Prof. R. F. Legget as head of the Division of Building Research, 598
  Release of Information on Atomic Energy, 719
  Establishment of a Special Committee on Mathematical Methods in Industrial Production Problems, 736
National Research Council for Natural Sciences in Sweden, 297
National Research Council of Washington : Publication of the Proceedings of the Pacific Science Conference, 412
National Research Laboratories of India—Introduction (Sir Shanti Bhatnagar), 183
Naval Scientific Service, Royal : Appointment of F. Brundrett as chief, 498, 631
  Retirement of Sir Charles Wright as chief, 631
Neal, Ernest G. : Exploring Nature with a Camera, *review* by Frances Pitt, 420

Neal, R. A.: *Entamoeba* sp. from the Syrian Hamster (*Cricetus auratus*), 502
Nechvatal, A. (Gerrard, Dr. W., and): *Neo*-pentyl Alcohol and Steric Hindrance, 812
Neill, Dr. James N.: Awarded a Louis Livingston Seaman Award of the New York Academy of Medicine, 786
Nelson, Dr. Alexander: Principles of Agricultural Botany, *review* by Prof. W. B. Brierley, 385
Nelson, J. B., and Riley, Dr. D. P.: Structure of Graphite, 637
Netherlands Academy of Sciences of Amsterdam, Royal: Election of Prof. V. G. Childe as a member of the Section of Letters and Historical Sciences, 838
Neufeld, H. (Ransley, Dr. C. E., and): Absorption of Hydrogen by Aluminium Attacked in Caustic Soda Solution, 709
Neukom, H. (Deuel, H., and): Derivatives of Pectic Acid as Models of Proteins, 882
New York Academy of Medicine: Kast Lecture at the nineteenth Graduate Fortnight (Dr. Peyton Rous), 12
  Salmon Memorial Lectures of the (Dr. David Mordecai Levy), 38
  Centenary Celebrations, 192, 494
  Centenary Awards, 786
  To form a Section on Microbiology, 870
New York Academy of Sciences: Election of officers for 1947, 92
  Conference on Antibiotics, 344
Newitt, Prof. D. M.: The Place of Thermodynamics in Education, 627
Newman, Dr. A. C. C.: Particle Size Analysis, 717
Newnham, E. V.: Dew in Palestine, 515
Newstead, Prof. Robert: *Obituary*, 428
Newton, C. C., and others: Gyro Interaction of Radio Waves, 300
Nicholas, D. J. D.: Significance of Trace Elements in Plants and Animals, 206
Nicholls, Dr.: Application of Statistical Methods to Food Problems, 37
Nicholls, Flight-Lieut. K. V. W.: Appointed meteorological officer, Malaya, 567
Nichols, Prof. J. E.: Science and Stockbreeding, *review*, 78
  Breeding of Farm Animals, *review*, 623
Nilsson, Martin P.: Astrology in the Hellenistic Age, 92
Noakes, G. R.: Experimental Physics, *review*, 283
Noble, R. L.: Degree of D.Sc. of the University of London conferred on, 23
Non-Ferrous Metals Research Association, British: Appointment of W. L. Hall as chief officer of the Liaison Department, 534
Nord, F. F. (edited by): Advances in Enzymology and related subjects of Biochemistry, Vol. 6, *review* by Dr. J. H. Quastel, 824
Norrish, Prof. R. G. W., and Long, L. H.: Heat of Atomization of Carbon, 131
Northampton Polytechnic: Course of lectures on Television Practice, 23
Norwegian Academy of Sciences, Royal: Election of Sir Robert Robinson as a foreign member, 671
Norzi, Dr. Livio: Spiral Cracks in Glass Tubes, 306; *erratum*, 498
Nuffield College (Education Sub-Committee): The Further Education of Men and Women, 552
Nurse, R. W. (Lea, Dr. F. M., and): Particle Size Analysis, 717
Nutrition, British Journal of: To be published by the Nutrition Society, 55, 869
Nutrition Society: To publish the *British Journal of Nutrition*, 55, 869
Nye, P. H.: Appointed specialist agricultural officer, Malaya, 160

OAKES, W. G.: Intrinsic Electric Strength of Polythene, 29
Obermaier, Dr. Hugo: *Obituary* by M. C. Burkitt, 18
Öblom, Karin, and others: Antibiotic Agents in the Substrates from Cultures of the Genus *Marasmius*, 840
Occhialini, Dr. G. P. S., and others: Processes involving Charged Mesons, 694
Occhialini, Dr. G. P. S., and Powell, Dr. C. F.: Multiple Disintegration Processes produced by Cosmic Rays, 93
  Nuclear Disintegrations produced by Slow Charged Particles of Small Mass, 186

Roy, R. R. (Champion, Dr. F. C., and): Angular Distribution of Protons Ejected in the Disintegration of Nitrogen by α-Particles, 127
Royal Academy, 1947 (Dr. A. Tindell Hopwood), 764
Royal Aeronautical Society: Congress on the Technical Aspects of Aviation, 634
  Awards, 669
  Election of Dr. H. Roxbee Cox as president for 1947–48, 836
Royal Astronomical Society: Discussion on the Giacobinid Meteor Shower 1946, 119
  Gold Medal for 1947 awarded to Prof. M. G. J. Minnaert, 92, 121
  Election of officers, 298
  Geophysical discussion on Atmospheric Oscillations, 357
Royal Cancer Hospital (Free): Appointment of Dr. D. W. Smithers to the University of London chair of radiotherapy, 160
  Mechanical Recording of Information about Cancer Patients (D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
  Appointment of Dr. E. S. Horning to the University of London readership in experimental pathology, 772
Royal Dublin Society: Award of the Boyle Medal to Prof. J. H. J. Poole, 598
Royal Geographical Society: Exhibition of Polar Exploration, 22
  Glossaries of Geographical Terms in Different Languages, 431
  Awards, 532
Royal Holloway College: Retirement of Prof. Frank Horton from the University of London chair of physics, 122
Royal Institute of Chemistry: Anniversary Meeting, 600
  Election of G. Roche Lynch as president, 600
Royal Institute of Chemistry (Dublin Section) and the Irish Chemical Association: Colloquium on Industrial Utilization of Agricultural Products and of Seaweed, 671
Royal Institute of Chemistry (Scottish Sections): Symposium on Coal, Petroleum and their Newer Derivatives, 193
Royal Institution: Election of officers, 670
Royal Meteorological Society: Presidential Address (G. Manley), 92
  Presentation of the Symons Medal to Prof. David Brunt, 92
  Election of officers, 193
Royal Microscopical Society: Election of officers, 193
Royal Naval Scientific Service: Appointment of F. Brundrett as chief, 498, 631
  Retirement of Sir Charles Wright as chief, 631
Royal Netherlands Academy of Sciences: Election of Prof. V. G. Childe as a member of the Section of Letters and Historical Sciences, 838
Royal Norwegian Academy of Sciences: Election of Sir Robert Robinson as a foreign member, 671
Royal Observatory, Hong Kong: Appointment of Flight-Lieut. R. C. Bannister as professional assistant, 568
  Appointment of N. Lawrence as professional assistant, 871
Royal Photographic Society: Election of officers, 466
Royal Scottish Museum: Gordon's Astrolabe at the, 533
Royal Society: Election of Princess Elizabeth as a Royal Fellow, 193
  New Fellows of the, 429
  To nominate marine biologists to visit the Roscoff Biological Station, Finistère, 534
  Election of foreign members, 631, 668
  Conversazione, 671
  International Conference on the Emission from the Aurora and the Night Sky, 671
  Election of Clement R. Attlee as a Fellow under the special Statute, 704
  Appointment of a committee to co-operate with U.N.E.S.C.O. in the Natural Sciences, 770
Royal Society and the British Academy: Social Science in the Gap between the (Dr. Lewis F. Richardson), 269
Royal Society of Arts: Series of lectures on Economic Reconstruction in Great Britain, 57
  Joint meeting with the Chemical Society to commemorate the centenary of the Chemical Society, 193
  Albert Medal awarded to Sir Robert Robinson, 704

Royal Society of Edinburgh : Ritchie Lecture for 1945 (Dr. N. Feather), 242
  Presentation of papers and volumes on the Hydracarina by William Williamson, 330
  Election of fellows, 366
  Award of the Makdougall-Brisbane Prize for 1944–46 to Dr. William Black, 366
Royal Society of Edinburgh and others : To commemorate the 150th anniversary of the death of James Hutton, 737
Royal Society of New Zealand : Sixth Science Congress, 869
  Election of officers, 869
Royal Society of South Africa : Election of officers for 1947, 466
  Election of Dr. Robert Broom as an honorary fellow, 598
Royal Veterinary College, London : Appointment of Dr. E. C. Amoroso to the chair of veterinary physiology, 671
Rubber Industry, Institution of the : Discussion on Electrostatic Hazards in Industry, 514
Rubber Producers' Research Association, British : Appointment of Dr. Geoffrey Gee as director of research, 568, 734
Ruffo, A. (Monroy, Dr. A., and) : Hyaluronidase in Sea-Urchin Sperm, 603
Ruhemann, Dr. Martin : Power, *review* by Prof. J. A. Crowther, 4
  The Place of Thermodynamics in Education, 627
Ruhlmann, Dr. A. : At the Pan-African Congress on Prehistory, 216
Ruiz-Castañeda, Dr. M. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Runcorn, S. K., and others : An Example of Meson Production in Lead, 227
Rusconi, Aldo (Campi, Plinius, e) : Fisica nucleare, *review* by Prof. R. E. Peierls, 79
Rushbrooke, Dr. G. S. : Appointed lecturer in mathematical chemistry in the University of Leeds, 299
Russ, Dr. Sydney : Title of professor emeritus of physics in the University of London conferred on, 23
Russell, Bertrand : History of Western Philosophy and its Connection with Political and Social Circumstances from the Earliest Times to the Present Day, *review* by Lord Lindsay of Birker, 723
Russell, Dr. E. W. (Schofield, Dr. R. K., and) : Particle Size Analysis, 717
Russell, Wing-Comdr. F. S. : Marine Biology at Plymouth, 830
Russell, Sir John : Elected a foreign associate of the Paris Academy of Sciences, 398
  Richard Jefferies and the English Farm Worker, *review*, 588
Russell, P. B., and others : Phenolic Substances concerned in Hardening the Insect Cuticle, 399
Russell, R. P. : Awarded the Cadman Medal of the Institute of Petroleum, 121 ; work of, 121
Russian Mineralogical Society : Celebration of the hundred and thirtieth anniversary, 90
Ryle, Prof. John A. : Social Medicine and Social Pathology, 494
  Elected an honorary fellow of the New York Academy of Medicine, 786

SADRON, C. : High Polymers, 138
Safety in Mines Research Board : Paper No. 104, Intrinsic Safety of Electrical Apparatus, 159
Salah, M. K., and others : Retinene$_2$ and Vitamin A$_2$, 744
Salisbury, Sir Edward : Significance of Trace Elements in Plants and Animals, 206
  Appointed a member of the Advisory Council on Scientific Policy, 224
  Appointed chairman of the Forest Products Research Board, 497
Salter, Lawrence C., and others : D.D.T. and the Insect Problem, *review* by Dr. Kenneth Mellanby, 488
Salvini, Dr. G., and others : Presence of a Penetrating Component in Extensive Showers in the Atmosphere, 367
San-Tsiang, Tsien, and others : Ternary and Quaternary Fission of Uranium Nuclei, 773
Sand, Dr. René : Elected an honorary fellow of the New York Academy of Medicine, 786
Sander, K. F. : Radio Noise from the Sun at 3.2 cm., 506
Sandström, J. W. : *Death* of, 156 ; *obituary* by Lieut.-Colonel E. Gold, 395
Santen, Dr. J. H. van, and Jonker, Dr. G. H. : Effect of Temperature on the Permittivity of Barium Titanate, 333
Sarbadhikary, Prof. P. C. : Appointed Sir Rash Behari Ghosh professor of botany in the University of Calcutta, 92
Sarjant, Dr. R. J. : Appointed to the chair of fuel technology in the University of Sheffield, 23, 89 ; work of, 89
  The Industrial Problems of the Sheffield Area and their Solution by Methods of Research, 853
Sarkar, Dr. P. B. : Elected a fellow of the National Institute of Sciences of India, 123
Saunders, Dr. B. C. (McCombie, Dr. H., and) : Toxic Organo-Lead Compounds, 491
Savigear, R. A. G. : Appointed an assistant lecturer in geography in the University of Sheffield, 871
Sayers, Prof. J. : Fundamental Problems in Modern Physics, 117
Sayers, R. S. : Appointed to the Sir Ernest Cassel chair of economics at the London School of Economics, 772
Schild, Dr. Alfred : Awarded a Frank B. Jewett Fellowship, 397
Schoch, Prof. Eugene P., and others : General Chemistry, *review*, 590
Schoental, Dr. R. (Berenblum, Dr. I., and) : Action of Mustard Gas ($\beta\beta'$-Dichlorodiethylsulphide) on Nucleoproteins, 727
Schofield, Dr. R. K., and Russell, Dr. E. W. : Particle Size Analysis, 717
Schutz, Prof. Philip W. : *Death* of, 835
Schweitzer, Dr. Alfred : Appointed to the University of London readership in experimental physiology at University College, 567
Science Masters' Association : Report of the Forty-fourth Annual Meeting (A. E. Bell), 106
Science Museum : March of Time film on Atomic Power to be continued, 193
  Pasteur Exhibition, 398, 601
  Exhibition to commemorate the Centenary of the Institution of Mechanical Engineers, 771
Scientific Advisory Department for Defence : To be formed in Australia under A. P. Rowe, 869
Scientific Civil Service : Promotion of individual Research Workers, 464
Scientific Film Association : Memorandum on the Classification, Appraisal and Grading of Scientific Films, 736
Scientific Instrument Manufacturers' Association, British : Prizes for Scientific Instrument Development, 432
  Appointment of A. J. Philpot as director, 534
Scientific Instrument Research Association, British : Information Bulletin, 91
Scientific Policy, Advisory Council on : To be set up by the Government, 191
  Appointment of Sir Henry Tizard as chairman, 191
  Appointment of members, 224
Scientific Research Bureau, Eire Emergency : Report for 1941–1945, 311
Scientific Workers, Association of : Conference on the Future of the Social Sciences, 173
  First meeting of the Section of Psychology, 480
  Conference on Science and the Real Freedoms, 511
Scientific Workers, World Federation of : Appointment of J. G. Crowther as secretary-general designate, 365
Scientific and Industrial Research, Department of : To supply and erect for the Department of Natural Philosophy, University of Glasgow, a 300 MeV. synchrotron, 261
  Appointment of new chairmen of Research Boards, 497
  Appointment of Dr. Franklin Kidd as director of food investigation, 568
  Government Estimates for the, 702
  Special organisation to carry out scientific research in mechanical engineering, 769
  Appointment of Dr. G. A. Hankins as director of mechanical engineering research, 769
Scientific and Industrial Research (India), Council of : Survey of the thorium-bearing minerals in Travancore, and a survey of the uranium-bearing minerals in India, recommended by the Atomic Research Committee, 192
Scott, Dr. Alexander : *Death* of, 463 ; *obituaries* by Sir Robert Robinson and Dr. H. J. Plenderleith, 564
Scott, Dr. Robert L. : Awarded a Frank B. Jewett Fellowship, 397
Scottish Council for Health Education : Summer schools in Health Education, 772
Scottish Museum, Royal : Gordon's Astrolabe at the, 533
Seaborg, Prof. Glenn T. : Trans-Uranium Elements in Chemistry, 31
Seaborg, Prof. Glenn T., and Segrè, Prof. Emilio : The Trans-Uranium Elements, 863
Seago, Edward : A Canvas to Cover, *review* by Dr. A. Tindell Hopwood, 860
Segrè, Prof. Emilio, and others : Astatine, the Element of Atomic Number 85, 24
Segrè, Prof. Emilio (Perrier, C., and) : Technetium, the Element of Atomic Number 43, 24
Segrè, Prof. Emilio (Seaborg, Prof. Glenn T., and) : The Trans-Uranium Elements, 863
Semmens, Dr. Elizabeth Sidney : Chemical Effects of Moonlight, 613
Sen, Dr. B., and Chakravarti, S. C. : Vernalization of Excised Mustard Embryo, 783
Sen Gupta, Dr. N. C. (Reid, A., and) : Effect of Sodium Hexametaphosphate on the Yield Value and Viscosity of a Hydrogen Bentonite Suspension, 336
Serra, Prof. J. A. : A Possible Explanation of the Relations between Hereditary Anæmias and Depigmentation in the Mouse, 504
Shanks, Dr. R. A. : Resignation from the Department of Materia Medica in the University of Glasgow, 261
  Appointed medical registrar at Yorkhill Hospital for Children, Glasgow, 261
Sharp, A. E. (Jennings, Dr. M. A., and) : Antibacterial Activity of the Staphylococcus, 133
Shaw, A. C., and others : Seasonal Variations in Vitamin C Content of Tomatoes grown in Great Britain, 171
Shaw, Prof. A. F. Bernard : *Death* of, 835
Sheldon, Norman : Elected president of the British Association of Chemists, 21
Shell Petroleum Co., Ltd. : Production in Great Britain of Chemicals from Petroleum, 365
Shenfield, A. : Labour for the War Industries—the Experience of Coventry, 90
Sheppard, N., and Sutherland, Dr. G. B. B. M. : Infra-Red Spectrum of C_nD_{2n+2} and the 'Long-Chain Frequency' in Paraffins, 739
Shklovsky, Joseph S. : Emission of Radio-Waves by the Galaxy and the Sun, 752
Shoenberg, Dr. D. : Uranium Not a Super-conductor, 303
Shoenberg, Dr. D. (Désirant, M., and) : Penetration of Magnetic Field into Superconducting Mercury, 201
Sholl, Dr. Donald : Allometry of the Vertebrate Brain, 269
Shoppee, Dr. C. W. : The Adrenal Cortex, 765 ; *erratum*, 871
Short-Wave Therapeutics : International Congress on, 704
Shortt, Prof. H. E. : Nature of Virulence, 427
Shull, Prof. A. Franklin, with the collaboration of Larue, Prof. George R., and Ruthven, Alexander G. : Principles of Animal Biology, sixth edition, *review* by Dr. E. Hindle, 453
Siegbahn, Dr. Kai, and Slätis, Prof. Hilding : Gamma-Radiation from Polonium and from Lithium Bombarded with Alpha-Particles, 471
Sigerist, Dr. H. E. : Elected an honorary fellow of the New York Academy of Medicine, 786
Signer, R. : High Polymers, 138
Sikorski, J. : Single Fibre Testing, 379
Silow, Dr. R. A. : Appointed director of the British Council's Science Office in China, 21 ; work of, 21
Simon, Lord : The Place of Universities in the Community, 698
Simon, Prof. F. E. : The Place of Thermodynamics in Education, 627
Simons, E. N. : The Works Library of Tomorrow, 771
Simpson, Dr. D. M. : Fluorimetric Analysis, 548
Simpson, Dr. G. G. : Elected a foreign member of the Linnean Society, 734
Simpson, Dr. J. B. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 559
Simpson, M. (Cullumbine, Dr. H., and) : Thiothymine (2-Thio-5-Methyl-Uracil), 680
  Pulmonary Œdema and the Spleen, 781
Simpson, O., and others : Lead Sulphide Photoconductive Cells, 818
Singer, Dr. Charles : Elected president of the British Society for the History of Science, 703

Singer, Dr. Charles, and Rabin, C.: A Prelude to Modern Science, being a Discussion of the History, Sources and Circumstances of the 'Tabulæ Anatomicæ Sex' of Vesalius, *review* by Prof. F. J. Cole, 655
Singwi, K. S. (Agarwala, B. K., and) : Nuclear Thermodynamics and Showers, 816
Sircar, Dr. S. M., and Ghosh, B. N. : Effects of High Temperature and Short Days on Vernalization Response of Summer Varieties of Rice, 605
Skempton, A. W. : Appointed to the University of London readership in soil mechanics at the Imperial College of Science and Technology, 567
Skilling, Prof. William T., and Richardson, Robert S. : Sun, Moon and Stars, *review* by the Rev. M. Davidson, 420
Skinner, Dr. D. G., and Boas-Traube, Dr. S. : Particle Size Analysis, 717
Slack, H. D. : Feeding Mechanism of Water-Bugs, 605
Slater, Leonard : Appointed reader in geography in the Durham Colleges, 498
Slater, N. B. : Absolute Values of the Rates of Unimolecular Reactions, 264
Slätis, Prof. Hilding (Siegbahn, Dr. Kai, and) : Gamma-Radiation from Polonium and from Lithium Bombarded with Alpha-Particles, 471
Slizynski, B. M. : Production of Structural Changes in Somatic Chromosomes of *Drosophila melanogaster*, 66
Sloane, Dr. R. H., and Love, H. M. : Surface Formation of Lithium Negative Ions, 302
Smart, Arch. B. : Soil Sterilization on a Field-Scale, 102
Smart, Dr. John : Careers in Zoology, 378
Smillie, Prof. Wilson G. : Preventive Medicine and Public Health, *review* by Sir Arthur MacNalty, 758
Smith, B. (Heller, Dr. H., and) : The Water-balance Principle of Crustacean Eye-stalk Extracts, 544
Smith, Eng.-Capt. Edgar C. : Scientific Centenaries in 1947, 16
Smith, Sir Ewart : Appointed a member of the Advisory Council on Scientific Policy, 224
Smith, Dr. G. F. Herbert : *Obituary* of C. W. Hobley, 768
Smith, G. Stanley : A Russian Review of Bonds in Chemistry, *review*, 386
Smith, J. : Awarded the Edward Busk Memorial Prize of the Royal Aeronautical Society, 669
Smith, J. D. (Keilin, Prof. D., and) : Hæmoglobin and Nitrogen Fixation in the Root Nodules of Leguminous Plants, 692
Smith, Dr. J. L. B. : Appointed professor in ichthyology at Rhodes University College, 534
  Awarded a research fellowship in ichthyology by the South African Council of Scientific and Industrial Research, 534
Smith, Dr. Kenneth M. : Nature of Virulence, 428
Smith, Dr. Kenneth M., and others : Electron Microscopy of Tobacco Necrosis Virus Crystals, 574
Smith, Dr. M. L. : Particle Size Analysis, 717
Smith, Dr. Stanley : Awarded the Lyell Medal of the Geological Society, 123
Smith, W. Hugh : Control of Low-Temperature Injury in the Victoria Plum, 541
Smithers, Dr. D. W. : Appointed to the University of London chair of radiotherapy at the Royal Cancer Hospital (Free), 160
Smithers, Dr. D. W., and others : Mechanical Recording of Information about Cancer Patients at the Royal Cancer Hospital, 261
Snell, K. S. : A Unified Course in Mathematics in Secondary Schools, 582
Social Anthropologists, Association of : Foundation of the, 703
Social Hygiene Council, British : Summer School in Switzerland on Social Biology, 262
Social Hygiene Council, British, and the Town and Country Planning Association : Conference on the Family at Work and Play, 23
Social Science Research Council, Colonial : Second Annual Report of the, 614
Société Française de Physique : Medaille Holweck awarded to Prof. E. N. da C. Andrade, 534
Solomon, M. E. : Mortality Required to Prevent Population Increase, 848
Sosnowski, L., and others : Lead Sulphide Photoconductive Cells, 818
South African Association for the Advancement of Science : To publish a monthly periodical, 803
South African Council for Scientific and Industrial Research : Research fellowship in ichthyology awarded to Dr. J. L. B. Smith, 534
South African Museum : Report for 1945, 226
South Pacific Commission : Establishment of the, 735
Southwell, Dr. R. V. : The 'Squares' Method for Potential Problems, 168
  Existence of New Types of Wakes behind a Moving Body, 642
Southwell, Dr. R. V., and Vaisey, G. : Relaxation Methods applied to Engineering Problems, 345
Southworth, C. R. : Awarded a Bowen-Brooks Scholarship of the New York Academy of Medicine, 786
Spanier, Edwin H. : Awarded a Frank B. Jewett Fellowship, 397
Speakman, Prof. J. B. : Structure of the Keratin Molecule, 338
  Single Fibre Testing, 379
Speakman, Prof. J. B. (Cross, Dr. E. J., and) : *Obituary* of Prof. F. M. Rowe, 53
Speakman, Prof. J. B. (Menkart, J., and) : Felting of Animal Fibres, 640
Special Libraries and Information Bureaux, Association of : Classified List of German Scientific and other Periodicals, 566
Special Libraries and Information Bureaux, Association of (Northern Branch) : Conference on the Works Library, 771
Spectrochimica Acta : Re-publication of, 124
Spectrographic Discussion Group : Suggested Definitions of Terms used in Spectrographic Analysis, 567
Spencer, Dr. James F. : Title of professor emeritus of chemistry in the University of London conferred on, 772
Spink, J. A. (Gregory, J. N., and) : Lubricating Properties of Molecular Layers of Stearic Acid and Calcium Stearate on Metal Surfaces, 403
Spinoza, Portrait of a Spiritual Hero (Rudolk Kayser), translated by Amy Allen and Maxim Newmark, *review* by Prof. A. D. Ritchie, 147
Spooner, Dr. E. T. C. : Appointed to the University of London chair of bacteriology and immunology at the London School of Hygiene and Tropical Medicine, 466, 496 ; work of, 496
Squire, H. B. : Appointed a senior principal scientific officer, 464
Squires, P. (Kraus, E. B., and) : Experiments on the Stimulation of Clouds to Produce Rain, 489
Srivastava, Dr. B. N. : Elected a fellow of the National Institute of Sciences of India, 123
St. Ives Research Station, Bingley : Appointment of J. H. Arthur by the Board of Greenkeeping Research as an additional advisory officer, 23
St. Thomas's Hospital Medical School : Title of University of London reader in physiology conferred on Dr. C. C. N. Vass, 23
  Title of University of London reader in anatomy conferred on Dr. R. W. Haines, 160
Stairmand, C. J. : Particle Size Analysis, 717
Ställberg-Stenhagen, S., and Stenhagen, E. : A Recording Surface Balance of the Horizontal Type, 814
Stamp, Prof. L. Dudley : *Obituary* of Prof. L. W. Lyde, 260
  Obituary of the Rt. Hon. Sir Halford Mackinder, 530
Stampar, Dr. A. : Elected an honorary fellow of the New York Academy of Medicine, 786
Standards, National Bureau of : New format of the *Journal of Research*, 159
Standards Institution, British : British Standard 7, Cable Insulation, new edition, 262
Stanford University : Twenty-first National Colloid Symposium to be held in June, 432
Stanier, Dr. R. Y. : Oriented Movement of Blue-Green Algæ on a Stretched Gel, 682
Stansfield, H. : Appointed lecturer in mechanical engineering in the University of Leeds, 871
Starkiewicz, J., and others : Lead Sulphide Photoconductive Cells, 818
Statens Naturvetenskapliga Forskningsrad, 298
Staveley Coal and Iron Co., Ltd. : Gift of £50,000 to the University of Sheffield for research in the Department of Chemistry, 633
Stebbing, Prof. E. P. : The New Position of the Forestry Commission, 785
Stedman, Dr. E. : Molecular Asymmetry and Biological Activity, 195
Steers, J. A. : The Coast-line of England and Wales, *review* by Prof. A. E. Trueman, 349
Stehanov, A. (Gross, Prof. E., and) : Born's Theory and the Spectrum of Light Scattering of Crystals, 474
Steiner, E. H. : Application of Statistical Methods to Food Problems, 36, 37
Stelfox, A. W. : Elected an associate *honoris causa* of the Linnean Society, 734
Stellar, Stanley : Awarded a Bowen-Brooks Scholarship of the New York Academy of Medicine, 786
Stenhagen, E. (Ställberg-Stenhagen, S., and) : A Recording Surface Balance of the Horizontal Type, 814
Stetson, Dr. H. T. : Effect of the Moon on Radio Wave Propagation, 396
Steven, G. A. : The Irish Pilchard Fishery (Arthur E. J. Went), 855
Stevens, Dr. T. S. : Resignation from the Department of Chemistry in the University of Glasgow, 261
  Appointed lecturer in organic chemistry in the University of Sheffield, 261
Stevenson, G. C. : Appointed sugar agronomist and plant breeder, British Guiana, 160
Steward, E. G. (Rooksby, H. P., and) : Structure of Graphite, 638
Stewardson, Dr. E. A. : Appointed to the chair of physics at University College, Leicester, 23
Stewart, G. S., and others : The Giacobinid Meteor Shower 1946, 120
Stewart, John Q. : Coasts, Waves and Weather for Navigators, *review*, 793
Stewart, John Q., and Pierce, Newton L. : Marine and Air Navigation, *review*, 793
Stiles, Dr. W. S. : Appointed a senior principal scientific officer, 464
Stocken, L. A. (Ennor, A. H., and) : Metabolism of Fatty Livers, 308
Stodola, Dr. Frank H. : The Name 'Penicillin', 607
Stone, Joyce D. : Enzymic Modification of the Reaction between Influenza Virus and Susceptible Tissue Cells, 780
Stone, W. S., and others : Mutations Induced by Irradiation of the Substrate, 837
Stoner, Prof. E. C. : Metallurgical Atoms, *review*, 78
Stopes, Marie Carmichael : The Bathe, an Ecstasy, *review* by Margaret Howard, 522
Störmer, Prof. Carl : Elected a *Correspondant* of the Section of Astronomy of the Paris Academy of Sciences, 466
  Degree of D.Sc., *honoris causa*, in the University of Oxford, conferred on, 734
  Polar Aurora in Southern Norway (Halley Lecture), 734
Storti, Prof. Edoardo : Awarded a Lady Tata Memorial Trust grant for research, 871
Stoughton, Prof. R. H. : Fruit Growing, *review*, 249
Stradling, Sir Reginald : Appointed a member of the Advisory Council on Scientific Policy, 224
  Awarded the Medal for Merit by the Government of the United States, 684
Stratton, Prof. F. J. M. : The Total Solar Eclipse of May 20, 1947, 287
  Elected a Fellow of the Royal Society, 430
  Retirement from the chair of astrophysics at the University of Cambridge, 463 ; work of, 463
  Elected a *Correspondant* for the Section of Astronomy of the Paris Academy of Sciences, 534
  Obituary of Prof. Heinrich Kayser, 732
Strøm, Dr. Kaare Münster : Correlation between $\varkappa_{18}$ and *p*H in Lakes, 782
Strong, John H. : *Obituary* by Dr. J. A. Carroll, 667
Stubbs, A. L., and others : Retinene$_2$ and Vitamin A$_2$, 744
Stuckey, Dr. R. E. (Firth, Dr. J. B., and) : Spontaneous Combustion of Hay, 624
Style, Dr. D. W. G. : Title of University of London reader in chemistry conferred on, 466
Sullivan, D. Michael (Te-k'un, Cheng, and) : Tibetan Culture, 22
Sully, B. Dudley : Detection of End Groups in Polymer Molecules, 882
Supply, Ministry of : Appointment of Sir Ben Lockspeiser as chief scientist, 20
  Appointment of Sir John Lennard-Jones as chairman of the Advisory Council on Scientific Research and Technical Development, 466
  Retirement of Sir Frank Heath as chairman of the Advisory Council on Scientific Research and Technical Development, 466
  Report upon the Needs of European Countries for Scientific Instruments and Laboratory Equipment, 523
  Appointments to the Advisory Council on Scientific Research and Technical Development, 671
Survey of India : Historical Records of the, Vol. I, 18th Century (Colonel R. H. Phillimore), *review* by Major-General M. N. MacLeod, 213

Sutherland, Dr. G. B. B. M. (Sheppard, N., and) : Infra-Red Spectrum of C_nD_{2n+2} and the 'Long-Chain Frequency' in Paraffins, 739
Sutherland, Dr. J. D. : Relations between Psychologists and other Professional Workers, 480
Sutton, Robert William : Awarded the second (1946) Charles Vernon Boys Prize of the Physical Society, 21, 160
Swainger, Dr. K. H. : Electrical Resistance Wire Strain-Gauges to Measure Large Strains, 61
  A New Criterion of Yielding in Metals, 741
Swann, M. M., and others : Orientation of Fibrils in Natural Membranes, 434
Swann, Dr. W. F. G. (Grosvenor, Dr. Gilbert, and) : Experiments on Cosmic Rays in High-flying Aircraft, 329
Swedish Atomic Committee : Proposal for the formation of an Atomic Energy Company, 703
Swinbank, W. C. : Collisions of Cloud Droplets, 849
Swinbank, W. C. (Priestley, C. H. B., and) : Transport of Heat and other Properties by Atmospheric Turbulence, 61
Swyer, G. I. M. : A Tubal Factor concerned in the Denudation of Rabbit Ova, 873
Sykes, B. : Appointed a senior principal scientific officer, 464
Sykes, Dr. C. : Steels for Use at Elevated Temperatures (Hatfield Memorial Lecture), 498.
Syrkin, Ya. K., and Dyatkina, M. E. : The Chemical Bond and the Structure of Molecules, *review* by G. Stanley Smith, 386
Systematics Association and the Linnean Society of London : Joint discussion on the Teaching of Taxonomy, 446
Szent-Györgyi, Prof. A. : Elected a corresponding fellow of the New York Academy of Medicine, 786
Szent-Györgyi, Prof. A., and others : Nature of Myosin, 194

TAGLIAFERRI, G., and others : Presence of a Penetrating Component in Extensive Showers in the Atmosphere, 367
Tallantire, P., and Walters, S. M. : The Late-Glacial Period, 556
Tan Koen Hiok (Burgers, Prof. W. G., and) : Diffuse Bands on Laue Photographs of Silver Chloride Crystals, 845
Tansley, Prof. A. G. : The Teaching of Taxonomy, 447
Tata (Lady) Memorial Fund : Grants and Scholarships for research in diseases of the blood, 226, 871
Taylor, Dr. D. B., and others : Relationship between Structure and Action in Drugs with Curariform Actions, 86
Taylor, E. G., and others : Ultra-violet Absorption Spectrum of Anhydrous Nitric Acid, 163
Taylor, Prof. E. G. R. : Awarded the Victoria Medal of the Royal Geographical Society, 532
Taylor, Dr. E. L. : Careers in Zoology, 378
Taylor, Sir Geoffrey : Atmospheric Oscillations, 357
  Awarded the Medal for Merit by the Government of the United States, 684
Taylor, Dr. Harden F. : Elected president for 1947 of the New York Academy of Sciences, 92
Taylor, Dr. H. V., and Johnstone, Dr. Katharine H. : Commercial Flower Production ; Part 2, Summer Flowers ; Part 3, Foliage and Foliage Plants ; Part 4, Flowering Plants in Pots, 431
Taylor, R. J., and others : Units in Photo-Electric Absorptiometry, 777
Taylor, Dr. Stephen : Possibilities and Conditions of Employment of Social Psychologists in the Public Services, 480
Taylor, Dr. W. H. : Structure and Properties of Diamond, 729
Tcherniavsky, Prof. A. : Equivalence of Mass and Energy, 677
Te-k'un, Cheng, and Sullivan, D. Michael : Tibetan Culture, 22
Teegan, John, and others : Coupling of Diazonium Complexes from an Aliphatic Base, 643
Temperley, H. N. V. : The Liquid State, *review*, 317
Temple, Prof. G. : The 'Squares' Method for Potential Problems, 169
Terenin, Prof. A., and Karlakin, A. : Proton Transfer between Organic Molecules caused by Light, 881
Tetlow, K. S. : Silver Chloride Plates for Infra-Red Spectroscopy, 850
Tevendale, W. B. : Appointed geologist, Gold Coast, 567
Textile Institute : Mather Lecture to be delivered by Sir Walter Haworth, 299
  Award of a scholarship from the Cotton Trade War Memorial Fund to George H. Ewins, 366
  Conference on Single Fibre Testing, 379
  Offer of a scholarship from the Cotton Trade War Memorial Fund, 704
  Election of Prof. Fred Bradbury to honorary life membership, 704
  Warner Memorial Medals for 1947 awarded to D. A. Derrett-Smith and Dr. D. A. Clibbens, 737
Thain, W., and others : Spectroscopic Estimation of Penicillin G, 839
Thaysen, Dr. A. C., and Morris, Muriel : Medium Suitable for the Cultivation of Meredith's Actinomycete, 100
Therapeutics (Short-Wave) : International Congress on, 704
Thibaud, Jean : Vie et transmutations des atomes, deuxième édition, *review*, 7
Thirring, Hans : Die Geschichte der Atombombe, *review* by Dr. E. Broda, 792
Thistlethwaite, W. P. : Spiral Cracks in Glass Tubing, 192
Thomas, G. Garrod, and Davies, Prof. C. W. : Ion Exchange Resins as Catalysts, 372
Thompson, Prof. F. C., and Tyldesley, W. R. : Determination of Limit of Proportionality of Wires, 30
Thompson, Dr. H. W. : Fluorimetric Analysis, 549
Thompson, Dr. H. W., and others : Infra-Red and Raman Spectrum of *Cyclo*-octatetraene, 739
Thompson, Dr. R. N. S. : Appointed to the University of London chair of chemical pathology at Guy's Hospital Medical School, 466, 566 ; work of, 566
Thomson, Prof. Godfrey : Advanced Theory of Statistics, *review*, 148
  Mathematics of Statistics, *review*, 826
Thomson, R. H. K. : Single Fibre Testing, 379
Thorn, G. D., and others : Ultra-violet Absorption Spectrum of Anhydrous Nitric Acid, 163
Thorp, R. H., and others : Analgesic Activity in Compounds related to Acridone, 679
Thorpe, F. T. : Appointed lecturer in mental diseases in the University of Sheffield, 704
Thorpe, H. C. : Appointed senior plant breeder, Kenya, 871
Thorpe, Dr. W. H. : Appointed a trustee of the Arthur Stanley Eddington Foundation Trust, 498
  Nature Conservation in the Belgian Congo, *review*, 520
Thring, M. W. : Application of Similarity Principles to Thermal Transport Systems, 203
Thrower, R. D., and others : A New Indicator for Iodometric Analysis, 810
Tilley, Prof. C. E. : *Obituary* of Prof. V. M. Goldschmidt, 700
Tillotson, E. : Japanese Earthquake of December 21, 1946, 72
Timiriazev, Founder of Soviet Genetics (Dr. G. H. Beale), 51
Timoshenko, Prof. S. : Awarded the James Watt International Medal for 1947 of the Institution of Mechanical Engineers, 498
Tipper, G. H. : *Death* of, 668 ; *obituary*, 834
Tiselius, Dr. A. : Elected an honorary fellow of the New York Academy of Medicine, 786
Titchmarsh, Prof. E. C. : The Geometry of Numbers, 104
Tizard, Sir Henry : Appointed chairman of the Advisory Council on Scientific Policy, 191, 224
  Awarded the Medal for Merit by the Government of the United States, 684
Todd, Prof. A. R. : Appointed a member of the Advisory Council on Scientific Policy, 224
Todd, Prof. A. R., and others : Phenolic Substances concerned in Hardening the Insect Cuticle, 399
Toit, Prof. A. L. du : At the Pan-African Congress on Prehistory, 216
Tolansky, Dr. S. : *Obituary* of Prof. F. Paschen, 529
Tomlinson, George : Appointed chairman of the United Kingdom Committee of the United Nations Educational, Scientific and Cultural Organisation, 532
Tompkins, Dr. F. C. : Appointed to the University of London readership in physical chemistry at the Imperial College of Science and Technology, 772
Toms, Dr. B. A. (Walton, W. H., and) : A Novel Method of Making Aerosols, 232
Toothill, J. N. : Research and the Progress of Industry in Scotland, 752
Topley and Wilson : Principles of Bacteriology and Immunity, third edition, revised by Prof. G. S. Wilson and Prof. A. A. Miles, *review* by Prof. C. H. Browning, 112
Tortonese, Prof. Enrico : Biological Investigations in the Aegean Sea, 887
Tory, Dr. H. M. : *Death* of, 223 : *obituary* by Dr. C. J. Mackenzie, 630
Tosic, Dr. J. : Mechanism of Hydrogen Peroxide Formation by Spermatozoa and the Role of Amino-Acids in Sperm Motility, 544
Tötterman, Dr. G. H. R. : Awarded a Lady Tata Memorial scholarship for research, 871
Tout, Herbert : Appointed to the University of London readership in political economy at University College, 772
Town and Country Planning Association and the British Social Hygiene Council : Conference on the Family at Work and Play, 23
Townend, Dr. D. T. A. : Brotherton Lecture of the Society of Chemical Industry, 71
Trade, Board of : Working Party Reports—Linoleum and Felt Base, 687
  Working Party Reports—Wool, 688
Traill, D. : Single Fibre Testing, 379
Treloar, Dr. L. R. G. : Stress-Optical Properties of Rubber, 231
  The Place of Thermodynamics in Education, 628
Tremellen, K. W., and Cox, J. W. : Radio-communication during the War, 548
Trinity College, Cambridge : Offer of research studentships and exhibitions, 124
  Celebration of the four hundredth anniversary, 802
Tristram, Dr. G. R. : The Chemistry of the Proteins, 581
Tritton, F. J. : Elected president of the Royal Photographic Society, 466
Trueman, Prof. A. E. : Appointed a member of the Advisory Council on Scientific Policy, 224
  The Coast of England and Wales, *review*, 349
  The Teaching of Taxonomy, 447
  Obituary of B. H. Barrett, 868
Tsien San-Tsiang, and others : Ternary and Quaternary Fission of Uranium Nuclei, 773
Tuke, Dame Margaret : *Obituary* by Prof. Frank Horton, 461
Turfitt, Dr. G. E. : Science and Crime, *review*, 453
Turing, Dr. A. M. : Appointed a senior principal scientific officer, 464
Turnbull, Prof. H. M. : Title of professor emeritus of morbid anatomy in the University of London conferred on, 160
Turner, C. H. M., and Lewis, W. E. : Electrical Conductivity in Insulating Amorphous Solids, 334
Turner, D. A. (Wassell, H. C., and) : Degaussing, 56
Turner, James : Appointed a member of the Agricultural Research Council, 398
Turner, J. N. : Applied Biology in the Leather Industry, 750
Turpajew' T. M. (Koschtojanz, Prof. Ch. S., and) : Role of Sulphydryl Groups in the Action of Acetylcholine and Inhibition of the Vagus Nerve, *erratum*, 330
Turrill, Dr. W. B. : A Merrill Festschrift, *review*, 282
  The Teaching of Taxonomy, 446
Twigg, Dr. G. H., and others: Spectroscopic Estimation of Penicillin G, 839
Tyldesley, W. R. (Thompson, Prof. F. C., and) : Determination of Limit of Proportionality of Wires, 30
Tyrrell, Dr. G. W. : The New Lava from Hekla, 646
Tyrrell, Dr. Joseph Burr : Awarded the Wollaston Medal of the Geological Society, 123

UNDERWOOD, Dr. E. Ashworth : Foundation of the Johns Hopkins Hospital, *review*, 759
UNESCO : Debate on, 109
  Appointment of the United Kingdom Committee, 532
  Appointment by the Royal Society of a committee to co-operate in the Natural Sciences with, 770
Ungar, Dr. G. : The Adrenal Cortex in Shock and Stress, 766
Union Internationale contre le Cancer and the American Association for Cancer Research : Fourth International Cancer Research Congress, 398

- Unione Italiana Naturalisti : Publication of *Historia Naturalis*, 497
- United College, St. Andrews : Appointment of Dr. J. F. Allen to the chair of natural philosophy, 836
- United Kingdom Scientific Mission : Appointment of Dr. F. N. Woodward as director in the British Commonwealth Scientific Office in Washington, 704
- United Nations : The, a Handbook on the New World Organisation (Louis Dolivet), *review*, 114
- United Nations, Food and Agriculture Organisation of the : First Annual Report of the Director-General, 211
  - World Food Survey, 211
  - Proposals for a World Food Board, 211
  - Dr. G. Scott Robertson seconded to take up the post of director of agricultural production and research under the, 632
- United Nations Educational, Scientific, and Cultural Organisation : Debate on the, 109
  - Appointment of the United Kingdom Committee, 532
  - Appointment by the Royal Society of a committee to co-operate in the Natural Sciences, 770
- United States Chemical Corps : Appointment of an Advisory Committee, 736
- United States National Academy of Sciences : Charles L. Mayer Award allocated to Dr. C. Jayaratnam Eliezer, 20
- United States Office of Education : Bulletins on Education in Costa Rica, Colombia and Peru, 634
- Universities Bureau of the British Empire : Appointment of J. F. Foster as secretary, 398
- University of Aberdeen : Appointment of Rex Knight to the chair of psychology, 261
- University of Birmingham : Appointment of Dr. T. U. Matthew to the chair of production engineering, 838
  - Appointment of P. B. Medawar to the chair of zoology, 838
  - Appointment of Prof. V. G. Childe to be Mason Lecturer for 1947–48, 838
- University of Bristol : Research scholarship in vertebrate zoology to be provided by the Bristol, Clifton and West of England Zoological Society, 366
  - Conference on the Strength of Solids at the Wills Physical Laboratory, 671
- University of Bristol, in co-operation with the Institute of Physics : Summer School in Theoretical Physics and Conference on Mechanical Properties of Solids, 193
- University of Calcutta : Appointment of Prof. P. C. Sarbadhikary as Sir Rash Behari Ghosh professor of botany, 92
- University of California Medical School : Course in Nuclear Physics in Biological and Medical Sciences, 671
- University of Cambridge : Appointment of Dr. F. J. W. Roughton to the John Humphrey Plummer chair of colloid science, 122
  - Appointment of four Imperial Chemical Industries Fellowships, 226
  - Summer School in Physical Chemistry to be held in the Department of Physical Chemistry, 398
  - Retirement of Prof. F. J. M. Stratton from the chair of astrophysics, 463
  - Appointment of Dr. R. O. Redman as professor of astrophysics and director of the Observatories, 463
  - Appointment of Dr. C. S. Hanes as head of a unit of biochemistry, 568
  - Appointment of Dr. O. R. Frisch to the Jacksonian professorship of natural philosophy, 836
  - Conferment of honorary degrees, 838
- University of Ceylon : Appointment of Dr. H. Cullumbine as professor of physiology, 568
- University of Durham : Degree of D.Sc. awarded to Dr. C. C. Addison, 226
  - Retirement of Prof. J. W. Heslop Harrison from the chair of botany in King's College, Newcastle-upon-Tyne, 260
  - Title of professor emeritus conferred on Prof. J. W. Heslop Harrison, 260
  - Appointment of Martin Jones as professor of agricultural botany at King's College, Newcastle-upon-Tyne, 498, 770
  - Appointment of Ewen McEwen as professor of engineering in the Faculty of Agriculture at King's College, Newcastle-upon-Tyne, 498, 770
  - Appointment of Alexander Kennedy as professor of psychological medicine at King's College, Newcastle-upon-Tyne, 498
  - Appointment of Leonard Slater as reader in geography in the Durham Colleges, 498
  - Opening of the Londonderry Laboratory for Radio-chemistry, 888
- University of Edinburgh : Appointment of Dr. C. H. Waddington to the chair of animal genetics, 157
  - Course of lectures on the History of Medicine to be given by Dr. Douglas Guthrie, 498
  - Appointment of Prof. E. L. Hirst to the Forbes chair of organic chemistry, 701
- University of Glasgow : Offer from the Department of Scientific and Industrial Research to supply and erect a 300 MeV. synchrotron for the Department of Natural Philosophy, 261
  - Resignation of Dr. J. M. Hyslop as lecturer in mathematics, 261
  - Resignation of Dr. T. S. Stevens as lecturer in chemistry, 261
  - Resignation of Dr. Stanley Alstead and Dr. R. A. Shanks from the Department of Materia Medica, 261
  - Appointment of C. E. Bond, R. Lambert Hurt and A. J. Webster as assistants in the Department of Anatomy, 261
  - Appointment of John Higginson as an assistant in bacteriology, 261
  - Bicentenary of the institution of a lectureship in chemistry, 330
  - A Chemical Bicentenary at the (Dr. Andrew Kent), 594
  - Freshwater Biological Laboratory and Insect Field Station, 669
  - Appointment of Prof. G. W. Wishart as director of post-graduate medical education, 671
  - Appointment of J. R. Anderson as lecturer in pathology, 671
  - Appointment of Dr. W. F. Anderson as lecturer in materia medica, 671
  - Appointment of Dr. J. C. D. Brand as lecturer in chemistry, 671
  - Appointment of Dr. S. A. Hutchinson as lecturer in botany, 671
  - Appointment of A. C. Robb as Nuffield research assistant in physics, 671
  - Sir Robert Robinson to open a new research laboratory in the Department of Chemistry, 805
- University of Leeds : Chemical Engineering at the, 71
  - Appointment of Dr. A. J. Brown as professor of economics and head of the Department of Economics and Commerce, 299
  - Appointment of Dr. A. L. Roberts as Livesey professor of coal gas and fuel industries, 299, 430
  - Appointment of Dr. G. S. Rushbrooke as lecturer in mathematical chemistry, 299
  - Appointment of Dr. Philip George as Brotherton research lecturer in physical chemistry, 432
  - Appointment of Dr. G. E. Pringle as lecturer in inorganic and physical chemistry, 432
  - Advanced course in Physical Chemistry, 634
  - Appointment of G. P. Meredith as lecturer in educational psychology, 871
  - Appointment of H. Stansfield as lecturer in mechanical engineering, 871
  - Appointment of S. Mackey as lecturer in civil engineering, 871
  - Appointment of Dr. E. Mundel as lecturer in electrical engineering, 871
- University of Liège : Dr. Herman F. Mark invited to the Chair Francqui for the academic year 1947–48, 737
- University of London : Retirement of Prof. Sydney Russ from the Joel chair of physics at Middlesex Hospital Medical School, 23, 54
  - Appointment of Dr. J. E. Roberts to the Joel chair of physics at Middlesex Hospital Medical School, 23, 54
  - Title of professor emeritus of physics conferred on Dr. Sydney Russ, 23, 54
  - Title of professor emeritus of Chinese art and archæology conferred on Dr. W. P. Yetts, 23
  - Appointment of Dr. Reinhold Fürth to the University readership in theoretical physics at Birkbeck College, 23
  - Title of University reader of physics conferred on Dr. G. B. Brown, 23
  - Title of University reader of experimental physics conferred on Dr. F. C. Champion, 23
  - Title of University reader of mathematics conferred on Dr. E. T. Davies, 23
  - Title of University reader of zoology conferred on Dr. Benjamin Dawes, 23
  - Title of University reader of chemical engineering conferred on M. B. Donald, 23
  - Title of University reader of metallurgy conferred on Dr. M. S. Fisher, 23
  - Title of University reader of fuel technology conferred on Dr. G. W. Himus, 23
  - Title of University reader of physiology conferred on Dr. C. C. N. Vass, 23
  - Title of University reader of zoology conferred on Dr. M. J. D. White, 23
  - Title of University reader of metallurgy conferred on E. W. Yeoman, 23
  - Degree of D.Sc. conferred on E. E. Cheeseman, C. W. Davies, R. L. Noble and J. M. Watson, 23
  - Appointment of Dr. B. S. Platt as professor of human nutrition at the London School of Hygiene and Tropical Medicine, 122
  - Retirement of Prof. Frank Horton from the University chair of physics at Royal Holloway College, 122
  - Appointment of Dr. J. J. C. Buckley to the William Julien Courtauld chair of helminthology at the London School of Hygiene and Tropical Medicine, 160
  - Appointment of Dr. D. W. Smithers to the University chair of radiotherapy at the Royal Cancer Hospital (Free), 160
  - Appointment of G. A. Barnard to the University readership in mathematics at the Imperial College of Science and Technology, 160
  - Title of professor emeritus of morbid anatomy conferred on Prof. H. M. Turnbull, 160
  - Title of University reader in anatomy conferred on Dr. R. W. Haines, 160
  - Title of University reader in palæontology conferred on Dr. Alan Wood, 160
  - Appointment of Dr. C. A. Coulson to the University chair of theoretical physics at King's College, 466, 632
  - Appointment of Dr. E. T. C. Spooner to the University chair of bacteriology and immunology at the London School of Hygiene and Tropical Medicine, 466, 496
  - Appointment of Dr. R. N. S. Thompson to the University chair of chemical pathology at Guy's Hospital Medical School, 466, 566
  - Appointment of Dr. H. Grüneberg to the University readership in genetics at University College, 466
  - Appointment of Dr. J. F. Kirkaldy to the University readership in geology at Queen Mary College, 466
  - Title of University reader in education conferred on Dr. Charlotte M. Fleming, 466
  - Title of University reader in mechanical engineering conferred on Dr. B. J. Lloyd Evans, 466
  - Title of University reader in chemistry conferred on Dr. D. W. G. Style, 466
  - Appointment of Prof. S. W. Wooldridge to the University chair of geography at King's College, 567
  - Appointment of Dr. P. R. Crowe to the University readership in geography at Queen Mary College, 567
  - Appointment of Dr. Alfred Schweitzer to the University readership in experimental physiology at University College, 567
  - Appointment of A. W. Skempton to the University readership in soil mechanics at the Imperial College of Science and Technology, 567
  - Appointment of J. R. Gilmour to the University readership in morbid anatomy at London Hospital Medical College, 567
  - Title of University professor of mathematics conferred on Dr. W. G. Bickley, 567
  - Appointment of Dr. Harry Jones to the University chair of mathematics at the Imperial College of Science and Technology, 772
  - Appointment of Dr. Alan Kekwick to the University chair of medicine at Middlesex Hospital Medical School, 772
  - Appointment of M. E. L. Mallowan to the University chair of western Asiatic archæology at the University of London Institute of Archæology, 772
  - Appointment of Dr. H. W. Miles to the University chair of horticulture at Wye College, 772

  Appointment of R. S. Sayers to the Sir Ernest Cassel chair of economics at the London School of Economics, 772
  Appointment of Herbert Tout to the University readership in political economy at University College, 772
  Appointment of Dr. W. J. Hickinbottom to the University readership in organic chemistry at Queen Mary College, 772
  Appointment of Dr. E. S. Horning to the University readership in experimental pathology at the Royal Cancer Hospital (Free), 772
  Appointment of Dr. F. C. Tompkins to the University readership in physical chemistry at the Imperial College of Science and Technology, 772
  Title of professor emeritus of chemistry in the University conferred on Dr. James F. Spencer, 772
  Title of professor of comparative education in the University conferred on Dr. J. A. Lauwerys, 772
  Degree of D.Sc. conferred on O. V. S. Heath and S. S. Joski, 772
University of London Institute of Archæology : Appointment of M. E. L. Mallowan to the University chair of western Asiatic archæology, 772
University of London Institute of Education : Title of University reader in education conferred on Dr. Charlotte M. Fleming, 466
  Title of professor of comparative education in the University of London conferred on Dr. J. A. Lauwerys, 772
University of Melbourne : Appointment of Dr. D. W. Davison as a senior research officer in the Research School of Metallurgy, 805
University of Miami : Honorary degree of doctor of laws conferred on Dr. William A. Hamor, 366
University of Notre Dame : Symposium on Radiation Chemistry and Photochemistry, 634
University at Olomouc : New (Opening ceremony of the), 328
University of Oxford : Degree of D.Sc., *honoris causa*, conferred on Prof. Carl Størmer, 734
University of Sheffield : Appointment of Dr. R. J. Sarjant to the chair of fuel technology, 23, 89
  Appointment of Dr. A. G. Walker to the chair of mathematics, 89
  Appointment of Dr. T. S. Stevens as lecturer in organic chemistry, 261
  Gift of £50,000 from the Staveley Coal and Iron Co., Ltd., for research in the Department of Chemistry, 633
  Appointment of G. L. Hermitte as lecturer in histology, 704
  Appointment of F. T. Thorpe as lecturer in mental diseases, 704
  Appointment of R. M. Haythornthwaite as lecturer in civil engineering, 704
  Appointment of A. J. Hunt and R. A. G. Savigear as assistant lecturers in geography, 871
  Appointment of A. E. Bender and Monica Lindsay as assistant lecturers in biochemistry, 871
University of Strasbourg : International Conference on High Polymers, 138
University of Sydney : Appointment of Dr. T. Iredale, Dr. F. Lions and Dr. D. P. Mellor to newly created readerships in chemistry, 224
University of the Witwatersrand : Appointment of Dr. J. M. Hyslop to the chair of mathematics, 261
University College, Bangor : Refresher course on Modern Aspects of Chemistry, 771
University College, Leicester : Appointment of Dr. E. A. Stewardson to the chair of physics, 23
University College, London : Title of University of London reader in physics conferred on Dr. G. B. Brown, 23
  Title of University of London reader in chemical engineering conferred on M. B. Donald, 23
  Title of University of London reader in zoology conferred on Dr. M. J. D. White, 23
  Appointment of Dr. H. Grüneberg to the University of London readership in genetics, 466
  Title of University reader in mechanical engineering conferred on Dr. B. J. Lloyd Evans, 466
  Appointment of Dr. Alfred Schweitzer to the University of London readership in experimental physiology, 567
  Appointment of Herbert Tout to the University of London readership in political economy, 772
University College in Nigeria : Appointment of Dr. K. Mellanby as principal designate, 702
University College, Nottingham : The Midland Agricultural College to become the University College School of Agriculture, 566
University College, Swansea : Appointment of Dr. Duncan Leitch as professor of geology, 329
University Grants Advisory Committee, Colonial : Appointed by the Secretary of State for the Colonies, 329
  Appointment of members, 329
Unna, P. J. H. : Sea Waves, 239
Unny, M. Mukandan (Chidambaram, K., and) : Preliminary Study of the Chank Marking Experiments at Tuticorin, 651
Urey, Prof. H. C. : Elected a foreign member of the Royal Society, 631, 668
Ursell, F. (Barber, N., and) : Study of Ocean Swell, 205
Ushenko, Andrew Paul : Power and Events, *review* by F. Ian G. Rawlins, 861
Uttley, Dr. A. M. : Appointed a senior principal scientific officer, 464

VAGE, E. E., and others : Infra-Red and Raman Spectrum of *Cyclo*-octatetraene, 739
Vaidya, P. C. (Narlikar, Prof. V. V., and) : A Spherically Symmetrical Non-Static Electromagnetic Field, 642
Vaisey, G. (Southwell, Dr. R. V., and) : Relaxation Methods applied to Engineering Problems, 345
Valentine, Prof. Willard L. : *Death* of, 496 ; *obituary* by Dr. Dael L. Wolfle, 768
Vallée, Henri : *Death* of, 496
Vand, Dr. V., and others : Crystal Structure of a Crossed-Chain Potassium Soap, 507
Vandendriessche, L., and others : Volume Change accompanying the Splitting of Ribonucleic Acid by Ribonuclease, 877
Vargha, Prof. L., and others : Conversion of 2-Aceto-furan to Hexen-2-dion-4,5-acetal-1 and Pyrocatechol, 744
Varshney, Y. P. : Central Glass and Ceramic Research Institute, India, 290
Vass, Dr. C. C. N. : Title of University of London reader in physiology conferred on, 23
Vaucouleurs, Gerard de : La conquête de l'énergie atomique, *review* by Prof. P. B. Moon, 862
Vavilov, S., and Ioffé, A. : *Obituary* of Prof. A. A. Glagoleva-Arkadieva, 296
Veeraraghavan, Dr. N. : Cultivation of Rabies Virus *in vitro*, 782
Velišek, Prof. J. : *Obituary* by Dr. J. G. F. Druce, 835
Venkateswarlu, Dr. K. : Temperature Dependence of the Intensities of Raman Lines, 96
Verman, Dr. L. C. : Elected a fellow of the National Institute of Sciences of India, 123
Vernon, Dr. W. H. J. : Appointed a senior principal scientific officer, 464
Versnel, A. (Ziel, A. van der, and) : Total Emission Noise in Diodes, 640
Vesalius : New Light on, *review* by Prof. F. J. Cole, 655
Vesselo, I. R. : The Place of Visual Aids in the Teaching of Mathematics, 582
Veterinary College, Royal : Appointment of Dr. E. C. Amoroso to the chair of veterinary physiology, 671
Vienna Academy of Sciences (1847–1947), (Dr. Robert W. Lawson), 831 ; (Dr. F. P. Bowden), 833
Vieweg, Prof. Richard, and Walther, Prof. Alwin : To rebuild the Darmstadt Technische Hochschule, 704
Vieyra, B. E., and others : Degaussing, 56
Vigneron, L., and others : Ternary and Quaternary Fission of Uranium Nuclei, 773
Viking Fund of New York : Preparation of the second issue of the Yearbook of Physical Anthropology, 262
Vincent, J. M. : Distortion of Fungal Hyphæ in the Presence of Certain Inhibitors, 850
Viès, Prof. Fred : *Obituary* by Prof. H. Munro Fox, 597
Vogt, Dr. Marthe : The Adrenal Cortex, 767
Vries, Hl. de, and others : Neutron Experiments of the Physical Laboratory of Groningen, 569
Vyvyan, Dr. M. C. : Fruit-Fall and its Control by Synthetic Growth-Substances, 617
Vyvyan, R. N. : *Death* of, 19

WACHSTEIN, Dr. Max : Influence of *dl*-Methionine and other Substances on the Nephrotoxic Action of *dl*-Serine, 236
Waddington, Prof. C. H. : Appointed to the chair of animal genetics in the University of Edinburgh, 157 ; work of, 157
  Careers in Zoology, 378
  Elected a Fellow of the Royal Society, 430
  Physiological Embryology, *review*, 657
Wael, A. de : Dilatancy and Thixotropy, 71
Wagner, Dr. G. : The Future of the Social Sciences, 173
Wain, Dr. R. L., and Martin, Dr. A. E. : Dehydrohalogenation of *p,p'*-D.D.T., 68
Wajda, Dr. S. H. : Origin of Erythrocytes, 254, 579
Walker, Dr. A. G. : Appointed to the chair of mathematics in the University of Sheffield, 89 ; work of, 89
Wallace, Prof. T. : Significance of Trace Elements in Plants and Animals, 206
Wallis, Dr. T. E. : Peat, Hay-Fever and Pharmacognosy, 525
Walsh, Dr. A. D. : Structures of Ethylene Oxide and Cyclopropane, 165, 712
Walters, C. L. (Williams, J. L., and) : Tumour Inhibition with Extracts of Urine, 503
Walters, S. M. (Tallantire, P., and) : The Late-Glacial Period, 556
Walther, Prof. Alwin, and Vieweg, Prof. Richard : To rebuild the Darmstadt Technische Hochschule, 704
Walton, E., and others : Analgesic Activity in Compounds related to Amidone, 679
Walton, W. H. : Particle Size Analysis, 717
Walton, W. H., and Toms, Dr. B. A. : A Novel Method of Making Aerosols, 232
Warburg, Comdr. H. D. : *Death* of, 668
Warburton, F. L. : Single Fibre Testing, 379
Warne, Dr. L. G. G. : Vernalization of Lettuce, 31
Wassell, H. C., and Turner, D. A. : Degaussing, 56
Wassermann, A. (Mongar, J. L., and) : Ionic Exchange and Fibre Contraction, 746
Watson, A. G. D. : Absolute Axes and Tidal Forces, 233
Watson, Dr. D. J. : Vernalization and Photoperiodism, *review*, 179
Watson, J. M. : Degree of D.Sc. of the University of London conferred on, 23
Watson, William : Textile Design and Colour, fifth edition, *review* by A. M. Latham, 7
Watson-Watt, Sir Robert : The Evolution of Radiolocation, 174
  Awarded a Valdemar Poulsen Gold Medal of the Copenhagen Academy of Technical Sciences, 496
  Science and the Real Freedoms, 511
  Awarded the Medal for Merit by the Government of the United States, 684
Watt, Dr. A. S. : The Survival and Extinction of Flora and Fauna in Glacial and Post-glacial Times, 556
Watt, Prof. George W., and others : General Chemistry, *review*, 590
Way, Katharine (edited by Masters, Dexter, and) : One World or None, *review* by Prof. M. L. Oliphant, 247
Wayland, A. J. : At the Pan-African Congress on Prehistory, 216
Weatherburn, Prof. C. E. : A First Course in Mathematical Statistics, *review* by Prof. Godfrey Thomson, 826
Webley, D. M. : Activity of Thermophilic Bacteria in Composts of Fresh Green Material, 35
Webster, A. J. : Appointed an assistant in the Department of Anatomy in the University of Glasgow, 261
Weekes, K. : Atmospheric Oscillations, 357
Weibull, Prof. Waloddi : Spread Around the Initiating Point of the Detonation Wave in High Explosives, 402
Weidenreich, Dr. Franz : Awarded the first Viking Fund Medal and Prize in Physical Anthropology, 193
  Palæolithic Child from the Teshik-Tash Cave, 218
Weigert, Prof. Fritz : *Obituary* by Dr. I. Berenblum and Prof. H. von Halban, 733
Weights and Measures, International Committee of : First Plenary Session since 1937, 325

Weil, R. : Reflectivity of Steel, 305
Weinberger, M. A. (Evans, Dr. Alwyn G., and) : The Boron-Trifluoride Catalysed Reaction of Di-isobutene, 437, 498
Weintroub, S. : Technical and Scientific Aspects of Atomic Energy, *review*, 488
Weiss, Prof. F. E. : *Obituary* of Prof. Ludwig Jost, 701
Weiss, Dr. J. (Clemo, Prof. G. R., and) : Constitution of Melanin, 339
Weissenberg, Dr. Karl : Awarded the twenty-third Duddell Medal of the Physical Society, 21
  A Continuum Theory of Rheological Phenomena, 310
Welch, Dr. A. J. E. : Teaching of Inorganic Chemistry, *review*, 352
Welding Research Association, British : Appointment of F. A. Fox as assistant director of research, 23
Wellcome Marston Archæological Research Expedition, 432
Wells, Dr. L. H. : At the Pan-African Congress on Prehistory, 216
Went, Arthur E. J. : The Irish Pilchard Fishery, 855
West, G. B. (Jalon, P. Ga. de, and) : Use of Potassium in the Assay of Curare, 841
West, Prof. Gilbert D. : Fluid Flow at a Small Hole due to Vibration, 167
West, Dr. T. F. : Appointed an assistant director of the Ontario Research Foundation, 805
Westcott, Dr. C. H. : Apparent Breakdown of the Reciprocity Law for Transmission Lines, 540
Whewell, Dr. C. S. : Modern Methods of Fibre Investigation, 379
Whipp, H., and Bernhardt, F. W. : Particle Size Analysis, 717
Whipple, Fred L. : Earth, Moon and Planets, *review* by the Rev. M. Davidson, 522
Whitaker, A. : An Optical-Acoustic Method of Gas Analysis, 398
Whitaker, Dr. J. W. : Fuel Research Institute of India, 288
Whitby, Sir Lionel : Elected master of Downing College, Cambridge, 772
  Elected a corresponding fellow of the New York Academy of Medicine, 786
White, Dr. : Fluorimetric Analysis, 549
White, Dr. M. J. D. : Title of University of London reader in zoology conferred on, 23
Whittaker, Sir Edmund : Renewal of a Classic, *review*, 248
  Space and Spirit, *review* by the Rev. J. C. Hardwick, 418
Whittaker, E. J. W. : Friction and Wear, 541
Whittingham, Dr. G. : Luminescent Decomposition of Nitrous Oxide, 232 ; *erratum*, 299
Whittle, Air Commodore F. : Elected a Fellow of the Royal Society, 430
Whyte, R. O. : Crop Production and Environment, *review* by Dr. D. J. Watson, 179
Wigg, L. G. T. : Appointed senior assistant conservator of forests, Tanganyika, 568
Wigglesworth, Dr. V. B. : Careers in Zoology, 378
  The Corpus Allatum and the Control of Metamorphosis in Insects, 872
Wikén, Torsten, and others : Antibiotic Agents in the Substrates from Cultures of the Genus *Marasmius*, 840
Wild, Dr. F. : Characterisation of Organic Compounds, *review*, 590
Wild Birds Magazine : Publication of No. 1, 670
Wild-Barfield Electric Furnaces, Ltd. : Appointment of Dr. F. W. Haywood to the Board as technical director, 299
Wilde, Assoc. Prof. S. A. : Forest Soils and Forest Growth, *review* by J. L. Harley, 44
Wilder, Joseph R. : Awarded a Bowen-Brooks Scholarship of the New York Academy of Medicine, 786
Wilkes, Dr. M. V. : Atmospheric Oscillations, 357
Wilkes, S. H. : Electrostatic Hazards in Industry, 514
Wilkinson, D. H., and others : Interaction of Fast Neutrons with Beryllium and Aluminium, 473
Wilkinson, Dr. J. F., and others : Serum Bilirubin and the Van den Bergh Reaction, 842
Williams, Dr. D. : Appointed a senior principal scientific officer, 464
Williams, Francis : Press, Parliament and People, 2
Williams, G. F. : To join the Board of the British Drug Houses, Ltd., 57
Williams, J. L., and Walters, C. L. : Tumour Inhibition with Extracts of Urine, 503
Williamson, J., and others : Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Effects of Paludrine and other Antimalarials, 885
Williamson, William : Presentation of papers and volumes on the Hydracarina to the Royal Society of Edinburgh, 330
Willis, A. G. : Mauthner's Cells in the Larvæ of Anuran Amphibia, 410
Willmer, Dr. E. N. : Retinal Structure and Colour Vision, *review* by Prof. Ragnar Granit, 417
Willmore, P. L. (Hill, M. N., and) : Marine Seismic Prospecting, 707
Wilmot, John : Institution of Electrical Engineers conference on Radiolocation opened by, 174
Wilmott, A. J. : The Teaching of Taxonomy, 447
  The Survival and Extinction of Flora and Fauna in Glacial and Postglacial Times, 558
Wilshaw, R. G. H. : Appointed chief research officer, Malaya, 432
Wilson, A. (Gaddum, Prof. J. H., and) : Treatment of Myasthenia gravis with Di-isopropylfluorophosphonate, 680
Wilson, Prof. C. T. R. : Honorary degree of Sc.D. in the University of Cambridge conferred on, 838
Wilson, Donald C., and others : The Renal Factor in Alloxan Diabetes, 575
Wilson, Capt. G. C. : Invention of the Telephone, 870
Wilson, G. E. : Appointed chemist in the Scientific Research Department, London, Midland and Scottish Railway, Crewe, 226
Wilson, L. G. : Single Fibre Testing, 379
Wilson (Topley and) : Principles of Bacteriology and Immunity, third edition, revised by Prof. G. S. Wilson and Prof. A. A. Miles, *review* by Prof. C. H. Browning, 112
Wiltshire, Dr. S. P. : The Teaching of Taxonomy, 447
Winch, Dr. : Fluorimetric Analysis, 549
Winder, Dr. C. V. : Misuse of 'Deduced Ratios' in the Estimation of Median Effective Doses, 883
Winge, Prof. Øjvind : Elected a foreign member of the Royal Society, 631, 668
Winterbotham, Brigadier H. St. J. L. : *Obituary* by Major-General G. Cheetham, 362
Wishart, Prof. G. W. : Appointed director of post-graduate medical education in the University of Glasgow, 671
Wojciechowska, Ir. (Butkow, Prof. K., and) : Elementary Photochemical Process in Halides of Bivalent Metals, 570
Wokes, Dr. Frank : Fluorimetric Analysis, 549
Wokes, Dr. Frank, and others : Seasonal Variations in Vitamin C Content of Tomatoes Grown in Great Britain, 171
Wolfle, Dr. Dael L. : *Obituary* of Prof. W. L. Valentine, 768
Wood, Dr. Alan : Title of reader in palæontology in the University of London conferred on, 160
Wood, Dr. Alex : The Contribution of Acoustical Science to Allied Studies. 534
Wood, E. C. : Application of Statistical Methods to Food Problems, 37
Wood, W. A. (Hardy, D. V. N., and) : Structure of 'Terylene', 673
Wood, W. L., and Cameron, A. : 'Thermal Wedge' Theory of the Parallel Surface Thrust Bearing, 61
Wood Jones, Prof. F. : The Premaxilla and the Ancestry of Man, 439
  The *Plesianthropus* Skull, 883
Woodcock, Dr. D. : Isolation of Phloridzin from Apple Seeds, 100
Woodland, Dr. Austin William : Awarded a Wollaston Fund of the Geological Society, 123
Woods, H. J. : Single Fibre Testing, 379
  Fibre Physics, *review*, 519
Woodward, Dr. F. N. : Appointed director of the United Kingdom Scientific Mission in the British Commonwealth Scientific Office in Washington, 704
Wooldridge, Prof. S. W. : Appointed to the University of London chair of geography at King's College, 567
Wooster, Dr. W. A. : A Theory of the Control of Twinning in Quartz, 94
  Piezoelectricity, *review*, 284
  X-Ray Crystallography in Industry, *review*, 348
World Federation of Scientific Workers : Appointment of J. G. Crowther as secretary-general designate, 365
World Food Board : Proposals for a (Food and Agriculture Organisation of the United Nations), 211
World Medicine, Abstracts of : New publication by the British Medical Association, 261
World Power Conference : Appointment of W. J. Drummond as honorary secretary of the British National Committee, 92
  Discussion on Fuel Economy, 498
World Surgery, Obstetrics and Gynaecology, Abstracts of : New publication by the British Medical Association, 261
Wormwell, Dr. F., and Brasher, Miss D. M. : Electrical Properties of Paint Films on Metals, 678
Wortley, H. A. S. : *Death* of, 396
Wright, Sir Almroth : *Obituary* by Dr. R. T. Mummery, 731
Wright, Sir Charles : Resignation as chief of the Royal Naval Scientific Service, 631 ; work of, 631
Wright, Claude William : Awarded a moiety of the Lyell Fund of the Geological Society, 123
Wright, John : Awarded the Cuthbert Peek Grant for 1946 of the Royal Geographical Society, 532
Wright, W. D. : Researches on Normal and Defective Colour Vision, *review* by J. G., 180
Wyckoff, Dr. Ralph W. G., and others : Electron Microscopy of Tobacco Necrosis Virus Crystals, 574
Wye College : Appointment of Dr. H. W. Miles to the University of London chair of horticulture, 772
Wyss, O., and others : Mutations Induced by Irradiation of the Substrate, 837

YARSLEY, Dr. V. E. (edited by) : Plastics Applied, second edition, *review*, 387
Yeates, G. K. : Bird Life in Two Deltas, *review* by Frances Pitt, 725
Yeaxlee, Dr. Basil A. : Adventures and Discoveries in Army Education, *review*, 790
Yenson, M. Mutahhar : Precipitating Effect of Cationic Detergents on Soluble Starch, 813
Yeoman, E. W. : Title of University of London reader in metallurgy conferred on, 23
Yetts, Dr. W. P. : Title of professor emeritus of Chinese art and archæology in the University of London conferred on, 23
Yorkhill Hospital for Children, Glasgow : Appointment of Dr. R. A. Shanks as medical registrar, 261
Young, Prof. F. G. : Adrenal Cortex and Metabolism (including Electrolyte Metabolism), 766
Young, G. M. : Elected a trustee of the British Museum, 160

ZAH-WEI, Ho, and others : Ternary and Quaternary Fission of Uranium Nuclei, 773
Zetterberg, Bo : New Substances Exerting a Combined Bacteriostatic and Respiration-inhibiting Effect on Tubercle Bacilli, 235
Zeuner, Prof. F. : At the Pan-African Congress on Prehistory, 216
  The Survival and Extinction of Flora and Fauna in Glacial and Postglacial Times, 558
Zeuthen, Erik : A Sensitive 'Cartesian Diver' Balance, 440
Ziel, A. van der : Total Emission Damping in Diodes, 675
Ziel, A. van der, and Versnel, A. : Total Emission Noise in Diodes, 640
Zondek, Prof. Bernhard, and others : Treatment of Keratitis rosacea with Small Doses of Testosterone, 171
Zoological Nomenclature, International Trust for : Formed by the International Commission on Zoological Nomenclature, 328
Zoological Society of Bengal : Appeal for reprints of scientific papers, 803
Zoological Society of London : To re-establish an Anatomical Research Fellowship, 90
  Joint Meeting of the Challenger Society and the staff of the, 225
Zoological Survey of India : To be transferred from Calcutta to Delhi, 803
  (Prof. H. Munro Fox), 865
Zuckerman, Prof. S. : The Future of the Social Sciences, 173
  Appointed a member of the Advisory Council on Scientific Policy, 224
  Scientific Policy for the New World, *review*, 316
  Mammalian Reproduction, *review*, 520
  Embryology for Medical Students, *review*, 691
  The Adrenal Cortex, 767

TITLE INDEX

A *PRIORI* in Physical Theory : The (Arthur Pap), *review* by F. Ian Rawlins, 43
Aboriginal Cave Paintings (Exhibition arranged by the News and Information Bureau of the Commonwealth of Australia at Australia House), 224
Absolute Axes and Tidal Forces (A. G. D. Watson), 233
Absorptiometry (Photo-Electric) : Units in (Dr. J. R. Edisbury, R. J. Taylor and N. T. Gridgeman), 777
Absorption of Hydrogen by Aluminium Attacked in Caustic Soda Solution (Dr. C. E. Ransley and H. Neufeld), 709
Absorption,Spectrum : Ultra-violet, of Anhydrous Nitric Acid (R. Norman Jones, G. D. Thorn, M. Lyne and E. G. Taylor), 163
Abstracts of World Medical Literature, 261
Acanthocephala of Trout and Anthelmintics—Behaviour *in vitro* (Dr. M. B. Lal), 545
Accelerated Oxidation of Cotton Cellulose in Presence of reduced Cibanone Orange R (G. D. Joshi and Dr. G. M. Nabar), 711
Accuracy : Experimental Data and 'Sufficient' (N. H. Carrier), 167
2-Acetaminofluorene : Succinoxidase Activity of Hepatic Tumours produced in Rats by Feeding (Cornelia Hoch-Ligeti), 780
Acetobacter xylinum : Synthesis of Cellulose by Resting Cells of (Dr. S. Hestrin, Dr. M. Aschner and J. Mager), 64
2-Aceto-furan : Conversion of, to Hexen-2-dion-4,5-acetal-1 and Pyrocatechol (Prof. L. Vargha, J. Ramonczai and P. Bite), 744
Acetylcholine : Electrogenic Properties of (Prof. T. Cunliffe Barnes and R. Beutner), 307
  Role of Sulphydryl Groups in the Action of, and Inhibition of the Vagus Nerve (Prof. Ch. S. Koschtojanz and T. M. Turpajew), *erratum*, 330
Acetylene on a Micro Scale : Conversion of Carbon Dioxide to (Dr. William J. Arrol and Raymond Glascock), 810
Acid Production by Yeast and its Bearing on Hydrochloric Acid Formation in the Stomach : Mechanism of High (Prof. Edward J. Conway and Dr. Thomas G. Brady), 137
Acoustical Quanta and the Theory of Hearing (Dr. D. Gabor), 591
Acoustical Science : The Contribution of, to Allied Studies (Dr. Alex Wood), 534
Acoustics for Architects (Dr. E. G. Richardson), *review*, 7
Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Acquired Resistance and Persistence after Passage through the Mosquito (Dr. Ann Bishop and Betty Birkett), 884
Acquired Resistance to Paludrine in *Plasmodium gallinaceum*—Effects of Paludrine and other Antimalarials (J. Williamson, D. S. Bertram and Dr. E. M. Lourie), 885
Actinomycete (Meredith's) : Medium Suitable for the Cultivation of (Dr. A. C. Thaysen and Muriel Morris), 100
Action in Drugs with Curariform Actions : Relationship between Structure and (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 86
Activation of Paludrine *in vitro* (F. Hawking), 409
Activator in Luminescence : Tetravalent Manganese as an (Dr. F. A. Kröger), 706
Administration (Higher) : Man-power for, 143
Adrenal Cortex (Society for Endocrinology discussion on), 765
Adult Education, the Record of the British Army (Major T. H. Hawkins and L. J. F. Brimble), *review* by Dr. Basil A. Yeaxlee, 790
Aegean Sea : Biological Investigations in the (Prof. Enrico Tortonese), 887
Aerial Photographs for Scientific Purposes, 838
Aeronautics : French Books on, *review*, 214
Aéronautique : Les essais de performances en (Francois Hussenot), *review*, 214
Aerosols : A Novel Method of Making (W. H. Walton and Dr. B. A. Toms), 232
Africa (East) : Oil Plants in (A. Glendon Hill), 650
Africa (South) : A Science Journal for, 803
  University Library Service in, 277
African Lakes (East) : Selective Mating as a Factor for Speciation in Cichlid Fish of (Prof. Curt Kosswig), 604
African (South) Ape-man, *Plesianthropus* : Discovery of a New Skull of the (Dr. R. Broom), 672
African (South) Marine Expedition, 770
African (South) Trawled Fish : A Protozoal Disease of, and its Routine Detection by Fluorescence (Rees Davies and E. Beyers), 714
After-glow in Flame Gases : Latent Energy and (Prof. W. T. David), 407
Age of the Earth : A Revised Estimate of the (Prof. Arthur Holmes), 127
Agricultural Botany : Principles of (Dr. Alexander Nelson), *review* by Prof. W. B. Brierley, 385
Agricultural Production : Colonial (Sir Alan Pim), *review* by Dr. C. S. Orwin, 350
Agricultural Products and of Seaweed : Industrial Utilization of (Irish Chemical Association and the Dublin Section of the Royal Institute of Chemistry colloquium on), 671
Agricultural Scholarships (Ministry of Agriculture and Fisheries), 466
Agricultural Science at Newcastle-upon-Tyne, 770
Air of Atmospheric Pressure at Very Low Voltage : Gas Discharge in (Dr. O. Kantorowicz), 675
Air Navigation : Marine and (John Q. Stewart and Newton L. Pierce), *review*, 793
Air-cored Field : An Electron Accelerator with an (Dr. R. D. Hill), 774
Air-Sea Rescue : Size versus Colour in (Dr. W. R. G. Atkins), 612
Aircraft : Ice Accretion on, 431
Aircraft (High-flying) : Experiments on Cosmic Rays in (Dr. Gilbert Grosvenor and Dr. W. F. G. Swann), 329
Aircraft Research : Civil, 803
Airy Integral (British Association for the Advancement of Science Mathematical Tables, Part-Volume B, prepared by J. C. P. Miller), *review* by J. H. Pearce, 113
Albert Medal of the Royal Society of Arts awarded to Sir Robert Robinson, 704
Alchemy and Early Chemistry : History of (Prof. J. R. Partington), 81
Alcohols (Unsaturated) : Autoxidation of Olefins—Formation of, from Olefins by the Action of Organic Peracids (Dr. W. J. Hickinbottom), 844
Aleutian Islands : Earthquake on October 30, 57 ; on November 1, 57
Alga (Planktonic Green) : Growth of a, at various Carbonic Acid and Hydrogen-ion Concentrations (Sven Österlind), 199
Algæ (Blue-Green) : Oriented Movement of, on a Stretched Gel (Dr. R. Y. Stanier), 682
Algebra : College (Prof. A. Adrian Albert), *review* by F. G. W. Brown, 6
  Unification of, *review* by F. G. W. Brown, 6
Aliphatic Base : Coupling of Diazonium Complexes from an (Prof. Joseph Reilly, John Teegan and Michael Carey), 643
Alkaline Phosphatase in Helminth Parasites : Histological Distribution of (Dr. W. P. Rogers), 374
Alkaloids (Belladonna) : Biosynthesis of the (Wm. Mitchell), 196 ; (Dr. W. O. James), 196
Alkaloids on Hydrogen Overpotential : Effect of (Dr. J. O'M. Bockris and B. E. Conway), 711
Allometry of the Vertebrate Brain (Dr. Donald Sholl), 269
Alloxan Diabetes : The Renal Factor in (Prof. G. Lyman Duff, Donald C. Wilson and Gardner C. McMillan), 575
Alloxan Diabetes and the Kidney in the Rat (Dr. Allen Gold), 574
Alloys by Magnetic Analysis : A New Method of Studying the Structure of (P. T. Hobson), 436
Alluvium : Turbulent Flow in (Gerald Lacey), 407
α-Particles : Angular Distribution of Protons Ejected in the Disintegration of Nitrogen by (Dr. F. C. Champion and R. R. Roy), 127
  Gamma-Radiation from Polonium and from Lithium Bombarded with (Dr. Kai Siegbahn and Prof. Hilding Slätis), 471
  Range-Energy Relation for Protons and, in the New Ilford 'Nuclear Research' Emulsions (Dr. C. M. G. Lattes, P. H. Fowler and P. Cuer), 301
Alps (Italian) : Earthquake on September 10, 57
Alps (Karnische) : Earthquake near Trieste on October 23, 57
Aluminium : Interaction of Fast Neutrons with Beryllium and (K. W. Allen, W. E. Burcham and D. H. Wilkinson), 473
Aluminium Attacked in Caustic Soda Solution : Absorption of Hydrogen by (Dr. C. E. Ransley and H. Neufeld), 709
America (North) : Birds of, *review* by Frances Pitt, 80
American Awards to British Men of Science, 684
American Point of View : D.D.T. from an, *review* by Dr. Kenneth Mellanby, 488
Amidone : Analgesic Activity of Compounds related to (R. H. Thorp, E. Walton and P. Ofner), 679
Amino-Acids : Synthesis of Methionine and similar (J. R. Catch, Dr. A. H. Cook, A. R. Graham and Sir Ian Heilbron), 578 ; *erratum*, 634
Amino-Acids in the Presence of Aminopherase : Labilization of the α-Hydrogen of (A. S. Konikova, N. N. Dobbert and Dr. A. E. Braunstein), 67
Amino-Acids in Sperm Motility : Mechanism of Hydrogen Peroxide Formation by Spermatozoa and the Role of (Dr. J. Tosic), 544
2-Amino-4-Methyl-6-Chloropyrimidine and 2-Amino-4,6-Dichloropyrimidine : Crystal Structures of (Dr. C. J. B. Clews and Dr. W. Cochran), 264
Aminopherase : Labilization of the α-Hydrogen of Amino-Acids in the Presence of (A. S. Konikova, N. N. Dobbert and Dr. A. E. Braunstein), 67
Amorphous Solids (Insulating) : Electrical Conductivity in (C. H. M. Turner and W. E. Lewis), 334
Amphibia (Anuran) : Mauthner's Cells in the Larvæ of (A. G. Willis), 410
Anæmias (Hereditary) : A Possible Explanation of the Relations between, and Depigmentation in the Mouse (Prof. J. A. Serra), 504
Anæsthesia : The Chemistry of (Dr. John Adriani), *review* by Prof. J. H. Gaddum, 588
Anæsthetists : A Text-Book for, *review* by Prof. J. H. Gaddum, 588
Analgesic Activity in Compounds related to Amidone (R. H. Thorp, E. Walton and P. Ofner), 679
Anatomical Research Fellowship (Zoological Society of London), 90
Ancestry of Man : The Premaxilla and the (Prof. F. Wood Jones), 439 ; (Prof. W. E. Le Gros Clark), 546
Anhydrous Nitric Acid : Ultra-violet Absorption Spectrum of (R. Norman Jones, G. D. Thorn, M. Lyne and E. G. Taylor), 163
Animal Biology : Principles of (Prof. A. Franklin Shull, with the collaboration of Prof. George R. Larue and Alexander G. Ruthven), sixth edition, *review* by Dr. E. Hindle, 453
Animal Breeding (Dr. A. L. Hagedoorn), second edition, *review* by Prof. J. E. Nichols, 78
Animal Fibres : Felting of (J. Menkart and Prof. J. B. Speakman), 640
Animal Fodder in India : Trees used for (M. V. Laurie), third edition, 124
Animal Organism : Fibrinolysis in the (Dr. Tage Astrup and Per M. Permin), 681
Animals (Farm) : The Breeding of (Chapman Pincher), *review* by Prof. J. E. Nichols, 623
Animals Hold their Heads : How (Prof. G. R. de Beer), 734
Animals (Plants and) : Significance of Trace Elements in (Association of Applied Biologists discussion on), 206
Animaux : L'Évolution du métabolisme des substances azotées chez le (Prof. Marcel Florkin), 617
Animaux protégés au Congo Belge et dans le territoire sous mandat du Ruanda-Urundi (S. Frechkop, en collaboration avec G. F. de Witte, J.-P. Harroy et E. Hubert), *review* by Dr. W. H. Thorpe, 520
Annuaire astronomique et météorologique pour 1947 (Camille Flammarion), *review*, 590
Antarctic Whaling Grounds, 1946–47 : Scientific Expedition to the (Dr. R. A. M. Case), 88
Antarctica : The Exploration of (Dr. Brian Roberts), 388

Anthelmintics : Acanthocephala of Trout and—Behaviour *in vitro* (Dr. M. B. Lal), 545
Anthers (Developing) : Respiration of (Dr. Ralph O. Erickson), 275
Anthracene (Solid) : Fluorescence of (E. J. Bowen and E. Mikiewicz), 706
Anthropology (Physical) : Yearbook of (Preparation of the second issue by the Viking Fund of New York), 262
Anthropology (Soviet) : Recent work on (Prof. A. Bunak), 218
Antibacterial Activity of the Staphylococcus (Dr. M. A. Jennings and A. E. Sharp), 133
Antibacterial Titre in Wood-destroying Fungi (Prof. S. R. Bose), 33
Antibiotic Action of an Extract of *Galleria mellonella* (Prof. H. R. Olivier), 685
Antibiotic Agents in the Substrates from Cultures of the Genus *Marasmius* (Prof. Elias Melin, Torsted Wikén and Karin Öblom), 840
Antibiotics (Dr. G. Lapage), 344 ; (New York Academy of Sciences conference on), 344
Antibodies (Incomplete Anti-*Rh*) : Use of Trypsin in the Detection of (J. A. Morton and M. M. Pickles), 779
Antibodies *in vitro* : Plasma Cellular Reaction and its relation to the Formation of (Astrid Fagraeus), 499 ; *erratum*, 601
Anti-*Rh* Antibodies (Incomplete) : Use of Trypsin in the Detection of (J. A. Morton and M. M. Pickles), 779
Anuran Amphibia : Mauthner's Cells in the Larvæ of (A. G. Willis), 410
Ape-man, *Plesianthropus* : The Upper Milk Molars of (Dr. R. Broom), 602
Ape-man, *Plesianthropus* (South African) : Discovery of a New Skull of the (Dr. R. Broom), 672
  See *also under Plesianthropus.*
Apple Seeds : Isolation of Phlorodzin from (Dr. D. Woodcock), 100
Apples (English) : Vitamin C in (Margaret E. Kieser and Dr. A. Pollard), 65
Aquatic Insect Nymphs and Larvæ : Taxonomy of (Dr. T. T. Macan), 595
Aqueous Solutions : Stability of Penicillin in (G. Halliwell), 747
  Stabilization of Penicillin in, by Low Concentrations of Phosphates (Robertson Pratt), 233
Aquinas to Einstein : From, *review* by the Rev. J. C. Hardwick, 418
Arc Discharges : Rate of Growth of Current in (K. D. Froome), 129
Archæology : Field (R. J. C. Atkinson), *review* by C. F. C. Hawkes, 387
Architects : Acoustics for (Dr. E. G. Richardson), *review*, 7
Arctic : Meteorological Stations in the, 430
Argentine : Plant Health in the (Prof. J. B. Marchionatto), 57
Armadillidium vulgare : Genetics of Red Body Colour in (Dr. H. W. Howard), 683
Armagh–Dunsink–Harvard Telescope : An (Dr. E. M. Lindsay), 324
Army Education : Adventures and Discoveries in, *review* by Dr. Basil A. Yeaxlee, 790
Aromatic Band in Substituted Benzene : Shift of (J. S. Gourlay), 129
Aromatization of *cyclo*Hexane Carboxylate in Liver Slices (Prof. F. Dickens), 839
Arsenic Compounds (Organic) : Effects of, on Tissue Enzymes and Proteins and on Tissue Metabolism (Dr. J. J. Gordon and Dr. J. H. Quastel), 97
Arteriosclerosis and other Fibrous-Tissue Reactions : Cytosiderosis and the Genesis of (Dr. J. Gillman, Dr. T. Gillman, J. Mandelstam and C. Gilbert), 875
Arts (Fine) : Natural Science and the (F. Ian G. Rawlins), 628
Asia : Palæolithic Human Remains in (Dr. W. L. H. Duckworth), 218
Assays for Penicillin : Practical Three-Hour and Two-Hour Cylinder-Plate (Dr. Robertson Pratt and Dr. Jean Dufrenoy), 576
Astatine, the Element of Atomic Number 85 (D. R. Corson, K. R. Mackenzie and Prof. E. Segrè), 24
Astrology in the Hellenistic Age (Martin P. Nilsson), 92
Astrology and Astronomy in the Seventeenth Century (Joshua C. Gregory), 393
Astronomique et météorologique annuaire pour 1947 (Camille Flammarion), *review*, 590
Astronomy : Frontiers of (Dr. David S. Evans), *review* by Prof. J. A. Crowther, 4
Astronomy in the Schools (P. F. Burns), 583
Astronomy in the Seventeenth Century : Astrology and (Joshua C. Gregory), 393
Astronomy and Human Thought, *review* by Lieut.-Colonel H. D. Anthony, 521
Astrophysics at Cambridge, 463
Atlantic Ocean : Earthquake on November 3, 57
Atmosphere : Presence of a Penetrating Component in Extensive Showers in the (Dr. A. Mura, Dr. G. Salvini and G. Tagliaferri), 367
Atmospheres : Controlled, for the Heat Treatment of Metals (Ivor Jenkins), *review*, 759
Atmospheric Oscillations (Royal Astronomical Society Geophysical discussion on), 357
Atmospheric Pressure at Very Low Voltage : Gas Discharge in Air of (Dr. O. Kantorowicz), 675
Atmospheric Turbulence : Transport of Heat and other Properties by (C. H. B. Priestley and W. C. Swinbank), 61
Atmospherics during Sunrise and Sunset : Location of Thunderstorm Centres from Directional Observations of (Dr. S. R. Khastgir, M. K. Dàs Gupta and D. K. Ganguli), 572
Atom Bomb : A German View of the, *review* by Dr. E. Broda, 792
Atombombe : Die Geschichte der (Hans Thirring), *review* by Dr. E. Broda, 792
Atomes : Vie et transmutations des (Jean Thibaud), deuxième édition, *review*, 7
Atomic Bomb : M.-G.-M. film on the, 583
Atomic Bomb Explosion : Earth Movement resulting from an, 85
Atomic Bomb Test : Earth Motion from the (L. Don Leet), 86
Atomic Energy : B.B.C. Talks on, 449
  Control of, 823
  Ethical Aspects of the Development of (Lionel Curtis), 125 ; (J. W. Jeffery), 410
  International Control of (Atomic Scientists' Association), 47
  Metallurgical Problems Involved in the Generation of Useful Power from (Sir Wallace Akers), 534
  Release of Information on, 411 ; (National Research Council of Canada), 719
  One-day School for Journalists on (Atomic Scientists' Association), 534
  Technical and Scientific Aspects of, *review* by S. Weintroub, 488
Atomic Energy (Science News, No. 2), (edited by Prof. R. E. Peierls and John Enogat), *review* by S. Weintroub, 488
Atomic Energy—Destruction or Construction ? (*Daily Express* Exhibition), 157
Atomic Energy and its Applications (Sir James Chadwick), 421
Atomic Energy in Sweden, 703
Atomic Energy Act : Exemption Order, 157
Atomic Energy Exhibition : Travelling (Atomic Scientists' Association), 601
Atomic Energy Utilization in Britain, 533
Atomic Mass of Silicon (Prof. T. Batuecas), 705
Atomic Number 43 : Technetium, the Element of (C. Perrier and Prof. E. Segrè), 24
Atomic Number 85 : Astatine, the Element of (D. R. Corson, K. R. Mackenzie and Prof. E. Segrè), 24
Atomic Numbers 43 and 75 : Elements of (Dr. Gerald Druce), 205
Atomic Power : March of Time film to be continued at the Science Museum, 193
Atomic Research in India, 192
Atomic Survey (Prof. P. B. Moon and Dr. E. H. S. Burhop), 533
Atomic Theory for Students of Metallurgy (Dr. William Hume-Rothery), *review* by Prof. E. C. Stoner, 78
Atomique (l'énergie) : La conquête de (Gerard de Vaucouleurs), *review* by Prof. P. B. Moon, 862
Atomization of Carbon : Heat of (Prof. Bengt Edlén), 129 ; (Dr. J. Duchesne, P. Goldfinger and Dr. B. Rosen), 130 ; (Prof. R. G. W. Norrish and L. H. Long), 131 ; (Prof. S. Goudsmit), 742
Atoms : Metallurgical, *review* by Prof. E. C. Stoner, 78
Atoms of Mercury and Potassium (Neutral) : Emission of Secondary Electrons from Nickel and Molybdenum by (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Atoms, Stars and Nebulæ (Leo Goldberg and Lawrence H. Aller), *review*, 793
Audubon Bird Guide—Eastern Land Birds (Richard H. Pough), *review* by Frances Pitt, 80
Aurora : Polar, in Southern Norway (Prof. Carl Størmer), 734
Aurora and the Night Sky : Emission from the (Royal Society international conference on), 671
Australian Aboriginal Art (Exhibition arranged by the News and Information Bureau of the Commonwealth of Australia at Australia House), 224
Australopithecinæ or Dartians (Sir Arthur Keith), 377
Automatic Regulators and Servo-mechanisms (Institution of Electrical Engineers convention on), 330
Autoxidation of Olefins—Formation of Unsaturated Alcohols from Olefins by the Action of Organic Peracids (Dr. W. J. Hickinbottom), 844
Auxins : Neutral (Dr. Poul Larsen), 842
Aviation : Technical Aspects of (Royal Aeronautical Society congress on), 634
Avions : Les vibrations sur les (Maurice Berthaume), *review*, 214
  Considérations sur la conduite et l'exploitation des essais de qualités de vol des (Maurice Cambois), *review*, 214
Awards for Inventions (War-time) : Claims for, 92
Axes : Absolute, and Tidal Forces (A. G. D. Watson), 233
Azimuthal Method of Measuring Cloud Height with a Searchlight (E. G. Bilham), 677
Azotées (substances) : L'Évolution du Métabolisme des, chez les animaux (Prof. Marcel Florkin), 617

BACK Grant of the Royal Geographical Society awarded to Lieut.-Colonel Andrew Croft, 532
Bacteria : Nucleotide Metabolism of, and the Bacterial Nucleus (B. Malmgren and C.-G. Hedén), 577 ; *erratum*, 704
Bacteria (Resting) : A Correlation between Redox Potentials and Synergisms in (Dr. Bruce E. Baker and Dr. Moritz Michaelis), 197
Bacteria (Sulphur) : Species of, associated with the Corrosion of Concrete (C. D. Parker), 439
Bacteria (Thermophilic) : Activity of, in Composts of Fresh Green Material (D. M. Webley), 35
Bacterial Cell in its relation to Problems of Virulence, Immunity and Chemotherapy (Prof. Rene J. Dubos), *review*, 859
Bacterial Nucleus : Nucleotide Metabolism of Bacteria and the (B. Malmgren and C.-G. Hedén), 577 ; *erratum*, 704
Bacterial Structure and Activity, *review*, 859
Bacteriology and Immunity : Topley and Wilson's Principles of, third edition, revised by Prof. G. S. Wilson and Prof. A. A. Miles, *review* by Prof. C. H. Browning, 112
Bacteriology and Immunology in the University of London, 496
Bacteriostatic Dyes : Synergic Action of Penicillin and (Miss Mariam George and K. M. Pandalai), *erratum*, 56
Bacteriostatic and Respiration-inhibiting Effect on Tubercle Bacilli : New Substances Exerting a Combined (Bo Zetterberg), 235
Balance : A Simple Film, for Demonstration and Research Purposes (Dr. A. E. Alexander), 304
Balance ('Cartesian Diver') : A Sensitive (Erik Zeuthen), 440
Balance of the Horizontal Type : A Recording Surface (S. Ställberg-Stenhagen and E. Stenhagen), 814
Barium Titanate : Effect of Temperature on the Permittivity of (Dr. J. H. van Santen and Dr. G. H. Jonker), 333
Barnacle (Immigrant) : Establishment of an, in British Coastal Waters (M. W. H. Bishop), 501
Barred Plymouth Rock Fowls : Physiology of Pattern Formation in Male and Female Feathers of (G. Montalenti), 886
Bathe : The, an Ecstasy (Marie Carmichael Stopes), *review* by Margaret Howard, 522
Bats : A Hæmosporidian of (G. C. Mer and N. Goldblum), 444
Battery Reliability : A Short Method for Calculating Maximum (E. A. Peel), 816
B.B.C. Talks on Atomic Energy, 449
Beginning or the End ? : The (Metro-Goldwyn-Mayer film), 583
Belgian Congo : Nature Conservation in the, *review* by Dr. W. H. Thorpe, 520
Belgium : Biochemistry in, 617
Bell (Alexander Graham) and the Invention of the Telephone (Prof. G. W. O. Howe), 455 ; (Capt. G. C. Wilson), 870
Belladonna Alkaloids : Biosynthesis of the (Wm. Mitchell), 196 ; (Dr. W. O. James), 196

Benzene (Substituted) : Shift of Aromatic Band in (J. S. Gourlay), 129
Benzyl Hyponitrite : Free Radicals from (Ivan Harris, Ian Marshall and Kenneth Barry Jarrett), 843
Beryllium and Aluminium : Interaction of Fast Neutrons with (K. W. Allen, W. E. Burcham and D. H. Wilkinson), 473
Betatrons : Measurement of Out-of-Phase Magnetic Fields in (W. Bosley, Dr. J. D. Craggs and D. H. McEwan), 229
Bibliography of Statistical Quality Control (Grant I. Butterbaugh), *review* by F. J. Anscombe, 387
Bicentenary at the University of Glasgow : A Chemical (Dr. Andrew Kent), 591
Bigsby Medal of the Geological Society awarded to Dr. George Hoole Mitchell, 123
Bilirubin : Serum, and the Van den Bergh Reaction (C. Gardikas, Dr. J. E. Kench and Dr. J. F. Wilkinson), 842
Binocular Colour Combinations (Dr. R. W. Pickford), 268
Biochemical Research at Oxford upon Mustard Gas (Prof. R. A. Peters), 149
Biochemistry : Advances in Enzymology and related subjects of (edited by F. F. Nord), Vol. 6, *review* by Dr. J. H. Quastel, 824
Biochemistry in Belgium, 617
Biochemistry at Guy's Hospital Medical School, 566
Biochimie dans les Pays Anglo-Saxons depuis 1940 : Aperçus sur les progrès de la (Prof. Marcel Florkin), 617
Biochimique et clinique : Méthodes nouvelles d'analyse (Ghislaine Duchateau), 617
Biological Actions of Sex Hormones (Dr. Harold Burrows), *review*, 182
Biological Activity : Molecular Asymmetry and (Dr. G. M. Badger), 194 ; (Dr. E. Stedman), 195
Biological Investigations in the Aegean Sea (Prof. Enrico Tortonese), 887
Biological News-Letter, 298
Biological Substances : Microdetermination of Copper in (E. Loriente and Dr. J. Casas), 470
Biological Value of Soya-bean Protein : Heat Treatment and the (Dr. S. S. De and J. Ganguly), 341
Biological and Medical Sciences : Nuclear Physics in (University of California Medical School course in), 671
Biologie : Esquisse d'une histoire de la (Jean Rostand), *review*, 420
Biologie végétale : Une voie nouvelle en (R.-J. Gautheret), *review* by Alan Burges, 80
Biology : Applied, in the Leather Industry (Association of Applied Biologists in conjunction with the British Leather Manufacturers' Research Association symposium on), 750
  Fresh Water, in Italy, 804
  Marine, at Plymouth (Wing-Comdr. F. S. Russell), 830
  Social (British Social Hygiene Council Summer School in), 262
  Social, for Sixth Forms, *review* by Cyril Bibby, 147
  Statistical Analysis in (Dr. K. Mather), second edition, *review*, 522
Biology (Animal) : Principles of (Prof. A. Franklin Shull, with the collaboration of Prof. George R. Larue and Alexander G. Ruthven), sixth edition, *review* by Dr. E. Hindle, 453
Biology (Fisheries) : Population Studies in (G. L. Kesteven), 10 ; (H. R. Hulme, R. J. H. Beverton and S. J. Holt), 714
Biology (Social) : An Introduction to (Alan Dale), *review* by Cyril Bibby, 147
Biology of Carcinogenesis by Chemical Compounds, *review* by Dr. E. Boyland, 554
Biology of Schizophrenia (Dr. R. G. Hoskins), *review* by Dr. Clifford Allen, 725
Biology of Sex Hormones, *review*, 182
Biology of the Trematoda, *review* by Dr. G. Lapage, 250
Biosynthesis of the Belladonna Alkaloids (Wm. Mitchell), 196 ; (Dr. W. O. James), 196
Bird Guide : Audubon—Eastern Land Birds (Richard H. Pough), *review* by Frances Pitt, 80
Bird Life in Two Deltas (G. K. Yeates), *review* by Frances Pitt, 725
Bird Photographer Abroad : A, *review* by Frances Pitt, 725
Bird Photography : Masterpieces of (edited by Eric Hosking and Harold Lowes), *review* by Seton Gordon, 757
Birds of Denmark: The Breeding (Poul Jespersen), *review* by N. B. Kinnear, 146
Birds of Heligoland, 566
Birds of North America, *review* by Frances Pitt, 80
Birds of the Philippines (Jean Delacour and Ernst Mayr), *review* by N. B. Kinnear, 386
Blood Cells (Red) : Effect of Mono- and Divalent Salts on (Major H. Lehmann, Capt. J. O. Laws and N. Ahmed), 169
Blood Coagulation : Influence of 2,3-Dimercaptopropanol (*BAL*) on (Dr. P. Fantl and Margaret H. Nance), 777
Blood Corpuscles (Red) : Secretion of (Dr. Frederic Duran-Jorda), 293
Blood Group Reference Laboratory (Ministry of Health), 92
Blood Group Research Unit (Medical Research Council), 92
Blue-Green Algæ on a Stretched Gel : Oriented Movement of (Dr. R. Y. Stanier), 682
Blurred Tests : Measurement of Visual Acuity with (Y. Le Grand and E. Guillemot), 132
Body Colour in *Armadillidium vulgare* (Red) : Genetics of (Dr. H. W. Howard), 683
Body's Chemical Mechanisms of Defence : The (Dr. C. R. Harington), 319
Bonds in Chemistry : A Russian Review of, *review* by G. Stanley Smith, 386
Books : Recent Scientific and Technical, Supp. ii, January 25 ; Supp. ii, February 22 ; Supp. ii, March 29 ; Supp. ii, April 26 ; Supp. ii, May 31 ; Supp. ii, June 28
Born's Theory and the Spectrum of Light Scattering of Crystals (Prof. E. Gross and A. Stehanov), 474
Boron-Trifluoride Catalysed Reaction of Di-isobutene (Dr. Alwyn G. Evans and M. A. Weinberger), 437, 498
Bossom Gift Lecture (Prof. H. J. Collins), 343
Botany (Agricultural) : Principles of (Dr. Alexander Nelson), *review* by Prof. W. B. Brierley, 385
Bowen-Brooks Scholarship Awards of the New York Academy of Medicine, 786
Boyle Medal of the Royal Dublin Society awarded to Prof. J. H. J. Poole, 598
Boys (Charles Vernon) Prize of the Physical Society awarded to Robert William Sutton, 21, 160
Brain (Vertebrate) : Allometry of the (Dr. Donald Sholl), 269
Brass (Duplex) : Recrystallization of (R. W. K. Honeycombe and Dr. W. Boas), 847
Brazil : British Eclipse Expedition to, 666
'Breaking' : Artificial, of the Diapause in *Drosophila nitens* (Dr. Giuseppe Bertani), 309
Breeding of Farm Animals (Chapman Pincher), *review* by Prof. J. E. Nichols, 623
Britain : Atomic Energy Utilization in, 533
  Use of the Land in, 415
  Radiochemistry in—Opening of the Londonderry Laboratory at Durham, 888
  Scientific Man-power in, 177
  See also under Great Britain
British Academy : Social Science in the Gap between the Royal Society and the (Dr. Lewis F. Richardson), 269
British Chemicals and their Manufacturers (Association of Chemical Manufacturers), 466
British Coastal Waters : Establishment of an Immigrant Barnacle in (M. W. H. Bishop), 501
British Colonial Territories : Mining Policy in, 347
  Research in, 614
  See also under Colonial
British Committee for Co-operation with U.N.E.S.C.O. in the Natural Sciences appointed by the Royal Society, 770
British Commonwealth Scientific Co-operation, 257
British Contribution to Radiolocation, 174
British Eclipse Expedition to Brazil, 666
British Fauna : A Copepod Parasite of the Mussel New to the (Dr. C. Ellenby), 645
British Folliculinidæ (Ciliata, Heterotricha), (Dr. S. M. Das), 502
British Industry : Native Farmers and, *review* by Dr. C. S. Orwin, 350
British Isles : A List of Medical Libraries and Information Bureaux in the (W. R. Le Fanu), 837
British Men of Science : American Awards to, 684
British Metrical System : Lord Kelvin and the, 805
British Ornithological Magazine : New, 670
British Scientific Instruments (Physical Society's Exhibition of), 726
British Somaliland : Report on the Survey of (Major John A. Hunt), 366
British Species of the Genus *Rorippa* Scop. (part of the Genus *Nasturtium* R. Br.) : Chromosome Numbers of (Dr. H. W. Howard), 66
British Standard Specification for Cable Insulation, new edition, 262
British Universities and 'Secret' Theses for Degrees (Dr. J. E. Keyston), 24 ; (Sir Robert Robinson), 25
Broadcasting: Frequency-Modulation in (H. L. Kirke), 15
Bronze Art of Ancient China, *review* by Basil Gray, 282
Bronzes (Chinese) : A Descriptive and Illustrative Catalogue of, acquired during the Administration of John Ellerton Lodge (Staff of the Freer Gallery of Art), *review*, by Basil Gray, 282
Brotherton Lecture of the Society of Chemical Industry (Dr. D. T. A. Townend), 71
Buffalo's Milk : Digestibility of Cow's and (Prof. Ahmed Ghoneim and M. Taha El-Katib), 273
Busk (Edward) Memorial Prize of the Royal Aeronautical Society awarded to J. Smith, 669

CABLE Insulation : British Standard Specification for, new edition, 262
Cadman Medal of the Institute of Petroleum awarded to R. P. Russell, 121
Calciferol and of Penicillin : Effect of, on Experimental Tuberculosis of Guinea Pigs (Dr. Lois Dickinson), 681
Calcium Stearate : Lubricating Properties of Molecular Layers of Stearic Acid and, on Metal Surfaces (J. N. Gregory and J. A. Spink), 403
Calculus : Differential and Integral (Prof. Ross R. Middlemiss), second edition, *review*, 7
Camera : Exploring Nature with a (Ernest G. Neal), *review* by Frances Pitt, 420
  A New Form of (Edwin H. Land), 497
  An Ultra High-speed Motion-picture (K. M. Baird), 225
Canada : The Discovery of (Lawrence J. Burpee), *review* by J. N. L. Baker, 182
  Quality Control Methods in, 736
  Research in (Papers given at the Symposium of the Chemical Institute of Canada), *review* by R. Brightman, 589
Canadian Research in Geodesy and Geophysics, 344
Cancer : Science versus (Dr. I. Berenblum), *review* by Prof. J. A. Crowther, 4
Cancer Cells : Chromosome Numbers in (Claudio Barigozzi and Luigi Cusmano), 505
Cancer Patients at the Royal Cancer Hospital : Mechanical Recording of Information about (Dr. D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
Cancer Research : Progress of (Dr. I. Hieger), 527
  Recent Advances in (Dr. Peyton Rous), 12
Cancers produits par des substances chimiques exogènes (Prof. Antoine Lacassagne), *review* by Dr. E. Boyland, 554
Cannel Coal : Formation of Coking Coal by Thermal Treatment of a (H. E. Blayden, J. Gibson and Prof. H. L. Riley), 536
Canvas to Cover : A (Edward Seago), *review* by Dr. A. Tindell Hopwood, 860
Capillary Condensation : Dimensional Changes accompanying (Dr. W. Hirst), 267
Capitalism : Studies in the Development of (Maurice Dobb), *review* by Maurice Bruce, 452
Carbon : Heat of Atomization of (Prof. Bengt Edlén), 129 ; (Dr. J. Duchesne, P. Goldfinger and Dr. B. Rosen), 130 ; (Prof. R. G. W. Norrish and L. H. Long), 131 ; (Prof. S. Goudsmit), 742
Carbon Dioxide to Acetylene on a Micro Scale : Conversion of (Dr. William J. Arrol and Raymond Glascock), 810
Carbon Dioxide on the Prothrombin Activity of Plasma : Effect of Ultra-Filtration and (I. M. Chak and K. V. Giri), 878

C_nD_{2n+2} and the 'Long-Chain Frequency' in Paraffins (N. Sheppard and Dr. G. B. B. M. Sutherland), 739
CH_3X Molecules : Hybridization in the Methyl Radical of (Dr. Jules Duchesne), 62
Carbonic Acid and Hydrogen-Ion Concentrations : Growth of a Planktonic Green Alga at various (Sven Österlind), 199
Carbonic Anhydrase : Plant (J. R. G. Bradfield), 467
Carcinogen : Mutations in *Drosophila* induced by a (M. Demerec), 604
Carcinogenesis by Chemical Compounds : Biology of, *review* by Dr. E. Boyland, 554
Careers in Zoology (Association of British Zoologists discussion on), 378
'Cartesian Diver' Balance : A Sensitive (Erik Zeuthen), 440
Caspian Sea (near the) : Earthquake on November 4, 57
Caste in India (Dr. J. H. Hutton), *review* by F. J. Richards, 621
Casuarina equisetifolia Forst. : Hereditary (Seed-borne) Symbiosis in (Prof. S. R. Bose), 512
Catabolisme de l'hémoglobine : Conception actuelle du (Claude Liébecq), 618
Catalyse vue d'ensemble et essai de synthèse : La théorie de la (Prof. Jacques Métadier), *review* by Prof. H. W. Melville, 791
Catalysed Reaction of Di-isobutene : The Boron-Trifluoride (Dr. Alwyn G. Evans and M. A. Weinberger), 437, 498
Catalysis, *review* by Prof. H. W. Melville, 791
Catalysts : Ion Exchange Resins as (G. Garrod Thomas and Prof. C. W. Davies), 372
Catechol Bacteriostasis by Molybdates : Inhibition of (J. C. McGowan and Dr. P. W. Brian), 373 ; (Dr. H. Blaschko), 373
Cathodes ('Oxide') : Identification by X-Rays of Interface Compounds on (H. P. Rooksby), 609
Cationic Detergents on Soluble Starch : Precipitating Effect of (M. Mutahhar Yenson), 813
Cations in the Production of Citric Acid by Yeast : Influence of (Dr. M. Deffner and A. Issidoridis), 879
Cattle (Dairy) : Mount Hope and its (Parmalee Prentice), 719
Causal Factors in Schizophrenia, *review* by Dr. Clifford Allen, 725
Caustic Soda Solution : Absorption of Hydrogen by Aluminium Attacked in (Dr. C. E. Ransley and H. Neufeld), 709
Cave Art at Lascaux, 89
Cave Paintings : Aboriginal (Exhibition arranged by the News and Information Bureau of the Commonwealth of Australia at Australia House), 224
Cell-free Tryptophanase : Preparation of (E. A. Dawes, J. Dawson and Prof. F. C. Happold), 99
Cells of *Acetobacter xylinum* (Resting) : Synthesis of Cellulose by (Dr. S. Hestrin, Dr. M. Aschner and J. Mager), 64
Cells (Cancer) : Chromosome Numbers in (Claudio Barigozzi and Luigi Cusmano), 505
Cells (Living) : Partition-Chromatography and (Dr. L. F. La Cour and R. Drew), 307
Cellulose : Structure of Starch and (T. G. Halsall, Prof. E. L. Hirst and Dr. J. K. N. Jones), 97
Cellulose : Synthesis of, by Resting Cells of *Acetobacter xylinum* (Dr. S. Hestrin, Dr. M. Aschner and J. Mager), 64
Cellulose Acetate : Solvent-treated, as the Stationary Phase in Partition Chromatography (R. J. Boscott), 342
Cellulose Fibres : Contribution to the Physics of (P. H. Hermans), *review* by H. J. Woods, 519
Cementing Substance : Connective Tissue (T. D. Day), 100
Centenaries in 1947 : Scientific (Eng.-Capt. Edgar C. Smith), 16
Centenary of the Institution of Mechanical Engineers (R. H. Parsons), 799
Challenge to Democracy (M. A. Pink), 245
Chank Marking Experiments at Tuticorin : Preliminary Study of the (K. Chidambaram and M. Mukandan Unny), 651
Charged Mesons : Processes Involving (Dr. C. M. G. Lattes, H. Muirhead, Dr. G. P. S. Occhialini and Dr. C. F. Powell), 694
Chemical Analyses : Statistical Methods in (Vernon J. Clancey), 339
Chemical Aspects of Light (E. J. Bowen), second edition, *review* by Dr. C. H. Bamford, 46
Chemical Bicentenary at the University of Glasgow (Dr. Andrew Kent), 594
Chemical Bond and the Structure of Molecules (Ya. K. Syrkin and M. E. Dyatkina), *review* by G. Stanley Smith, 386
Chemical Composition of Egyptian Cow's Milk in relation to Milk Laws (Prof. Ahmed Ghoneim, M. Taha El-Katib and M. Raafat), 506
Chemical Compounds : Biology of Carcinogenesis by, *review* by Dr. E. Boyland, 554
Chemical Effects of Moonlight (Dr. Elizabeth Sidney Semmens), 613
Chemical Elements (Missing) : The Making of the (Prof. F. A. Paneth), 8
Chemical Engineering at the University of Leeds, 71
Chemical Journal : The First (Prof. James Kendall), 867
Chemical Mechanisms of Defence : The Body's (Dr. C. R. Harington), 319
Chemical Research (Ramsay Memorial Fellowships), 568
Chemical Thermodynamics (Dr. J. A. V. Butler), fourth edition, *review* by Dr. F. P. Bowden, 114
Chemicals : British, and their Manufacturers (Association of Chemical Manufacturers), 466
Chemicals from Methane (Dr. J. P. Lawrie), 670
Chemicals from Petroleum : Production in Great Britain of (Shell Petroleum Co., Ltd.), 365
Chemistry : A Century of (Sir Harold Hartley), 193
  Introductory College (Prof. Harry N. Holmes), fourth edition, *review*, 555
  Forensic (Henry T. F. Rhodes), second edition, *review* by Dr. G. E. Turfitt, 453
  General (Prof. Eugene P. Schoch, Prof. William A. Felsing and Prof. George W. Watt), *review*, 590
  General and Inorganic (Prof. J. R. Partington), *review* by Dr. A. J. E. Welch, 352
  Modern, some Sketches of its Historical Development (A. J. Berry), *review* by Prof. H. W. Melville, 3
  Organic, at Edinburgh, 701
  Physical (Advanced course at the University of Leeds), 634
  A Russian Review of Bonds in, *review* by G. Stanley Smith, 386
  Trans-uranium Elements in (Prof. G. T. Seaborg), 21
Chemistry (Applied) : Reports of the Progress of (Society of Chemical Industry), Vol. 29 (1944), *review*, 522
Chemistry (Early) : History of Alchemy and (Prof. J. R. Partington), 81
Chemistry (Inorganic) : Teaching of, *review* by Dr. A. J. E. Welch, 352
Chemistry (Physical) : Summer School in (Department of Physical Chemistry, University of Cambridge), 398
Chemistry (Surface) : The Application of, to Colloidal Problems (Dr. A. E. Alexander), 160
Chemistry of Anæsthesia (Dr. John Adriani), *review* by Prof. J. H. Gaddum, 588
Chemistry of the Polysaccharides (Sir Walter Haworth), 299
Chemistry of the Proteins (Chemical Society discussion on the), 581
Chemistry at the University of Sheffield, 633
Chemistry at the University of Sydney, 224
Chemistry Owes to X-Rays : What (Dr. Kathleen Lonsdale), 285
Chemistry and Light, *review* by Dr. C. H. Bamford, 46
Chemotherapy (*British Medical Bulletin*, Vol. 4, No. 4, on), 91
Chemotherapy—Yesterday, Today and Tomorrow (Sir Alexander Fleming), 208
Chick Embryo : Cultivation of Viruses and Rickettsiæ in the (Dr. W. I. B. Beveridge and Dr. F. M. Burnet), 277
Child : Palæolithic, from the Teshik-Tash Cave (Dr. Franz Weidenreich), 218
China : Earthquake on March 17, 771
  Earthquake in Shansi province on September 12, 57
China (Ancient) : The Bronze Art of, *review* by Basil Gray, 282
Chinese Bronzes acquired during the Administration of John Ellerton Lodge : A Descriptive and Illustrative Catalogue of (Staff of the Freer Gallery of Art), *review* by Basil Gray, 282
Chinese Fisheries, 736
Chlorides : Serum, in Pregnant Mice (A. J. Lea), 469
Choline Compound (Complex) : Curative Effects of a, on the Impaired Metabolism of Choline-deficient Rats (Dr. N.-O. Abdon and N. E. Borglin), 272
Choline-deficient Rats : Curative Effects of a Complex Choline Compound on the Impaired Metabolism of (Dr. N.-O. Abdon and N. E. Borglin), 272
Chromatographic Column : A New Method for the Observation of Zones of Colourless Substances on a (Stig Claesson), 708
Chromatographic Separations : Quantitative, of Synthetic Peptides (M. Jutisz and E. Lederer), 445
Chromatography (Partition-) : Solvent-treated Cellulose Acetate as the Stationary Phase in (R. J. Boscott), 342
Chromatography (Partition-) and Living Cells (Dr. L. F. La Cour and R. Drew), 307
Chromium Ions and the Szilard Effect : Exchange between (R. Muxart, P. Daudel, R. Daudel and M. Haissinsky), 538
Chromosome Numbers of British Species of the Genus *Rorippa* Scop. (part of the Genus *Nasturtium* R. Br.), (Dr. H. W. Howard), 66
Chromosome Numbers in Cancer Cells (Claudio Barigozzi and Luigi Cusmano), 505
Chromosomes of *Drosophila melanogaster* (Somatic) : Production of Structural Changes in (B. M. Slizynski), 66
Cibanone Orange R. : Accelerated Oxidation of Cotton Cellulose in Presence of reduced (G. D. Joshi and Dr. G. M. Nabar), 711
Cichlid Fish of East African Lakes : Selective Mating as a Factor for Speciation in (Prof. Curt Kosswig), 604
Cinchonine : Constitution of Strychnine and its relation to (Sir Robert Robinson), 263, *erratum*, 366
Circulation in the Frog (G. E. H. Foxon), 236
Citric Acid by Yeast : Influence of Cations in the Production of (Dr. M. Deffner and A. Issidoridis), 879
Citrus Concentrates : Gaseous Sulphur Dioxide and Sodium Bisulphite as Preservatives of (Dr. Jacob Feigenbaum and Shalom Israelashvili), 32
Civil Aircraft Research, 803
Civil Government : The Second Treatise of, and a Letter concerning Toleration (John Locke), *review* by Maurice Bruce, 248
Civilization (Industrial) : The Social Problems of an (Prof. Elton Mayo), 313
Classic : Renewal of a, *review* by Sir Edmund Whittaker, 248
Classification and Distance between Two Populations : The Problem of (C. Radhakrishna Rao), 30
Clay : Structure of (Prof. Nils Hast), 354
Clinical Aspect of Preventive Medicine, *review* by Sir Arthur MacNalty, 758
Cloud Droplets : Collisions of (W. C. Swinbank), 849
Cloud Height : An Azimuthal Method of Measuring, with a Searchlight (E. G. Bilham), 677
Clouds to Produce Rain : Experiments on the Stimulation of (E. B. Kraus and P. Squires), 489
Coagulation du sang : Données récentes sur la (Pierre Fredericq), 617
Coal in Germany : Oil from (Dr. A. Parker), 158
Coal (Cannel) : Formation of Coking Coal by Thermal Treatment of a (H. E. Blayden, J. Gibson and Prof. H. L. Riley), 536
Coal Gas and Fuel Industries at the University of Leeds, 430
Coal Measures of Northumberland : A Marine Bed in the (G. A. Burnett), 69
Coal Utilisation Research in Great Britain (H. J. Hodsman), 208
Coal, Petroleum and their Newer Derivatives (Royal Institute of Chemistry, Scottish Sections, symposium on), 193
Coast-line of England and Wales (J. A. Steers), *review* by Prof. A. E. Trueman, 349
Coastal Waters (British) : Establishment of an Immigrant Barnacle in (M. W. H. Bishop), 501
Coasts, Waves and Weather for Navigators (John Q. Stewart), *review*, 793
Coatings : Interferometric Determination of Apparent Thickness of (Dr. W. K. Donaldson and Dr. A. Khamsavi), 228
$Co[Hg(CNS)_4]$: Crystal Structure of (H. W. Jeffery), 610
Cockroaches (Domestic) : Use of 'Gammexane' Dust against (H. B. N. Hynes), 200
Coking Coal by Thermal Treatment of a Cannel Coal : Formation of (H. E. Blayden, J. Gibson and Prof. H. L. Riley), 536
Collagen and Gelatin : 'Incipient Shrinkage' of (Dr. Kenneth Pankhurst), 538
Collisions of Cloud Droplets (W. C. Swinbank), 849
Colloid Symposium : Twenty-first National, 432
Colloidal Problems : The Application of Surface Chemistry to (Dr. A. E. Alexander), 160
Colonial Agricultural Production (Sir Alan Pim), *review* by Dr. C. S. Orwin, 350
Colonial Medical Research Studentships, 704

Colonial Mining Policy : Memorandum on, 347
Colonial Research 1945–46, 614
Colonial Territories : Development of, 585
Colonial Territories (British) : Mining Policy in, 347
  Research in, 614
  see also under British Colonial
Colorimetry (Photo-electric) : A New Unit in (Dr. Walter Koch and Dr. Deborah Kaplan), 273
Colour in Air-Sea Rescue : Size versus (Dr. W. R. G. Atkins), 612
Colour and Constitution (E. J. Bowen), 568
Colour Combinations : Binocular (Dr. R. W. Pickford), 268
Colour Sensitivity, Contrast and Polarity of the Retinal Elements (Dr. Bo Gernandt), 806
Colour Vision :- Mechanism of, *review* by Prof. Ragnar Granit, 417
  Researches on Normal and Defective (W. D. Wright), *review* by J. G., 180
  Retinal Structure and (Dr. E. N. Willmer), *review* by Prof. Ragnar Granit), 417
  Sex Differences in (Dr. R. W. Pickford), 606
Colour Vision in Industry : Defective (Physical Society, Colour Group, Report on), 460
Colourless Substances on a Chromatographic Column : A New Method for the Observation of Zones of (Stig Claesson), 708
Colours of Jupiter (Arthur J. Birch), 478
Combustion of Hay : Spontaneous (Dr. J. B. Firth and Dr. R. E. Stuckey), 624
Comet Bečvár (1947*c*), 568
Comet Bester (1946*k*), 601
Comet Grigg-Skjellerup (1947*a*), 601
Comet Jones (1946*h*), 601
Comet Rondanina-Bester (1947*b*), 568
Comets, 601
Comets : Recent, 568
Common Sense of the Exact Sciences (William Kingdon Clifford), *review* by Sir Edmund Whittaker, 248
Commonwealth : Leviathan or the Matter, Forme and Power of a, Ecclesiasticall and Civil (Thomas Hobbes), *review* by Maurice Bruce, 248
Commonwealth Scientific Co-operation : British, 257
Community : The Place of Universities in the (British Association for the Advancement of Science, Division for Social and International Relations of Science, conference on), 601, 698
Complexes (Internal) : Stability Constants of (Dr. D. P. Mellor and Dr. L. Maley), 370
Composts of Fresh Green Material : Activity of Thermophilic Bacteria in (D. M. Webley), 35
Compounds related to Amidone : Analgesic Activity in (R. H. Thorp, E. Walton and P. Ofner), 679
Compounds (Organic) : Characterisation of (Dr. F. Wild), *review*, 590
Compounds on 'Oxide' Cathodes : Identification by X-Rays of Interface (H. P. Rooksby), 609
Compressor-Engines : Free-Piston (H. O. Farmer), 413
Concrete : Species of Sulphur Bacteria associated with the Corrosion of (C. D. Parker), 439
Condensation (Capillary) : Dimensional Changes accompanying (Dr. W. Hirst), 267
Conductivity Hysteresis of Dust Deposits (K. Goldschmidt), 815
Congo Belge : Animaux protégés au, et dans le territoire sous mandat Ruanda-Urundi (S. Frechkop, en collaboration avec G. F. de Witte, J.-P. Harroy et E. Hubert), *review* by Dr. W. H. Thorpe, 520
Connective Tissue Cementing Substance (T. D. Day), 100
Constitution : Colour and (E. J. Bowen), 568
Continental Shelf : Internal Waves and Upwelling of Oceanic Water from Mid-depths on to a (L. H. N. Cooper), 579
Continuum Theory of Rheological Phenomena (Dr. K. Weissenberg), 310
Contrast in the Microscope Image by means of Opaque Diaphragms : Production of (Dr. A. F. Hallimond), 851
Contrast and Polarity of the Retinal Elements : Colour Sensitivity, (Dr. Bo Gernandt), 806
Conversion of Carbon Dioxide to Acetylene on a Micro Scale (Dr. William J. Arrol and Raymond Glascock), 810
Copepod Parasite of the Mussel New to the British Fauna (Dr. C. Ellenby), 645
Copper (Annealed and Cold-worked) : Temperature-Dependence of Magnetic Susceptibility of (T. S. Hutchison and Prof. J. Reekie), 537, *erratum*, 772
Copper in Biological Substances : Microdetermination of (E. Loriente and Dr. J. Casas), 470
Copper in Diatoms (N. Ingram Hendey), 646
Copper Butyrate Monohydrate : Crystal Structure of (J. Iball), 95
Copper Carbonyl : Evidence for the Formation of a (H. Bloom), 539
Cord : The Harmonic (Cyril H. H. Franklin), 848
Córdoba : Organisation of an Institute for research in fundamental branches of medicine in, 634
Corpus Allatum and the Control of Metamorphosis in Insects (Dr. V. B. Wigglesworth), 872
Corrosion of Concrete : Species of Sulphur Bacteria associated with the (C. D. Parker), 439
Cosmic Physics : School of (Inaugurated at the Dublin Institute for Advanced Studies), 567
Cosmic Ray Intensity at Manchester and Solar Disturbances of July 25, 1946 (D. W. N. Dolbear and H. Elliot), 58
Cosmic Ray Mesons at Sea-Level : Slow (G. R. Evans and T. C. Griffiths), 879
Cosmic Rays : Determination of the Energy and Momentum of Fast Neutrons in (Dr. C. M. G. Lattes and Dr. G. P. S. Occhialini), 331
  Multiple Disintegration Processes produced by (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 93
Cosmic Rays in High-flying Aircraft : Experiments on (Dr. Gilbert Grosvenor and Dr. W. F. G. Swann), 329
Cotton Cellulose : Accelerated Oxidation of, in Presence of reduced Cibanone Orange R (G. D. Joshi and Dr. G. M. Nabar), 711
Cotton-Seed, Okra and Fenugreek to Maize Flour : Value of adding (M. M. Taha El-Katib), 716
Cotyledons of *Phaseolus vulgaris* L. : Influence of Heteroauxin on the (Dr. Leopold Portheim), 510
Coumarin as a Selective Phytocidal Agent (Dr. L. J. Audus and Dr. J. H. Quastel), 320
Coupling of Diazonium Complexes from an Aliphatic Base (Prof. Joseph Reilly, John Teegan and Michael Carey), 643
Coventry : Labour for the War Industries—the Experience of (A. Shinfield), 90
Coventry : The Economics and Dis-economics of Industrial Concentration —the War-time Experience of (Prof. P. Sargant Florence), 91
Cow : The Milch, in England (E. R. Cochrane), *review* by Prof. J. E. Nichols, 78
Cow's Milk (Egyptian) : Chemical Composition of, in relation to Milk Laws (Prof. Ahmed Ghoneim, M. Taha El-Katib and M. Raafat), 506
Cow's Milk during Early Lactation : Changes in the Electrophoretic Pattern of (Dr. Anders Grönwall), 376
Cow's and Buffalo's Milk : Digestibility of (Prof. Ahmed Ghoneim and M. Taha El-Katib), 273
Cracks : Spiral, in Glass Tubes (Dr. Livio Norzi), 306, *erratum*, 498
  Spiral, in Glass Tubing (B. N. Clack and N. L. Harris), 541 ; (W. P. Thistlethwaite), 192
Crime : Science and, *review* by Dr. G. E. Turfitt, 453
Criteria of Hybridity (Dr. H. G. Baker), 546
Crop Production and Environment (R. O. Whyte), *review* by Dr. D. J. Watson, 179
Crossed-Chain Potassium Soap : Crystal Structure of a (Dr. V. Vand, T. R. Lomer and A. Lang), 507
Crustacean Eye-stalk Extracts : The Water-balance Principle of (Dr. H. Heller and B. Smith), 544
Crystal Formation in High Polymers : Mixed (C. W. Bunn and H. S. Peiser), 161
Crystal Growth in Glass : Rate of (S. M. Cox and P. L. Kirby), 162
Crystal Structure of $Co[Hg(CNS)_4]$, (J. W. Jeffery), 610
Crystal Structure of Copper Butyrate Monohydrate (J. Iball), 95
Crystal Structure of a Crossed-Chain Potassium Soap (Dr. V. Vand, T. R. Lomer and A. Lang), 507
Crystal Structures of 2-Amino-4-Methyl-6-Chloropyrimidine and 2-Amino-4, 6-Dichloropyrimidine (Dr. C. J. B. Clews and Dr. W. Cochran), 264
Crystallization of Supersaturated Solutions by means of Electric Current (A. J. H. Boerboom), 230
Crystallographic Fourier Synthesis : Use of Punched Card Tabulating Machines for (Prof. E. G. Cox, L. Gross and Dr. G. A. Jeffrey), 433
Crystals : Born's Theory and the Spectrum of Light Scattering of (Prof. E. Gross and A. Stehanov), 474
Cultivation of Meredith's Actinomycete : Medium Suitable for the (Dr. A. C. Thaysen and Muriel Morris), 100
Culture : Tibetan (Cheng Te-k'un and D. Michael Sullivan), 22
Culture Medium for *Penicillium notatum* : New (Dr. E. Rosenthal), 22
Cultures : Artificial, in the Chick Embryo, 277
Cultures of the Genus *Marasmius* : Antibiotic Agents in the Substrates from (Prof. Elias Melin, Torsten Wikén and Karin Öblom), 840
Cupric Hexammino Sulphate : Existence of (Dr. Arun K. Dey), 339
Curare : Use of Potassium in the Assay of (P. Ga. de Jalon and G. B. West), 841
Curariform Actions : Relationship between Structure and Action in Drugs with (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 86
Curative Effects of a Complex Choline Compound on the Impaired Metabolism of Choline-deficient Rats (Dr. N.-O. Abdon and N. E. Borglin), 272
Current in Arc Discharges : Rate of Growth of (K. D. Froome), 129
Current in a Photo-Electric Cell : Spontaneous Fluctuations of (Dr. R. Fürth and Dr. D. K. C. MacDonald), 608
Cuticle (Insect) : Permeability of (Dr. Rajindar Pal), 400
  Phenolic Substances concerned in Hardening the (M. G. M. Pryor, P. B. Russell and Prof. A. R. Todd), 399
Cyclic Variations (Suspected) : Choice of a 'Reality Index' for (Dr. W. O. Kermack), 305
cyclo-Hexane Carboxylate in Liver Slices : Aromatization of (Prof. F. Dickens), 839
cyclo-Octatetraene : Infra-Red and Raman Spectrum of (M. St. C. Flett, W. T. Cave, E. E. Vago and Dr. H. W. Thompson), 739
cyclo-Propane : Structures of Ethylene Oxide and (Dr. A. D. Walsh), 165, 712 ; (Sir Robert Robinson), 400 ; (C. A. McDowell), 508
Cyclotron to Detect Short-Period Activities : Use of a (J. M. Cassels and R. Latham), 367
Cylinder-Plate Assays for Penicillin : Practical Three-Hour and Two-Hour (Dr. Robertson Pratt and Dr. Jean Dufrenoy), 576
Cytochemical Effects of Œstradiol (Prof. R. Jenner), 578
'Cytogenetics' of Black and White Guinea Pig Skin (R. E. Billingham and P. B. Medawar), 115
Cytosiderosis and the Genesis of Arteriosclerosis and other Fibrous-Tissue Reactions (Dr. J. Gillman, Dr. T. Gillman, J. Mandelstam and C. Gilbert), 875

DAIRY Cattle : Mount Hope and its (Parmalee Prentice), 719
Dart of an Extinct Mollusc (Dr. Alex. Comfort), 270
Dartians : Australopithecinæ or (Sir Arthur Keith), 377
Darwin in Uruguay : A Monument to, 90
Data : Experimental, and 'Sufficient' Accuracy (N. H. Carrier), 167
Date Palm Tree *Phoenix dactylifera* L., Palmæ : An Oestrogenic Substance in Pollen-grains of (Dr. Ali Hassan and M. Hassan-Abou El Wafa), 409
D.D.T. from an American Point of View, *review* by Dr. Kenneth Mellanby, 488
D.D.T. and the Insect Problem (James C. Leary, Dr. William I. Fishbein and Lawrence C. Salter), *review* by Dr. Kenneth Mellanby, 488
D.D.T. to prevent Outbreak of Spider Mites : Addition of Dinitro Compounds to (R. M. Greenslade and E. G. Goscombe), 843
p,p'-D.D.T. : Dehydrohalogenation of (Dr. R. L. Wain and Dr. A. E. Martin), 68
Decline of Liberalism as an Ideology (John H. Hallowell), *review* by Maurice Bruce, 181
Decomposition : Luminescent, of Nitrous Oxide (Dr. G. Whittingham), 232 ; *erratum*, 299
'Deduced Ratios' in the Estimation of Median Effective Doses : Misuse of (Dr. C. V. Winder), 883
Defence : The Body's Chemical Mechanisms of (Dr. C. R. Harington), 319

Deformation and Mechanical Treatment of Solids : New Physico-Chemical Phenomena in the (P. Rehbinder), 866.
Degaussing, 56
Degrees : British Universities and 'Secret' Theses for (Dr. J. E. Keyston), 24 ; (Sir Robert Robinson), 25
Dehydrohalogenation of *p,p*′-D.D.T. (Dr. R. L. Wain and Dr. A. E. Martin), 68
Deltas (Two) : Bird Life in (G. K. Yeates), *review* by Frances Pitt, 725
Democracy : The Challenge to (M. A. Pink), 245
  Freedom in, 245
Demonstration and Research Purposes : A Simple Film Balance for (Dr. A. E. Alexander), 304
Denmark : The Breeding Birds of (Poul Jesperson), *review* by N. B. Kinnear, 146
Denudation of Rabbit Ova : A Tubal Factor concerned in the (G. I. M. Swyer), 873
Depigmentation in the Mouse : A Possible Explanation of the Relations between Hereditary Anæmias and (Prof. J. A. Serra), 504
Derivatives of Pectic Acid as Models of Proteins (H. Deuel and H. Neukom), 882
Desert Landscape : The (V. L. Bosazza), 478
Desert Locust : Evolutionary Significance of Periodicity of Variation-Intensity and Population-Flux in the (Dr. M. L. Roonwal), 872
Detectability of the Negative Proton (J. McConnell and Dr. L. Jánossy), 335
Detection of End Groups in Polymer Molecules (B. Dudley Sully), 882
Detection of Incomplete Anti-*Rh* Antibodies : Use of Trypsin in the (J. A. Morton and M. M. Pickles), 779
Determining the Penetration Depth in Superconductors : A New Method for (A. B. Pippard), 434
Detonation Wave in High Explosives : Spread Around the Initiating Point of the (Prof. Waloddi Weibull), 402
Detoxicating Effect of Verdoperoxidase on Toxins (Kjell Agner), 271
Deuterons : Disintegration of Nitrogen into Four α-Particles by Collision with (P. H. Fowler, Miss H. B. Burrows and W. J. J. Curry), 569
Development Councils in Industry, 381
Deviation of Radio Waves at Sunrise : Lateral (W. Ross and E. N. Bramley), 132
Dew : An Optical Method of Estimation of (S. Duvdevani), 515
Dew in Palestine (E. V. Newnham), 515
Di-isobutene : The Boron-Fluoride Catalysed Reaction of (Dr. Alwyn G. Evans and M. A. Weinberger), 437, 498
Di-isopropylfluorophosphonate : Treatment of Myasthenia gravis with (Prof. J. H. Gaddum and A. Wilson), 680
Diagnosis of a Failure, *review* by the Rev. J. C. Hardwick, 145
Diamond : Structure and Properties of (Dr. W. H. Taylor), 729
  Thermal Scattering of Light in (Dr. R. S. Krishnan), 740
Diamond under High Resolution : Raman Spectrum of (Dr. R. S. Krishnan), 60
Diapause in *Drosophila nitens* : Artificial 'Breaking' of the (Dr. Giuseppe Bertani), 309
Diaphragms (Opaque): Production of Contrast in the Microscope Image by means of (Dr. A. F. Hallimond), 851
Diatoms : Copper in (N. Ingram Hendey), 646
Diazonium Complexes from an Aliphatic Base : Coupling of (Prof. Joseph Reilly, John Teegan and Michael Carey), 643
Diffraction of Light by High-Frequency Ultrasonic Waves (Prof. S. Bhagavantam and B. Ramachandra Rao), 267
Diffraction of X-Rays and Electrons by Free Molecules (Dr. M. H. Pirenne), *review* by Dr. R. Fürth, 45
Diffuse Bands on Laue Photographs of Silver Chloride Crystals (Prof. W. G. Burgers and Tan Koen Hiok), 845
Digestibility of Cow's and Buffalo's Milk (Prof. Ahmed Ghoneim and M. Taha El-Katib), 273
Dilatancy and Thixotropy (Faraday Society and the British Rheologists' Club discussion on), 70
Dimensional Changes accompanying Capillary Condensation (Dr. W. Hirst), 267
2,3-Dimercaptopropanol (*BAL*) on Blood Coagulation : Influence of (Dr. P. Fantl and Margaret H. Nance), 777
Dinitro Compounds : Addition of, to D.D.T. to prevent Outbreak of Spider Mites (R. M. Greenslade and E. G. Goscombe), 843
Dinitrogen Tetroxide and Trioxide : Constitution of (Prof. C. K. Ingold and E. Hilda Ingold), 743
Diodes : Total Emission Damping in (A. van der Ziel), 675
  Total Emission Noise in (A. van der Ziel and A. Versnel), 640
Discharge in Geiger Counters : Spread of (Dr. J. D. Craggs and A. A. Jaffe), 369
Discovery of Canada (Lawrence J. Burpee), *review* by J. N. L. Baker, 182
Disintegration of Nitrogen into Four α-Particles by Collision with Deuterons (P. H. Fowler, Miss H. B. Burrows and W. J. J. Curry), 569
Disintegration Processes : Multiple, produced by Cosmic Rays (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 93
Disintegrations : Nuclear, produced by Slow Charged Particles of Small Mass (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 186
Dissociation Constants : Relationships between some (J. C. McGowan), 644
Distance between Two Populations : The Problem of Classification and (C. Radhakrishna Rao), 30
Distortion of Fungal Hyphæ in the Presence of Certain Inhibitors (J. M. Vincent), 850
Disturbing Field : Optimum, for Synchrotron Beam Ejection (F. K. Goward and J. Dain), 636
Divalent Salts (Mono- and) : Effect of, on Red Blood Cells (Major H. Lehmann, Capt. J. O. Laws and N. Ahmed), 169
dl-Methionine and other Substances on the Nephrotoxic Action of *dl*-Serine : Influence of (Dr. Max Wachstein), 236
dl-Serine : Influence of *dl*-Methionine and other Substances on the Nephrotoxic Action of (Dr. Max Wachstein), 236
Documentation : Complete (Dr. S. C. Bradford), 105
Doppler Effect in Hydrogen Positive Rays : Triatomic Hydrogen and (Dr. C. Dakshinamurti), 27
Doses (Median Effective) : Misuse of 'Deduced Ratios' in the Estimation of (Dr. C. V. Winder), 883
Drainage (Naturally Free and Impeded) : Distribution of the Total and Acetic Acid-Soluble Phosphate in Soil Profiles having (Dr. R. Glentworth), 441
Droplets (Cloud) : Collisions of (W. C. Swinbank), 849
Drosophila : Mutations in, induced by a Carcinogen (M. Demerec), 604
Drosophila melanogaster : Production of Structural Changes in Somatic Chromosomes of (B. M. Slizynski), 66
Drosophila nitens : Artificial 'Breaking' of the Diapause in (Dr. Giuseppe Bertani), 309
Drugs : Relationship between Structure and Action in, with Curariform Actions (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 86
Duddell Medal of the Physical Society awarded to Dr. Karl Weissenberg, 21
Duplex Brass : Recrystallization of (R. W. K. Honeycombe and Dr. W. Boas), 847
Dust Deposits : Conductivity Hysteresis of (K. Goldschmidt), 815
Dust Suppression in Mines : Silicosis, Pneumokoniosis and (Institution of Mining Engineers and the Institution of Mining and Metallurgy conference on), 365
Dyes (Bacteriostatic) : Synergic Action of Penicillin and (Miss Mariam George and K. M. Pandalai), *erratum*, 56

EARTH : A revised Estimate of the Age of the (Prof. Arthur Holmes), 127
Earth Motion from the Atomic Bomb Test (L. Don Leet), 86
Earth Movement resulting from an Atomic Bomb Explosion, 85
Earth Tremor in Scotland on December 25, 23
Earth, Moon and Planets (Fred L. Whipple), *review* by the Rev. M. Davidson, 522
Earth and the Stars (Dr. C. G. Abbot), *review*, 862
Earthquake : Inverness-shire, of December 25, 1946 (Dr. A. T. J. Dollar), 648
  Japanese, of December 21, 1946 (E. Tillotson), 72
Earthquake in the Aleutian Islands on October 30, 57 ; on November 1, 57
Earthquake in the Atlantic Ocean on November 3, 57
Earthquake near the Caspian Sea on November 4, 57
Earthquake in China on March 17, 771
Earthquake in China (Shansi province) on September 12, 57
Earthquake at Piémont, France, on February 17, 771
Earthquake in the Italian Alps (near V. Camonica) on September 10, 57
Earthquake in Japan on February 24, 771
Earthquake in the Karnische Alps (near Trieste) on October 23, 57
Earthquake in western Nicaragua on January 26, 771
Earthquake in the Pacific Ocean on November 12, 57
Earthquake in the Pacific Ocean (off Japan) on December 21, 1946, 72
Earthquake in Peru on September 30, 57
Earthquake in Peru (near Sihuas) on November 10, 57
Earthquake in the Solomon Islands on September 29, 57
Earthquake in the Uzbeck and Kirghiz districts of the U.S.S.R. on November 2, 57
Earthquakes : Recent, 57, 771
Earthquakes in New Zealand during January, 771
Earthquakes near Switzerland on January 16 and 24, 771
Earthquakes registered in Switzerland during September, 57 ; during October, 57
East Africa : Oil Plants in (A. Glendon Hill), 650
East African Lakes : Selective Mating as a Factor for Speciation in Cichlid Fish of (Prof. Curt Kosswig), 604
Eclipse of May 20, 1947 : The Total Solar (Prof. F. J. M. Stratton), 287
Eclipse of November 23, 1946 (Partial) : Micro-Wave Solar Noise Observations during the (A. E. Covington), 405
Eclipse Expedition to Brazil : British, 666
Ecology : Scrub Typhus as a Study in (Lieut.-Colonel J. R. Audy), 295
Economic Considerations affecting Relations between Employers and Works : Statement on the, 279
Economic Position of Great Britain, 458
Economic Reconstruction in Great Britain (Lectures at the Royal Society of Arts), 57
Economic Status of Men and Women in the Professions, 41
Economy (National) : Industrial Research and the (Sir William Larke), 649
Education : The Place of Thermodynamics in (Physical Society, Low-Temperature Group, discussion on), 626
Education : Further, 551
Education (Adult), the Record of the British Army (Major T. H. Hawkins and L. J. F. Brimble), *review* by Dr. Basil A. Yeaxlee, 790
Education (Adult) : Science in (Dr. M. H. Clifford), 560
Education (Army) : Adventures and Discoveries in, *review* by Dr. Basil A. Yeaxlee, 790
Education for Living, 857
Educaton and Research : Paper Shortage, 721
Eggs (Salmon) : Rhythmical Impedance Changes in (Lord Rothschild), 134
Egyptian Cow's Milk in relation to Milk Laws : Chemical Composition of (Prof. Ahmed Ghoneim, M. Taha El-Katib and M. Raafat), 506
Eigenfunctions of an Enclosed Particle : Surface Tension of Nuclear Matter and the Enumeration of (Prof. D. S. Kothari and Dr. F. C. Auluck), 204
Einstein : From Aquinas to, *review* by the Rev. J. C. Hardwick, 418
Electric Current : Crystallization of Supersaturated Solutions by means of (A. J. H. Boerboom), 230
Electric Strength of Polythene : Intrinsic (W. G. Oakes), 29
Electric and Magnetic Vectors in Electromagnetic Waves *in vacuo* : Relative Directions of the (Dr. N. S. Japolsky), 580, 817
Electrical Apparatus : Intrinsic Safety of (Safety in Mines Research Board, Paper No. 104), 159
Electrical Conductivity in Insulating Amorphous Solids (C. H. M. Turner and W. E. Lewis), 334
Electrical Conductivity of Molybdenite Crystals (Ajit Kumar Dutta), 477
Electrical Conductivity of River, Rain and Snow Water (Dr. W. R. G. Atkins), 674
Electrical Discharges : Low-Pressure (E. W. B. Gill and A. von Engel), 404
Electrical Hypothesis of Central Inhibition (C. McC. Brooks and Prof. J. C. Eccles), 760
Electrical Properties of Paint Films on Metals (Dr. F. Wormwell and Miss D. M. Brasher), 678
Electrical Resistance Wire Strain-Gauges to Measure Large Strains (Dr. K. H. Swainger), 61
Electrochemistry of Radioactive Substances, *review* by F. Morgan, 690
Électrochimie des substances radioactives et des solutions extrêmement diluées (M. Haissinsky), *review* by F. Morgan, 690

Electrogenic Properties of Acetylcholine (Prof. T. Cunliffe-Barnes and R. Beutner), 307
Electromagnetic Field : A Spherically Symmetrical Non-Static (Prof. V. V. Narlikar and P. C. Vaidya), 642
Electromagnetic Waves : Velocity of (Dr. L. Essen), 611
Electromagnetic Waves *in vacuo* : Relative Directions of the Electric and Magnetic Vectors in (Dr. N. S. Japolsky), 580, 817
Electron : Jubilee of the, 599
Electron Accelerator with an Air-cored Field (Dr. R. D. Hill), 774
Electron Microscopy : A Methyl Methacrylate-Silica Replica Technique for (A. F. Brown and Dr. W. M. Jones), 635
Electron Microscopy of Tobacco Necrosis Virus Crystals (Dr. Roy Markham, Dr. Kenneth M. Smith and Dr. Ralph W. G. Wyckoff), 574
Electron Trajectories : Oil-drop Method for (Dr. L. Jacob), 475
Electronic Function Generator (D. J. Mynall), 743
  A High-Speed (D. M. MacKay), 406
Electrons : The Diffraction of X-Rays and, by Free Molecules (Dr. M. H. Pirenne), *review* by Dr. R. Fürth, 45
Electrons (Secondary) : Emission of, from Nickel and Molybdenum by Neutral Atoms of Mercury and Potassium (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Electrons in Action (Dr. J. G. Daunt), *review* by Prof. J. A. Crowther, 4
Electrophoretic Pattern of Cow's Milk during Early Lactation : Changes in the (Dr. Anders Grönwall), 376
Electrostatic Hazards in Industry (Institution of the Rubber Industry discussion on), 514
Element of Atomic Number 43 : Technetium, the (C. Perrier and Prof. E. Segrè), 24
Element of Atomic Number 85 : Astatine, the (D. R. Corson, K. R. Mackenzie and Prof. E. Segrè), 24
Elements : The Number of the (Dr. N. Feather), 242
  The Trans-Uranium (Prof. Glenn T. Seaborg and Prof. Emilio Segrè), 863
Elements of Atomic Numbers 43 and 75 (Dr. Gerald Druce), 205
Elements and their Isotopes, 242
Embryo (Chick) : Cultivation of Viruses and Rickettsiæ in the (Dr. W. I. B. Beveridge and Dr. F. M. Burnet), 277
Embryologie (physiologische) : Einführung in die (Prof. F. E. Lehmann), *review* by Prof. C. H. Waddington, 657
Embryology : Human (Prof. Bradley M. Patten), *review* by Prof. S. Zuckerman, 691
  Physiological, *review* by Prof. C. H. Waddington, 657
Embryology for Medical Students, *review* by Prof. S. Zuckerman, 691
Emission from the Aurora and the Night Sky (Royal Society international conference on), 671
Emission of Secondary Charged Particles in Fission (Prof. N. Feather), 607
Emission of Secondary Electrons from Nickel and Molybdenum by Neutral Atoms of Mercury and Potassium (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Emission Noise in Diodes : Total (A. van der Ziel and A. Versnel), 640
Employers and Workers : Statement on the Economic Considerations affecting Relations between, 279
Emulsions (New Ilford 'Nuclear Research') : Range-Energy Relation for Protons and α-Particles in the (Dr. C, M. G. Lattes, P. H. Fowler and P. Cuer), 301
Encyclopedia of Hydrocarbon Compounds (compiled by Dr. Joseph Escott Faraday), 1945 Replacement-Addition of C_1–C·, 159 ; 1945 Replacement-Addition of C_6–C_7, 159 ; Vol. 3, C_8, *review*, 862
Encyclopedia of Psychology (edited by Philip Lawrence Harriman), *review* by Prof. F. C. Bartlett, 5
End ? : The Beginning or the (Metro-Goldwyn-Mayer film), 583
End Groups in Polymer Molecules : Detection of (B. Dudley Sully), 882
Endless Horizons (Dr. Vannevar Bush), *review* by Prof. S. Zuckerman, 316
l'Énergie atomique : La conquête de (Gerard de Vaucouleurs), *review* by Prof. P. B. Moon, 862
Energy : Equivalence of Mass and (Prof. A. Tcherniavsky), 677
  Latent, and After-Glow in Flame Gases (Prof. W. T. David), 407
Energy and Momentum of Fast Neutrons in Cosmic Rays : Determination of the (Dr. C. M. G. Lattes and Dr. G. P. S. Occhialini), 331
Energy Bands in Graphite (C. A. Coulson), 265
Engineering (Structural) : Some Aspects of (Prof. H. J. Collins), 343
Engineering Degree Courses for Ex-Servicemen (O. S. Puckle), 497
Engineering Education, International Congress on, 704
Engineering Problems : Relaxation Methods applied to (Dr. R. V. Southwell and G. Vaisey), 345
England : The Milch Cow in (E. R. Cochrane), *review* by Prof. J. E. Nichols, 78
England and Wales : The Coast-line of (J. A. Steers), *review* by Prof. A. E. Trueman, 349
English Apples : Vitamin C in (Margaret E. Kieser and Dr. A. Pollard), 65
English Farm Worker : Richard Jefferies and the, *review* by Sir E. John Russell, 588
English Farming : A Classic of—Hodge and his Masters (Richard Jefferies), edited by Henry Williamson, *review* by Sir E. John Russell, 588
Entamoeba sp. from the Syrian Hamster (*Cricetus auratus*), (R. A. Neal), 502
Enumeration of Eigenfunctions of an Enclosed Particle : Surface Tension of Nuclear Matter and the (Prof. D. S. Kothari and Dr. F. C. Auluck), 204
Environment : Revolution of (Dr. E. A. Gutkind), *review* by Maurice Bruce, 452
Enzymes in Water-Solution : Mechanism of the Action of X-Rays on (Dr. A. Forssberg), 308
Enzymic Modification of the Reaction between Influenza Virus and Susceptible Tissue Cells (Joyce D. Stone), 780
l'Enzymologie : Acquisitions récentes dans le domaine (Prof. L. Massart), 618
Enzymology and related subjects of Biochemistry : Advances in (edited by F. F. Nord), Vol 6, *review* by Dr. J. H. Quastel, 824
Epeirogenic Movements : A Volumetric Method for a Study of the History of (Alexander B. Ronov), 479
Epidermal Thickness following Oestrone Injections in the Mouse (Dr. Helena F. Bullough), 101
Equivalence of Mass and Energy (Prof. A. Tcherniavsky), 677
Eros in Piccadilly Circus, London : Statue of, 870
Erythrocytes : Origin of (Dr. S. H. Wajda), 254, 579 ; (Prof. W. E. Le Gros Clark), 579
Esterases in Liver Juice : Co-existence of Two Different (Dr. P. J. Fodor), 375
Estimation of Dew : Optical Method of (S. Duvdevani), 515
Estimation of Median Effective Doses : Misuse of 'Deduced Ratios' in the (Dr. C. V. Winder), 883
Ethers of Glycerol : Muscle-Relaxing (W. Bradley and F. M. Berger), 813
Ethical Aspects of the Development of Atomic Energy (Lionel Curtis), 125 ; (J. W. Jeffery), 410
Ethylene Oxide and Cyclopropane : Structures of (Dr. A. D. Walsh), 165, 712 ; (Sir Robert Robinson), 400 ; (C. A. McDowell), 508
Europe : Scientific Equipment in—Present Needs (Thomas Martin), 523
Events : Power and (Andrew Paul Ushenko), *review* by F Ian G. Rawlins, 861
Evolutionary Significance of Periodicity of Variation-Intensity and Population-Flux in the Desert Locust (Dr. M. L. Roonwal), 872
Ewing (James Alfred) Medal for 1946 of the Institution of Civil Engineers awarded to Sir Clifford Paterson, 669
Ex-Servicemen : Engineering Degree Courses for (O. S. Pickle), 497
Exact Sciences : The Common Sense of the (William Kingdon Clifford), *review* by Sir Edmund Whittaker, 248
Exhibition in 1951 : Proposed International, 159
Expedition : Scientific, to the Antarctic Whaling Grounds, 1946–47 (Dr. R. A. M. Case), 88
Exploration : Polar (Royal Geographical Society's exhibition), 22
Exploration of Antarctica (Dr. Brian Roberts), 388
Explorers of Canada, *review* by J. N. L. Baker, 182
Exploring Nature with a Camera (Ernest G. Neal), *review* by Frances Pitt, 420
Explosives (High) : Spread Around the Initiating Point of the Detonation Wave of (Prof. Waloddi Weibull), 402
Extinct Mollusc : Dart of an (Dr. Alex. Comfort), 270
Eye-stalk Extracts (Crustacean) : The Water-balance Principle of (Dr. H. Heller and B. Smith), 544

FAILURE : Diagnosis of a, *review* by the Rev. J. C. Hardwick, 145
Faith and Society : Science, (Prof. M. Polanyi), *review* by F. Ian G. Rawlins, 793
Family at Work and Play (British Social Hygiene Council and the Town and Country Planning Association conference on), 23
Faraday Medal of the Institution of Electrical Engineers awarded to Sir Standen Leonard Pearce, 122
Farm Animals : The Breeding of (Chapman Pincher), *review* by Prof. J. E. Nichols, 623
Farm Worker (English) : Richard Jefferies and the, *review* by Sir E. John Russell, 588
Farmers : Native, and British Industry, *review* by Dr. C. S. Orwin, 350
Farming (English) : A Classic of—Hodge and his Masters (Richard Jefferies), edited by Henry Williamson, *review* by Sir E. John Russell, 588
Farmyard Manure : Nitrogen Fixation by (Prof. N. R. Dhar), 65
Faroes in Pictures : The (Gordon Huson), *review*, 555
Fauna : The Survival and Extinction of Flora and, in Glacial and Post-glacial Times (British Ecological Society discussion on), 556
Fauna (British) : A Copepod Parasite of the Mussel New to the (Dr. C. Ellenby), 645
Feathers (Male and Female) : Physiology of Pattern Formation in, of Barred Plymouth Rock Fowls (G. Montalenti), 886
Feeding Mechanism of Water-Bugs (H. D. Slack), 605
Fellowship : Anatomical Research (Zoological Society of London), 90
Fellowships : Mond Nickel, 869
Fellowships for Chemical Research : Ramsay Memorial, 568
Felting of Animal Fibres (J. Menkart and Prof. J. B. Speakmen), 640
Fenugreek : Value of adding Cotton-Seed, Okra and, to Maize Flour (M. M. Taha El-Katib), 716
γ-Ferric Oxide : Magnetic Dispersion of (J. B. Birks), 775
Ferrous Hydroxide : Reduction Potentials of (S. H. Mhatre and Dr. G. M. Nabar), 372
Fertility of Stock Cultures of *Melanospora destruens* : Effect of Temperature of Storage on the Rate of Loss of (Dr. Lilian E. Hawker), 136
Fertilized Rabbit Ova Stored at Low Temperature for Several Days : Normal Development of (Dr. Min-Chueh Chang), 602
Fibre Contraction : Ionic Exchange and (J. L. Mongar and A. Wassermann), 746
Fibre Physics, *review* by H. J. Woods, 519
Fibre Testing : Single (Textile Institute conference on), 379
Fibres (Animal) : Felting of (J. Menkart and Prof. J. B. Speakman), 640
Fibres (Cellulose) : Contribution to the Physics of (P. H. Hermans), *review* by H. J. Woods, 519
Fibrils in Natural Membranes : Orientation of (Dr. L. E. R. Picken, M. G. M. Pryor and M. M. Swann), 434
Fibrinolysis in the Animal Organism (Dr. Tage Astrup and Per M. Permin), 681
Fibrinolytic Activity of Normal Urine (Dr. R. G. Macfarlane and J. Pilling), 779
Fibrous Keratin : Structure of (J. L. Farrant, A. L. G. Rees and E. H. Mercer), 535
Fibrous-Tissue Reactions : Cytosiderosis and the Genesis of Arteriosclerosis and other (Dr. J. Gillman, Dr. T. Gillman, J. Mandelstam and C. Gilbert), 875
Field Archæology (R. J. C. Atkinson), *review* by C. F. C. Hawkes, 387
Field-Scale : Soil Sterilization on a (Arch. B. Smart), 102
Filamentous Fungi : Experiments with Different Methods of Isolating Physiological Mutations of (Dr. Nils Fries), 199
Film Balance for Demonstration and Research Purposes : A Simple (Dr. A. E. Alexander), 304
Films (Scientific) : The Classification, Appraisal and Grading of (Scientific Film Association memorandum on), 736
Films (Thin Specimen) : Preparation of (Prof. Nils Hast), 370
Fine Arts : Natural Science and the (F. Ian G. Rawlins), 628
Finite Objects : An Optical Magnification for (H. H. Hopkins), 573
Firm : The Smaller, and its Application of Research (Dr. F. C. Lea), 853
Firm (Smaller) : Research and the (Report of the Manchester Joint Research Council's conference on), 805

Fish (South African Trawled) : A Protozoa Disease of, and its Routine Detection by Fluorescence (Rees Davies and E. Beyers), 714
Fisheries : Chinese, 736
Fisheries Biology : Population Studies in (G. L. Kesteven), 10 ; (H. R. Hulme, R. J. H. Beverton and S. J. Holt), 714
Fisica nucleare (Plinius Campi e Aldo Rosconi), *review* by Prof. R. E. Peierls, 79
Fission : Emission of Secondary Charged Particles in (Prof. N. Feather), 607
Fission of Uranium : Emission of Light Charged Particles in the (L. L. Green and D. L. Livesey), 332
Fission of Uranium Nuclei : Ternary and Quaternary (Tsien San-Tsiang, Ho Zah-Wei, L. Vigneron and R. Chastel), 773
Flame Gases : Latent Energy and After-glow in (Prof. W. T. David), 407
Flash Visual Acuity (Prof. L. C. Martin and W. Kaniowski), 25
Flora and Fauna in Glacial and Post-glacial Times : The Survival and Extinction of (British Ecological Society discussion on), 556
Flow : Fluid, at a Small Hole due to Vibration (Prof. E. N. da C. Andrade), 132 ; (Prof. Gilbert D. West), 167 ; (Dr. Robert W. Lawson), 168
Flow : Turbulent, in Alluvium (Gerald Lacey), 407
Flower Production : Commercial (Dr. H. V. Taylor and Dr. Katharine H. Johnstone), Part 2, Summer Flowers ; Part 3, Foliage and Foliage Plants ; Part 4, Flowering Plants in Pots, 431
Fluid Flow at a Small Hole due to Vibration (Prof. E. N. da C. Andrade), 132 ; (Prof. Gilbert D. West), 167 ; (Dr. Robert W. Lawson), 168
Fluids : X-Ray and Electron Diffraction in, *review* by Dr. R. Fürth, 45
Fluorescence : A Protozoal Disease of South African Trawled Fish and its Routine Detection by (Rees Davies and E. Beyers), 714
Fluorescence of Solid Anthracene (E. J. Bowen and E. Mikiewicz), 706
Fluorescence of Tungstates and Molybdates (Dr. F. A. Kröger), 674
Fluorimetric Analysis (Physical Methods Group of the Society of Public Analysts discussion on), 548
Fœtal Sheep Hæmoglobin : Osmotic Pressure of (E. F. McCarthy and G. Popjak), 198
Folk-Tales of Mahakoshal (Dr. Verrier Elwin), *review* by K. de B. Codrington, 215
Folliculinidæ (Ciliata, Heterotricha) : British (Dr. S. M. Das), 502
Food Board (World) : Proposals for a (Food and Agriculture Organisation of the United Nations), 211
Food Problems : Application of Statistical Methods to (Society of Public Analysts and other Analytical Chemists and the Food Group of the Society of Chemical Industry conference on), 36
Food Survey : World (Food and Agriculture Organisation of the United Nations), 211
Forensic Chemistry (Henry T. F. Rhodes), second edition, *review* by Dr. G. E. Turfitt, 453
Forest Soils and Forest Growth (Assoc. Prof. S. A. Wilde), *review* by J. L. Harley, 44
Forestry Commission : The New Position of the (Prof. E. P. Stebbing), 785
Fossil Man, *review* by Prof. W. E. Le Gros Clark, 553
Fossiles : Les hommes (Prof. Marcellin Boule), troisième édition par Henri V. Vallois, *review* by Prof. W. E. Le Gros Clark, 553
Fossils : The Story of (C. P. Chatwin), 225
Founder's Medal of the Royal Geographical Society awarded to Brigadier Martin Hotine, 532
Fourier Syntheses (Crystallographic) : Use of Punched Card Tabulating Machines for (Prof. E. G. Cox, L. Gross and Dr. G. A. Jeffrey), 433
Fowls (Barred Plymouth Rock) : Physiology of Pattern Formation in Male and Female Feathers of (G. Montalenti), 886
France : Earthquake at Piémont on February 17, 771
Free Radicals from Benzyl Hyponitrite (Ivan Harris, Ian Marshall and Kenneth Barry Jarrett), 843
Free-Piston Compressor-Engines (H. O. Farmer), 413
Freedom in Democracy, 245
Freedom of the Press, 1
Freedoms (Real) : Science and the (Association of Scientific Workers conference on), 511
Freeze-drying Process : Effect of Shape of Operating Chamber in the (A. J. Ede), 610
French Books on Aeronautics, *review*, 214
Frequencies (Very High) : Hiedemann Patterns at (Prof. S. Bhagavantam and B. Ramachandra Rao), 742
Frequency-Modulation in Broadcasting (H. L. Kirke), 15
Fresh Water Biology in Italy, 804
Friction and Wear (E. J. W. Whittaker), 541
Frog : Circulation in the (G. E. H. Foxon), 236
Fruit Growing : Hardy (Sir Frederick Keeble and A. N. Rawes), second edition, *review* by Prof. R. H. Stoughton, 249
  Practical, *review* by Dr. H. B. S. Montgomery, 622
Fruit Growing Outdoors (Raymond Bush), *review* by Dr. H. B. S. Montgomery, 622
Fruit-Fall and its Control by Synthetic Growth-Substances (Dr. M. C. Vyvyan), 617
Fuel : Pulverized (Institute of Fuel conference on), 22, 465
Fuel Economy (World Power Conference discussion on), 498
Fuel Technology at Sheffield, 89
Functional *a pricri* : The, *review* by F. Ian G. Rawlins, 43
Fundamental Theory (Sir A. S. Eddington), *review* by Prof. E. A. Milne, 486
Fungal Hyphæ in the Presence of Certain Inhibitors : Distortion of (J. M. Vincent), 850
Fungi (Filamentous) : Experiments with Different Methods of Isolating Physiological Mutations of (Dr. Nils Fries), 199
Fungi (Wood-destroying) : Antibacterial Titre in (Prof. S. R. Bose), 33
Fungicides : Insecticides and (Murphy Chemical Co., Ltd., pamphlet on), 871
Future of Government (Prof. Herman Finer), 246

GALAXY and the Sun : Emission of Radio-Waves by the (Joseph S. Shklovsky), 752
Galleria mellonella : Antibiotic Action of an Extract of (Prof. H. R. Olivier), 685
Gamma-Radiation from Polonium and from Lithium Bombarded with Alpha-Particles (Dr. Kai Siegbahn and Prof. Hilding Slätis), 471
'Gammexane' : Unco-ordinated Growth in *Paramecium* Induced by (Dr. Ll. Lloyd), 135
'Gammexane' Dust : Use of, against Domestic Cockroaches (H. B. N. Hynes), 200
Gas Analysis : An Optical-Acoustic Method of (Dr. F. I. Callisen), 167 ; (A. Whitaker), 398
Gas Discharge in Air of Atmospheric Pressure at Very Low Voltage (Dr. O. Kantorowicz), 675
Gaseous Sulphur Dioxide and Sodium Bisulphite as Preservatives of Citrus Concentrates (Dr. Jacob Feigenbaum and Shalom Israelashvili), 32
Gases : Metals and, *review*, 759
Gases (Flame) : Latent Energy and After-glow in (Prof. W. T. David), 407
Gastric Mucosa : Elaboration of Hydrochloric Acid by (R. E. Davies, N. M. Longmuir and E. E. Crane), 468
  Hydrochloric Acid Formation in the (Prof. E. J. Conway and Dr. T. G. Brady), 876
Geiger Counters : Spread of Discharge in (Dr. J. D. Craggs and A. A. Jaffe), 369
Gel (Stretched) : Oriented Movement of Blue-Green Algæ on a (Dr. R. Y. Stanier), 682
Gelatin : 'Incipient Shrinkage' of Collagen and (Dr. Kenneth Pankhurst), 538
Genetics (Soviet) : Timiriazev, Founder of (Dr. G. H. Beale), 51
Genetics at Edinburgh, 157
Genetics of Red Body Colour in *Armadillidium vulgare* (Dr. H. W. Howard), 683
Geodesy and Geophysics : Canadian Research in, 344
Geographer's Contribution to Meteorology (G. Manley), 92
Geographical Terms in Different Languages : Glossaries of, 431
Geology at University College, Swansea, 329
Geometry of Numbers (London Mathematical Society symposium on), 104 ; (Prof. H. Davenport), 582
Geophysics : Canadian Research in Geodesy and, 344
German Museums : Present State of some (Francis J. Griffin), 140
German Scientific Periodicals : Publication of, 366
German Scientific and other Periodicals : ASLIB Classified List of, 566
German View of the Atom Bomb, *review* by Dr. E. Broda, 792
German Youth (Prof. Howard Becker), *review* by Maurice Bruce, 181
Germany : Oil from Coal in (Dr. A. Parker), 158
Ghee : Rancidity in Indian Butter Fat (K. T. Achaya), 274
Giacobinid Meteor Shower, 1946 (Royal Astronomical Society discussion on), 119
Gibbs (Edward N.) Memorial Prize of the New York Academy of Medicine, 786
Gill Memorial for 1947 of the Royal Geographical Society awarded to Comdr. K. St. B. Collins, 532
Glacial Period : The Late- (P. Tallantire and S. M. Walters), 556
Glacial and Post-glacial Times : The Survival and Extinction of Flora and Fauna in (British Ecological Society discussion on), 556
Glass : Rate of Crystal Growth in (S. M. Cox and P. L. Kirby), 162
  A New Heat-absorbing and Heat-resisting (Chance Bros., Ltd.), 298
Glass Tubes : Spiral Cracks in (Dr. Livio Norzi), 306 ; *erratum*, 498
Glass Tubing : Spiral Cracks in (W. P. Thistlethwaite), 192 ; (B. N. Clack and N. L. Harris), 541
Glossaries of Geographical Terms in Different Languages, 431
Glycerol : Muscle-Relaxing Ethers of (W. Bradley and F. M. Berger), 813
Gold Medal of Linnean Society awarded to Prof. Maurice Caullery, 226, 734
Gold Medal in Therapeutics of the Society of Apothecaries awarded to Dr. F. H. S. Curd, Dr. D. G. Davey and Dr. F. L. Rose, 871
Gordon's Astrolabe at the Royal Scottish Museum, 533
Government : The Future of (Prof. Herman Finer), 246
  Science, Industry and (Sir Edward Appleton), 735
Government (Civil) : The Second Treatise of, and a Letter concerning Toleration (John Locke), *review* by Maurice Bruce, 248
Government (Representative) : On Liberty and Considerations on (J. S. Mill), *review* by Maurice Bruce, 248
Government Estimates for Scientific and Industrial Research, 702
Graduate Centre at Oxford opened by Lord Halifax, 158
Grain : Correlation between Yield of Wheat and Temperature during Ripening of (Dr. J. J. Chinoy), 442
Graphite : Energy Bands in (C. A. Coulson), 265
  Structure of (J. B. Nelson and Dr. D. P. Riley), 637 ; (H. P. Rooksby and E. G. Steward), 638
Great Britain : Production in, of Chemicals from Petroleum (Shell Petroleum Co., Ltd.), 365
  Coal Utilization Research in (H. J. Hodsman), 208
  The Economic Position of, 458
  Economic Reconstruction in (Lectures at Royal Society of Arts), 57
  Research Associations in, 75
  Scientific Research Organisation in, 735
  Seasonal Variations in Vitamin C Content of Tomatoes grown in (Dr. Frank Wokes, J. R. Barr, L. Brunskill and A. C. Shaw), 171
  University Development in, 483
  University Planning in, 755
  See also under Britain
Grid Lenses : Stabilizing Linear Particle Accelerators by means of (Dr. D. Gabor), 303
Groningen : Neutron Experiments of the Physical Laboratory of (Prof. D. Coster, Hl. de Vries and H. Groendijk), 569
Group-protecting Agent : Phenyl-thiocarbonyl Chloride as a (Dr. G. C. H. Ehrensvärd), 500
Growth : On Trephocytes and Trephocytosis, a Study on the Role of Leucocytes in Nutrition and (Dr. Liebman), 413
Growth of Current in Arc Discharges : Rate of (K. D. Froome), 129
Growth in *Paramecium* Induced by 'Gammexane' : Unco-ordinated (Dr. Ll. Lloyd), 135
Growth of a Planktonic Green Alga at various Carbonic Acid and Hydrogen-ion Concentrations (Sven Österlind), 199
Growth-Substances (Synthetic) : Fruit-Fall and its Control by (Dr. M. C. Vyvyan), 617
Guerre : Travaux récents sur les toxiques de (Prof. Z. M. Bacq), 617
Guinea Pig Skin (Black and White) : 'Cytogenetics' of (R. E. Billingham and P. B. Medawar), 115
Guinea Pigs : Effect of Calciferol and of Penicillin on Experimental Tuberculosis of (Dr. Löis Dickinson), 681
Gyro Interaction of Radio Waves (Dr. L. G. H. Huxley, H. G. Foster and C. C. Newton), 300

HÆMOGLOBIN (Fœtal Sheep) : Osmotic Pressure of (E. F. McCarthy and G. Popják), 198
Hæmoglobin and Nitrogen Fixation in the Root Nodules of Leguminous Plants (Prof. D. Keilin and J. D. Smith), 692
Hæmosporidian of Bats (G. G. Mer and N. Goldblum), 444
Halides of Bivalent Metals : Elementary Photochemical Process in (Prof. K. Butkow and Ir. Wojciechowska), 570
Halides (Organic) : Reactions of, in Solution (Prof. E. D. Hughes and Prof. C. K. Ingold), 166 ; (Dr. Alwyn G. Evans), 166
Halley Lecture (Prof. Carl Størmer), 734
Hamster (*Cricetus auratus*) : *Entamoeba* sp. from the Syrian (R. A. Neal), 502
Hankel Functions of Order One-Third and of their Derivatives (Modified) : Tables of the (Staff of the Computation Laboratory of Harvard University), *review* by Dr. L. J. Comrie, 590
Hardenability of Steel : Symposium on (Iron and Steel Institute), 853
Hardening the Insect Cuticle : Phenolic Substances concerned in (M. G. M. Pryor, P. B. Russell and Prof. A. R. Todd), 399
Harmonic Cord : The (Cyril H. H. Franklin), 848
Hatfield Memorial Lecture (Dr. C. Sykes), 498
Hay : Spontaneous Combustion of (Dr. J. B. Firth and Dr. R. E. Stuckey), 624
Hay-Fever and Pharmacognosy : Peat, (Dr. T. E. Wallis), 525
Heads : How Animals Hold their (Prof. G. R. de Beer), 734
Health and the Suppression of Dust in Mines, 365
Health (Public) : Preventive Medicine and (Prof. Wilson G. Smillie), *review* by Sir Arthur MacNalty, 758
Health Education : Scottish Summer Schools in, 772
Hearing : Acoustical Quanta and the Theory of (Dr. D. Gabor), 591
Heat and other Properties : Transport of, by Atmospheric Turbulence (C. H. B. Priestley and W. C. Swinbank), 61
Heat of Atomization of Carbon (Prof. Bengt Edlén), 129 ; (Dr. J. Duchesne, P. Goldfinger and Dr. B. Rosen), 130 ; (Prof. R. G. W. Norrish and L. H. Long), 131 ; (Prof. S. Goudsmit), 742
Heat Treatment and the Biological Value of Soya-bean Protein (Dr. S. S. De and J. Ganguly), 341
Heat Treatment of Metals : Controlled Atmospheres for the (Ivor Jenkins), *review*, 759
Heat-absorbing and Heat-resisting Glass : A New (Chance Bros., Ltd.), 298
Hekla : The New Lava from (Dr. G. W. Tyrrell), 646
Heligoland : Birds of, 566
Helium : Liquid (Clarendon Laboratory conference on), 772
Helenistic Age : Astrology in the (Martin P. Nilsson), 92
Helminth Parasites : Histological Distribution of Alkaline Phosphatase in (Dr. W. P. Rogers), 374
Helminth Parasites of Limpets (W. Crewe), 238
l'Hémoglobine : Conception actuelle du catabolisme de (Claude Liébecq), 618
Hepatic Tumours produced in Rats by Feeding 2-Acetaminofluorene : Succinoxidase Activity of (Cornelia Hoch-Ligeti), 780
Hereditary Anæmias and Depigmentation in the Mouse : A Possible Explanation of the Relations between (Prof. J. A. Serra), 504
Hereditary (Seed-borne) Symbiosis in *Casuarina equisetifolia* Forst. (Prof. S. R. Bose), 512
Herty Medal awarded to Dr. E. Emmet Reid by the Chemistry Club of the Georgia State College for Women, 737
Heteroauxin on the Cotyledons of *Phaseolus vulgaris* L. : Influence of (Dr. Leopold Portheim), 510
Hexammino Sulphate (Cupric) : Existence of (Dr. Arun K. Dey), 339
Hexen-2-dion-4, 5-acetal-1 and Pyro-catechol : Conversion of 2-Aceto-furan to (Prof. L. Vargha, J. Ramonczai and P. Bite), 744
Heyman Prize of the Göteborgs Högskola awarded to Börje Kullenberg, 805
Hiedemann Patterns at Very High Frequencies (Prof. S. Bhagavantam and B. Ramachandra Rao), 742
High Polymers : Mixed Crystal Formation in (C. W. Bunn and H. S. Peiser), 161
High-Frequency Ultrasonic Waves : Diffraction of Light by (Prof. S. Bhagavantam and R. Ramachandra Rao), 267
High-Speed Electronic Function Generator (D. M. MacKay), 406
Hinchley Medal of the British Association of Chemists presented to C. S. Garland, 21
Histamine : Leukotaxine and (Dr. H. Cullumbine), 841
Histoire de la biologie : Esquisse d'une (Jean Rostand), *review*, 420
Histological Distribution of Alkaline Phosphatase in Helminth Parasites (Dr. W. P. Rogers), 374
Historians : Philosophers and, *review* by Maurice Bruce, 248
Hobhouse Memorial Trust Lecture (Rev. Dr. Charles E. Raven), 145
Hodge and his Masters : A Classic of English Farming—(Richard Jefferies), edited by Henry Williamson, *review* by Sir E. John Russell, 588
Holweck Medaille of the Société Française de Physique awarded to Prof. E. N. da C. Andrade, 534
Holweck Prize for 1947 of the Physical Society awarded to Prof. E. N. da C. Andrade, 534
Hommes fossiles : Les (Prof. Marcellin Boule), troisième édition par Henri V. Vallois, *review* by Prof. W. E. Le Gros Clark, 553
Homo sapiens and the Peace Problem (Dr. G. H. Monrad-Krohn), 246
Honours List : King's Birthday, 836
  New Year, 20
Horizons : Endless (Dr. Vannevar Bush), *review* by Prof. S. Zuckerman, 316
Hormones and Fruit-Fall (Dr. J. Grainger), 617
Hormones (Sex) ; Biological Actions of (Dr. Harold Burrows), *review*, 182
Howe (Harrison) Lecture of the American Chemical Society (Prof. G. T. Seaborg), 21
'H.S.' Elements and Chemicals : 'Specpure' and, 600
Human Embryology (Prof. Bradley M. Patten), *review* by Prof. S. Zuckerman, 691
Human Nature, War and Society (Dr. John Cohen), *review* by Maurice Bruce, 181
Human Nutrition at the London School of Hygiene and Tropical Medicine, 122
Human Remains in Asia : Palæolithic (Dr. W. L. H. Duckworth), 218
Human Spermatozoa : A Rapid Supra-vital Staining Method for Assessing the Viability of (A. C. Crooke and Anita M. Mandl), 749
Human Thought : Astronomy and, *review* by Lieut.-Colonel H. D. Anthony, 521
Humanities in the Universities : Science and the, 789
Hutton (Dr. James) and the Manufacture of Sal Ammoniac (Archibald Clow and Nan L. Clow), 425
Hyaluronidase in Sea-Urchin Sperm (Dr. A. Monroy and A. Ruffo), 603
Hybridity : Criteria of (Dr. H. G. Baker), 221, 546
Hybridization in the Methyl Radical of CH_3X Molecules (Dr. Jules Duchesne), 62
Hydracarina : Papers and volumes on, presented by William Williamson to the Royal Society of Edinburgh, 330
Hydrocarbon Compounds : Encyclopedia of (compiled by Dr. Joseph Escott Faraday), 1945 Replacement-Addition of C_1-C_5, 159 ; 1945 Replacement-Addition of C_6 and C_7, 159 ; Vol. 3, C_8, *review*, 862
Hydrochloric Acid : Elaboration of, by Gastric Mucosa (R. E. Davies, N. M. Longmuir and E. E. Crane), 468
Hydrochloric Acid Formation in the Gastric Mucosa (Prof. E. J. Conway and Dr. T. G. Brady), 876
Hydrochloric Acid Formation in the Stomach : Mechanism of High Acid Production by Yeast and its Bearing on (Prof. Edward J. Conway and Dr. T. G. Brady), 137
Hydrogen : Absorption of, by Aluminium Attacked in Caustic Soda Solution (Dr. C. E. Ransley and H. Neufeld), 709
α-Hydrogen of Amino-acids in the Presence of Aminopherase : Labilization of the (A. S. Konikova, N. N. Dobbert and Dr. A. E. Braunstein), 67
Hydrogen Bentonite Suspension : Effect of Sodium Hexametaphosphate on the Yield Value and Viscosity of a (A. Reid and Dr. N. C. Sen Gupta), 336
Hydrogen Bonding in Ice (Dr. A. E. Martin), 403
Hydrogen Overpotential : Effect of Alkaloids on (Dr. J. O'M. Bockris and B. E. Conway), 711
Hydrogen Overpotential and the Thermionic Work Function (Dr. J. O'M. Bockris), 539
Hydrogen Peroxide Formation by Spermatozoa and the Role of Amino-Acids in Sperm Motility : Mechanism of (Dr. J. Tosic), 544
Hydrogen Positive Rays : Triatomic Hydrogen and Doppler Effect in (Dr. C. Dakshinamurti), 27
Hydrogen-Cooled Turbo-Alternators, 432
Hydrogen-ion Concentrations : Growth of a Planktonic Green Alga at various Carbonic Acid and (Sven Österlind), 199
Hydroxy Compounds : Influence of Tertiary Bases on the Interaction of Thionyl Chloride and (Dr. W. Gerrard and K. H. V. French), 263
Hypophysial Portal Vessels of the Porpoise (*Phocaena phocaena*), (Dr. G. W. Harris), 874
Hypothesis : An Electrical, of Central Inhibition (C. McC. Brooks and Prof. J. C. Eccles), 760

ICE : Hydrogen Bonding in (Dr. A. E. Martin), 403
Ice in Bulk : Vacuum Sublimation of (C. J. Bradish, C. M. Brain and A. S. McFarlane), 28
Ice Accretion on Aircraft, 431
Idea of Nationalism (Prof. Hans Kohn), *review* by Maurice Bruce, 181
Identification by X-Rays of Interface Compounds on 'Oxide' Cathodes (H. P. Rooksby), 609
Ideology : The Decline of Liberalism as an (John H. Hallowell), *review* by Maurice Bruce, 181
Ilford 'Nuclear Research' Emulsions : Range-Energy Relation for Protons and *α*-Particles in the New (Dr. C. M. G. Lattes, P. H. Fowler and P. Cuer), 301
Immigrant Barnacle in British Coastal Waters : Establishment of an (M. W. H. Bishop), 501
Immunity : Topley and Wilson's Principles of Bacteriology and, third edition revised by Prof. G. S. Wilson and Prof. A. A. Miles, *review* by Prof. C. H. Browning, 112
Impedance Changes : Rhythmical, in Salmon Eggs (Lord Rothschild), 134
Inactivation of Tetanus Toxin by X-Ray Irradiation : Influence of the Medium on the (E. Efrati, A. Back and Prof. L. Halberstaedter), 715
Incentives in Industry, 313
Incentives in Management and Production, 619
'Incipient Shrinkage' of Collagen and Gelatin (Dr. Kenneth Pankhurst), 538
India : Atomic Research in, 192
  Caste in (Dr. J. H. Hutton), *review* by F. J. Richards, 621
  Central Glass and Ceramic Research Institute of (Y. P. Varshney), 290
  Fuel Research Institute of (Dr. J. W. Whitaker), 288
  National Chemical Laboratory of (Dr. Bashir Ahmad), 219
  National Metallurgical Laboratory of (Dr. G. P. Contractor), 219
  National Physical Laboratory of (Dr. K. N. Mathur), 184
  National Research Laboratories of—Introduction (Sir Shanti Bhatnagar), 183
  Historical Records of the Survey of, Vol. 1, 18th Century (Colonel R. H. Phillimore), *review* by Major-General M. N. MacLeod, 213
  Trees used for Animal Fodder in (M. V. Laurie), third edition, 124
  Zoological Survey of (Prof. H. Munro Fox), 865
India as a Social Kaleidoscope, *review* by F. J. Richards, 621
Indian Butter Fat (Ghee) : Rancidity in (K. T. Achaya), 274
Indian Folk-Tales, *review* by K. de B. Codrington, 215
Indian Science Congress, Delhi Meeting, 20 ; (Sir Charles Darwin), 353
Indicator for Iodometric Analysis : A New (Dr. S. Peat, E. J. Bourne and R. D. Thrower), 810
Industrial Civilization : The Social Problems of an (Prof. Elton Mayo), 313
Industrial Concentration : The Economics and Dis-economics of—the War-time Experience of Coventry, 91
Industrial Research (Federation of British Industries regional conferences on), 226, 534, 649, 751, 852
  Technical Colleges and, 653
Industrial Research in Scotland, 534
Industrial Research and the National Economy (Sir William Larke), 649
Industrial Uses of Methane, 670
Industrial Utilization of Agricultural Products and of Seaweed (Irish Chemical Association and the Dublin Section of the Royal Institute of Chemistry colloquium on), 671

Industry : Defective Colour Vision in (Physical Society, Colour Group, Report on), 460
  Development Councils in, 381
  Electrostatic Hazards in (Institution of the Rubber Industry discussion on), 514
  Incentives in, 313
  Library Service in, 771
  Applications of Radioactive Tracer Elements in Physics Research and (Institute of Physics, Manchester and District Branch, conference on), 498
  Research Associations and, 687
  X-Ray Crystallography in, *review* by Dr. W A. Wooster, 348
Industry (British) : Native Farmers and, *review* by Dr. C. S. Orwin, 350
Industry in Scotland : Research and the Progress of (Federation of British Industries Scottish regional conference on), 534, 751
Industry and Government : Science, (Sir Edward Appleton), 735
Industry and Research (Federation of British Industries regional conferences on), 226, 534, 649, 751, 852
Industry and Research (Report of the Federation of British Industries 1946 conference on), 634
Industry and Research in the Sheffield Area (Federation of British Industries regional conference on), 852
Infections : Relation of the Thyroid to (Dr. R. Reitler), 505
Influenza Virus and Susceptible Tissue Cells : Enzymic Modification of the Reaction between (Joyce D. Stone), 780
Information on Atomic Energy : Release of, 411 ; (National Research Council of Canada), 719
Information about Cancer Patients at the Royal Cancer Hospital : Mechanical Recording of (Dr. D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
Infra-Red Radiation : Polarization of (A. Elliott and E. J. Ambrose), 641
Infra-Red Spectroscopy : Silver Chloride Plates for (K. S. Tetlow), 850
Infra-Red Spectrum of C_nD_{2n+2} and the 'Long-Chain Frequency' in Paraffins (N. Sheppard and Dr. G. B. B. M. Sutherland), 739
Infra-Red and Raman Spectrum of *Cyclo*-octatetraene (M. St. C. Flett, W. T. Cave, E. E. Vago and Dr. H. W. Thompson), 739
Inhibition of Catechol Bacteriostasis by Molybdates (J. C. McGowan and Dr. P. W. Brian), 373 ; (Dr. H. Blaschko), 373
Inhibition of the Vagus Nerve : Role of Sulphydryl Groups in the Action of Acetylcholine and (Prof. Ch. S. Koschtojanz and T. M. Turpajew), *erratum*, 330
Inhibition (Central) : An Electrical Hypothesis of (C. McC. Brooks and Prof. J. C. Eccles), 760
Inhibition and the Polarity of the Retinal Elements (Dr. Bo Gernandt and Prof. Ragnar Granit), 806
Inhibitors : Distortion of Fungal Hyphæ in the Presence of certain (J. M. Vincent), 850
Initiating Point of the Detonation Wave in High Explosives : Spread Around the (Prof. Waloddi Weibull), 402
Injury (Low-Temperature) : Control of, in the Victoria Plum (W. Hugh Smith), 541
Insect Cuticle : Permeability of (Dr. Rajindar Pal), 400
  Phenolic Substances concerned in Hardening the (M. G. M. Pryor, P. B. Russell and Prof. A. R. Todd), 399
Insect Nymphs and Larvæ (Aquatic) : Taxonomy of (Dr. T. T. Macan), 595
Insect Problem : D.D.T. and the (James C. Leary, Dr. William I. Fishbein and Lawrence C. Salter), *review* by Dr. Kenneth Mellanby, 488
Insect Transmission of some Plant Viruses : Use of Seeds in the (A. F. Posnette), 500
Insecticides and Fungicides (Murphy Chemical Co., Ltd., pamphlet on), 871
Insects : The Corpus Allatum and the Control of Metamorphosis in (Dr. V. B. Wigglesworth), 872
Insects that Feed upon Different Plants : Relationships between the Assemblages of Plants Fed upon by Different Insects, and between the Assemblages of (Dr. S. Maulik), 269
Insects of the Pacific World (C. H. Curran), *review*, 420
Insulating Amorphous Solids : Electrical Conductivity in (C. H. M. Turner and W. E. Lewis), 334
Intensities of Raman Lines : Temperature Dependence of the (Dr. K. Venkateswarlu), 96
Interaction of Fast Neutrons with Beryllium and Aluminium (K. W. Allen, W. E. Burcham and D. H. Wilkinson), 473
Interaction of Thionyl Chloride and Hydroxy Compounds : Influence of Tertiary Bases on the (Dr. W. Gerrard and K. H. V. French), 263
Interferometric Determination of Apparent Thickness of Coatings (Dr. W. K. Donaldson and Dr. A. Khamsavi), 228
Internal Complexes : Stability Constants of (Dr. D. P. Mellor and Dr. L. Maley), 370
International Cancer Research Congress : Fourth, 398
International Conference on the Emission from the Aurora and the Night Sky (Royal Society), 671
International Congress for Applied Mechanics : Now known as the International Union of Theoretical and Applied Mechanics, 787
International Congress of Chemistry, Tenth : *Proceedings* of the, 805
International Congress on Engineering Education, 704
International Congress of Experimental Cytology, Sixth : To meet in Stockholm, 634
International Congress of Psychology : Twelfth, 601
International Congress on Short-Wave Therapeutics, 704
International Control of Atomic Energy (Atomic Scientists' Association), 47
International Exhibition in 1951 : Proposed, 159
International Geological Congress : 18th Session to be held in Great Britain, 600
International Meeting on Radio Aids to Marine Navigation : Proceedings of the, 647
International Union of Physics, 1923–39—Activities of the (Prof. R. W. Ditchburn), 562
Intrinsic Electric Strength of Polythene (W. G. Oakes), 29
Invention of the Telephone : Alexander Graham Bell and the (Prof. G. W. O. Howe), 455 ; (Capt. G. C. Wilson), 870
Inventions : Claims for War-time Awards for, 92
Inverness-shire Earthquake of December 25, 1946 (Dr. A. T. J. Dollar), 648
Iodometric Analysis : A New Indicator for (Dr. S. Peat, E. J. Bourne and R. D. Thrower), 810
Ion (Semiquinone) : Polymerization of a (G. K. Hughes, N. Hush and D. P. Mellor), 612
Ion Exchange Resins as Catalysts (G. Garrod Thomas and Prof. C. W. Davies), 372
Ionic Exchange and Fibre Contraction (J. L. Mongar and A. Wassermann), 746
Ionosphere : Measurements of Changes of the Phase-Paths of Radio Waves in the (J. W. Findlay), 58
Ionospheric Conditions : The Investigation and Forecasting of (Sir Edward Appleton), 397
Ions (Lithium Negative) : Surface Formation of (Dr. R. H. Sloane and H. M. Love), 302
Irish Pilchard Fishery (Arthur E. J. Went), 855
Irradiation of the Substrate : Mutations Induced by (W. S. Stone, O. Wyss and F. Haas), 837
Isolating Physiological Mutations of Filamentous Fungi : Experiments with Different Methods of (Dr. Nils Fries), 199
Isomorphic Form of Urea Picrate (P. A. Ongley), 812
Isotopes : Elements and their, 242
Isotropy in the *J* Striation of Striated Muscle (A. G. Matoltsy and M. Gerendás), 502
Italy : Fresh Water Biology in, 804

JACKSON (Herbert) Prize for 1946 of the London, Midland and Scottish Railway awarded to J. O. Cowburn, 330
Japan : Earthquake on February 24, 771
Japanese Earthquake of December 21, 1946 (E. Tillotson), 72
Jefferies (Richard) and the English Farm Worker, *review* by Sir E. John Russell, 588
Jewett (Frank B.) Fellowship Awards for 1947–48 (American Telephone and Telegraph Co.), 397
Jewish Luminaries in Medical History (Prof. Harry Friedenwald), *review* by Dr. W. Pagel, 521
Jewish Physicians and Men of Science through History, *review* by Dr. W. Pagel, 521
Johns Hopkins Hospital and the Johns Hopkins University School of Medicine (Prof. Alan M. Chesney), Vol. I, Early Years, 1867–1893, *review* by Dr. E. Ashworth Underwood, 759
Journals : New Scientific, 55
Jupiter : Colours of (Arthur J. Birch), 478
Jute : Action of Light upon (H. J. Callow), 309

KAST (Ludwig) Lecture of the New York Academy of Medicine, 12
Kelvin (Lord) and the British Metrical System, 805
Keratin (Fibrous) : Structure of (J. L. Farrant, A. L. G. Rees and E. H. Mercer), 535
Keratin Molecule : Structure of the (Prof. J. B. Speakman), 338
Keratitis rosacea : Treatment of, with Small Doses of Testosterone (Prof. Bernhard Zondek, Y. M. Bromberg and J. Landau), 171
Kerotakis Apparatus : The (Prof. J. R. Partington), 784
Ketonæmia : Effect of Proteins on (Dr. Andrew Góth and Dr. George Bikich), 170
Kidney in the Rat : Alloxan Diabetes and the (Dr. Allen Gold), 574
Kinetic Theory of Liquids (Prof. Max Born and H. S. Green), 251
Kinetic Theory of Liquids (J. Frenkel), *review* by H. N. V. Temperley, 317
Kinetics of Polymerization and Molecular Weight Distributions in Polymethyl Methacrylates (Dr. E. F. G. Herington and A. Robertson), 745
King's Birthday Honours List, 836
King's New Year Honours List, 20
King's College Engineering Society, 1847–1947 (Prof. S. J. Davies), 515
Kingdom : Nature's Undiscovered (Walter J. C. Murray), *review* by Frances Pitt, 862

LABILIZATION of the α-Hydrogen of Amino-acids in the Presence of Aminopherase (A. S. Konikova, N. N. Dobbert and Dr. A. E. Braunstein), 67
Labour for the War Industries—the Experience of Coventry (A. Shenfield), 90
Lacertilia : Sacral Ribs of (Dr. M. R. El-Toubi), 342
Lactation (Early) : Changes in the Electrophoretic Pattern of Cow's Milk during (Dr. Anders Grönwall), 376
Lakes : Correlation between $\varkappa_{18}$ and *p*H in (Dr. Kaare Münster Strøm), 782
Land in Britain : Use of the, 415
Landscape : The Desert (V. L. Bosazza), 478
Larvæ of Anuran Amphibia : Mauthner's Cells in the (A. G. Willis), 410
Lascaux : Cave Art at, 89
Late-Glacial Period (P. Tallantire and S. M. Walters), 556
Laue Photographs of Silver Chloride Crystals : Diffuse Bands on (Prof. W. G. Burgers and Tan Koen Hiok), 845
Lava from Hekla : The New (Dr. G. W. Tyrrell), 646
Lead : An Example of Meson Production in (Dr. G. D. Rochester, C. C. Butler and S. K. Runcorn), 227
Lead Sulphide Cells (Photoconductive) : Response of (W. A. Hepner), 96
Lead Sulphide Layers : Spectral Sensitivity of (T. S. Moss), 476
Lead Sulphide Photoconductive Cells (L. Sosnowski, J. Starkiewicz and O. Simpson), 818
Leather Industry : Applied Biology in the (Association of Applied Biologists in conjunction with the British Leather Manufacturers' Research Association symposium on), 750
Leaves of *Theobroma cacao* : A Morphological Change Induced in, by Mineral Deficiency (M. Greenwood and A. F. Posnette), 542
Legendre Polynomials (British Association for the Advancement of Science, Mathematical Tables, Part-Volume A), *review* by J. H. Pearce, 46
Leguminous Plants : Hæmoglobin and Nitrogen Fixation in the Root Nodules of (Prof. D. Keilin and J. D. Smith), 692
Lenses (Grid) : Stabilizing Linear Particle Accelerators by means of (Dr. D. Gabor), 303
Lettuce : Vernalization of (Dr. L. G. G. Warne), 31

Leucocytes in Nutrition and Growth : On Trephycytes and Trephycytosis, a Study on the Role of (Dr. Liebman), 413
Leukotaxine and Histamine (Dr. H. Cullumbine), 841
Levelling : Submarine Tubes for (Prof. R. B. Montgomery), 408
Leviathan or the Matter, Forme and Power of a Commonwealth, Ecclesiasticall and Civil (Thomas Hobbes), *review* by Maurice Bruce, 248
Liberalism as an Ideology : The Decline of (John H. Hallowell), *review* by Maurice Bruce, 181
Liberty and Considerations on Representative Government : On (J. S. Mill), *review* by Maurice Bruce, 248
Library : The University, its Function and Potentialities (Dr. H. Coblans), 277
  The Works (Association of Special Libraries and Information Bureaux, Northern Branch, conference on), 771
Library Service in Industry, 771
Life : School to, 857
Life (Pre-Natal) : Researches on (Sir Joseph Barcroft), Vol. I, *review* by Dr. F. H. A. Marshall, 383
Light : The Chemical Aspects of (E. J. Bowen), second edition, *review* by Dr. C. H. Bamford, 46
  Diffraction of, by High-Frequency Ultrasonic Waves (Prof. S. Bhagavantam and B. Ramachandra Rao), 267
  Proton Transfer between Organic Molecules caused by (Prof. A. Terenin and A. Karlakin), 881
Light in Diamond : Thermal Scattering of (Dr. R. S. Krishnan), 740
Light upon Jute : Action of (H. J. Callow), 309
Light Charged Particles in the Fission of Uranium : Emission of (L. L. Green and D. L. Livesey), 332
Light Scattering of Crystals : Born's Theory and the Spectrum of (Prof. E. Gross and A. Stehanov), 474
Light-Filter : A New Polarizing (Dr. Bruce Billings), 192
Light-induced Stomatal Movement, and a New Reagent for Staining Stomatal Starch : Role of Starch in (Dr. O. V. S. Heath), 647
Limit of Proportionality of Wires : Determination of (Prof. F. C. Thompson and W. R. Tyldesley), 30
Limpets : Helminth Parasites of (W. Crewe), 238
Linacre Lecture for 1946 (Sir Alexander Fleming), 208
Linoleum and Felt Base (Board of Trade Working Party Report on), 687
Liquid Helium (Clarendon Laboratory conference on), 772
Liquid State : The, *review* by H. N. V. Temperley, 317
Liquides dispersifs et leurs applications (Dr. G. Ahier), *review* by G. J. Minkoff, 114
Liquids : A Kinetic Theory of (Prof. Max Born and H. S. Green), 251 ; (J. Frenkel), *review* by H. N. V. Temperley, 317
  Quantum Theory of (Prof. Max Born and Herbert Sydney Green), 738 ; (Prof. R. Fürth), 739
Liquids (Polar) : Theory of Molecular Coupling in (Prof. Arcadius Piekara), 337
Lithium Bombarded with Alpha-Particles : Gamma-Radiation from Polonium and from (Dr. Kai Siegbahn and Prof. Hilding Slätis), 471
Lithium Negative Ions : Surface Formation of (Dr. R. H. Sloane and H. M. Love), 302
Little (A. D.) Memorial Lecture (Sir Edward Appleton), 735
Liver (Mammalian) : Urea Synthesis in (Prof. H. A. Krebs, L. V. Eggleston and R. Hems), 808
Liver Juice : Co-existence of Two Different Esterases in (Dr. P. J. Fodor), 375
Liver Slices : Aromatization of *cyclo*Hexane Carboxylate in (Prof. F. Dickens), 839
Livers (Fatty) : Metabolism of (A. H. Ennor and L. A. Stocken), 308
Living : Education for, 857
Living Cells : Partition-Chromatography and (Dr. L. F. La Cour and R. Drew), 307
'Loading' in Paper : Determination of the, by Microradiography (H. J. Lambot), 676
Locust (Desert) : Evolutionary Significance of Periodicity of Variation-Intensity and Population-Flux of the (Dr. M. L. Roonwal), 872
'Long-Chain Frequency' in Paraffins : Infra-Red Spectrum of C_nD_{2n+2} and the (N. Sheppard and Dr. G. B. B. M. Sutherland), 739
Low-Pressure Electrical Discharges (E. W. B. Gill and A. von Engel), 404
Low-Temperature Injury in the Victoria Plum : Control of (W. Hugh Smith), 541
Lower Miocene Ape *Proconsul* : Casts of the mandible of the, available for distribution (Dr. L. S. B. Leakey), 871
Lubricating Properties of Molecular Layers of Stearic Acid and Calcium Stearate on Metal Surfaces (J. N. Gregory and J. A. Spink), 403
Luminescence : Tetravalent Manganese as an Activator in (Dr. F. A. Kröger), 706
Luminescent Decomposition of Nitrous Oxide (Dr. G. Whittingham), 232, *erratum*, 299
Luminous Phenomena in Oxygen (Lord Rayleigh), 777
Lyell Fund of the Geological Society (a moiety of the) awarded to Dr. Leslie Rowsell Moore and to Claude William Wright, 123
Lyell Medal of the Geological Society awarded to Dr. Stanley Smith, 123

M. *TUBERCULOSIS* : A Product of *Pseudomonas aeruginosa* Active *in vitro* against (Dr. G. C. Hughes and R. A. Kiernan), 197
Magnetic Analysis : A New Method of Studying the Structure of Alloys by (P. T. Hobson), 436
Magnetic Dispersion of γ-Ferric Oxide (J. B. Birks), 775
Magnetic Field : Penetration of, into Superconducting Mercury (M. Désirant and Dr. D. Shoenberg), 201
Magnetic Field of Massive Rotating Bodies (Prof. P. M. S. Blackett), 601, 658
Magnetic Fields in Betatrons (Out-of-Phase) : Measurement of (W. Bosley, Dr. J. D. Craggs and D. H. McEwan), 229
Magnetic Recording of Sound : Developments in (P. T. Hobson), 735
Magnetic Resonance at Low Temperatures : Nuclear (B. V. Rollin and J. Hatton), 201
Magnetic Susceptibility of Annealed and Cold-worked Copper : Temperature-Dependence of (T. S. Hutchison and Prof. J. Reekie), 537 ; *erratum*, 772
Magnetic Vectors in Electromagnetic Waves *in vacuo* : Relative Directions of the Electric and (Dr. N. S. Japolsky), 580, 817
Magnification : An Optical, for Finite Objects (H. H. Hopkins), 573
Mahakoshal : Folk-Tales of (Dr. Verrier Elwin), *review* by K. de B. Codrington, 215
Maize Flour : Value of adding Cotton-Seed, Okra and Fenugreek to (M. M. Taha El-Katib), 716
Makdougall-Brisbane Prize of the Royal Society of Edinburgh for 1944–46 awarded to Dr. William Black, 366
Malaria Control for Planters, Miners and others (Annual course to be resumed at the London School of Hygiene and Tropical Medicine), 568
Mammalian Liver : Urea Synthesis in (Prof. H. A. Krebs, L. V. Eggleston and R. Hems), 808
Mammalian Reproduction : Patterns of (Prof. S. A. Asdell), *review* by Prof. S. Zuckerman, 520
Man : Fossil, *review* by Prof. W. E. Le Gros Clark, 553
  The Premaxilla and the Ancestry of (Prof. F. Wood Jones), 439 ; (Prof. W. E. Le Gros Clark), 546
Man, Nature and Time (William Alexander Gauld), 246
Man-power : Scientific, in Britain, 177
Man-power for Higher Administration, 143
Management and Production : Incentives in, 619
Manchester : Cosmic Ray Intensity at, and Solar Disturbances of July 25, 1946 (D. W. N. Dolbear and H. Elliot), 58
Manganese : Tetravalent, as an Activator in Luminescence (Dr. F. A. Kröger), 706
Manure (Farmyard) : Nitrogen Fixation by (Prof. N. R. Dhar), 65
Map Projections (George P. Kellaway), *review* by A. Hinckley, 113
Marasmius : Antibiotic Agents in the Substrates from Cultures of the Genus (Prof. Elias Melin, Torsten Wikén and Karin Öblom), 841
March of Time film entitled Atomic Power to be continued at the Science Museum, 193
Marconi Jubilee and Exhibition, 598
Marine Bed in the Coal Measures of Northumberland (G. A. Burnett), 69
Marine Biologists to be nominated by the Royal Society to visit the Roscoff Biological Station, Finistère, 534
Marine Biology at Plymouth (Wing-Comdr. F. S. Russell), 830
Marine Expedition : South African, 770
Marine Navigation : Proceedings of the International Meeting on Radio Aids to, 647
Marine Seismic Prospecting (M. N. Hill and P. L. Willmore), 707
Marine and Air Navigation (John Q. Stewart and Newton L. Pierce), *review*, 793
Mass and Energy : Equivalence of (Prof. A. Tcherniavsky), 677
Massive Rotating Bodies : The Magnetic Field of (Prof. P. M. S. Blackett), 601, 658
Mathematical Methods of Statistics (Prof. Harald Cramér), *review* by Prof. Godfrey Thomson, 826
Mathematical Statistics : A First Course in (Prof. C. E. Weatherburn), *review* by Prof. Godfrey Thomson, 826
Mathematics : General (Clement V. Durell), *review*, 114
  The Place of Visual Aids in the Teaching of (I. R. Vesselo), 582 ; (G. Patrick Meredith), 582
Mathematics (School) : A Century of (W. F. Bushell), 582
Mathematics in Secondary Schools : A Unified Course in (Mathematical Association discussion on), 582
Mathematics at Sheffield, 89
Mathematics of Statistics, *review* by Prof. Godfrey Thomson, 826
Mather Lecture of the Textile Institute (Sir Walter Haworth), 299
Mating : Selective, as a Factor for Speciation in Cichlid Fish of East African Lakes (Prof. Curt Kosswig), 604
Mauthner's Cells in the Larvæ of Anuran Amphibia (A. G. Willis), 410
Mayer (Charles L.) Award of the United States National Academy of Sciences allocated to Dr. C. Jayaratnam Eliezer, 20
Mechanical Engineering : Research in, 769
Mechanical Properties of Solids (University of Bristol in co-operation with the Institute of Physics conference on), 193, 671
Mechanical Recording of Information about Cancer Patients at the Royal Cancer Hospital (Dr. D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
Mechanical Treatment of Solids : New Physico-Chemical Phenomena in the Deformation and (P. Rehbinder), 866
Mechanism of Colour Vision, *review* by Prof. Ragnar Granit, 417
Mechanisms of Defence : The Body's Chemical (Dr. C. R. Harington), 319
Medal of Freedom awarded by the American Government to J. Davidson Pratt, 671
Medal for Merit awarded by the Government of the United States to Sir Edward Appleton, Prof. P. M. S. Blackett, Dr. Robert Cockburn, A. P. Rowe, Sir Reginald Stradling, Sir Geoffrey Taylor, Sir Henry Tizard and Sir Robert Watson-Watt, 684
Median Effective Doses : Misuse of 'Deduced Ratios' in the Estimation of (Dr. C. V. Winder), 883
Medical Aspects of Mustard Gas Poisoning (Dr. H. Cullumbine), 151
Medical History : Jewish Luminaries in (Prof. Harry Friedenwald), *review* by Dr. W. Pagel, 521
Medical Libraries and Information Bureaux in the British Isles : A List of (W. R. Le Fanu), 837
Medical Literature (World) : Abstracts of, 261
Medical Research (War-time) : Social Value of (Dr. G. Lapage), 854
Medical Research Studentships : Colonial, 704
Medical Sciences : Nuclear Physics in Biological and (University of California Medical School course in), 671
Medicine : Preventive, and Public Health (Prof. Wilson G. Smillie), *review* by Sir Arthur MacNalty, 758
  War-time Advances in, which might be translated into Civil Practice (Sir Alexander Biggam), 854
  Social, and Social Pathology (Dr. Iago Galdston), 494
Melandrium : Sex in (Dr. H. G. Baker), 34
Melanin : Constitution of (J. Harley-Mason), 338 ; (Prof. G. R. Clemo and Dr. J. Weiss), 339
  Molecular Weight of (A. J. Lea), 843
Melanospora destruens : Effect of Temperature of Storage on the Rate of Loss of Fertility of Stock Cultures of (Dr. Lilian E. Hawker), 136
Melchett Lecture of the Institute of Fuel (Sir James Chadwick), 421
Membranes (Natural) : Orientation of Fibrils in (Dr. L. E. R. Picken, M. G. M. Pryor and M. M. Swann), 434
Men of Science (British) : American Awards to, 684

Men of Science through History : Jewish Physicians and, *review* by Dr. W. Pagel, 521
Men and Woman in the Professions : Economic Status of, 41
Mendel Manuscript : Disappearance of a, 22
Mepacrine : Resolution of (B. R. Brown and D. Ll. Hammick), 612
Mercer Lecture of the Society of Dyers and Colourists (E. J. Bowen), 568
Mercury (Superconducting) : Penetration of Magnetic Field into (M. Désirant and Dr. D. Shoenberg), 201
Mercury and Potassium : Emission of Secondary Electrons from Nickel and Molybdenum by Neutral Atoms of (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Meredith's Actinomycete : Medium Suitable for the Cultivation of (Dr. A. C. Thaysen and Muriel Morris), 100
Merrill Festschrift : A, *review* by Dr. W. B. Turrill, 283
Merrilleana, a Selection from the General Writings of Prof. Elmer Drew Merrill, *review* by Dr. W. B. Turrill, 283
Meson Capture : Nuclear Disintegration by (D. H. Perkins), 126
Meson Production in Lead : An Example of (Dr. G. D. Rochester, C. C. Butler and S. K. Runcorn), 227
Meson Spectrum near Sea-Level (M. Della Corte, T. F. Fazzini and S. A. Franchetti), 845
Mesons : Slow Cosmic Ray, at Sea-Level (G. R. Evans and T. C. Griffiths), 879
Mesons (Charged) : Processes Involving (Dr. C. M. G. Lattes, H. Muirhead, Dr. G. P. S. Occhialini and Dr. C. F. Powell), 694
Metabolism (including Electrolyte Metabolism) : Adrenal Cortex and (Prof. F. G. Young), 766
Metabolism of Choline-deficient Rats : Curative Effects of a Complex Choline Compound on the Impaired (Dr. N.-O. Abdon and N. E. Borglin), 272
Metabolism of Fatty Livers (A. H. Ennor and L. A. Stocken), 308
Métabolisme de l'Os : Données récentes sur la nature et le (Prof. Marcel J. Dallemagne), 617
Métabolisme des substances azotées chez les animaux : L'Evolution du (Prof. Marcel Florkin), 617
Metal Physics : Summer School in, 330
Metal Surfaces : Lubricating Properties of Molecular Layers of Stearic Acid and Calcium Stearate on (J. N. Gregory and J. A. Spink), 403
Metal–Ammonia Solutions (Dr. A. J. Birch and Dr. D. K. C. MacDonald), 811
Metallurgical Atoms, *review* by Prof. E. C. Stoner, 78
Metallurgical Problems involved in the Generation of Useful Power from Atomic Energy (Sir Wallace Akers), 534
Metallurgical Research, 56
Metallurgy : Atomic Theory for Students of (Dr. William Hume-Rothery), *review* by Prof. E. C. Stoner, 78
Metals : Controlled Atmospheres for the Heat Treatment of (Ivor Jenkins), *review*, 759
  Electrical Properties of Paint Films on (Dr. F. Wormwell and Miss D. M. Brasher), 678
  Phase-Contrast in the Photomicrography of (F. W. Cuckow), 639 ; *erratum*, 671
  Self-Recovery of (Prof. W. G. Burgers), 203
  A New Criterion of Yielding in (Dr. K. H. Swainger), 741
Metals (Bivalent) : Elementary Photochemical Process in Halides of (Prof. K. Butkow and Ir. Wojciechowska), 570
Metals and Gases, *review*, 759
Metamorphosis in Insects : The Corpus Allatum and the Control of (Dr. V. B. Wigglesworth), 872
Meteor Shower 1946 : The Giacobinid (Royal Astronomical Society discussion on), 119
Meteorological Service in Portugal, National : Establishment of a, 772
Meteorological Stations in the Arctic, 430
Meteorology : The Geographer's Contribution to (G. Manley), 92
Methane : Chemicals from (Dr. J. P. Lawrie), 670
Methionine and similar Amino-Acids : Synthesis of (J. R. Catch, Dr. A. H. Cook, A. R. Graham and Sir Ian Heilbron), 578 ; *erratum*, 634
Methyl Methacrylate-Silica Replica Technique for Electron Microscopy (A. F. Brown and Dr. W. M. Jones), 635
Methyl Radical of CH_3X Molecules : Hybridization in the (Dr. Jules Duchesne), 62
Methylthiouracil : New Aspects of the Action of (B. Berde), 748
Metrical System (British) : Lord Kelvin and the, 805
Mice (Pregnant) : Serum Chlorides in (A. J. Lea), 469
Micro-Chemistry (Inorganic) : Summer School in, 601
Micro-Wave Solar Noise Observations during the Partial Eclipse of November 23, 1946 (A. E. Covington), 405
Microbiology : International Association of Microbiologists fourth International Congress for, 567
Microdetermination of Copper in Biological Substances (E. Loriente and Dr. J. Casas), 470
Microradiography : Determination of the 'Loading' in Paper by (H. J. Lambot), 676
Microscope Image : Production of Contrast in the, by means of Opaque Diaphragms (Dr. A. F. Hallimond), 851
Microscopy : Course of lectures on (Imperial College of Science and Technology), 432
  Phase-Contrast Methods in (Prof. L. C. Martin), 827
  A Variable Phase-Contrast System for (W. G. Hartley), 880
Milch Cow in England (E. R. Cochrane), *review* by Prof. J. E. Nichols, 78
Milk (Cow's) : Changes in the Electrophoretic Pattern of, during Early Lactation (Dr. Anders Grönwall), 376
Milk (Egyptian Cow's) : Chemical Composition of, in relation to Milk Laws (Prof. Ahmed Ghoneim, M. Taha El-Katib and M. Raafat), 506
Milk (Cow's and Buffalo's) : Digestibility of (Prof. Ahmed Ghoneim and M. Taha El-Katib), 273
Milk ('Sterilized') : A Proposed Test for (G. F. V. Morgan and C. H. Chalmers), 510
Milk Laws : Chemical Composition of Egyptian Cow's Milk in relation to (Prof. Ahmed Ghoneim, M. Taha El-Katib and M. Raafat), 506
Milky Way : The (Bart J. Bok and Priscilla F. Bok), second edition, *review* by the Rev. Dr. M. Davidson, 387 ; *erratum*, 568
Mind : The Stars and the (Rev. Dr. Martin Davidson), *review* by Lieut.-Colonel H. D. Anthony, 521
Mineral Deficiency : A Morphological Change induced in Leaves of *Theobroma cacao* by (M. Greenwood and A. F. Posnette), 542
Mineral Species : Richmondite, a Discredited (C. Osborne Hutton), 817
Mines : Silicosis, Pneumokoniosis and Dust Suppression in (Institution of Mining Engineers and the Institution of Mining and Metallurgy conference on), 365
Mining Policy in British Colonial Territories, 347
Mission of the Universities (J. Mackay-Mure), 392
Misuse of 'Deduced Ratios' in the Estimation of Median Effective Doses (Dr. C. V. Winder), 883
Mitosis : Function of Volutin (Metaphosphate) in (Dr. Carl C. Lindegren), 63
Mitotic Poisoning : Some New Aspects of (Dr. Pierre Dustin), 794
Molars of the Ape-man, *Plesianthropus* : The Upper Milk (Dr. R. Broom), 602
Molecular Asymmetry : Discovery of (Sir Robert Robinson), 161
Molecular Asymmetry and Biological Activity (Dr. G. M. Badger), 194 ; (Dr. E. Stedman), 195
Molecular Coupling in Polar Liquids : Theory of (Prof. Arcadius Piekara), 337
Molecular Layers of Stearic Acid and Calcium Stearate on Metal Surfaces : Lubricating Properties of (J. N. Gregory and J. A. Spink), 403
Molecular Sieve Action at Low Temperatures (R. M. Barrer), 508
Molecular Weight of Melanin (A. J. Lea), 843
Molecular Weight Distributions in Polymethyl Methacrylates : Kinetics of Polymerization and (Dr. E. F. G. Herington and A. Robertson), 745
Molecules : The Chemical Bond and the Structure of (Ya. K. Syrkin and M. E. Dyatkina), *review* by G. Stanley Smith, 386
Molecules (Free) : The Diffraction of X-Rays and Electrons by (Dr. M. H. Pirenne), *review* by Dr. R. Fürth, 45
Molecules (Organic) : Proton Transfer between, caused by Light (Prof. A. Terenin and A. Karlakin), 881
Molecules (Polymer) : Detection of End Groups in (B. Dudley Sully), 882
Mollusc (Extinct) : Dart of an (Dr. Alex. Comfort), 270
Molybdates : Fluorescence of Tungstates and (Dr. F. A. Kröger), 674
  Inhibition of Catechol Bacteriostasis by (J. C. McGowan and Dr. P. W. Brian), 373 ; (Dr. H. Blaschko), 373
Molybdenite Crystals : Electrical Conductivity of (Ajit Kumar Dutta), 477
Molybdenum (Nickel and) : Emission of Secondary Electrons from, by Neutral Atoms of Mercury and Potassium (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Momentum of Fast Neutrons in Cosmic Rays : Determination of the Energy and (Dr. C. M. G. Lattes and Dr. G. P. S. Occhialini), 331
Mond Nickel Fellowships, 869
Mono- and Divalent Salts on Red Blood Cells : Effect of (Major H. Lehmann, Capt. J. O. Laws and N. Ahmed), 169
Monotropic Transformation in Trinitroanisole : Occurrence of a (Dr. T. C. J. Ovenston), 437
Moon : Effect of the, on Radio Wave Propagation (Dr. H. T. Stetson), 396 ; (P. A. de G. Howell), 396
Moon and Planets : Earth, (Fred L. Whipple), *review* by the Rev. M. Davidson, 522
Moon and Stars : Sun, (Prof. William T. Skilling and Robert S. Richardson), *review* by the Rev. M. Davidson, 420
Moonlight : Chemical Effects of (Dr. Elizabeth Sidney Semmens), 613
Morals : Politics and (Benedetto Croce), translated from the Italian by Salvatore J. Castiglione, *review* by Maurice Bruce, 248
Morphological Change induced in Leaves of *Theobroma cacao* by Mineral Deficiency (M. Greenwood and A. F. Posnette), 542
Mortality Required to Prevent Population Increase (M. E. Solomon), 848
Motion-Picture Camera : An Ultra High-speed (K. M. Baird), 225
Mount Hope and its Dairy Cattle (Parmalee Prentice), 719
Mouse : Epidermal Thickness following Oestrone Injections in the (Dr. Helena F. Bullough), 101
  A Possible Explanation of the Relations between Hereditary Anæmias and Depigmentation in the (Prof. J. A. Serra), 504
Moving Body : Existence of New Types of Wakes behind a (Dr. R. V. Southwell), 642
Mucosa (Gastric) : Elaboration of Hydrochloric Acid by (R. E. Davies, N. M. Longmuir and E. E. Crane), 468
  Hydrochloric Acid Formation in the (Prof. E. J. Conway and Dr. T. G. Brady), 876
Murchison Fund of the Geological Society awarded to Dr. Duncan Leitch, 123
Murchison Grant of the Royal Geographical Society awarded to Gordon Manley, 532
Murchison Medal of the Geological Society awarded to Percy Evans, 123
Muscle (Striated) : Isotropy in the *J* Striation of (A. G. Matoltsy and M. Gerendás), 502
Muscle-Relaxing Ethers of Glycerol (W. Bradley and F. M. Berger), 813
Museums (German) : Present State of some (Francis J. Griffin), 140
Mussel : A Copepod Parasite of the, New to the British Fauna (Dr. C. Ellenby), 645
Mustard Embryo (Excised) : Vernalization of (Dr. B. Sen and S. C. Chakravarti), 783
Mustard Gas : Biochemical Research at Oxford upon (Prof. R. A. Peters), 149
Mustard Gas ($\beta\beta'$-Dichlorodiethylsulphide) : Action of, on Nucleoproteins (Dr. I. Berenblum and Dr. R. Schoental), 727
  Action of, on Thiol Groups of Proteins (Prof. Z. M. Bacq, V. Desreux and M. Goffart), 478
Mustard Gas Poisoning : Medical Aspects of (Dr. H. Cullumbine), 151
Mutations induced by Irradiation of the Substrate (W. S. Stone, O. Wyss and F. Haas), 837
Mutations in *Drosophila* induced by a Carcinogen (M. Demerec), 604
Mutations of Filamentous Fungi : Experiments with Different Methods of Isolating Physiological (Dr. Nils Fries), 199
Myasthenia gravis : Treatment of, with Di-isopropylfluorophosphonate (Prof. J. H. Gaddum and A. Wilson), 680
Myosin : Nature of (I. Bange, F. Guba and Prof. A. Szent-Györgyi), 194

NATION : Scientific Instrument Manufacture and the (A. J. Philpot), 534
National Colloid Symposium : To be held at Stanford University, 432
National Economy : Industrial Research and the (Sir William Larke), 649
National Meteorological Service established in Portugal, 772

National Recovery : Research and (Sir William Larke), 852
Nationalism : The Idea of (Prof. Hans Kohn), *review* by Maurice Bruce, 181
Nations : War and, *review* by Maurice Bruce, 181
Native Farmers and British Industry, *review* by Dr. C. S. Orwin, 350
Natural Science and the Fine Arts (F. Ian G. Rawlins), 628
Natural Sciences : British Committee for co-operation with U.N.E.S.C.O. in the, 770
Nature : Exploring, with a Camera (Ernest G. Neal), *review* by Frances Pitt, 420
Nature and Time : Man, (William Alexander Gauld), 246
Nature Conservation in the Belgian Congo, *review* by Dr. W. H. Thorpe, 520
Nature's Undiscovered Kingdom (Walter J. C. Murray), *review* by Frances Pitt, 862
Navigation (Marine) : Proceedings of the International Meeting on Radio Aids to, 647
Navigation : Marine and Air (John Q. Stewart and Newton L. Pierce), *review*, 793
Navigators : Coasts, Waves and Weather for (John Q. Stewart), *review*, 793
Nebulæ : Atoms, Stars and (Leo Goldberg and Lawrence H. Aller), *review*, 793
Negative Ions (Lithium) : Surface Formation of (Dr. R. H. Sloane and H. M. Love), 302
Negative Proton : Detectability of the (J. McConnell and Dr. L. Jánossy), 335
Neo-pentyl Alcohol and Steric Hindrance (Dr. W. Gerrard and A. Nechvatal), 812
Nephrotoxic Action of *dl*-Serine : Influence of *dl*-Methionine and other Substances on the (Dr. Max Wachstein), 236
Neutron Experiments of the Physical Laboratory of Groningen (Prof. D. Coster, Hl. de Vries and H. Groendijk), 569
Neutrons (Fast) : Determination of the Energy and Momentum of, in Cosmic Rays (Dr. C. M. G. Lattes and Dr. G. P. S. Occhialini), 331
  Interaction of, with Beryllium and Aluminium (K. W. Allen, W. E. Burcham and D. H. Wilkinson), 473
New Zealand : Earthquakes during January, 771
  Seismic sea wave on March 26, 771
Nicaragua (western) : Earthquake on January 26, 771
Nickel and Molybdenum : Emission of Secondary Electrons from, by Neutral Atoms of Mercury and Potassium (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Nitric Acid (Anhydrous) : Ultra-violet Absorption Spectrum of (R. Norman Jones, G. D. Thorn, M. Lyne and E. G. Taylor), 163
Nitrogen : Angular Distribution of Protons Ejected in the Disintegration of, by *a*-Particles (Dr. F. C. Champion and R. R. Roy), 127
  Disintegration of, into Four *a*-Particles by Collision with Deuterons (P. H. Fowler, Miss H. B. Burrows and W. J. J. Curry), 569
Nitrogen in the Medium : Effect of the Source of, on the Formation of Penicillin by Surface Cultures of *Penicillium notatum* (Dr. R. P. Cook and Margaret B. Brown), 376
Nitrogen Fixation by Farmyard Manure (Prof. N. R. Dhar), 65
Nitrogen Fixation in the Root Nodules of Leguminous Plants : Hæmoglobin and (Prof. D. Keilin and J. D. Smith), 692
Nitrous Oxide : Luminescent Decomposition of (Dr. G. Whittingham), 232 ; *erratum*, 299
Nomenclature (Zoological) : A Plea for Brevity—and Sanity—in (Prof. J. C. Faure), 225
North America : Birds of, *review* by Frances Pitt, 80
Northumberland : A Marine Bed in the Coal Measures of (G. A. Burnett), 69
Norway (southern) : Polar Aurora in (Prof. Carl Størmer), 734
Nuclear Disintegration by Meson Capture (D. H. Perkins), 126
Nuclear Disintegrations produced by Slow Charged Particles of Small Mass (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 186
Nuclear Explosives, Nuclear Power and World Affairs, *review* by Prof. M. L. Oliphant, 247
Nuclear Magnetic Resonance at Low Temperatures (B. V. Rollin and J. Hatton), 201
Nuclear Matter : Surface Tension of, and the Enumeration of Eigenfunctions of an Enclosed Particle (Prof. D. S. Kothari and Dr. F. C. Auluck), 204
Nuclear Physics, *review* by Prof. R. E. Peierls, 79
Nuclear Physics in Biological and Medical Sciences (University of California Medical School course in), 671
'Nuclear Research' Emulsions (New Ilford) : Range-Energy Relation for Protons and *a*-Particles in the (Dr. C. M. G. Lattes, P. H. Fowler and P. Cuer), 301
Nuclear Thermodynamics and Showers (B. K. Agarwala and K. S. Singwi), 816
Nucleare : Fisica (Plinius Campi e Aldo Rusconi), *review* by Prof. R. E. Peierls, 79
  La scissione, dell'uranio (Dott. Emidio Prata), *review* by Prof. R. E. Peierls, 79
Nucleoproteins : Action of Mustard Gas (*ββ'*-Dichlorodiethylsulphide) on (Dr. I. Berenblum and Dr. R. Schoental), 727
Nucleotide Metabolism of Bacteria and the Bacterial Nucleus (B. Malmgren and C.-G. Hedén), 577 ; *erratum*, 704
Numbers : The Geometry of (London Mathematical Society symposium on), 104 ; (Prof. H. Davenport), 582
Nutrition : Human, at the London School of Hygiene and Tropical Medicine, 122
Nutrition and Growth : On Trephocytes and Trephocytosis, a Study on the Role of Leucocytes in (Dr. Liebman), 413

OCEAN Swell : Study of (N. Barber and F. Ursell), 205
Oceanic Water from Mid-depths on to a Continental Shelf : Internal Waves and Upwelling of (L. H. N. Cooper), 579
Oersted Medal of the American Association of Physics Teachers awarded to Prof. Duane Roller, 54
Œstradiol : Cytochemical Effects of (Prof. R. Jeener), 578
Œstrogenic Substance in Pollen-grains of Date Palm Tree *Phoenix dactylifera* L., Palmæ (Dr. Ali Hassan and M. Hassan Abou El Wafa), 409
Œstrone Injections in the Mouse : Epidermal Thickness following (Dr. Helena F. Bullough), 101
Oil from Coal in Germany (Dr. A. Parker), 158
Oil Plants in East Africa (A. Glendon Hill), 650
Oil Shock in the Orchard : Prevention of (L. W. L. Cole and W. Heeley), 32
Oil-drop Method for Electron Trajectories (Dr. L. Jacob), 475
Okra and Fenugreek to Maize Flour : Value of adding Cotton Seed, (M. M. Taha El-Katib), 716
Olefins : Autoxidation of—Formation of Unsaturated Alcohols from Olefins by the Action of Organic Peracids (Dr. W. J. Hickinbottom), 844
Oliarus cuspidatus : A Mistaken Symbiont of (Prof. S. Mahdihassan), 237
ON 19, a new Heat-absorbing Glass (Chance Bros., Ltd.) , 298
Opaque Diaphragms : Production of Contrast in the Microscope Image by means of (Dr. A. F. Hallimond), 851
Operating Chamber in the Freeze-drying Process : Effect of Shape of (A. J. Ede), 610
Optical Magnification for Finite Objects (H. H. Hopkins), 573
Optical Method of Estimation of Dew (S. Duvdevani), 515
Optical-Acoustic Method of Gas Analysis (Dr. F. I. Callisen), 167 ; (A. Whitaker), 398
Optically Active Quaternary Phosphonium Salt (F. G .Holliman and Dr. F. G. Mann), 438
Orchard : Prevention of Oil Shock in the (L. W. L. Cole and W. Heeley), 32
Organic Arsenic Compounds : Effect of, on Tissue Enzymes and Proteins and on Tissue Metabolism (Dr. J. J. Gordon and Dr. J. H. Quastel), 97
Organic Compounds : Characterisation of (Dr. F. Wild), *review*, 590
Organic Molecules : Proton Transfer between, caused by Light (Prof. A. Terenin and A. Kariakin), 881
Organism (Animal) : Fibrinolysis in the (Dr. Tage Astrup and Per M. Permin), 681
Organo-Lead Compounds : Toxic (Dr. H. McCombie and Dr. B. C. Saunders), 491
Orientation of Fibrils in Natural Membranes (Dr. L. E. R. Picken, M. G. M. Pryor and M. M. Swann), 434
Ornithodorus moubata on Normal and Thiamin-deficient Rats : Development of (Dr. Botha De Meillon and Dr. Leon Golberg), 171
Ornithological Magazine : New British, 670
l'Os : Données récentes sur la nature et le métabolisme de (Prof. Marcel J. Dallemagne), 617
Osmotic Pressure of Fœtal Sheep Hæmoglobin (E. F. McCarthy and G. Pópják), 198
Out-of-Phase Magnetic Fields in Betatrons : Measurement of (W. Bosley, Dr. J. D. Craggs and D. H. McEwan), 229
Ova (Rabbit) : A Tubal Factor concerned in the Denudation of (G. I. M. Swyer), 873
Ova (Fertilized Rabbit) : Normal Development of, Stored at Low Temperature for Several Days (Dr. Min-Chueh Chang), 602
Ovalbumin : A New Protein from (Prof. K. Linderstrøm-Lang and M. Ottesen), 807
Overpotential (Oxygen) : Effect of the Solvent on (Dr. J. O'M. Bockris), 401
Oxford : Biochemical Research at, upon Mustard Gas (Prof. R. A. Peters), 149
Oxford : Early Science in (Dr. R. T. Gunther), Vol. 2, Life and Letters of Edward Lhwyd, 154
Oxidation : Accelerated, of Cotton Cellulose in Presence of reduced Cibanone Orange R (G. D. Joshi and Dr. G. M. Nabar), 711
Oxidation Activity of Selenium Dioxide (Prof. H. L. Riley), 571
'Oxide' Cathodes : Identification by X-Rays of Interface Compounds on (H. P. Rooksby), 609
Oxygen : Active (Prof. J. Kaplan), 673
  Luminous Phenomena in (Lord Rayleigh), 777
Oxygen Overpotential : Effect of the Solvent on (Dr. J. O'M. Bockris), 401

PACIFIC Area : Scientific Research in the, 412
Pacific Area (south) : Research in the, 735
Pacific Ocean : Earthquake on November 12, 57
Pacific Ocean (off Japan) : Earthquake on December 21, 1946, 72
Pacific World : Insects of the (C. H. Curran), *review*, 420
Packing of Equal Spheres : Densest (Sidney Melmore), 817
Paint ! : Whither (Dr. L. A. Jordan), 820
Paint Films on Metals : Electrical Properties of (Dr. F. Wormwell and Miss D. M. Brasher), 678
Painter and Writer, *review* by Dr. A. Tindell Hopwood, 860
Palæolithic Child from the Teshik-Tash Cave (Dr. Franz Weidenreich), 218
Palæolithic Human Remains in Asia (Dr. W. L. H. Duckworth), 218
Palestine : Dew in (E. V. Newnham), 515
Paludrine : Acquired Resistance to, in *Plasmodium gallinaceum*—Acquired Resistance and Persistence after Passage through the Mosquito (Dr. Ann Bishop and Betty Birkett), 884
  Acquired Resistance to, in *Plasmodium gallinaceum*—Effects of Paludrine and other Antimalarials (J. Williamson, D. S. Bertram and Dr. E. M. Lourie), 885
Paludrine *in vitro* : Activation of (F. Hawking), 409
Pan-African Congress on Prehistory, 216
  Proceedings of the, 547
Paper : Determination of the 'Loading' in, by Microradiography (H. J. Lambot), 676
Paper Shortage, Education and Research, 721
Paraffins : Infra-Red Spectrum of C_nD_{2n+2} and the 'Long-Chain Frequency' in (N. Sheppard and Dr. G. B. B. M. Sutherland), 739
Parallel Surface Thrust Bearing : 'Thermal Wedge' Theory of the (W. L. Wood and A. Cameron), 61
Paramecium : Unco-ordinated Growth in, Induced by 'Gammexane' (Dr. Ll. Lloyd), 135
Parasite of the Mussel : A Copepod, New to the British Fauna (Dr. C. Ellenby), 645
Parasites : Helminth, of Limpets (W. Crewe), 238
Parasites (Helminth) : Histological Distribution of Alkaline Phosphatase in (Dr. W. P. Rogers), 374
Parliament and People : Press, (Francis Williams), 2
Particle (Enclosed) : Surface Tension of Nuclear Matter and the Enumeration of Eigenfunctions of an (Prof. D. S. Kothari and Dr. F. C. Auluck), 204

Particle Accelerators : Stabilizing Linear, by means of Grid Lenses (Dr. D. Gabor), 303
Particle Size : Set Time and (Prof. F. H. Garner, Dr. Alfred H. Nissan and F. Mayo), 709
Particle Size Analysis (Institution of Chemical Engineers and the Society of Chemical Industry conference on), 717
Partition-Chromatography : Solvent-treated Cellulose Acetate as the Stationary Phase in (R. J. Boscott), 342
Partition-Chromatography and Living Cells (Dr. L. F. La Cour and R. Drew), 307
Pasteur Exhibition at the Science Museum, 398, 601
Pathology (Social) : Social Medicine and (Dr. Iago Galdston), 494
Patron's Medal of the Royal Geographical Society awarded to Colonel Daniel van der Meulen, 532
Pattern Formation in Male and Female Feathers of Barred Plymouth Rock Fowls : Physiology of (G. Montalenti), 886
Peace : Population, Psychology and (J. C. Flugel), *review* by Dr. John Cohen, 793
Peace Problems : *Homo sapiens* and the (Dr. G. H. Monrad-Krohn), 246
Peat, Hay-Fever and Pharmacognosy (Dr. T. E. Wallis), 525
Pectic Acid : Derivatives of, as Models of Proteins (H. Deuel and H. Neukom), 882
Pedler (Alexander) Lecture of the British Association (Prof. E. D. Adrian), 601
Peek (Cuthbert) Grant for 1946 of the Royal Geographical Society awarded to John Wright, 532
Peek (Cuthbert) Grant for 1947 of the Royal Geographical Society awarded to André Guibaut, 532
Penetrating Component in Extensive Showers in the Atmosphere : Presence of a (Dr. A. Mura, Dr. G. Salvini and G. Tagliaferri), 367
Penetration of Magnetic Field into Superconducting Mercury (M. Désirant and Dr. D. Shoenberg), 201
Penetration Depth in Superconductors : A New Method for Determining the (A. B. Pippard), 434
Penicillin : The Name (Dr. Frank H. Stodola), 607
  Effect of Calciferol and of, on Experimental Tuberculosis of Guinea Pigs (Dr. Löis Dickinson), 681
  Effect of the Source of Nitrogen in the Medium on the Formation of, by Surface Cultures of *Penicillium notatum* (Dr. R. P. Cook and Margaret B. Brown), 376
  Practical Three-Hour and Two-Hour Cylinder-Plate Assays for (Dr. Robertson Pratt and Dr. Jean Dufrenoy), 576
  Reports on, 565
Penicillin G : Spectroscopic Estimation of (A. R. Philpotts, W. Thain and Dr. G. H. Twigg), 839
Penicillin in Aqueous Solutions : Stability of (G. Halliwell), 747
  Stabilization of, by Low Concentrations of Phosphates (Robertson Pratt), 233
Penicillin and Bacteriostatic Dyes : Synergic Action of (Miss Mariam George and K. M. Pandalai), *erratum*, 57
Penicillium notatum : New Culture Medium for (Dr. E. Rosenthal), 22
  Effect of the Source of Nitrogen in the Medium on the Formation of Penicillin by Surface Cultures of (Dr. R. P. Cook and Margaret B. Brown), 376
People : Press, Parliament and (Francis Williams), 2
Peoples : Prophets and (Prof. Hans Kohn), *review* by Maurice Bruce, 248
Peptides (Synthetic) : Quantitative Chromatographic Separations of (M. Jutisz and E. Lederer), 445
Peracids (Organic) : Autoxidation of Olefins—Formation of Unsaturated Alcohols from Olefins by the Action of (Dr. W. J. Hickinbottom), 844
Periodicity of Variation-Intensity and Population-Flux in the Desert Locust : Evolutionary Significance of (Dr. M. L. Roonwal), 872
Permeability of Insect Cuticle (Dr. Rajindar Pal), 400
Permittivity of Barium Titanate : Effect of Temperature on the (Dr. J. H. van Santen and Dr. G. H. Jonker), 333
Peru : Earthquake on September 30, 57
Peru (near Sihuas) : Earthquake on November 10, 57
Petroleum : Production in Great Britain of Chemicals from (Shell Petroleum Co., Ltd.), 365
Petroleum and their Newer Derivatives : Coal, (Royal Institute of Chemistry, Scottish Sections, symposium on), 193
*p*H in Lakes : Correlation between $\varkappa_{18}$ and (Dr. Kaare Münster Strom), 782
*p*H Values : Test Papers for (Johnson and Sons, Ltd.), 56
Pharmacognosy : Peat, Hay-Fever and (Dr. T. E. Wallis), 525
Phase Boundaries (Marked) : A Method of using (Dr. Robert Jagitsch), 166
Phase-Contrast in the Photomicrography of Metals (F. W. Cuckow), 639 ; *erratum*, 671
Phase-Contrast Methods in Microscopy (Prof. L. C. Martin), 827
Phase-Contrast System for Microscopy : A Variable (W. G. Hartley), 880
Phase-Paths of Radio Waves in the Ionosphere : Measurements of Changes of the (J. W. Findlay), 58
Phaseolus vulgaris L. : Influence of Heteroauxin on the Cotyledons of (Dr. Leopold Portheim), 510
Phenolic Substances concerned in Hardening the Insect Cuticle (M. G. M. Pryor, P. B. Russell and Prof. A. R. Todd), 399
Phenyl-thio-carbonyl Chloride as a Group-protecting Agent (Dr. G. C. H. Ehrensvärd), 500
Philippines : Birds of the (Jean Delacour and Ernst Mayr), *review* by N. B. Kinnear, 386
Philosophers and Historians, *review* by Maurice Bruce, 248
Philosophy in Action, *review* by F. Ian G. Rawlins, 861
Philosophy and its Background, *review* by Lord Lindsay of Birker, 723
Philosophy (Western) : History of, and its Connection with Political and Social Circumstances from the Earliest Times to the Present Day (Bertrand Russell), *review* by Lord Lindsay of Birker, 723
Phloridzin from Apple Seeds : Isolation of (Dr. D. Woodcock), 100
Phoenix dactylifera L., Palmæ : An Oestrogenic Substance in Pollen-grains of Date Palm Tree (Dr. Ali Hassan and M. Hassan Abou El Wafa), 409
Phosphate : Distribution of the Total and Acetic Acid-Soluble, in Soil Profiles having Naturally Free and Impeded Drainage (Dr. R. Glentworth), 441
Phosphates : Stabilization of Penicillin in Aqueous Solutions by Low Concentrations of (Robertson Pratt), 233
Phosphocreatine : Splitting of (Frank Lundquist), 98
Phosphonium Salt : An Optically Active Quaternary (F. G. Holliman and Dr. F. G. Mann), 438
Phosphorus Pentachloride on *p*-Sulphonamido Benzoic Acid : Action of (A. D. Kemp), 509
Photochemical Process in Halides of Bivalent Metals : Elementary (Prof. K. Butkow and Ir. Wojciechowska), 570
Photo-chemistry : Radiation Chemistry and (University of Notre Dame symposium on), 634
Photoconductive Cells : Lead Sulphide (L. Sosnowski, J. Starkiewicz and O. Simpson), 818
Photoconductive Lead Sulphide Cells : Response of (W. A. Hepner), 96
Photo-electric Absorptiometry : Units in (Dr. J. R. Edisbury, R. J. Taylor and N. T. Gridgeman), 777
Photo-electric Cell : Spontaneous Fluctuations of Current in a (Dr. R. Fürth and Dr. D. K. C. MacDonald), 608
Photo-electric Colorimetry : A New Unit in (Dr. Walter Koch and Dr. Deborah Kaplan), 273
Photographic Year Book : 'Wellcome', 397
Photographs : Aerial, for Scientific Purposes, 838
Photography (Applied) : Exhibition of (Kodak, Ltd.), 601, 633
Photomicrography of Metals : Phase-Contrast in the (F. W. Cuckow), 639 ; *erratum*, 671
Photoperiodism : Vernalization and, *review* by Dr. D. J. Watson, 179
Physical Laboratory of Groningen : Neutron Experiments of the (Prof. D. Coster, Hl. de Vries and H. Groendijk), 569
Physical Theory : The *a priori* in (Arthur Pap), *review* by F. Ian G. Rawlins, 43
Physicians and Men of Science through History : Jewish, *review* by Dr. W. Pagel, 521
Physicist : Last Testament of a, *review* by Prof. E. A. Milne, 486
Physico-Chemical Phenomena in the Deformation and Mechanical Treatment of Solids : New (P. Rehbinder), 866
Physics : Analytical Experimental (Prof. Harvey Brace Lemon and Assoc. Prof. Michael Ference, Jr.), revised edition, *review* by G. R. Noakes, 283
  Fibre, *review* by H. J. Woods, 519
  Nuclear, *review* by Prof. R. E. Peierls, 79
Physics (Modern) : Fundamental Problems in (Physical Society conference on), 117
Physics (Theoretical) : Summer School in (University of Bristol in co-operation with the Institute of Physics), 193
Physics of Cellulose Fibres : Contribution to the (P. H. Hermans), *review* by H. J. Woods, 519
Physics at King's College, London, 632
Physics at Middlesex Hospital Medical School, 54
Physics at St. Andrews, 836
Physics Research and Industry : Applications of Radioactive Tracer Elements in (Institute of Physics, Manchester and District Branch, conference on), 498
Physiological Embryology, *review* by Prof. C. H. Waddington, 657
Physiological Mutations of Filamentous Fungi : Experiments with Different Methods of Isolating (Dr. Nils Fries), 199
Physiologische Embryologie : Einführung in die (Prof. F. E. Lehmann), *review* by Prof. C. H. Waddington, 657
Physiology : Pre-Natal, *review* by Dr. F. H. A. Marshall, 383
Physiology of Pattern Formation in Male and Female Feathers of Barred Plymouth Rock Fowls (G. Montalenti), 886
Phytocidal Agent (Selective) : Coumarin as a (Dr. L. J. Audus and Dr. J. H. Quastel), 320
Piezoelectricity (Prof. Walter Guyton Cady), *review* by Dr. W. A. Wooster, 284
Pilchard Fishery : The Irish (Arthur E. J. Went), 855
Pituitary-Adrenal Relationship (Dr. M. Reiss), 765
Planets : Earth, Moon and (Fred L. Whipple), *review* by the Rev. M. Davidson, 522
Planktonic Green Alga at various Carbonic Acid and Hydrogen-Ion Concentrations : Growth of a (Sven Österlind), 199
Plant Carbonic Anhydrase (J. R. G. Bradfield), 467
Plant Health in the Argentine (Prof. J. B. Marchionatto), 57
Plant Hormones : Sunflower Stem Cultures for the Detection of (R. S. de Ropp), 606
Plant Tissue Culture, *review* by Alan Burges, 80
Plant Viruses : Use of Seeds in the Insect Transmission of some (A. F. Posnette), 500
Plants Fed upon by Different Insects : Relations between the Assemblages of, and between the Assemblages of Insects that Feed upon Different Plants (Dr. S. Maulik), 269
Plants (Leguminous) : Hæmoglobin and Nitrogen Fixation in the Root Nodules of (Prof. D. Keilin and J. D. Smith), 692
Plants and Animals : Significance of Trace Elements in (Association of Applied Biologists discussion on), 206
Plasma : Effect of Ultra-Filtration and Carbon Dioxide on the Prothrombin Activity of (I. M. Chak and K. V. Giri), 878
Plasma Cellular Reaction and its relation to the Formation of Antibodies *in vitro* (Astrid Fagraeus), 499 ; *erratum*, 601
Plasmodium gallinaceum : Acquired Resistance to Paludrine in—Acquired Resistance and Persistence after Passage through the Mosquito (Dr. Ann Bishop and Betty Birkett), 884
  Acquired Resistance to Paludrine in—Effects of Paludrine and other Antimalarials (J. Williamson, D. S. Bertram and Dr. E. M. Lourie), 885
Plastics Applied (edited by Dr. V. E. Yarsley), second edition, *review* 387
Plesianthropus : Discovery of a New Skull of the South African Ape-man (Dr. R. Broom), 672
  The Upper Milk Molars of the Ape-Man (Dr. R. Broom), 602
Plesianthropus Skull : The (Prof. F. Wood Jones), 883
  Two Features of the (Dr. R. Broom and J. T. Robinson), 808
Plot-Size in Yield Surveys (Dr. V. G. Panse), 820
Plum (Victoria) : Control of Low-Temperature Injury in the (W. Hugh Smith), 541
Plymouth : Marine Biology at (Wing-Comdr. F. S. Russell), 830
Plymouth Rock Fowls (Barred) : Physiology of Pattern Formation in Male and Female Feathers of (G. Montalenti), 886
Pneumokoniosis and Dust Suppression in Mines : Silicosis, (Institution of Mining Engineers and the Institution of Mining and Metallurgy conference on), 365

Poisoning (Mitotic) : Some New Aspects of (Dr. Pierre Dustin), 794
Poisoning (Mustard Gas) : Medical Aspects of (Dr. H. Cullumbine), 151
Polar Aurora in Southern Norway (Prof. Carl Størmer), 734
Polar Exploration (Royal Geographical Society's exhibition), 22
Polar Liquids : Theory of Molecular Coupling in (Prof. Arcadius Piekara), 337
Polarity of the Retinal Elements : Colour Sensitivity, Contrast and (Dr. Bo Gernandt), 806
  Inhibition and the (Dr. Bo Gernandt and Prof. Ragnar Granit), 806
Polarization of Infra-Red Radiation (A. Elliott and E. J. Ambrose) 641
Polarizing Light-Filter : A New (Dr. Bruce Billings), 192
Politics and Morals (Benedetto Croce), translated from the Italian by Salvatore J. Castiglione, *review* by Maurice Bruce, 248
Pollen-grains of Date Palm Tree *Phoenix dactylifera* L., Palmæ : An Oestrogenic Substance in (Dr. Ali Hassan and M. Hassan Abou El Wafa), 409
Polonium : Gamma-Radiation from, and from Lithium Bombarded with Alpha-Particles (Dr. Kai Siegbahn and Prof. Hilding Slätis), 471
Polymer Molecules : Detection of End Groups in (B. Dudley Sully), 882
Polymerization : Kinetics of, and Molecular Weight Distributions in Polymethyl Methacrylates (Dr. E. F. G. Herington and A. Robertson), 745
Polymerization of a Semiquinone Ion (G. K. Hughes, N. Hush and D. P. Mellor), 612
Polymers : High (International Conference at the University of Strasbourg), 138
Polymers (High) : Mixed Crystal Formation in (C. W. Bunn and H. S. Peiser), 161
Polymethyl Methacrylates : Kinetics of Polymerization and Molecular Weight Distributions in (Dr. E. F. G. Herington and A. Robertson), 745
Polyploidy in *Polypodium vulgare* (Prof. I. Manton), 136
Polysaccharides : The Chemistry of the (Sir Walter Haworth), 299
Polythene : Intrinsic Electric Strength of (W. G. Oakes), 29
Population Increase : Mortality Required to Prevent (M. E. Solomon), 848
Population Studies in Fisheries Biology (G. L. Kesteven), 10 ; (H. R. Hulme, R. J. H. Beverton and S. J. Holt), 714
Population Trends and the World's Resources (Dr. C. L. Bertram), 396
Population-Flux in the Desert Locust : Evolutionary Significance of Periodicity of Variation-Intensity and (Dr. M. L. Roonwal), 872
Population, Psychology and Peace (J. C. Flugel), *review* by Dr. John Cohen, 793
Populations (Two) : The Problem of Classification and Distance between (C. Radhakrishna Rao), 30
Porpoise (*Phocaena phocaena*) : The Hypophysial Portal Vessels of the (Dr. G. W. Harris), 874
Portugal : Establishment of a National Meteorological Service in, 772
Post-Glacial Times : The Survival and Extinction of Flora and Fauna in Glacial and (British Ecological Society discussion on), 556
Potassium in the Assay of Curare : Use of (P. Ga. de Jalon and G. B. West), 841
Potassium (Mercury and) : Emission of Secondary Electrons from Nickel and Molybdenum by Neutral Atoms of (Prof. Rafi Mohammed Chaudhri and Abdul Wahid Khan), 202
Potassium Soap (Crossed-Chain) : Crystal Structure of a (Dr. V. Vand, T. R. Lomer and A. Lang), 507
Potato Virus B : Status of (R. E. F. Matthews), 713
Potential Problems : The 'Squares' Method for (Dr. R. V. Southwell), 168 ; (Prof. G. Temple), 169
Poulsen (Valdemar) Gold Medals awarded to Dr. E. F. W. Alexanderson and Sir Robert Watson-Watt, 496
Power (Dr. Martin Ruhemann), *review* by Prof. J. A. Crowther, 4
Power and Events (Andrew Paul Ushenko), *review* by F. Ian G. Rawlins, 861
Pre-Natal Life : Researches on (Sir Joseph Barcroft), Vol. 1, *review* by Dr. F. H. A. Marshall, 383
Precipitating Effect of Cationic Detergents on Soluble Starch (M. Mutahhar Yenson), 813
Pregnant Mice : Serum Chlorides in (A. J. Lea), 469
Prehistory : Pan-African Congress on, 216
  Proceedings of the, 547
Premaxilla and the Ancestry of Man : The (Prof. F. Wood Jones), 439 ; (Prof. W. E. Le Gros Clark), 546
Preservatives of Citrus Concentrates : Gaseous Sulphur Dioxide and Sodium Bisulphite as (Dr. Jacob Feigenbaum and Shalom Israelashvili), 32
Press : Freedom of the, 1
Press, Parliament and People (Francis Williams), 2
Preventive Medicine and Public Health (Prof. Wilson G. Smillie), *review* by Sir Arthur MacNalty, 758
Proconsul : Casts of the mandible of the Lower Miocene Ape, available for distribution (Dr. L. S. B. Leakey), 871
Production : Incentives in Management and, 619
Production of Citric Acid by Yeast : Effect of Cations in the (Dr. M. Deffner and A. Issidoridis), 879
Productivity (Increased) : Fundamentals of, 279
Professions : Economic Status of Men and Women in the, 41
Proof by *reductio ad absurdum* (Dr. R. L. Goodstein), 532
Prophets and Peoples (Prof. Hans Kohn), *review* by Maurice Bruce, 248
Proportionality of Wires : Determination of Limit of (Prof. F. C. Thompson and W. R. Tyldesley), 30
Protein from Ovalbumin : A New (Prof. K. Linderstrøm-Lang and M. Ottesen), 807
Protein (Soya-bean) : Heat Treatment and the Biological Value of the (Dr. S. S. De and J. Ganguly), 341
Proteins : The Chemistry of the (Chemical Society discussion on), 581
  Derivatives of Pectic Acid as Models of (H. Deuel and H. Neukom), 882
  Action of Mustard Gas ($\beta\beta'$- Dichloroethylsulphide) on Thiol Groups of (Prof. Z. M. Bacq, V. Desreux and M. Goffart), 478
Proteins on Ketonæmia : Effect of (Dr. Andrew Góth and Dr. George Bikich), 170
Prothrombin Activity of Plasma : Effect of Ultra Filtration and Carbon Dioxide on the (I. M. Chak and K. V. Giri), 878
Proton (Negative) : Detectability of the (J. McConnell and Dr. L. Jánossy), 335
Proton Transfer between Organic Molecules caused by Light (Prof. A. Terenin and A. Kariakin), 881
Protons Ejected in the Disintegration of Nitrogen by α-Particles : Angular Distribution of (Dr. F. C. Champion and R. R. Roy), 127
Protons and α-Particles in the New Ilford 'Nuclear Research' Emulsions : Range Energy Relation for (Dr. C. M. G. Lattes, P. H. Fowler and P. Cuer), 301
Protozoa : Succinic Dehydrogenase in (Beverley A. Humphrey and George F. Humphrey), 374
Protozoal Disease of South African Trawled Fish and its Routine Detection by Fluorescence (Rees Davies and E. Beyers), 714
Pseudomonas aeruginosa Active *in vitro* against *M. tuberculosis* : A Product of (Dr. G. C. Hughes and R. A. Kiernan), 197
Psychiatry (Modern) : Growth of (Dr. David Mordecai Levy), 38
Psychologists : Facilities for Training (Dr. H. J. Eysenck), 481
  A Survey of the Fields of Employment of (Miss I. M. Dunsdon), 481
Psychologists (Social) : Possibilities and Conditions of Employment of, in the Public Services (Dr. Stephen Taylor), 480
Psychologists in the Association of Scientific Workers (Prof. T. H. Pear), 480
Psychologists and other Professional Workers : Relations between (Dr. J. D. Sutherland), 480
Psychology : Encyclopedia of (edited by Philip Lawrence Harriman), *review* by Prof. F. C. Bartlett, 5
  International Congress of, 601
Psychology at the University of Aberdeen, 261
Psychology and Peace : Population, (J. C. Flugel), *review* by Dr. John Cohen, 793
Psylla mali : Two Symbiotes of (Prof. S. Mahdihassan), 749
Public Health : Preventive Medicine and (Prof. Wilson G. Smillie), *review* by Sir Arthur MacNalty, 758
Public Services : Possibilities and Conditions of Employment of Social Psychologists in the (Dr. Stephen Taylor), 480
Pulmonary Œdema and the Spleen (Dr. H. Cullumbine and M. Simpson), 781
Pulverized Fuel (Institute of Fuel conference on), 22, 465
Punched Card Tabulating Machines for Crystallographic Fourier Syntheses : Use of (Prof. E. G. Cox, L. Gross and Dr. G. A. Jeffrey), 433
Pyrocatechol : Conversion of 2-Aceto-furan to Hexen-2-dion-4,5-acetal-1 and (Prof. L. Vargha, J. Ramonczai and P. Bite), 744

QUALITY Control : Statistical (Prof. Eugene L. Grant), *review* by Maurice Kendall, 454
  A Bibliography of Statistical (Grant I. Butterbaugh), *review* by F. J. Anscombe, 387
Quality Control Methods in Canada, 736
Quantitative Chromatographic Separations of Synthetic Peptides (M. Jutisz and E. Lederer), 445
Quantum Theory of Liquids (Prof. Max Born and Herbert Sydney Green), 738 ; (Prof. R. Fürth), 739
Quartz : A Theory of the Control of Twinning in (Dr. W. A. Wooster), 94
Quaternary Fission of Uranium Nuclei : Ternary and (Tsien San-Tsiang, Ho Zah-Wei, L. Vigneron and R. Chastel), 773
Quaternary Phosphonium Salt : An Optically Active (F. G. Holliman and Dr. F. G. Mann), 438

R.38 Memorial Prize of the Royal Aeronautical Society awarded to J. K. Hardy, 669
Rabbit Ova : A Tubal Factor concerned in the Denudation of (G. I. M. Swyer), 873
Rabbit Ova (Fertilized) : Norman Development of, Stored at Low Temperature for Several Days (Dr. Min-Chueh Chang), 602
Rabies Virus *in vitro* : Cultivation of (Dr. N. Veeraraghavan), 782
Racial Pride and Prejudice (Eric John Dingwall), *review* by Prof. E. G. Bowen, 555
Radiation (Infra Red) : Polarization of (A. Elliott and E. J. Ambrose), 641
Radiation Chemistry and Photo-chemistry (University of Notre Dame symposium on), 634
Radicals : Free, from Benzyl Hyponitrite (Ivan Harris, Ian Marshall and Kenneth Barry Jarrett), 843
Radio Aids to Marine Navigation : Proceedings of the International Meeting on, 647
Radio Emissions from the Disturbed Sun : Origin of (Dr. D. F. Martyn), 26
Radio Noise from the Sun at 3·2 cm. (K. F. Sander), 506
Radio Wave Propagation : Effect of the Moon on (Dr. H. T. Stetson), 396 ; (P. A. de G. Howell), 396
Radio Waves : Emission of, by the Galaxy and the Sun (Joseph S. Shklovsky), 752
  Gyro Interaction of (Dr. L. G. H. Huxley, H. G. Foster and C. C. Newton), 300
Radio Waves in the Ionosphere : Measurements of Changes of the Phase-Paths of (J. W. Findlay), 58
Radio Waves at Sunrise : Lateral Deviation of (W. Ross and E. N. Bramley), 132
Radioactive Substances : Electrochemistry of, *review* by F. Morgan, 690
Radioactive Tracer Elements in Physics Research and Industry : Applications of (Institute of Physics, Manchester and District Branch, conference on), 498
Radioactivity of Radioaluminium (J. V. Dunworth), 436
Radiochemistry in Britain—Opening of the Londonderry Laboratory at Durham, 888
Radiocommunication during the War (Institution of Electrical Engineers convention on), 299, 397, 547
Radiocristallographie (André Guinier), *review* by Dr. W. A. Wooster, 348
Radiolocation (Institution of Electrical Engineers conference on), 174 ; Publication of the Conference Papers, 804
  The Evolution of (Sir Robert Watson-Watt), 174
Railway Network : The Scottish (J. F. Pownall), *review*, 555
Rain : Experiments on the Stimulation of Clouds to Produce (E. B. Kraus and P. Squires), 489
Rain and Snow Water (River,) : Electrical Conductivity of (Dr. W. R. G. Atkins), 674
Raman Lines : Temperature Dependence of the Intensities of (Dr. K. Venkateswarlu), 96
Raman Spectrum of Diamond under High Resolution (Dr. R. S. Krishnan), 60
Raman Spectrum of *Cyclo*-octatetraene : Infra-Red and (M. St. C. Flett, W. T. Cave, E. E. Vago and Dr. H. W. Thompson), 739

Raman Spectrum of Rock Salt under High Resolution (Dr. R. S. Krishnan), 266 ; (Prof. M. Born), 266
Ramsay Memorial Fellowships for Chemical Research, 568
Rancidity in Indian Butter Fat (Ghee), (K. T. Achaya), 274
Range Energy Relation for Protons and α-Particles in the New Ilford 'Nuclear Research' Emulsions (Dr. C. M. G. Lattes, P. H. Fowler and P. Cuer), 301
Rat : Alloxan Diabetes and the Kidney in the (Dr. Allen Gold), 574
Rat (Female) : Transference of Vitamin D from the, to her Young (Joan Embleton and Audrey J. Collings), 340
Rat Poison : A New, 633
Rats : Succinoxidase Activity of Hepatic Tumours produced in, by Feeding 2-Acetaminofluorene (Cornelia Hoch-Ligeti), 780
Rats (Choline-deficient) : Curative Effects of a Complex Choline Compound on the Impaired Metabolism of (Dr. N.-O. Abdon and N. E. Borglin), 272
Rats (Normal and Thiamin-deficient) : Development of *Ornithodorus moubata* on (Dr. Botha De Meillon and Dr. Leon Golberg), 171
Reaction of Di-isobutene : The Boron-Trifluoride Catalysed (Dr. Alwyn G. Evans and M. A. Weinberger), 437, 498
Reaction between Influenza Virus and Susceptible Tissue Cells : Enzymic Modification of the (Joyce D. Stone), 780
Reactions (Unimolecular) : Absolute Values of the Rates of (N. B. Slater), 264
Reactions of Organic Halides in Solution (Prof. E. D. Hughes and Prof. C. K. Ingold), 166 ; (Dr. Alwyn G. Evans), 166
Reagent for Staining Stomatal Starch : Role of Starch in Light-induced Stomatal Movement, and a New (Dr. O. V. S. Heath), 647
'Reality Index' for Suspected Cyclic Variations : Choice of a (Dr. W. O. Kermack), 305
Reciprocity Law for Transmission Lines : Apparent Breakdown of the (Dr. C. H. Westcott), 540
Reconstruction : Economic, in Great Britain (Lectures at the Royal Society of Arts), 57
Recording : Mechanical, of Information about Cancer Patients at the Royal Cancer Hospital (Dr. D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
Recording of Sound (Magnetic) : Developments in (P. T. Hobson), 735
Recording Surface Balance of the Horizontal Type (S. Ställberg-Stenhagen and E. Stenhagen), 814
Recrystallization of Duplex Brass (R. W. K. Honeycombe and Dr. W. Boas), 847
Red Blood Cells : Effect of Mono- and Divalent Salts on (Major H. Lehmann, Capt. J. O. Laws and N. Ahmed), 169
Red Blood Corpuscles : Secretion of (Dr. Frederic Duran-Jorda), 293
Red Body Colour in *Armadillidium vulgare* : Genetics of (Dr. H. W. Howard), 683
Redox Potentials and Synergisms in Resting Bacteria : A Correlation between (Dr. Bruce E. Baker and Dr. Moritz Michaelis), 197
reductio ad absurdum : Proof by (Dr. R. L. Goodstein), 582
Reduction Potentials of Ferrous Hydroxide (S. H. Mhatre and Dr. G. M. Nabar), 372
Reflectivity of Steel (R. Weil), 305
Refresher Courses for Science Teachers, 771
Relationships between some Dissociation Constants (J. C. McGowan), 644
Relativistic Wave Equations (Dr. C. Jayaratnam Eliezer), 60
Relaxation Methods : Summer School in (Imperial College of Science and Technology), 567
Relaxation Methods applied to Engineering Problems (Dr. R. V. Southwell and G. Vaisey), 345
Religion : History and Comparative Study of, 262
Religion and Science (Rev. Dr. Charles E. Raven), *review* by the Rev. J. C. Hardwick, 145
Renal Factor in Alloxan Diabetes (Prof. G. Lyman Duff, Donald C. Wilson and Gardner C. McMillan), 575
Replica Technique : A Methyl Methacrylate-Silica, for Electron Microscopy (A. F. Brown and Dr. W. M. Jones), 635
Representative Government : On Liberty and Considerations on (J. S. Mill), *review* by Maurice Bruce, 248
Reproduction (Mammalian) : Patterns of (Prof. S. A. Asdell), *review* by Prof. S. Zuckerman, 520
Rescue (Air-Sea) : Size versus Colour in (Dr. W. R. G. Atkins), 612
Research : Atomic, in India, 192
  Biochemical, at Oxford upon Mustard Gas (Prof. R. A. Peters), 149
  Canadian, in Geodesy and Geophysics, 344
  Chemical (Ramsay Memorial Fellowships), 568
  Civil Aircraft, 803
  Coal Utilisation, in Great Britain (H. J. Hodsman), 208
  Colonial (1945–46), 614
  Industrial, and the National Economy (Sir William Larke), 649
  Industrial, in Scotland, 534, 751
  Industry and (Federation of British Industries regional conferences on), 226, 649, 852 ; (Report of the Federation of British Industries 1946 conference on), 634
  Metallurgical, 56
  Paper Shortage, Education and, 721
  Scientific, in the Pacific Area, 412
  The Smaller Firm and its Application of (Dr. F. C. Lea), 853
Research (Cancer) : Progress of (Dr. I. Hieger), 527
  Recent Advances in (Dr. Peyton Rous), 12
Research (Industrial) : Technical Colleges and, 653
Research (War-time Medical) : Social Value of (Dr. G. Lapage), 854
Research at the Bermuda Biological Station, 465
Research in British Colonial Territories, 614
Research in Canada (Papers given at the Symposium of the Chemical Institute of Canada), *review* by R. Brightman, 589
Research in Mechanical Engineering, 769
Research and National Recovery (Sir William Larke), 852
Research in the Sheffield Area : Industry and (Federation of British Industries regional conference on), 852
Research in the Region between Subsonic and Supersonic Speeds, 632
Research and the Smaller Firm (Publication of the Report of the Manchester Joint Research Council's conference on), 805
Research and the Progress of Industry in Scotland (Federation of British Industries Scottish regional conference on), 534, 751
Research in the South Pacific Area, 735
Research Associations in Great Britain, 75
Research Associations and Industry, 687
Research Organisation : Scientific, in Great Britain, 735
Research Purposes : A Simple Film Balance for Demonstration and (Dr. A. E. Alexander), 304
Research Studentships : Colonial Medical, 704
Researches on Pre-Natal Life (Sir Joseph Barcroft), Vol. I, *review* by Dr. F. H. A. Marshall, 383
Résineux : Products (Dr. René Lombard), *review*, 215
Resins : Ion Exchange, as Catalysts (G. Garrod Thomas and Prof. C. W. Davies), 372
Resistance to Paludrine : Acquired, in *Plasmodium gallinaceum*—Acquired Resistance and Persistence after Passage through the Mosquito (Dr. Ann Bishop and Betty Birkett), 884
  Acquired, in *Plasmodium gallinaceum*—Effects of Paludrine and other Antimalarials (J. Williamson, D. S. Bertram and Dr. E. M. Lourie), 885
Resonance at Low Temperatures : Nuclear Magnetic (B. V. Rollin and J. Hatton), 201
Respiration of Developing Anthers (Dr. Ralph O. Erickson), 275
Respiration-Inhibiting Effect on Tubercle Bacilli : New Substances Exerting a Combined Bacteriostatic and (Bo Zetterberg), 235
Retinal Elements : Colour Sensitivity, Contrast and Polarity of the (Dr. Bo Gernandt), 806
  Inhibition and the Polarity of the (Dr. Bo Gernandt and Prof. Ragnar Granit), 806
Retinal Structure and Colour Vision (Dr. E. N. Willmer), *review* by Prof. Ragnar Granit), 417
Retinene$_2$ and Vitamin A$_2$ (Prof. R. A. Morton, M. K. Salah and A. L. Stubbs), 744
Reverberation : Sound Absorption and (Physical Society, Acoustics Group, summer symposium on), 772
Rh (Anti-) Antibodies : Use of Trypsin in the Detection of Incomplete (J. A. Morton and M. M. Pickles), 779
Rheological Phenomena : A Continuum Theory of (Dr. K. Weissenberg), 310
Rheology : Summer Course on, 601
Rhythmical Impedance Changes in Salmon Eggs (Lord Rothschild), 134
Ribonuclease : Volume Change accompanying the Splitting of Ribonucleic Acid by (H. Chantrenne, Prof. K. Linderstrøm-Lang and L. Vandendriessche), 877
Ribonucleic Acid : Volume Change accompanying the Splitting of, by Ribonuclease (H. Chantrenne, Prof. K. Linderstrøm-Lang and L. Vandendriessche), 877
Ribs of Lacertilia : Sacral (Dr. M. R. El-Toubi), 342
Rice : Effects of High Temperature and Short Days on Vernalization Response of Summer Varieties of (Dr. S. M. Sircar and B. N. Ghosh), 605
Richmondite, a Discredited Mineral Species (C. Osborne Hutton), 817
Rickets : Yeast and (E. Hoff-Jørgensen), 99
Rickettsiæ in the Chick Embryo : Cultivation of Viruses and (Dr. W. I. B. Beveridge and Dr. F. M. Burnet), 277
Riddell Memorial Lectures (Prof. M. Polanyi), *review* by F. Ian G. Rawlins, 793
Ripening of Grain : Correlation between Yield of Wheat and Temperature during (Dr. J. J. Chinoy), 442
Ritchie Lecture for 1945 of the Royal Society of Edinburgh (Dr. N. Feather), 242
River, Rain and Snow Water : Electrical Conductivity of (Dr. W. R. G. Atkins), 674
Rock Salt under High Resolution : Raman Spectrum of (Dr. R. S. Krishnan), 266 ; (Prof. M. Born), 266
Root Nodules of Leguminous Plants : Hæmoglobin and Nitrogen Fixation in the (Prof. D. Keilin and J. D. Smith), 692
Rorippa Scop. : Chromosome Numbers of the British Species of (part of the Genus *Nasturtium* R. Br.), (Dr. H. W. Howard), 66
Rosin and its Products, *review*, 215
Rotating Bodies (Massive) : The Magnetic Field of (Prof. P. M. S. Blackett), 601, 658
Royal Academy, 1947 (Dr. A. Tindell Hopwood), 764
Royal Cancer Hospital (Free) : Mechanical Recording of Information about Cancer Patients (Dr. D. W. Smithers, K. M. H. Branson and H. O. Hartley), 261
Royal Society and the British Academy : Social Science in the Gap between the (Dr. Lewis F. Richardson), 269
Ruanda-Urundi : Animaux protégés au Congo Belge et dans le territoire sous mandat du (S. Frechkop, en collaboration avec G. F. de Witte, J.-P. Harroy et E. Hubert), *review* by Dr. W. H. Thorpe, 520
Rubber : Stress-Optical Properties of (Dr. L. R. G. Treloar), 231
Russian Review of Bonds in Chemistry, *review* by G. Stanley Smith, 386

S-MATRIX : Interpretation of Complex Roots of the (Prof. W. Heitler and N. Hu), 776
Sacral Ribs of Lacertilia (Dr. M. R. El-Toubi), 342
Safety : Intrinsic, of Electrical Apparatus (Safety in Mines Research Board, Paper No. 104), 159
Sal Ammoniac : Dr. James Hutton and the Manufacture of (Archibald Clow and Nan L. Clow), 425
Salmon Eggs : Rhythmical Impedance Changes in (Lord Rothschild), 134
Salmon Memorial Lectures of the New York Academy of Medicine (Dr. David Mordecai Levy), 38
Salts (Mono- and Divalent) : Effect of, on Red Blood Cells (Major H. Lehmann, Capt. J. O. Laws and N. Ahmed), 169
Sandfly described in 1691 (Michel Lavoipierre and Pierre Lambert), 444
Sang : Données récentes sur la coagulation du (Pierre Fredericq), 617
Schizophrenia : The Biology of (Dr. R. G. Hoskins), *review* by Dr. Clifford Allen, 725
Scholarships : Agricultural (Ministry of Agriculture and Fisheries), 466
  Whitworth (New regulations for), 599
School to Life, 857
Schools : Astronomy in the (P. F. Burns), 583
Schools (Secondary) : A Unified Course in Mathematics in (Mathematical Association discussion on), 582

- Science : Early, in Oxford (Dr. R. T. Gunther), Vol. 2, Life and Letters of Edward Lhwyd, 154
  - Introducing, *review* by Prof. J. A. Crowther, 4
  - Natural, and the Fine Arts (F. Ian G. Rawlins), 628
  - The Path of (Dr. C. E. Kenneth Mees, with the co-operation of Dr. John R. Baker), *review* by Lieut.-Colonel H. D. Anthony, 351
  - Religion and (Rev. Dr. Charles E. Raven), review by the Rev. J. C. Hardwick, 145
- Science (Modern) : A Prelude to, being a Discussion of the History, Sources and Circumstances of the 'Tabulae Anatomicae Sex' of Vesalius (Dr. Charles Singer and C. Rabin), *review* by Prof. F. J. Cole, 655
- Science in Adult Education (Dr. M. H. Clifford), 560
- Science versus Cancer (Dr. I. Berenblum), *review* by Prof. J. A. Crowther, 4
- Science and Crime, *review* by Dr. G. E. Turfitt, 453
- Science and the Real Freedoms (Association of Scientific Workers conference on), 511
- Science and the History of Society, *review* by Lieut.-Colonel H. D. Anthony, 351
- Science, Faith and Society (Prof. M. Polanyi), *review* by F. Ian G. Rawlins, 793
- Science and the Humanities in the Universities, 789
- Science, Industry and Government (Sir Edward Appleton), 735
- Science and Stockbreeding, *review* by Prof. J. E. Nichols, 78
- Science in Teaching : The Place of (Lord Horder), 106
- Science Journal for South Africa, 803
- Science News, 2, Atomic Energy Number (edited by Prof. R. E. Peierls and John Enogat), *review* by S. Weintroub, 488
- Science Teachers : Refresher Courses for, 771
- Sciences (Exact) : The Common Sense of the (William Kingdon Clifford), *review* by Sir Edmund Whittaker, 248
- Scientific Basis for Sylviculture, *review* by J. L. Harvey, 44
- Scientific Centenaries in 1947 (Eng.-Capt. Edgar C. Smith), 16
- Scientific Equipment in Europe—Present Needs (Thomas Martin), 523
- Scientific Films : The Classification, Appraisal and Grading of (Scientific Film Association memorandum on), 736
- Scientific Instrument Development : Prizes for (British Scientific Instrument Manufacturers' Association), 432
- Scientific Instrument Industry, 517
- Scientific Instrument Manufacture and the Nation (A. J. Philpot), 534
- Scientific Instruments : British (Physical Society's Exhibition of), 726
- Scientific Man-power in Britain, 177
- Scientific Periodicals (German) : Publication of, 366
- Scientific and other Periodicals (German) : ASLIB Classified List of, 566
- Scientific Policy for the New World, *review* by Prof. S. Zuckerman, 316
- Scientific Purposes : Aerial Photographs for, 838
- Scientific Research in the Pacific Area, 412
- Scientific Research Organisation in Great Britain, 735
- Scientific and Industrial Research : Government Estimates for, 702
- Scissione nucleare dell'uranio (Dott. Emidio Prata), *review* by Prof. R. E. Peierls, 79
- Scotland : Earth Tremor in the Lochaber district of Inverness-shire on December 25, 23
  - Industrial Research in, 534
  - Research and the Progress of Industry in (Federation of British Industries Scottish Regional conference on), 751
- Scottish Railway Network (J. F. Pownall), *review*, 555
- Scottish Summer Schools in Health Education 772
- Scrub Typhus as a Study in Ecology (Lieut.-Colonel J. R. Audy), 295
- Sea Waves (P. J. H. Unna), 239
- Sea-Level : The Meson Spectrum near (M. Della Corte, T. F. Fazzini and S. A. Franchetti), 845
  - Slow Cosmic Ray Mesons at (G. R. Evans and T. C. Griffiths), 879
- Sea-Urchin Sperm : Hyaluronidase in (Dr. A. Monroy and A. Ruffo), 603
- Seaman (Louis Livingston) Awards of the New York Academy of Medicine, 786
- Searchlight : An Azimuthal Method of Measuring Cloud Height with a (E. G. Bilham), 677
- Seaweed : Industrial Utilization of Agricultural Products and of (Irish Chemical Association and the Dublin Section of the Royal Institute of Chemistry colloquium on), 671
- Secondary Charged Particles in Fission : Emission of (Prof. N. Feather), 607
- 'Secret' Theses for Degrees : British Universities and (Dr. J. E. Keyston), 24 ; (Sir Robert Robinson), 25
- Secretion of Red Blood Corpuscles (Dr. Frederic Duran-Jorda), 293
- Seed Germination Indicator : Tetrazolium Salt as a (Miss H. J. Cottrell), 748
- Seeds in the Insect Transmission of some Plant Viruses : Use of (A. F. Posnette), 500
- Seismic Prospecting : Marine (M. N. Hill and P. L. Willmore), 707
- Selenium Dioxide : Oxidation Activity of (Prof. H. L. Riley), 571
- Self-Recovery of Metals (Prof. W. G. Burgers), 203
- Semiquinone Ion : Polymerization of a (G. K. Hughes, N. Hush and D. P. Mellor), 612
- Serum Bilirubin and the Van den Bergh Reaction (C. Gardikas, Dr. J. E. Kench and Dr. J. F. Wilkinson), 842
- Serum Chlorides in Pregnant Mice (A. J. Lea), 469
- Servo-mechanisms : Automatic Regulators and (Institution of Electrical Engineers convention on), 330
- Set Time and Particle Size (Prof. F. H. Garner, Dr. Alfred H. Missan and F. Mayo), 709
- Seventeenth Century : Astrology and Astronomy in the (Joshua C. Gregory), 393
- Sex in *Melandrium* (Dr. H. G. Baker), 34
- Sex Differences in Colour Vision (Dr. R. W. Pickford), 606
- Sex Hormones : Biological Actions of (Dr. Harold Burrows), *review*, 182
- Shape of Operating Chamber in the Freeze-drying Process': Effect of (A. J. Ede), 610
- Sheep : Sweating in (J. B. Cragg and Lewis Davies), 34
- Sheep Hæmoglobin (Fœtal) : Osmotic Pressure of (E. F. McCarthy and G. Popják), 198
- Sheffield Area : Industry and Research in the (Federation of British Industries regional conference on), 852
- Sheffield Industries : The Historical Growth and Economic Development of (Dr. G. P. Jones), 852
- Short-Period Activities : Use of a Cyclotron to Detect (J. M. Cassels and R. Latham), 367
- Short-Wave Therapeutics, International Congress on, 704
- Showers in the Atmosphere (Extensive) : Presence of a Penetrating Component in (Dr. A. Mura, Dr. G. Salvini and G. Tagliaferri), 367
- Shrinkage' : 'Incipient, of Collagen and Gelatin (Dr. Kenneth Pankhurst), 538
- Sieve Action : Molecular, at Low Temperatures (R. M. Barrer), 508
- Silicon : Atomic Mass of (Prof. T. Batuecas), 705
- Silicosis : The History and Prevention of, with special reference to the Witwatersrand (Major-General A. J. Orenstein), 365
- Silicosis, Pneumokoniosis and Dust Suppression in Mines (Institution of Mining Engineers and the Institution of Mining and Metallurgy conference on), 365
- Silver Chloride Crystals : Diffuse Bands on Laue Photographs of (Prof. W. G. Burgers and Tan Koen Hiok), 845
- Silver Chloride Plates for Infra-Red Spectroscopy (K. S. Tetlow), 850
- Similarity Principles to Thermal Transport Systems : Application of (M. W. Thring), 203
- Simms Gold Medal of the Royal Aeronautical Society awarded to Prof. L. Aitchison, 669
- Size versus Colour in Air-Sea Rescue (Dr. W. R. G. Atkins), 612
- Skin (Black and White Guinea Pig) : 'Cytogenetics' of (R. E. Billingham and P. B. Medawar), 115
- Sky : The Night, in January, 23 ; in February, 160 ; in March, 299 ; in April, 432 ; in May, 568 ; in June, 737 ; in July, 871
- Sky (Night) : Emission from the Aurora and the (Royal Society International conference on), 671
- Smaller Firm : Research and the (Report of the Manchester Joint Research Council's conference on), 805
- Smaller Firm and its Application of Research : The (Dr. F. C. Lea), 853
- Smell : The Sense of (Prof. E. D. Adrian), 601
- Snow (William Freeman) Medal for 1946 of the American Social Hygiene Association awarded to Colonel L. W. Harrison, 92
- Snow Water (River, Rain and) : Electrical Conductivity of (Dr. W. R. G. Atkins), 674
- Soap (Crossed-Chain Potassium) : Crystal Structure of a (Dr. V. Vand, T. R. Lomer and A. Lang), 507
- Social Biology (British Social Hygiene Council Summer School in), 262
  - An Introduction to (Alan Dale), *review* by Cyril Bibby, 147
- Social Biology for Sixth Forms, *review* by Cyril Bibby, 147
- Social Kaleidoscope : India as a, *review* by F. J. Richards, 621
- Social Medicine and Social Pathology (Dr. Iago Galdston), 494
- Social Problems of an Industrial Civilization (Prof. Elton Mayo), 313
- Social Psychologists in the Public Services : Possibilities and Conditions of Employment of (Dr. Stephen Taylor), 480
- Social Science in the Gap between the Royal Society and the British Academy (Dr. Lewis F. Richardson), 269
- Social Sciences : The Future of the (Association of Scientific Workers conference on), 173
- Social Studies : Analysis and Prophecy in, *review* by Maurice Bruce, 452
- Social Value of War-time Medical Research (Dr. G. Lapage), 854
- Society : Human Nature, War and (Dr. John Cohen), *review* by Maurice Bruce, 181
  - Science, Faith and (Prof. M. Polanyi), *review* by F. Ian G. Rawlins, 793
  - Science and the History of, *review* by Lieut.-Colonel H. D. Anthony, 351
- Sodium Bisulphite : Gaseous Sulphur Dioxide and, as Preservatives of Citrus Concentrates (Dr. Jacob Feigenbaum and Shalom Israelashvili), 32
- Sodium Hexametaphosphate on the Yield Value and Viscosity of a Hydrogen Bentonite Suspension : Effect of (A. Reid and Dr. N. C. Sen Gupta), 336
- Soil Profiles having Naturally Free and Impeded Drainage : Distribution of the Total and Acetic Acid-Soluble Phosphate in (Dr. R. Glentworth), 441
- Soil Sterilization on a Field-Scale (Arch. B. Smart), 102
- Solar Activity : Recent, 549
- Solar Disturbances of July 25, 1946 : Cosmic Ray Intensity at Manchester and (D. W. N. Dolbear and H. Elliot), 58
- Solar Eclipse of May 20, 1947 : The Total (Prof. F. J. M. Stratton), 387
- Solar Noise Observations : Micro-Wave, during the Partial Eclipse of November 23, 1946 (A. E. Covington), 405
- Solar 'Static' : Origin of (Dr. Chas. E. R. Bruce), 580
- Solids : Mechanical Properties of (University of Bristol in co-operation with the Institute of Physics conference on), 193, 671
  - New Physico-Chemical Phenomena in the Deformation and Mechanical Treatment of (P. Rehbinder), 866
- Solomon Islands : Earthquake on September 29, 57
- Solution : Reactions of Organic Halides in (Prof. E. D. Hughes and Prof. C. K. Ingold), 166 ; (Dr. Alwyn G. Evans), 166
- Solutions (Supersaturated) : Crystallization of, by means of Electric Current (A. J. H. Boerboom), 230
- Solvent on Oxygen Overpotential : Effect of the (Dr. J. O'M. Bockris), 401
- Solvent-treated Cellulose Acetate as the Stationary Phase in Partition Chromatography (R. J. Boscott), 342
- Somaliland (British) : Report on the Survey of (Major John A. Hunt), 366
- Somatic Chromosomes of *Drosophila melanogaster* : Production of Structural Changes in (B. M. Slizynski), 66
- Sound : Developments in Magnetic Recording of (P. T. Hobson), 735
- Sound Absorption and Reverberation (Physical Society, Acoustics Group, summer symposium on), 772
- South Africa : A Science Journal for, 803
  - University Library Service in, 277
- South African Ape man, *Plesianthropus* : Discovery of a New Skull of the (Dr. R. Broom), 672
- South African Marine Expedition, 770
- South African Trawled Fish : A Protozoal Disease of, and its Routine Detection by Fluorescence (Rees Davies and E. Beyers), 714
- Soviet Anthropology : Recent Work on (Prof. A. Bunak), 218
- Soviet Genetics : Timiriazev, Founder of (Dr. G. H. Beale), 51
- Soya-bean Protein : Heat Treatment and the Biological Value of (Dr. S. S. De and J. Ganguly), 341
- Space and Spirit (Sir Edmund Whittaker), *review* by the Rev. J. C. Hardwick, 418
- Speciation in Cichlid Fish of East African Lakes : Selective Mating as a Factor for (Prof. Curt Kosswig), 604
- 'Specpure' and 'H.S.' Elements and Chemicals, 600
- Specific Conductivity and *p*H in Lakes : Correlation between (Dr. Kaare Münster Strøm), 782
- Spectral Sensitivity of Lead Sulphide Layers (T. S. Moss), 476
- Spectrographic Analysis : Suggested Definitions of Terms used in (Spectrographic Discussion Group), 567

Spectroscopic Estimation of Penicillin G (A. R. Philpotts, W. Thain and Dr. G. H. Twigg), 839
Spectroscopy (Groupement pour l'Avancement des Méthodes Spectrographiques general meeting on), 634
Spectroscopy (Infra-Red) : Silver Chloride Plates for (K. S. Tetlow), 850
Spectrum : Ultra-violet Absorption, of Anhydrous Nitric Acid (R. Norman Jones, G. D. Thorn. M. Lyne and E. G. Taylor), 163
Spectrum of Light Scattering of Crystals : Born's Theory and the (Prof. E. Gross and A. Stehanov), 474
Speeds (Subsonic and Supersonic) : Research in the Region between, 632
Sperm (Sea-Urchin) : Hyaluronidase in (Dr. A. Monroy and A. Ruffo), 603
Sperm Motility : Mechanism of Hydrogen Peroxide Formation by Spermatozoa and the Role of Amino-Acids in (Dr. J. Tosic), 544
Spermatozoa (Human) : A Rapid Supra-vital Staining Method for Assessing the Viability of (A. C. Crooke and Anita M. Mandl), 749
Spermatozoa and the Role of Amino-Acids in Sperm Motility : Mechanism of Hydrogen Peroxide Formation by (Dr. J. Tosic), 544
Spheres (Equal) : Densest Packing of (Sidney Melmore), 817
Spherically Symmetrical Non-Static Electromagnetic Field (Prof. V. V. Narlikar and P. C. Vaidya), 642
Spider Mites : Addition of Dinitro Compounds to D.D.T. to prevent Outbreak of (R. M. Greenslade and E. G. Goscombe), 843
Spiral Cracks in Glass Tubes (Dr. Livio Norzi), 306 ; *erratum*, 498
Spiral Cracks in Glass Tubing (W. P. Thistlethwaite), 192 ; (B. N. Clack and N. L. Harris), 541
Spirit : Space and (Sir Edmund Whittaker), *review* by the Rev. J. C. Hardwick, 418
Spleen : Pulmonary Œdema and the (Dr. H. Cullumbine and M. Simpson), 781
Splitting of Phosphocreatine (Frank Lundquist), 98
Splitting of Ribonucleic Acid by Ribonuclease : Volume Change accompanying the (H. Chantrenne, Prof. K. Linderstrøm-Lang and L. Vandendriessche), 877
'Spoiling' of Tungsten Steel (K. Hoselitz and M. McCaig), 710
Spontaneous Combustion of Hay (Dr. J. B. Firth and Dr. R. E. Stuckey), 624
'Squares' Method for Potential Problems (Dr. R. V. Southwell), 168 ; (Prof. G. Temple), 169
Stability Constants of Internal Complexes (Dr. D. P. Mellor and Dr. L. Maley), 370
Stability of Penicillin in Aqueous Solutions (G. Halliwell), 747
Stabilization of Penicillin in Aqueous Solutions by Low Concentrations of Phosphates (Robertson Pratt), 233
Stabilizing Linear Particle Accelerators by means of Grid Lenses (Dr. D. Gabor), 303
Staining Method : A Rapid Supra-vital, for Assessing the Viability of Human Spermatozoa (A. C. Crooke and Anita M. Mandl), 749
Staining Stomatal Starch : Role of Starch in Light-induced Stomatal Movement, and a New Reagent for (Dr. O. V. S. Heath), 647
Staphylococcus : Antibacterial Activity of the (Dr. M. A. Jennings and A. E. Sharp), 133
Starch (Soluble) : Precipitating Effect of Cationic Detergents on (M. Mutahhar Yenson), 813
Starch in Light-induced Stomatal Movement, and a New Reagent for Staining Stomatal Starch : Role of (Dr. O. V. S. Heath), 647
Starch and Cellulose : Structure of (T. G. Halsall, Prof. E. L. Hirst and Dr. J. K. N. Jones), 97
Stars : The Earth and the (Dr. C. G. Abbot), *review*, 862
  Sun, Moon and (Prof. William T. Skilling and Robert S. Richardson), *review* by the Rev. M. Davidson, 420
Stars and the Mind : The (Dr. Martin Davidson), *review* by Lieut.-Colonel H. D. Anthony, 521
Stars and Nebulæ : Atoms, (Leo Goldberg and Lawrence H. Aller), *review*, 793
'Static' (Solar) : Origin of (Dr. Chas. E. R. Bruce), 580
Stationary Phase in Partition Chromatography : Solvent-treated Cellulose Acetate as the (R. J. Boscott), 342
Statistical Analysis in Biology (Dr. K. Mather), second edition, *review*, 522
Statistical Methods : Application of, to Food Problems (Society of Public Analysts and other Analytical Chemists and the Food Group of the Society of Chemical Industry conference on), 36
Statistical Methods in Chemical Analyses (Vernon J. Clancey), 339
Statistical Quality Control (Prof. Eugene L. Grant), *review* by Maurice Kendall, 454
  A Bibliography of (Grant I. Butterbaugh), *review* by F. J. Anscombe, 387
Statistics : The Advanced Theory of (Maurice G. Kendall), Vol. 2, *review* by Prof. Godfrey Thomson, 148
  Mathematical Methods of (Prof. Harald Cramér), *review* by Prof. Godfrey Thomson, 826
Statistics (Mathematical) : A First Course in (Prof. C. E. Weatherburn), *review* by Prof. Godfrey Thomson, 826
Statistics in a School Course : The Incorporation of (B. C. Brookes), 582
Stearic Acid and Calcium on Metal Surfaces : Lubricating Properties of Molecular Layers of (J. N. Gregory and J. A. Spink), 403
Steel : Hardenability of (Iron and Steel Institute symposium on the), 853
  Reflectivity of (R. Weil), 305
Steel (Mild) : X-Ray Diffraction Studies of Yielding in (J. M. Cowley and M. S. Paterson), 846
Steel (Tungsten) : 'Spoiling' of (K. Hoselitz and M. McCaig), 710
Steels for Use at Elevated Temperatures (Dr. C. Sykes), 498
Steric Hindrance : *Neo*-pentyl Alcohol and (Dr. W. Gerrard and A. Nechvatal), 812
Sterilization : Soil, on a Field-Scale (Arch. B. Smart), 102
'Sterilized' Milk : A Proposed Test for (G. F. V. Morgan and C. H. Chalmers), 510
Steroids : Vicinal Action in (Dr. D. H. R. Barton and J. D. Cox), 470
Stimulation of Clouds to Produce Rain : Experiments on the (E. B. Kraus and P. Squires), 489
Stockbreeding : Science and, *review* by Prof. J. E. Nichols, 78
Stomach : Mechanism of High Acid Production by Yeast and its Bearing on Hydrochloric Acid Formation in the (Prof. Edward J. Conway and Dr. Thomas Brady), 137
Stomatal Movement : Role of Starch in Light-induced, and a New Reagent for Staining Stomatal Starch (Dr. O. V. S. Heath), 647
Stomatal Starch : Role of Starch in Light-induced Stomatal Movement, and a New Reagent for Staining (Dr. O. V. S. Heath), 647
Storage : Effect of Temperature of, on the Rate of Loss of Fertility of Stock Cultures of *Melanospora destruens* (Dr. Lilian E. Hawker), 136
Strain-Gauges (Wire) : Electrical Resistance, to Measure Large Strains (Dr. K. H. Swainger), 61
Strength of Solids (University of Bristol, in co-operation with the Institute of Physics, conference on), 193, 671
Stress-Optical Properties of Rubber (Dr. L. R. G. Treloar), 231
Striated Muscle : Isotropy in the *J* Striation of (A. G. Matoltsy and M. Gerendás), 502
Structural Changes in Somatic Chromosomes of *Drosophila melanogaster* : Production of (B. M. Slizynski), 66
Structural Engineering : Some Aspects of (Prof. H. J. Collins), 343
Structure of Alloys by Magnetic Analysis : A New Method of Studying the (P. T. Hobson), 436
Structure and Action in Drugs with Curariform Actions : Relationship between (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 86
Structures of Ethylene Oxide and Cyclopropane (Dr. A. D. Walsh), 165, 712 ; (Sir Robert Robinson), 400 ; (C. A. McDowell), 508
Strychnine and its relation to Cinchonine : Constitution of (Sir Robert Robinson), 263 ; *erratum*, 366
Studentships : Colonial Medical Research, 704
Submarine Tubes for Levelling (Prof. R. B. Montgomery), 408
Subsonic and Supersonic Speeds : Research in the Region between, 632
Substances radioactives et des solutions extrêmement diluées : Electrochimie des (M. Haïssinsky), *review* by F. Morgan, 690
Substrate : Mutations induced by Irradiation of the (W. S. Stone, O. Wyss and F. Haas), 837
Substrates from Cultures of the Genus *Marasmius* : Antibiotic Agents in the (Prof. Elias Melin, Torsten Wikén and Karin Öblom), 840
Succinic Dehydrogenase in Protozoa (Beverley A. Humphrey and George F. Humphrey), 374
Succinoxidase Activity of Hepatic Tumours produced in Rats by Feeding 2-Acetaminofluorene (Cornelia Hoch-Ligeti), 780
Sugar Beet : Vernalization of (Jean de Roubaix and O. Lazar), 442
p-Sulphonamido Benzoic Acid : Action of Phosphorus Pentachloride on (A. D. Kemp), 509
Sulphur Bacteria associated with the Corrosion of Concrete : Species of (C. D. Parker), 439
Sulphur Dioxide and Sodium Bisulphite : Gaseous, as Preservatives of Citrus Concentrates (Dr. Jacob Fiegenbaum and Shalom Israelashvili), 32
Sulphydryl Groups in the Action of Acetylcholine and Inhibition of the Vagus Nerve : Role of (Prof. Ch. S. Koschtojanz and T. M. Turpajew), *erratum*, 330
Sun : Radio Noise from the, at 3·2 cm. (K. F. Sander), 506
  Emission of Radio-Waves by the Galaxy and the (Joseph S. Shklovsky), 752
Sun (Disturbed) : Origin of Radio Emissions from the (Dr. D. F. Martyn), 26
Sun, Moon and Stars (Prof. William T. Skilling and Robert S. Richardson), *review* by the Rev. M. Davidson, 420
Sunflower Stem Cultures for the Detection of Plant Hormones (R. S. de Ropp), 606
Sunrise : Lateral Deviation of Radio Waves at (W. Ross and E. N. Bramley), 132
Sunrise and Sunset : Location of Thunderstorm Centres from Directional Observations of Atmospherics during (Dr. S. R. Khastgir, M. K. Das Gupta and D. K. Ganguli), 572
Sunspot : A Giant, 396
Superconducting Mercury : Penetration of Magnetic Field into (M. Désirant and Dr. D. Shoenberg), 201
Superconductor : Uranium Not a (Dr. D. Shoenberg), 303
Superconductors : A New Method for Determining the Penetration Depth in (A. B. Pippard), 434
Supersaturated Solutions : Crystallization of, by means of Electric Current (A. J. H. Boerboom), 230
Supersonic Speeds : Research in the Region between Subsonic and, 632
Supra-vital Staining Method for Assessing the Viability of Human Spermatozoa : A Rapid (A. C. Crooke and Anita M. Mandl), 749
Surface Balance of the Horizontal Type : A Recording (S. Ställberg-Stenhagen and E. Stenhagen), 814
Surface Formation of Lithium Negative Ions (Dr. R. H. Sloane and H. M. Love), 302
Surface Tension of Nuclear Matter and the Enumeration of Eigenfunctions of an Enclosed Particle (Prof. D. S. Kothari and Dr. F. C. Auluck), 204
Survey of British Somaliland : Report on the (Major John A. Hunt), 366
Surveys (Yield) : Plot-Size in (Dr. V. G. Panse), 820
Sweating in Sheep (J. B. Cragg and Lewis Davies), 34
Sweden : Atomic Energy in, 703
  National Research Council for Natural Sciences in, 297
Switzerland : Earthquakes registered during September, 57 ; during October, 57
Switzerland (near) : Earthquakes on January 16 and 24, 771
Sylviculture : Scientific Basis for, *review* by J. L. Harley, 44
Symbiont of *Oliarus cuspidatus* : A Mistaken (Prof. S. Mahdihassan), 237
Symbiosis : Hereditary (Seed-borne), in *Casuarina equisetifolia* Forst. (Prof. S. R. Bose), 512
Symbiotes of *Psylla mali* : Two (Prof. S. Mahdihassan), 749
Symons Medal of the Royal Meteorological Society to be presented to Prof. David Brunt, 92
Synchrotron Beam Ejection : Optimum Disturbing Field for (F. K. Goward and J. Dain), 636
Synergic Action of Penicillin and Bacteriostatic Dyes (Miss Mariam George and K. M. Pandalai), *erratum*, 57
Synergisms in Resting Bacteria : A Correlation between Redox Potentials and (Dr. Bruce E. Baker and Dr. Moritz Michaelis), 197
Synthèse : La Théorie de la catalyse vue d'ensemble et essai de (Prof. Jacques Métadier), *review* by Prof. H. W. Melville, 791
Synthesis of Cellulose by Resting Cells of *Acetobacter xylinum* (Dr. S. Hestrin, Dr. M. Aschner and J. Mager), 64
Synthesis of Methionine and similar Amino-Acids (J. R. Catch, Dr. A. H. Cook, A. R. Graham and Sir Ian Heilbron), 578 ; *erratum*, 634
Synthetic Growth-Substances : Fruit-Fall and its Control by (Dr. M. C. Vyvyan), 617
Synthetic Peptides : Quantitative Chromatographic Separations of (M. Jutisz and E. Lederer), 445
Syrian Hamster (*Cricetus auratus*) : *Entamoeba* sp. from the (R. A. Neal), 502
Szilard Effect : Exchange between Chromium Ions and the (R. Muxart, P. Daudel, R. Daudel and M. Haïssinsky), 538

TABULATING Machines (Punched Card): Use of, for Crystallographic Fourier Syntheses (Prof. E. G. Cox, L. Gross and Dr. G. A. Jeffrey), 433
Tata (Lady) Memorial Trust Awards, 226, 871
Taxonomy: The Teaching of (Linnean Society and the Systematics Association joint discussion on), 446
Taxonomy of Aquatic Insect Nymphs and Larvæ (Dr. T. T. Macan), 595
Taylor (George) Gold Medal of the Royal Aeronautical Society awarded to Prof. A. R. Collar, 669
Teaching: The Place of Science in (Lord Horder), 106
Technetium, the Element of Atomic Number 43 (C. Perrier and Prof. E. Segrè), 24
Technical Colleges and Industrial Research, 653
Telecommunications in War (Sir Stanley Angwin), 299, 397, 547
Telephone: Alexander Graham Bell and the Invention of the (Prof. G. W. O. Howe), 455; (Capt. G. C. Wilson), 870
Telescope: An Armagh–Dunsink–Harvard (Dr. E. M. Lindsay), 324
Television Practice (Course of lectures to be given at the Northampton Polytechnic), 23
Temperature on the Permittivity of Barium Titanate: Effect of (Dr. J. H. van Santen and Dr. G. H. Jonker), 333
Temperature during Ripening of Grain: Correlation between Yield of Wheat and (Dr. J. J. Chinoy), 442
Temperature of Storage: Effect of, on the Rate of Loss of Fertility of Stock Cultures of *Melanospora destruens* (Dr. Lilian E. Hawker), 136
Temperature-Dependence of the Intensities of Raman Lines (Dr. K. Venkateswarlu), 96
Temperature-Dependence of Magnetic Susceptibility of Annealed and Cold-worked Copper (T. S. Hutchison and Prof. J. Reekie), 537; *erratum*, 772
Temperatures (Low): Nuclear Magnetic Resonance at (B. V. Rollin and J. Hatton), 201
Ternary and Quaternary Fission of Uranium Nuclei (Tsien San-Tsiang, Ho Zah-Wei, L. Vigneron and R. Chastel), 773
Tertiary Bases on the Interaction of Thionyl Chloride and Hydroxy Compounds: Influence of (Dr. W. Gerrard and K. H. V. French), 263
Terylene: Structure of (D. V. N. Hardy and W. A. Wood), 673
Teshik-Tash Cave: Palæolithic Child from the (Dr. Franz Weidenreich), 218
Testament of a Physicist: Last, *review* by Prof. E. A. Milne, 486
Testosterone: Treatment of Keratitis rosacea with Small Doses of (Prof. Bernhard Zondek, Y. M. Bromberg and J. Landau), 171
Tetanus Toxin by X-Ray Inactivation: Influence of the Medium on the Inactivation of (E. Efrati, A. Back and Prof. L. Halberstaedter), 715
Tetravalent Manganese as an Activator in Luminescence (Dr. F. A. Kröger), 706
Tetrazolium Salt as a Seed Germination Indicator (Miss H. J. Cottrell), 748
Textile Design and Colour (William Watson), fifth edition, *review* by A. M. Latham, 7
Theobroma cacao: A Morphological Change Induced in Leaves of, by Mineral Deficiency (M. Greenwood and A. F. Posnette), 542
Therapeutics: International Congress on Short-Wave, 704
Thermal Scattering of Light in Diamond (Dr. R. S. Krishnan), 740
Thermal Transport Systems: Application of Similarity Principles to (M. W. Thring), 203
Thermal Treatment of a Cannel Coal: Formation of Coking Coal by (H. E. Blayden, J. Gibson and Prof. H. L. Riley), 536
'Thermal Wedge' Theory of the Parallel Surface Thrust Bearing (W. L. Wood and A. Cameron), 61
Thermionic Work Function: Hydrogen Overpotential and the (Dr. J. O'M. Bockris), 539
Thermodynamic Outlook: The Cultivation of a (G. G. Haselden), 626
Thermodynamics: Chemical (Dr. J. A. V. Butler), fourth edition, *review* by Dr. F. P. Bowden, 114
Thermodynamics in Education: The Place of (Physical Society, Low-Temperature Group, discussion on), 626
Thermodynamics and Showers: Nuclear (B. K. Agarwala and K. S. Singwi), 816
Thermophilic Bacteria in Composts of Fresh Green Material: Activity of (D. M. Webley), 35
Theses for Degrees ('Secret'): British Universities and (Dr. J. E. Keyston), 24; (Sir Robert Robinson), 25
Thiamin-deficient Rats (Normal and): Development of *Ornithodorus moubata* on (Dr. Botha De Meillon and Dr. Leon Golberg), 171
Thickness of Coatings (Apparent): Interferometric Determination of (Dr. W. K. Donaldson and Dr. A. Khamsavi), 228
Thio-thymine (2-Thio-5-Methyl-Uracil), (Dr. H. Cullumbine and M. Simpson), 680
Thiol Groups of Proteins: Action of Mustard Gas ($\beta\beta'$-Dichloroethyl-sulphide) on (Prof. Z. M. Bacq, V. Desreux and M. Goffart), 478
Thionyl Chloride and Hydroxy Compounds: Influence of Tertiary Bases on the Interaction of (Dr. W. Gerrard and K. H. V. French), 263
Thixotropy: Dilatancy and (Faraday Society and the British Rheologists' Club discussion on), 70
Thrust Bearing (Parallel Surface): 'Thermal Wedge' Theory of the (W. L. Wood and A. Cameron), 61
Thunderstorm Centres: Location of, from Directional Observations of Atmospherics during Sunrise and Sunset (Dr. S. R. Khastgir, M. K. Das Gupta and D. K. Ganguli), 572
Thyroid: Relation of the, to Infections (Dr. R. Reitler), 505
Tibetan Culture (Cheng Te-k'un and D. Michael Sullivan), 22
Tidal Forces: Absolute Axes and (A. G. D. Watson), 233
Tilden Lecture of the Chemical Society (Dr. A. E. Alexander), 160
Timber Decay and its Control (Forest Products Research Laboratory, Leaflet No. 39), 72
Time: Man, Nature and (William Alexander Gauld), 246
  Set, and Particle Size (Prof. F. H. Garner, Dr. Alfred H. Nissan and F. Mayo), 708
Tissue Cells (Susceptible): Enzymic Modification of the Reaction between Influenza Virus and (Joyce D. Stone), 780
Tissue Enzymes and Proteins: Effects of Organic Arsenic Compounds on, and on Tissue Metabolism (Dr. J. J. Gordon and Dr. J. H. Quastel), 97
Tissue Metabolism: Effect of Organic Arsenic Compounds on Tissue Enzymes and Proteins and on (Dr. J. J. Gordon and Dr. J. H. Quastel), 97
Tobacco Necrosis Virus Crystals: Electron Microscopy of (Dr. Roy Markham, Dr. Kenneth M. Smith and Dr. Ralph W. G. Wyckoff), 574
Toleration: The Second Treatise of Civil Government, and a Letter concerning (John Locke), *review* by Maurice Bruce, 248
Tomatoes grown in Great Britain: Seasonal Variations in Vitamin C Content of (Dr. Frank Wokes, J. R. Barr, L. Brunskill and A. C. Shaw), 171
Total Emission Damping in Diodes (A. van der Ziel), 675
Town Planning: War Industries and, 90
Toxic Organo-Lead Compounds (Dr. H. McCombie and Dr. B. C. Saunders), 491
Toxins: Detoxicating Effect of Verdoperoxidase on (Kjell Agner), 271
Toxiques de guerre: Travaux récents sur les (Prof. Z. M. Bacq), 617
Trace Elements in Plants and Animals: Significance of (Association of Applied Biologists discussion on), 206
Tracer Elements (Radioactive): Applications of, in Physics Research and Industry (Institute of Physics, Manchester and District Branch, conference on), 498
Trajectories (Electron): Oil-drop Method for (Dr. L. Jacob), 475
Trans-Uranic Elements: X-Ray Spectra of (J. W. Fisher and Prof. H. T. Flint), 741
Trans-Uranium Elements (Prof. Glenn T. Seaborg and Prof. Emilio Segrè), 863
Trans-Uranium Elements in Chemistry (Prof. Glenn T. Seaborg), 21
Transmission Lines: Apparent Breakdown of the Reciprocity Law for (Dr. C. H. Westcott), 540
Transport: Water—Origins and Early Evolution (James Hornell), *review* by M. J. B. Davy, 419
Trawled Fish (South African): A Protozoal Disease of, and its Routine Detection by Fluorescence (Rees Davies and E. Beyers), 714
Trees used for Animal Fodder in India (M. V. Laurie), third edition, 124
Trematoda: The (Dr. Ben Dawes), *review* by Dr. G. Lapage, 250
Trephocytes and Trephocytosis (Dr. Liebman), 413
Triatomic Hydrogen and Doppler Effect in Hydrogen Positive Rays (Dr. C. Dakshinamurti), 27
Trinitroanisole: Occurrence of a Monotropic Transformation in (Dr. T. C. J. Ovenston), 437
Trout: Acanthocephala of, and Anthelmintics—Behaviour *in vitro* (Dr. M. B. Lal), 545
Trypsin in the Detection of Incomplete Anti-*Rh* Antibodies: Use of (J. A. Morton and M. M. Pickles), 779
Tryptophanase (Cell-free): Preparation of (E. A. Dawes, J. Dawson and Prof. F. C. Happold), 99
Tryptophanase Complex: Nature of the (E. A. Dawes, J. Dawson and Prof. F. C. Happold), 644
Tubal Factor concerned in the Denudation of Rabbit Ova (G. I. M. Swyer), 873
Tubercle Bacilli: New Substances Exerting a Combined Bacteriostatic and Respiration-inhibiting Effect on (Bo Zetterberg), 235
  Vitamin Content of (Dr. O. D. Bird), 33
Tuberculosis of Guinea Pigs (Experimental): Effect of Calciferol and of Penicillin on (Dr. Lois Dickinson), 681
Tumour Inhibition with Extracts of Urine (J. L. Williams and C. L. Walters), 503
Tungstates and Molybdates: Fluorescence of (Dr. F. A. Kröger), 674
Tungsten Steel: 'Spoiling' of (K. Hoselitz and M. McCaig), 710
Turbo-Alternators: Hydrogen-Cooled, 432
Turbulent Flow in Alluvium (Gerald Lacey), 407
Tuticorin: Preliminary Study of the Chank Marking Experiments at (K. Chidambaram and M. Mukandan Unny), 651
Twinning in Quartz: A Theory of the Control of (Dr. W. A. Wooster), 94
Typhus: Scrub, as a Study in Ecology (Lieut.-Colonel J. R. Audy), 295

ULTRA-FILTRATION and Carbon Dioxide on the Prothrombin Activity of Plasma: Effect of (I. M. Chak and K. V. Giri), 878
Ultrasonic Waves (High-Frequency): Diffraction of Light by (Prof. S. Bhagavantam and B. Ramachandra Rao), 267
Ultra-violet Absorption Spectrum of Anhydrous Nitric Acid (R. Norman Jones, G. D. Thorn, M. Lyne and E. G. Taylor), 163
Unimolecular Reactions: Absolute Values of the Rates of (N. B. Slater), 264
United Nations: The, a Handbook on the New World Organisation (Louis Dolivet), *review*, 114
Universities: The Mission of the (J. Mackay-Mure), 392
  Science and the Humanities in the, 789
  British, and 'Secret' Theses for Degrees (Dr. J. E. Keyston), 24; (Sir Robert Robinson), 25
Universities in the Community: The Place of (British Association, Division for Social and International Relations of Science, conference on), 601, 698
Universities and the Increase of Scientific Man-power (Parliamentary and Scientific Committee report on), 177
University Development in Great Britain, 483
University Planning in Great Britain, 755
University Library, its Function and Potentialities (Dr. H. Coblans), 277
University Pamphlets (Student Christian Movement Press, Ltd.), 392
Upwelling of Oceanic Water from Mid-depths on to a Continental Shelf: Internal Waves and (L. H. N. Cooper), 579
Uranio: La scissione nucleare dell' (Dott. Emidio Prata), *review* by Prof. R. E. Peierls, 79
Uranium: Emission of Light Charged Particles in the Fission of (L. L. Green and D. L. Livesey), 332
Uranium Not a Superconductor (Dr. D. Shoenberg), 303
Uranium Nuclei: Ternary and Quaternary Fission of (Tsien San-Tsiang, Ho Zah-Wei, L. Vigneron and R. Chastel), 773
Urea Picrate: Isomorphic Form of (P. A. Ongley), 812
Urea Synthesis in Mammalian Liver (Prof. H. A. Krebs, L. V. Eggleston and R. Hems), 808
Urine: Tumour Inhibition with Extracts of (J. L. Williams and C. L. Walters), 503
Urine (Normal): Fibrinolytic Activity of (Dr. R. G. Macfarlane and J. Pilling), 779
Uruguay: A Monument to Darwin in, 90
U.S.S.R.: Earthquake in the Uzbeck and Kirghiz districts on November 2, 57

VACUUM Sublimation of Ice in Bulk (C. J. Bradish, C. M. Brain and A. S. McFarlane), 28
Vagus Nerve : Role of Sulphydryl Groups in the Action of Acetylcholine and Inhibition of the (Prof. Ch. S. Koschtojanz and T. M. Turpajew), *erratum*, 330
Van den Bergh Reaction : Serum Bilirubin and the (C. Gardakas, Dr. J. E. Kench and Dr. J. F. Wilkinson), 842
Variation-Intensity and Population-Flux in the Desert Locust : Evolutionary Significance of Periodicity of (Dr. M. L. Roonwal), 872
Végétale (Biologie) : Une voie nouvelle en (R.-J. Gautheret), *review* by Alan Burges, 80
Velocity of Electromagnetic Waves (Dr. L. Essen), 611
Verdoperoxidase on Toxins : Detoxicating Effect of (Kjell Agner), 271
Vernalization of Lettuce (Dr. L. G. G. Warne), 31
Vernalization of Excised Mustard Embryo (Dr. B. Sen and S. C Chakravarti), 783
Vernalization of Sugar Beet (Jean de Roubaix and O. Lazar), 442
Vernalization Response of Summer Varieties of Rice ; Effects of High Temperature and Short Days on (Dr. S. M. Sircar and B. N. Ghosh), 605
Vernalization and Photoperiodism, *review* by Dr. D. J. Watson, 179
Vertebrate Brain : Allometry of the (Dr. Donald Sholl), 269
Vesalius : New Light on, *review* by Prof. F. J. Cole, 655
Viability of Human Spermatozoa : A Rapid Supra-vital Staining Method for Assessing the (A. C. Crooke and Anita M. Mandl), 749
Vibration : Fluid Flow at a Small Hole due to (Prof. E. N. da C. Andrade), 132 ; (Prof. Gilbert D. West), 167 ; (Dr. Robert W. Lawson), 168
Vibrations sur les avions (Maurice Berthaume), *review*, 214
Vicinal Action in Steroids (Dr. D. H. R. Barton and J. D. Cox), 470
Victoria Medal of the Royal Geographical Society awarded to Prof. E. G. R. Taylor, 532
Victoria Plum : Control of Low-Temperature Injury in the (W. Hugh Smith), 541
Viking Fund Medal and Prize in Physical Anthropology awarded to Dr. Franz Weidenreich, 193
Virulence : The Nature of (Society for Microbiology discussion on), 427
Virus Growth : Xanthine Oxidase and (Dr. D. J. Bauer), 438
Viruses (Plant) : Use of Seeds in the Insect Transmission of some (A. F. Posnette), 500
Viruses and Rickettsiæ in the Chick Embryo : Cultivation of (Dr. W. I. B. Beveridge and Dr. F. M. Burnet), 277
Viscosity of a Hydrogen Bentonite Suspension : Effect of Sodium Hexametaphosphate on the Yield Value and (A. Reid and Dr. N. C. Sen Gupta), 336
Vision (Colour) : Mechanism of, *review* by Prof. Ragnar Granit, 417
  Researches on Normal and Defective (W. D. Wright), *review* by J. G., 180
  Retinal Structure and (Dr. E. N. Willmer), *review* by Prof. Ragnar Granit, 417
  Sex Differences in (Dr. R. W. Pickford), 606
  Defective, in Industry (Physical Society, Colour Group, Report on), 460
Visual Acuity : Flash (Prof. L. C. Martin and W. Kanlowski), 25
Visual Acuity with Blurred Tests : Measurement of (Y. Le Grand and E. Guillemot), 132
Visual Aids in the Teaching of Mathematics : The Place of (I. R. Vesselo), 582 ; (G. Patrick Meredith), 582
Vitamin Content of Tubercle Bacilli (Dr. O. D. Bird), 33
Vitamin A_2 : Retinene$_2$ and (Prof. R. A. Morton, M. K. Salah and A. L. Stubbs), 744
Vitamin C in English Apples (Margaret E. Kieser and Dr. A. Pollard), 65
Vitamin C Content of Tomatoes grown in Great Britain : Seasonal Variations in (Dr. Frank Wokes, J. R. Barr, L. Brunskill and A. C. Shaw), 171
Vitamin D : Transference of, from the Female Rat to her Young (Joan Embleton and Audrey J. Collings), 340
Vol des avions : Considérations sur la conduite et l'exploitation des essais de qualités de (Maurice Cambois), *review*, 214
Voltages (Very Low) : Gas Discharge in Air of Atmospheric Pressure at (Dr. O. Kantorowicz), 675
Volume Change accompanying the Splitting of Ribonucleic Acid by Ribonuclease (H. Chantrenne, Prof. K. Linderstrøm-Lang and L. Vandendriessche), 877
Volumetric Method for a Study of the History of Epeirogenic Movements (Alexander B. Ronov), 479
Volutin (Metaphosphate) in Mitosis : Function of (Dr. Carl C. Lindegren), 63

WAKEFIELD Gold Medal of the Royal Aeronautical Society awarded to Edwin Link, 669
Wakes behind a Moving Body : Existence of New Types of (Dr. R. V. Southwell), 642
Wales : The Coast-line of England and (J. A. Steers), *review* by Prof. A. E. Trueman, 349
War : Radio-communication during the (Institution of Electrical Engineers convention on), 299, 397, 547
  Telecommunications in (Sir Stanley Angwin), 299, 397, 547
War and Nations, *review* by Maurice Bruce, 181
War and Society : Human Nature, (Dr. John Cohen), *review* by Maurice Bruce, 181
War Industries : Labour for the—the Experience of Coventry (A. Shinfield), 90
War Industries and Town Planning, 90
War-time Advances in Medicine which might be translated into Civil Practice (Sir Alexander Biggam), 854
War-time Awards for Inventions : Claims for, 92
War-time Medical Research : Social Value of (Dr. G. Lapage), 854
Warner Memorial Medals for 1947 of the Textile Institute awarded to D. A. Derrett-Smith and Dr. D. A. Clibbens, 737
Water (River, Rain and Snow) : Electrical Conductivity of (Dr. W. R. G. Atkins), 674
Water Transport—Origins and Early Evolution (James Hornell), *review* by M. J. B. Davy, 419
Water-Bugs : Feeding Mechanism of (H. D. Slack), 604
Water-Solution : Mechanism of the Action of X-Rays on Enzymes in (Dr. A. Forssberg), 308
Water-balance Principle of Crustacean Eye-stalk Extracts (Dr. H. Heller and B. Smith), 544
Watt (James) International Medal for 1947 of the Institution of Mechanical Engineers awarded to Prof. S. Timoshenko, 498
Wave Equations : Relativistic (Dr. C. Jayaratnam Eliezer), 60
Waves : Internal, and Upwelling of Oceanic Water from Mid-depths on to a Continental Shelf (L. H. N. Cooper), 579
Waves and Weather for Navigators : Coasts, (John Q. Stewart), *review*, 793
Waxwing Immigration, 805
Wear : Friction and (E. J. W. Whittaker), 541
Weather for Navigators : Coasts, Waves and (John Q. Stewart), *review*, 793
'Wellcome' Photographic Year Book, 397
Wernher (Sir Julius) Memorial Lecture of the Institution of Mining and Metallurgy (Major-General A. J. Orenstein), 365
Western Philosophy and its Connection with Political and Social Circumstances from the Earliest Times to the Present Day : History of (Bertrand Russell), *review* by Lord Lindsay of Birker, 723
Whaling Grounds, 1946–47 (Antarctic) : Scientific Expedition to the (Dr. R. A. M. Case), 88
Wheat : Correlation between Yield of, and Temperature during Ripening of Grain (Dr. J. J. Chinoy), 442
Whitworth Scholarships : New regulations for the, 599
Wire Strain-Gauges : Electrical Resistance, to Measure Large Strains (Dr. K. H. Swainger), 61
Wires : Determination of Limit of Proportionality of (Prof. F. C. Thompson and W. R. Tyldesley), 30
Witwatersrand : The History and Prevention of Silicosis, with special reference to the (Major-General A. J. Orenstein), 365
Wollaston Fund of the Geological Society awarded to Dr. Austin William Woodland, 123
Wollaston Medal of the Geological Society awarded to Dr. Joseph Burr Tyrrell, 123
Women in the Professions : Economic Status of Men and, 41
Wood-destroying Fungi : Antibacterial Titre in (Prof. S. R. Bose), 33
Wool (Board of Trade Working Party Report on), 688
Workers : Statement on the Economic Considerations affecting Relations between Employers and, 279
Works Library : The (Association of Special Libraries, Northern Branch, conference on), 771
World : One, or None (edited by Dexter Masters and Katharine Way), *review* by Prof. M. L. Oliphant, 247
World (New) : Scientific Policy for the, *review* by Prof. S. Zuckerman, 316
World Affairs : Nuclear Explosives, Nuclear Power and, *review* by Prof. M. L. Oliphant, 247
World Food Board : Proposals for a (Food and Agriculture Organisation of the United Nations), 211
World Food Survey (Food and Agriculture Organisation of the United Nations), 211
World Medical Literature : Abstracts of, 261
World's Resources : Population Trends and the (Dr. C. L. Bertram), 396
Writer : Painter and, *review* by Dr. A. Tindell Hopwood, 860

X-RAY Analysis (Institute of Physics, X-Ray Analysis Group, conference on), 498
X-Ray Crystallography : Summer School in, 398, 568
X-Ray Crystallography in Industry, *review* by Dr. W. A. Wooster, 348
X-Ray Diffraction Data : Index of (Preparation of a second Supplement by the American Society for Testing Materials), 465
X-Ray Diffraction Studies of Yielding in Mild Steel (J. M. Cowley and M. S. Paterson), 846
X-Ray Irradiation : Influence of the Medium on the Inactivation of Tetanus Toxin by (E. Efrati, A. Back and Prof. L. Halberstaedter), 715
X-Ray Spectra of Trans-Uranic Elements (J. W. Fisher and Prof. H. T. Flint), 741
X-Rays : What Chemistry Owes to (Dr. Kathleen Lonsdale), 285
  Identification by, of Interface Compounds on 'Oxide' Cathodes (H. P. Rooksby), 609
X-Rays on Enzymes in Water-Solution : Mechanism of the Action of (Dr. A. Forssberg), 308
X-Rays and Electrons : The Diffraction of, by Free Molecules (Dr. M. H. Pirenne), *review* by Dr. R. Fürth, 45
Xanthine Oxidase and Virus Growth (Dr. D. J. Bauer), 438

YEAST : Influence of Cations in the Production of Citric Acid by (Dr. M. Deffner and A. Issidoridis), 879
  Mechanism of High Acid Production by, and its Bearing on Hydrochloric Acid Formation in the Stomach (Prof. Edward J. Conway and Dr. Thomas Brady), 137
Yeast and Rickets (E. Hoff-Jorgensen), 99

TRADE ASHE MARK

Media and Supplements for

MICROBIOLOGICAL ASSAYS

of Vitamins and Amino Acids

We are now able to offer delivery of the following products for the microbiological assay of Riboflavin, Nicotinic Acid and Amino Acids. All materials are tested for uniformity and purity.

Vitamin-free Spray-dried Casein Hydrolysate. *Suitable for the microbiological assay of Nicotinic Acid and Tryptophan.*

Riboflavin-free Yeast Supplement. *In ampoules sufficient for the preparation of 1 litre of assay medium.*

Nicotinic Acid Basal Medium. *Specially prepared to meet the growing demand for a complete medium for the assay of Nicotinic Acid.*

Supplementary Ingredients. *Vitamins, Purine Bases and Amino Acids to prepare media.*

Amino Acid and Vitamin Assays. *We can also carry out assays of the "essential" Amino Acids and the following Vitamins: Riboflavin, Nicotinic Acid, Pantothenic Acid, Pyridoxin and Biotin. Fees on application.*

JUST PUBLISHED: "Practical Methods of Microbiological Assays" by Dr. E. C. Barton-Wright. ***(1st. Edn. pp. 64, 7/6 net).***

NEW ERA

HARD TIMES

with hard water

Water Companies taking a lot of trouble to treat hard water, often meet trouble too. Mineral salts are precipitated as hard scale which clogs the plant and makes the upkeep very costly. But there is now an answer. One part of Calgon introduced to a million parts of water can stop scale deposition. This "Threshold" treatment with Calgon is one of the many ways in which Albright & Wilson are helping Water Engineers to keep water free-flowing and make water troubles pipe down.

ALBRIGHT & WILSON LTD.

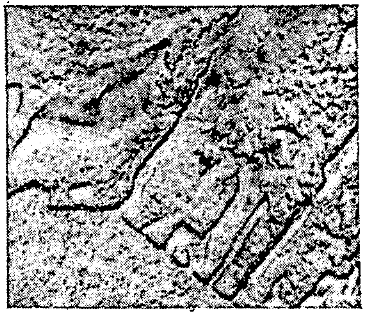
Chemicals for Industry

49 PARK LANE, LONDON, W.1 · WORKS: OLDBURY & WIDNES

Photography's unique ability to 'see' and record phenomena which lie beyond the limits of human vision is helping British industry in its great task of reconstruction. Radiography, spectrography, analysis-recording, high-speed photography, photo-micrography, electron micrography, X-ray micrography and X-ray diffraction are some of the important methods used—in engineering, metallurgy, welding, fabrication, foundry work, inspection, research and kindred industrial fields. For further information (including the new illustrated folder, *What is Applied Photography?*) you are invited to write to:—

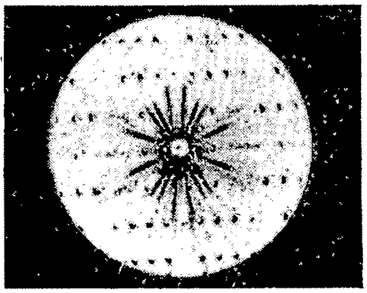
PHOTOGRAPHY'S KEEN EYES ARE HELPING INDUSTRY

KODAK LTD · KINGSWAY · LONDON · W.C.2

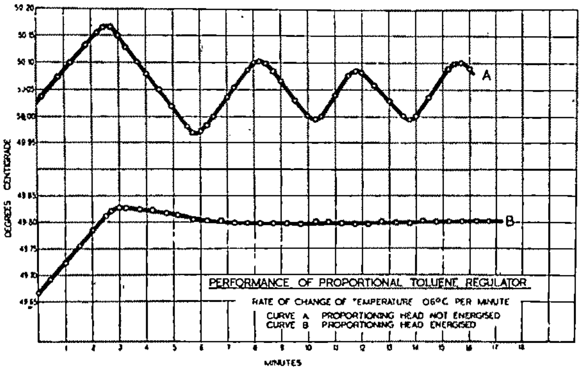


ELECTRON MICROGRAPHY magnifies up to 200,000 times, recording structural details previously undetectable.

X-RAY DIFFRACTION reveals crystal structure, identifies alloys and compositions, shows effect of drilling, punching, etc.



TENFOLD IMPROVEMENT IN TOLUENE REGULATOR PERFORMANCE



This record of an actual experiment shows how the SUNVIC Proportioning Head, used with any Standard Toluene Regulator, improves the fineness of regulation, giving a stability of the order of 5 milli-degrees.

The SUNVIC Proportioning Head is normally used in conjunction with a SUNVIC Type EA 2/T Electronic Relay. This apparatus is fully described in Technical Publication EA11/1. Please request a free copy today.

FREEDOM OF THE PRESS

THE lively debate on the control and ownership of the Press in the House of Commons on October 29, which issued in a resolution urging the appointment of a Royal Commission to inquire into its finance, control, management and ownership, touched on matters that lie very near the heart of democracy, and which may have a closer bearing on the advancement of science than a superficial examination would suggest. It is not that there is any great enthusiasm for a Royal Commission. On the contrary, few suggested that a Royal Commission could add significantly from the fact-finding point of view to the information already collected in the report issued in 1938 by Political and Economic Planning, and Mr. Douglas Jay was not alone in failing to see that such an inquiry would produce any very substantially useful results. Even if other facts were discovered, he questioned whether they would throw more light on the really essential question whether the present financial control of the Press is interfering with freedom of expression.

That central issue was clearly recognized in the debate. Few questioned that the general tendency for the great majority of newspapers to fall into the hands of a very few men constitutes a serious threat to political democracy. That was explicitly stated by Mr. Haydn Davies in moving the resolution: Could we, or could we not, have real freedom of the Press in a system of combines and chain newspapers ? But among those who agree with Mr. Davies that we cannot, there are still those who doubt whether Government action such as a Royal Commission might invite could be effective without involving worse dangers. What is wrong is not so much the private ownership of the Press, as the use that is being made of that ownership.

If, however, the existence of abuses is recognized, there is little indication of clear ideas as to how they are to be checked. Moreover, as Mr. Driberg pointed out, it is not solely a question of freedom of expression for the writer, but of a part of the general liberties of the citizen, who is entitled to receive accurate news and fair comment. However well-founded may be the belief that the citizen is not getting a full measure of either, no one succeeded in the debate in showing how that measure could be extended without either a direct curtailment of the liberty of the Press or an extension of Government control.

What is required, in fact, is some very clear and constructive thinking at just this point, and it can scarcely be expected that a Royal Commission will go beyond the fact-finding from which such thinking must start. No doubt a further inquiry will again emphasize the interference with freedom of expression which comes from the present law of libel ; and Mr. Mallalieu suggested that a Royal Commission might well look into the question of the way in which freedom of expression and of discussion is hindered by the tendency to exclude the Press directly or indirectly from the proceedings of local councils. Such matters, however, like the better training of journalists and the higher standard of writing for which Mr. Mallalieu and Mr. Derek Walker-Smith both pleaded, are scarcely matters on which a Royal Commission can formulate proposals. They must come in the main from the professional associations of journalists or from that body of informed public opinion which, recognizing the natural restraints on freedom which are inherent in an organised community, realize also the value of standards evolved from within rather than constraints imposed from without or above.

It could not be said that the opinion expressed in the debate was entirely pessimistic. Some speakers suggested that the position is already better than two decades ago, and Mr. Walker-Smith at least anticipates both advances in technique and in presentation from the production side, and also in the standards which a people whose mind is on the march would demand. Though this comes near the core of the problem, other speakers in the debate showed little consciousness that this whole question is bound up with the wider one of informing the public and assisting the formation of a sound public opinion in a democratic society, to which both broadcasting and the information services which a Government is bound to use have also important contributions to make.

It is the great merit of Francis Williams's "Press, Parliament and People" (W. Heinemann, Ltd. London, 1946. 8*s*. 6*d*. net) that he sets all these factors in their true perspective, and his book should certainly assist in assessing the value of the contribution which a Royal Commission can make. In fact, it is difficult to believe that the report of a Royal Commission could stimulate the constructive and creative thinking, which is our primary need, half so effectively as this lively and timely book. The key problem is not so much that of the ownership and control of the Press, as that of how a democracy can adjust itself to the great and inevitable increase in the concentration of power in the hands of a Government without endangering the personal liberties inherent in a democracy.

That thread is clearly visible in what might well have seemed an interminable debate on the address to the Throne, which well illustrates both the need on the Government side to inform the people of what it is doing in terms that they can understand, and on the other hand the balancing need for highly informed and critical watchfulness on the part of the Press and other instruments of public opinion in order to safeguard the liberties of the individual. As Mr. Williams truly observes, many of the problems of domestic reconstruction are so complex that an almost entirely new approach to the task of informing and explaining policy will be required if the great mass of ordinary people upon whose positive co-operation the success of these policies depends are to feel themselves participants in a common adventure. Moreover, not only is there a need for less secrecy and more information in home and in foreign affairs alike; the debate on certain topics such as the 'closed shop' also underlines the force of Sir Walter Layton's contention in his pamphlet, "Newsprint: a Problem for Democracy", that the present size of the Press, with the consequent limitation of knowledge of public affairs, constitutes a severe handicap to the country. On the evidence of this debate alone, it might be added that it constitutes a danger to personal liberties and to individual justice, apart from the fact that, as Sir Walter observes, "the press of a country is neither healthy nor truly free unless its circulation can respond to the impact of public opinion".

Mr. Williams has much that is pertinent to say about the British press censorship as it was exercised during the War. Emphasizing that it was always voluntary, he points out, too, that it was one of fact and not of opinion. It existed to advise the Press as to which facts could and which could not safely be published without running the risk of giving the enemy information of value in the prosecution of the War. It had no authority to advise the Press as to the opinions they should or should not express. Moreover, while Mr. Williams from his inside knowledge pays a high tribute to the liberality with which the British press censorship was on the whole conducted, he is convinced that censorship of any kind is an instrument to be used only in the most extreme circumstances and with the most rigorous safeguards, and that no Government can be trusted with power to control the Press or the publication of books. Even in the circumstances of war, more damage was done, on the whole, when newspapers accepted directives on policy outside the strict and narrow limitations of press censorship than when they ignored them.

That opinion is well substantiated by Mr. Williams's account of the failure of political censorship during the War. Whereas in the technical and factual field the machinery established for joint consultation and co-operation made for the elimination of clashes and contributed to the success of the censorship, in the political field he argues it cannot be justified. It represents a confession by the authorities of their refusal to trust the people to form sound opinions, and of their unwillingness to allow them to judge between conflicting views and to abide by the result as democracy requires.

The growth of public relation and information services is a much bigger question. Mr. Williams points out how that growth has been accentuated by the War and still more by the measures of social reconstruction to which Britain is now committed; and he shows that Government information services, including such research units as the Social Survey, have a permanent and essential place among those instruments which the executive in a democracy requires to carry through positive measures essential to national and international advance, while the democracy retains those checks upon the exercise of undue authority, those balances and counterbalances which are equally essential to safeguard liberty. We are here straying into that important problem of the organisation of government machinery, and it must suffice to note with Mr. Williams that publicity is no substitute for good administration; it is only effective when the administrative measures it seeks to explain are sound in themselves. What is essential is that the version of a measure or policy placed before the general public by the information services of the Government shall be fair and unbiased. Public judgment must be formed on the true facts, and not on a partisan presentation of them.

That is an argument for the constant scrutiny of the activities of Government information services, but not for their restriction; and one basic reason for Sir Walter Layton's plea for a more generous supply of newsprint is to enable the Press to play more effectively its part in such scrutiny, and in averting the further danger that under the guise of straightforward explanation and instruction the public may be led to accept as facts what are highly debatable propositions. This is a point which was missed by the unofficial 'working party' under Sir Richard Gregory's chairmanship which prepared for the recent Empire Scientific Conference a paper on the "Dissemination of Scientific Information to the General Public"; but it is one to which scientific workers need to give far more attention. It is one aspect of the obligations which their loyalty to truth demands in that partnership with science as a part of the social contract which in Burke's view constitutes the State. Beyond that it is a duty which they owe to science itself. A bad book was ever the enemy of other books, and in the conditions of to-day it has to be remembered that publication of a book or a periodical which does not meet those high standards of accuracy and impartiality which science rightly demands, may well be hampering the publication of another which does.

That is no reason for return to a censorship. The argument of Milton still stands. But it is imperative that the reviewing of books and the scrutiny of scientific publications of all kinds should be searching and objective, and that neither loose nor tenditious writing, inaccuracy, nor verbiage should escape the criticism it invites. It would be easy to instance recent scientific and technical books which have been too lightly handled in this respect. If the proceedings of the Royal Commission and Mr. Williams's book emphasize that scientific workers have real responsibilities in this field, much good will have been done; and possibly one way opened up for easing that serious position which the shortage of scientific and technical books is causing. It is true that increasing use is being made of broadcasting for the dissemination of scientific news, and scientific men in Britain are showing far more signs of awareness of the immense influence which the B.B.C. can exert in educating and informing the public on scientific and technical matters. The way in which this influence could be exerted and the use of this instrument, by which the mass of the people can learn more about the world in which they live and something about the purpose and significance of the policies their Government has adopted, were among the reasons prompting the desire for an independent inquiry on broadcasting policy which the Government rejected in the White Paper last July.

While, however, broadcasting is one important way in which information on Government policy or on scientific and technical matters can be disseminated, it cannot either replace the printed book or paper, or provide the check on executive action which is the other half of the democratic problem. That part of the problem relates to the machinery of government; this cannot be discussed further here, except to insist once more that any effective machinery of government must be equipped with adequate means of both keeping the executive in touch with the trend of public opinion and of providing the country and the world in general with an honest and truthful picture of the position of the nation and the reasons for its policy. Any form of censorship or control that would restrict the seeking out and disclosure of truth or dam the flow of knowledge, either within any one nation, or between nations, is a fatal bar to the efficiency of democratic government and the understanding between peoples on which all our hopes depend. It is only by a readiness to seek and publish the truth whatever its implications, to enter into frank debate between governed and governing, and between nation and nation, to challenge, to criticize and propose, and to offer to the test of world opinion the principles by which we seek to guide our affairs, that, as Mr. Williams concludes, freedom can flourish.

Until the terms of reference of the Royal Commission are published, it is, of course, not known whether or not its inquiry will embrace the scientific and technical Press as such. Indirectly at least it is clear that the whole question touches the dissemination of knowledge and the advancement of science very closely. Some of the particular problems which it offers to men of science have already been indicated. They on their side have repeatedly emphasized in the past year how closely not merely the advancement of science but also the future of civilization depend on the restoration of the fullest freedom of communication within and between the nations. There is in Mr. Williams's book, no less than in the debate just noted, much that should stir them to the constructive thinking on the organisation and use of information services which the functioning of democracy and the needs of science both demand.

HISTORY OF MODERN CHEMISTRY

Modern Chemistry

Some Sketches of its Historical Development. By A. J. Berry. Pp. x+240. (Cambridge: At the University Press, 1946.) 10*s*. 6*d*. net.

THIS is a history of chemistry that is different. Its title and sub-title indicate quite a new approach to the treatment of the subject. A chemistry curriculum is a crowded affair nowadays, partly because of the rapid advances and immense ramifications of chemistry, and partly because it is not yet certain, in these post-war years, just how the curriculum should be arranged. In this changing period the attempt is almost inevitably made to give students as much information as they can digest, with the result that many scarcely realize that all these advances have been made by men many of whom are still alive and still contributing to the science. With undergraduates it is especially important that this human side of chemistry should be brought to the fore, even at the expense of selection. Mr. Berry has set out to accomplish this difficult task of attaching a name or names to these achievements in chemistry. It is not an easy task, for naturally personal predilection is bound to occur, but it is well that the British contribution (and at times even the Cambridge contribution) should take its proper place among that from other countries.

An honours student will already be familiar with much that is in this book, but he will be none the worse for re-reading it from a rather different point of view—much of the detail is omitted and therefore the story has a continuity that is lacking from the average formal text-book. The physical side of chemistry is more suitable for Mr. Berry's treatment, and consequently we find chapters on atomic theory, electro-chemistry, stereo-chemistry, radioactivity, isotopes, gas reactions and the nature of solutions. There might have been more, but the variety of topics encompasses most divisions of physical chemistry. In short, the book forms an excellent companion to a good introductory text in physical chemistry, easily read and assimilated by any student even though his studies are already full. Mr. Berry is to be congratulated on putting physical chemistry of the last fifty years into a true historical perspective in a pleasant and painless manner.

H. W. MELVILLE

INTRODUCING SCIENCE

Frontiers of Astronomy

By Dr. David S. Evans. (Sigma Introduction to Science, 1.) Pp. 175+8 plates. (London: Sigma Books, Ltd., 1946.) 6*s*. net.

Science versus Cancer

By Dr. I. Berenblum. (Sigma Introduction to Science, 2.) Pp. 116+8 plates. (London: Sigma Books, Ltd., 1946.) 6*s*. net.

Electrons in Action

By Dr. J. G. Daunt. (Sigma Introduction to Science, 4.) Pp. 151+8 plates. (London: Sigma Books, Ltd., 1946.) 6*s*. net.

Power

By Dr. Martin Ruhemann. (Sigma Introduction to Science, 5.) Pp. 123+8 plates. (London: Sigma Books, Ltd., 1946.) 6*s*. net.

THE four slender volumes listed above are the first issues of a new series which, under the general title of "Sigma Introduction to Science", aims at raising and satisfying a thirst for scientific knowledge among the general public. The volumes are uniform in format, with that rather dreary-looking make-up to which we have, unfortunately, had to accustom ourselves in this austerity era. Each is illustrated with a set of excellent plates; and each is priced at 6*s*., which seems rather high, if the publishers are aiming at a really extensive circulation. None presupposes any previous knowledge of the subject, and all are free from mathematical equations, at any rate in the text. (Dr. Daunt, after struggling manfully against the temptation through 141 pages, does eventually succumb so far as to quote Ohm's law in an appendix.)

Here the similarities end. Though it is convenient to speak of the non-scientific reader, it is well to remember that since the term applies, unfortunately, to the vast majority of our fellow-countrymen, it embraces every grade of intellect and every variety of interest. Genius itself could scarcely produce a treatise which would satisfy the needs of so heterogeneous a company. An author must select his own company from the mass; and the present authors do not seem to have come to any agreement about the audience they are addressing. There is, perhaps, no particular reason why they should. This divergence of treatment does, however, make it impracticable to give a general recommendation to the series. Each volume will, no doubt, find a clientele; it would be an exceptionally undiscriminating reader who would find them all acceptable to him.

It was almost inevitable that the first introduction should be to astronomy. The public appetite for popular astronomical works appears to be almost insatiable, and for very obvious reasons. "Frontiers of Astronomy" is a straightforward matter-of-fact account of the present state of astronomical knowledge in most of its branches. There is a chapter on the solar system, two on stars in general, another on solar physics; novæ and cepheid variables are not neglected, and galaxies, nebulæ and the like also receive a perhaps somewhat scanty treatment. There is also an excellent chapter on astronomical instruments. Dr. Evans has a talent for clear statement and orderly arrangement, and has had, moreover, not a little experience in the popularization of science. Though necessarily highly condensed, the treatment is clear and logical, and the reader who is prepared to give it the requisite attention will find that the book provides a very sound introduction to a very extensive science.

The reader who has been brought up on earlier popular astronomy should perhaps be warned, as the author indeed warns him in a foreword, that the purpose of the book is to provide information, not to discuss its philosophical or religious implications. Unfortunately, Dr. Evans, in his reaction against what one may call the Jeans–Eddington school, has swung too far in the direction of the Gradgrind philosophy ("You are never to wonder, Louisa!"), and even purely scientific speculations on the universe are often dismissed too summarily with the statement that they are not proved. The framing of hypotheses is the ultimate aim of the scientific worker and the method by which he works. A little more indulgence in this direction would not only have made the book less arid, but would also have given a more balanced view of the subject.

"Science versus Cancer", the second of these 'introductions', is a wholly admirable book and will, we hope, receive the widest possible circulation. The problem of cancer is one in which we are all, quite literally, vitally interested; but there is no subject on which apparently well-substantiated rumours are more prevalent, and authoritative information is more difficult to come by. "What is cancer?", "Is it on the increase?", "Is it hereditary, or is it due to environment?", "Can it be prevented, and is there any cure?" These are questions which are constantly being asked, and sometimes being answered too, with more assurance than knowledge, both in conversation and in the general Press. It was high time that a simple, comprehensible and accurate statement of facts about cancer, so far as they are known, should be given to the public, together with the evidence on which they are accepted. Dr. Berenblum, in writing this little book, has performed a real public service.

It is not easy for a medical specialist to address the general public on his speciality. He has to hold the balance between arousing unjustifiable hopes and raising unnecessary and paralysing fears. Dr. Berenblum has a steady hand, and a sound judgment, and the balance in this case swings true. As a factual statement of the present position of our knowledge about this most deadly of human scourges, "Science versus Cancer" can be warmly commended.

The book, however, goes further than this. It provides, as the title implies, a most admirable précis of the history and progress of cancer research; surely one of the most difficult, baffling and fascinating fields of investigation ever explored. "One sometimes hears it stated that the layman is only interested in the practical results of research," writes Dr. Berenblum in his preface. ". . . If this is true, it is the result of bad education, and is to be deplored. . . . There is a romance of science which stimulates the mind and satisfies the soul; it also happens to be the surest approach for one's understanding of the truth." This is admirably said, and the editor of this, or any similar series of publications, might well consider issuing it as a general directive to all his contributors.

"Electrons in Action" is not a very apposite title for Dr. Daunt's little book. By a convention, which may be illogical but is now well established, it leads one to expect an account of the behaviour of electrons in the free state—in other words, an introduction to the science of electronics. What we have, in fact, is a descriptive sketch of the basic principles and phenomena of electricity and magnetism, covering (so far as such a large subject can be covered in 150 pages) the whole field from elementary electrostatics to radiolocation. The treatment is entirely non-mathematical, and the author has been at some pains to avoid, so far as possible, the use of technical terms. Imagery and analogy largely take the place of scientific argument. Analogy can be a dangerous tool, and some of Dr. Daunt's analogies seem to have been selected more for their entertainment than their didactic value. His picture of a magnetic field as a dense forest of pine trees, and electrons as little men who are terrified of the gloom and try to get out as quickly as possible, is definitely misleading. Electrons are not "terrified" of magnetic lines of force; on the contrary, they tend to describe circles around them, and Dr. Daunt's electronic men, so far from rushing out of the forest the nearest way, would tend to play ring-a-ring-o'-roses around the trees.

Dr. Daunt's material is well selected, and he keeps a firm grip on the development of the subject. The treatment is more elementary than that of the two preceding volumes of the series, and the author seems to have in mind a class of reader for whom the elementary notions of science have to be made very clear and simple. Within these limits he achieves probably as good a picture of the main outlines of the subject as can be attained without the use of some mathematical argument.

The author of "Power" has, in our opinion, missed an opportunity. There is a definite need for an authoritative, well-documented and widely comprehensible sketch of the power resources of the world, on which our present civilization is built. Without some knowledge of this subject it is impossible to plan intelligently either an Empire or a cottage, and a suitable book on the subject would be widely welcomed. Dr. Ruhemann could, we believe, have written such a book. He knows his subject, and much of the information which we should like to have is, in fact, to be found in his pages, though the search would be less tedious if he had provided the book with an index. Unfortunately, Dr. Ruhemann seems to have formed an unduly low opinion both of the seriousness and the mental capacity of his potential readers, and has adopted a style which is not merely conversational, but also, in places, positively facetious. We do not think, for example, that he adds either clarity or interest to his account of the Rankine cycle by calling the water molecule "George", and having his illustrator picture him (or it) as a little black bottle imp with golliwog eyes. The drawing of the steam engine would, in fact, have been of more assistance to the reader if the artist had left "George" out and put in the essential valves instead. (Incidentally, the whole policy of illustrating the series with humorous sketches is one which deserves reconsideration.)

When he is not striving after humour, Dr. Ruhemann can be both lucid and informative. He has selected his material well, though there are topics on which one would be glad to have the data on which his pronouncements are based. The best utilization of power for human welfare involves considerations other than those of engineering efficiency, and if Dr. Ruhemann (in common with engineers in general) wants the public to "change its habits" he must produce evidence. Would it be presumptuous to suggest that he should read Dr. Berenblum's "Science versus Cancer", and then reconsider his policy? Science can be made fascinating, without invoking the doubtful aid of the comic muse. J. A. CROWTHER

AN ENCYCLOPÆDIA OF PSYCHOLOGY

Encyclopedia of Psychology
Edited by Philip Lawrence Harriman. Pp. ix+897. (New York: Philosophical Library, Inc., 1946.) 10 dollars.

PERHAPS the fairest way of judging a work of this kind is to consider the relative amounts of space allotted to different topics. Considered in such a way, the present volume presents a somewhat queer picture. "Counseling in Student Personnel Work" occupies six pages, "Memorisation" rather less than two not particularly effective pages of a general article called "Genetic Psychology". "Experimental Psychoanalysis" and "Experimental Abnormal Psychology" receive together more than double the space allowed to "Experimental Psychology". "Porteus Maze Tests", no doubt excellent devices of their kind but after all not the only ones, get eight pages all to themselves, and "Lie Detection" has just about the same prominence as "Learning". "Rat in Animal Psychology" absorbs thirty-two pages, "Industrial Psychology" two and a half. "Semantics" (Language) runs to thirty-four pages, and "Intelligence Testing and Tests" to four. Speaking generally, problems of a pathological order receive very much more attention than anything else.

There seems a notable absence of plan, as if authors were more or less picked and then left 'to get away' with their particular pet topics. This works well enough at times, and at others gives rise to odd results, as in a rather detailed discussion of "Climate and Human Behavior" which, among other things, observes that "The hot drought phase is the typical season for despots, dictators, communism, totalitarianism, Gestapo, pogroms, fascism and decadence in general".

The writing is very uneven, but extremely rarely distinguished. With some exceptions the factual material is correctly and concisely reported. At the same time, it is in general highly selected, with an immensely strong bias towards the writing down or omission of anything that is not American.

The editor says that this encyclopædia is intended to serve the needs of three classes of people. First, there is the expert investigator who wants to find out the facts about topics of research which lie outside his own field. Well, such a person will no doubt have a background for critical evaluation and can look after himself. It seems likely, however, that most investigators will want to go where they can get both fuller and better information. Second, there are undergraduates and graduate students who have heard things mentioned in passing, by their lecturers, and want to discover more about them. The book is of far more doubtful value for these, because most of them will lack the critical equipment needed to appraise a large bulk of its contributions. Third, there are the people who want to know what are the trends in current psychology. Whether the book adequately or clearly represents these trends and whether in any event the trends can be properly understood without a much wider setting than can be attempted in a large series of short and shortish articles, many of them extremely restricted in scope, could obviously be a subject of long debate. One thing, however, seems plain. The last seven years have made a lot of difference to psychology, but this is far from obvious so far as the effort of the present volume is concerned.

For trends alone, a smaller book, with longer, better informed and much more international surveys of a few outstanding developments, would be preferable. For a genuine psychological encyclopædia—if this is required—a very much larger volume or succession of volumes could alone fill the bill.

F. C. Bartlett

UNIFICATION OF ALGEBRA

College Algebra

By Prof. A. Adrian Albert. Pp. xii+278. (New York and London: McGraw-Hill Book Co., Inc., 1946.) 14*s*.

In one sense, it is somewhat surprising to find how little progress has been made, during the past fifty or sixty years prior to 1939, in the presentation and content of many subjects taught in schools and colleges. In some directions there has been a considerable advance, notably in experimental science, but in mathematics the forward movement has been much slower. Our methods and subject-matter seem to be securely tied up in the bonds of tradition. Yet, all the time, a great and evolutionary force has been quietly at work; this has eventually inspired the necessity for a new outlook and a corresponding change in the *modus operandi*. The Second World War has contributed considerably to this onward sweep, for it has revealed in no unmistakable manner how far behind we are. It must not be forgotten that it took a long time to replace Euclid by modern geometry, as well as to break down the artificial barriers erected by tradition between the various compartments into which mathematics was originally divided. It is, for example, not so long ago that the student of arithmetic and pure geometry was denied any application of algebra to those subjects. Happily, those days have gradually passed away, yet much remains to be done. Only recently, the Mathematical Association devoted much time to a discussion of reforms in the school certificate examinations. As a result, it advocated considerable revision in the syllabuses prescribed by the examining authorities—less formal algebra and geometry, and a closer co-ordination between geometry and trigonometry.

But the evolutionary spirit has also penetrated the subject-matter itself. Newer conceptions are demanded which will not only develop a more coherent unity in mathematics generally, but also in the compartments themselves. In the case of algebra, for example, it asks: Is algebra, as taught to undergraduates, regarded as a complete entity, or is it made up of a collection of seemingly unrelated topics? Prof. Albert, who is well known for his outstanding research on algebra, declares that the time is ripe for the subject to be presented as a unified whole instead of a miscellaneous collection of isolated topics; hence this new and inspiring work on "College Algebra". As he pointed out in an earlier volume entitled "Introduction to Algebraic Theories" (1940): "During recent years there has been an ever increasing interest in modern algebra, not only of students in mathematics, but also of those in physics, chemistry, psychology, economics and statistics".

"College Algebra" formulates a standard minimum of requirements which emphasize that algebra has a basic unity. The first three chapters are devoted to number systems, and include permutations and combinations, since these "involve nothing but counting". The fourth chapter deals with the purely algebraic theory of polynomials and rational functions. In Chapter 5, on identities and applications, the binomial theorem, summation formulæ and the progressions are treated in logical sequence and with great clarity. The sixth and seventh chapters are concerned with equations, both in theory and practice, while in Chapter 8 the algebraic theory of vectors and linear equations is linked up with trigonometry and analytic geometry. Finally, in the last two chapters, matrices, determinants and linear systems are discussed. It should be mentioned here that the author regards Chapter 10, devoted to matrices and quadratic forms, as a pedagogical experiment, since his personal experience has shown that the "theorems and techniques can be taught to immature students if no attempt is made to derive the results". Thus the text is presented in this form and should be useful to mathematical economists and psychologists.

As in all Prof. Albert's books on algebra, the subject-matter is arranged with consummate skill and written with great clearness, with the laudable desire of providing a sound foundation upon which to build an intelligent course in the calculus. The order of treatment may seem a little unusual at first, but the book tends to open a new epoch in the presentation of algebra as a new and rigorous approach to the subject, and notably in the emphasis placed upon knitting together the various topics into a fundamental unity.

It would be both interesting and progressive to see a school algebra fashioned upon similar principles.

F. G. W. Brown

Textile Design and Colour

Elementary Weaves and Figured Fabrics. By William Watson. Fifth edition. Pp. xii+513. (London, New York and Toronto: Longmans, Green and Co., Ltd., 1946.) 25*s.* net.

THE author, in this edition of his book, has revised the earlier editions and added further chapters bringing his subject-matter up to date. The volume is, in consequence, more interesting and comprehensive and, because of its wider scope, more likely to have a general appeal.

In the earlier chapters, a detailed and well-illustrated description is given of all the simpler fundamental weaves requiring one warp and one weft, which makes this portion of the book particularly suitable for the young student or for those wishing to revise their knowledge of fabric structure. Herein, one finds all the structures clearly defined from plain weave, twills, satins, sateens, to bedford cords and piqués.

The second portion of the book, which describes the light and pigment theories of colour and their simple application to woven textiles, is sound, as are the chapters dealing with the simpler jacquards and the figured fabrics woven thereon. The author presents, in a lucid manner, the method by which jacquard designs are produced from the sketch, and developed through point paper drafting to the woven fabric.

But it is the latter part of the book which the more experienced reader will find valuable. To anyone connected with the textile industry, the glossaries of yarns, weaves and fabrics are most useful as sources of reference. The chapter on the manufacture of rayon, outlining as it does the processes for producing the different types, and the section on recent developments in fibres and yarns are particularly interesting, especially when dealing with the characteristics and definitions of the new synthetic yarns. The subject of cloth firmness, with the necessary calculations for finding the ideal cloth particulars, or any required changes either in sett or counts of yarn, will be found useful to both student and manufacturer alike.

In fact, this volume is a good, sound text-book and is recommended to those requiring a thorough knowledge of the simpler weaves and of the yarns necessary for building up their structures.

A. M. LATHAM

Differential and Integral Calculus

By Prof. Ross R. Middlemiss. Second edition. Pp. viii + 497. (New York and London: McGraw-Hill Book Co. Inc., 1946.) 16*s.* 6*d.*

THE first edition of this very useful book was briefly reviewed in *Nature* of July 19, 1941. In this new edition, the general plan has been retained and such modifications made in the text as experience has rendered necessary. These changes have involved the rewriting of many sections and several entire chapters. A serious attempt has been made to improve the rigour without adding to the difficulty of the text. For example, the treatment of partial derivatives has been practically recast in order to place emphasis on physical rather than purely geometrical aspects, while the chapter on multiple integrals has been revised and expanded to include spherical as well as cylindrical co-ordinates.

A commendable change in the sections devoted to the applications of the definite integral is the substitution of Duhamel's principle by simpler and, in some cases, by more valid methods. A drastic revision of the chapter on infinite series has been made, which now includes a useful theorem for estimating the comparative value of the remainder after k terms.

Finally, most of the problems in the original edition have been replaced and the total number increased. Curiously, answers are only provided to those exercises which bear odd numbers. As in the earlier edition, the text is clearly printed and excellently illustrated by many well-drawn figures.

Undoubtedly, the changes made by the author tend to improve the book, and no reader should have any difficulty in gaining a thorough understanding of the fundamental principles of the calculus.

Acoustics for Architects

By Dr. E. G. Richardson. Pp. 90. (London: Edward Arnold and Co., 1946.) 5*s.* net.

AS the title implies, this small book is specially written for the 'general practitioner' in architecture, who merely requires, according to the author, a statement of the fundamental acoustic principles, and help in applying them in practice. It is not intended for the physicist, who would, of course, find it far from satisfying.

In the first chapter, the author gives just sufficient information concerning the characteristics of sound to enable him to make the rest of the book fully intelligible to the reader, and he does this very well. Further, he emphasizes the importance to the architect of securing uniform acoustic conditions in a hall over the important range of frequency which lies between 100 and 5,000 vibrations per second.

A very useful second chapter is devoted to a historical survey of the study of the acoustics of buildings, to help the student to understand the problems which arise in applying the laws of sound to architecture. From this point the author develops his theme in a logical and clear way, and the last chapter gives a résumé of the principles of acoustics in the form of suggestions for planning various types of auditorium for the best conditions of listening.

The book, which is produced under war economy conditions, is well written, and what diagrams are included are straightforward and understandable.

Vie et transmutations des atomes

Par Jean Thibaud. (Sciences d'aujourd'hui.) Deuxième édition revisée. Pp. 290+24 plates. (Paris: Albin Michel, 1942.) 86 francs.

SINCE 1942, when this revised edition of an older book of 1937 appeared, relatively little has been published on nuclear physics, except in connexion with fission. This exceedingly lucid account of the subject, which has been received recently, probably remains one of the best of the few available texts of its kind. Emphasis is primarily on the experimental side, but the references to nuclear theory, and to fundamental matters of a more general character, are apt and suggestive. The plates constitute a most attractive feature. There are twenty-four of them, each beautifully printed on a separate page. A number are copied from other publications, but some appear to be original. Altogether they provide, among other things, a vivid record of the appearance of a nuclear physics laboratory and of the apparatus used in it, which is possibly of more than passing interest.

THE MAKING OF THE MISSING CHEMICAL ELEMENTS*

By PROF. F. A. PANETH

Radiochemical Laboratory, University of Durham

ALMOST five years ago, in a lecture to the Institute of Chemistry in London, the success that radioactive methods had achieved in the task of completing the Periodic System was described[1]. In the table given, the place of element 87 was filled by the symbol of a newly discovered branch product in the actinium series; but in the places of elements 43, 61, 85 and 93 no symbols were inserted, although, as explained in some detail, atoms of all these four elements had been artificially produced.

This denial of full citizenship to artificial elements seemed justified in those days. They had been produced in invisible amounts only, and they were unstable and usually not present on the earth; whereas in the case of all the natural elements, we could be sure that, even if they belonged to the radioactive families and were only represented by fairly short-lived isotopes, very considerable quantities always existed. (For example, the laws of radioactive equilibrium ensure the presence in the upper 60 km. of the earth's crust of more than 10,000 tons of polonium.) The limited importance attributed until a few years ago to the artificially produced elements was reflected also by the absence of any names suggested for them.

To-day the situation is very different. In the 1942 lecture the cyclotron was called "the most efficient instrument for atomic transmutation". Now this title goes to the uranium pile, with its largely superior output of neutrons. With its help many pounds of an artificial element with atomic number 94 have been produced which, on account of its half-life of more than 20,000 years, will be present on the earth for a long time to come. (For theoretical reasons we must expect a minute proportion of element 94 always to accompany natural uranium.) Although its manufacture was difficult, it would be a harder problem still to destroy the element; even if exploded as a bomb, only a fraction of the material comes to a premature end. Moreover, the availability of any desired quantity of element 94 opens the way to the production of visible amounts of elements still higher in the Periodic System. Finally, the uranium pile has given us the means of creating lighter elements in bulk too; among the very products of uranium fission are many new isotopes not only of well-known elements, but also of the missing elements 43 and 61, which can thus be obtained in a far greater quantity than by any previous method. The chemistry of some of the newly created elements is already known as well as, or better than, that of some of the less important ones which were discovered in Nature many decades ago, and their practical application is at least a possibility.

In these circumstances, there seems to be no doubt that the time has come for the systematizing chemist no longer to discriminate between natural and artificial elements, but to pay equal attention to the study of both and, in the tables of the Periodic System, to insert everywhere the appropriate symbols. In this latter attempt we are, however, confronted with the difficulty that there is at the moment no complete agreement about the relative merits of the various claims to the discovery, or manufacture, of new elements. It is to be hoped that this question will be carefully discussed at some future meeting of a committee invested with international authority; pending that, I can give merely my personal views. However, an exchange of letters with several scientific workers interested in these questions has convinced me that most of them have come to the same, or very similar, conclusions.

In accepting names and symbols for the elements 43, 61, 85, 87, 93, 94, 95 and 96, I think chemists ought to be guided by the following rules. (1) The right to name an element should go to the first to give definite proof of the existence of one of its isotopes. (2) In deciding the priority of the discovery, there should be no discrimination between naturally occurring and artificially produced isotopes. (3) If a claim to such a discovery has been accepted in the past, but is refuted by later research, the name given should be deleted and replaced by one chosen by the real discoverer.

To state the last rule in so many words would seem unnecessary, if it were not that in at least two cases the general practice violates it[2]. The names 'masurium' and 'illinium' are so firmly rooted in text-books and tables that recent work on artificial isotopes of the elements 43 and 61 is sometimes referred to as the production of species of masurium and illinium, while the artificial isotopes actually were the first representatives of the hitherto missing chemical elements. Without going into details of the alleged discoveries, it seems necessary to say that the slowness of chemists in taking the obvious action of abandoning the suggested names is due to the failure of the claimants to withdraw their statements, although during years of intensive effort they had been unable to substantiate them. In the case of masurium, W. Noddack even went so far, five years after the announcement of the discovery, as to complain to the convener of a chemical meeting in Königsberg for not having invited him to speak on this element, as the geographical neighbourhood of Masuren would have made this specially appropriate and he would have been in a position to disclose the whole chemistry of masurium; but no communication has ever appeared on this work. During the War, W. Noddack was appointed professor of inorganic chemistry in Strasbourg by the occupying power; when in 1945 the French chemists returned, they found the symbol Ma painted on the wall of the main chemistry lecture theatre in a large representation of the Periodic System. (Private communication from Dr. J. Guéron.)

Actually, element 43 was first produced by Perrier and Segrè in 1937 by bombarding in the cyclotron element 42, molybdenum, with deuterons or with neutrons[3]. This work was extended by Seaborg and Segrè[4]. Further details may be found in my lecture of 1942[1]. As to element 61, I mentioned in that lecture the work of two research teams, Law, Kurbatov, Pool and Quill at Ohio State University[5], and Wu

---

[*] Substance of a lecture delivered before the Royal Institute of Chemistry in Leeds on October 29, 1946.

and Segrè at the University of California[6]. It is most probable that both had isotopes of element 61 under investigation; but the difficulties of ascribing the various, not very strong, activities to definite atomic species were very great in those days, when cyclotron bombardment was the only means of producing them.

Now we are able to direct attention to an investigation on element 61 during the War by research workers engaged in the study of the radioactive fission products of the uranium pile. Speaking last April on the occasion of a symposium on nuclear chemistry at Atlantic City (New Jersey), Prof. Charles D. Coryell, of the Massachusetts Institute of Technology, then at the Clinton Laboratories, Oak Ridge, Tennessee, revealed that among the many scientifically important results obtained by workers on the project—he mentioned in this connexion especially N. E. Ballou, L. E. Glendenin, J. A. Marinsky, E. R. Tompkins and G. W. Parker—was the clear identification of an isotope of element 61, with a half-life of 3·7 years. It is formed by the β-disintegration of a neodymium isotope with half-life of 11 days, and decays into a stable samarium isotope. It is only a question of time when milligrams of this element, unknown in Nature, will be available for study.

The next of the missing elements, 85, was manufactured by Corson, Mackenzie and Segrè in 1940, and its chemical character studied[7]. The great significance of this work has been emphasized before[1]. We have to add now the interesting fact that about two years later Karlik and Bernert[8], in the Vienna Institute for Radium Research, obtained strong evidence that in all three natural radioactive series, isotopes of element 85 occur; they discovered new groups of α-rays, the energies of which agree very well with those to be expected for atoms of element 85 with mass numbers 218, 216 and 215; such isotopes could be formed in the radium, thorium and actinium series in the percentages observed, if either the *A*-members or the emanations showed a small tendency to β-disintegration in addition to their well-known α-decay. The experiments do not yet allow us to distinguish between these possibilities; whereas, therefore, the mechanism of the formation of these new branch products is still uncertain, there seems no doubt that the Misses Karlik and Bernert have to be credited with the proof of the existence of natural isotopes of element 85. Former claims were open to grave objections and were experimentally disproved by very careful work by the Vienna physicists[9].

Nothing new can be said about the undisputed discovery, reported earlier[1], of element 87 in the form of a natural isotope, actinium K, by Mlle. Perey[10].

The most spectacular development has taken place in the region of the trans-uranium elements. As is well known, this work had a direct bearing on the production of one type of atomic bomb and was secret during the War; but to-day a sufficient amount of information has been released to permit an appreciation of the scientific value of the new discoveries[11].

If a neutron is captured by a uranium atom $^{238}_{92}$U, a new uranium isotope $^{239}_{92}$U is formed which emits β-rays and changes, with a half-life of 23 min., into an element with a β-activity of half-life 2·3 days. The fact that this β-radiation, which had been observed before, belonged to the element 93 was proved by McMillan and Abelson[12] early in 1940 with the help of chemical and physical experiments; they are, therefore, to be considered as the discoverers of the first trans-uranium element. As its name they proposed neptunium (Np), from Neptune, the first trans-Uranus planet. Owing to its short life-time, invisible quantities only of $^{239}_{93}$Np are available. Later, however, A. C. Wahl and G. T. Seaborg found another isotope of neptunium, of mass number 237, which is an α-emitter with a half-life of 2·25 × 10^6 years; it is formed by the β-decay of a uranium isotope 237 (half-life 7 days), a substance which can be produced by bombarding $^{238}_{92}$U with fast neutrons either in the cyclotron or, better, in the uranium pile. Of this long-lived neptunium species, hundreds of milligrams have already been obtained in the form of pure chemical compounds. A thorough investigation showed that the chemistry of neptunium closely resembles that of uranium; it can occur in the same valency states III, IV, V and VI, of which the lower ones are, however, more stable than the corresponding ones in uranium.

It has already been mentioned that $^{239}_{93}$Np emits β-rays. Consequently, the daughter element occupies place 94 in the Periodic Table; its half-life is about 2·4 × 10^4 years, and it decays with α-radiation, thus being the parent of $^{235}_{92}$U, the well-known actino-uranium which forms 0·7 per cent of the naturally occurring element uranium. This isotope of element 94 was found by J. W. Kennedy, G. T. Seaborg, E. Segrè and A. C. Wahl[13] early in 1941; it was, however, not the first discovered; already in the preceding year G. T. Seaborg, E. M. McMillan, A. C. Wahl and J. W. Kennedy[14] had shown that deuteron bombardment of uranium 238 led to an isotope of neptunium of the same mass number, which is β-radiating, and thus gives rise to an isotope of element 94 with the mass number 238. This new substance emits α-rays and has a half-life of about fifty years; its disintegration product is identical with the uranium II of the natural series. Following the tradition of the naming of uranium and neptunium, the discoverers of element 94 suggested for it the name plutonium (Pu), after Pluto, the tiny outermost member of the solar family, found in 1930. The study of the properties of plutonium was at the outset very difficult owing to the invisibility of the quantities available of $^{238}_{94}$Pu; but of $^{239}_{94}$Pu, with its long life-time, one could prepare by extended cyclotron bombardment an amount sufficient for chemical investigation, albeit at the beginning only for 'ultra-microchemical' studies. Later, by the use of the neutron-capture reaction in the uranium pile, very large quantities of plutonium have been manufactured for military purposes. Its chemistry, electro-chemistry, and physical properties are very accurately known. It has been disclosed that this element, like neptunium, resembles uranium; again, we find the valencies III, IV, V and VI, valency III being more stable than in the case either of neptunium or uranium.

Since any desired amount of plutonium is now available in the laboratories engaged in the working up of the material of the uranium piles, it was only natural to try whether elements higher still in the Periodic Table could be obtained by bombarding plutonium in the cyclotron. G. T. Seaborg, R. A. James, L. O. Morgan and A. Ghiorso, in collaboration with J. G. Hamilton and his group of physicists, found that helium ions of very high energy (40 MeV.) actually produced isotopes of elements 95 and 96; not much has yet been published about their chemistry; but it seems that the general similarity of the trans-uranium group with uranium is maintained. This is no surprise if we remember that Bohr, so early as 1922, in his theoretical treatment of the Periodic System, predicted a kind of 'rare earths group' in this part of the table, beginning at, or shortly after, uranium[15]. Following this analogy, the discoverers of elements 95 and 96 propose the names 'americium' (Am) and 'curium' (Cm), to emphasize the probable similarity of their electronic structure with their lower homologues europium and gadolinium. (Obviously there were no names of further planets available; should such ever be discovered in the future, a leading American astronomer believes that his colleagues would follow then the chemical nomenclature[16].)

I hope I have made it clear that, in my opinion, if we observe the rules laid down above, there is scarcely room for any doubt as to who should be entitled to name the eight newly discovered chemical elements. For the elements 94–96 the question seems already settled, and the names neptunium, plutonium, americium and curium will most likely be generally accepted. As to element 87, a few more words are necessary. The name actinium K, as chosen by Mlle. Perey, is obviously only suitable for the particular isotope she discovered; the element, which may comprise various isotopes, should have a name not so closely linked with the special branch product of the actinium series. (Compare the sense in which 'polonium', which subsumes all the isotopes of element 84, is distinct from 'radium F', which is only the most important of the isotopes, and the first discovered.) As a result of correspondence with Mlle. Perey, I can state that she shares this view and proposes as the name for element 85 'francium' (symbol Fr).

So far no names for elements 43, 61 and 85 have officially been put forward by their discoverers, Perrier and Segrè, Coryell and his group, and Corson, Mackenzie and Segrè, respectively. Every chemist concerned with the task of teaching systematic inorganic chemistry and of keeping his table of the Periodic System up to date will be grateful if they will publish soon the names which they consider suitable. [See p. 24 of this issue of *Nature*.]

POPULATION STUDIES IN FISHERIES BIOLOGY

By G. L. KESTEVEN

Marine Biological Laboratory, Cronulla, N.S.W.

THE analysis of populations of fish, chiefly in relation to age composition, has developed greatly since Peterson[1] described his method of dissecting length–frequency curves. Such analysis makes use of the ability to identify the age of fish from certain structural features of scales, otoliths and similar structures, and is associated with the problem of measuring the rate of growth. For effective application, this work requires the employment of vigorous sampling techniques related to commercial and experimental operations, as described by Fridrickson[2], Hodgson[3] and Sette[4,5]. Analyses of this kind have been employed for the following purposes: (*a*) to compare stocks of different regions[6]; (*b*) to compare stocks at different times[7]; (*c*) to assess mortality-rates[8]. The first two have been employed chiefly in relation to the study of 'condition' of fisheries in connexion with the possibility of depletion. The latter use was developed by H. Thompson[8] when, in working on haddock, he presented a technique for measuring recruitment into the fishable stock and for subsequent assessment of the effect upon the stocks of the strength of successive broods.

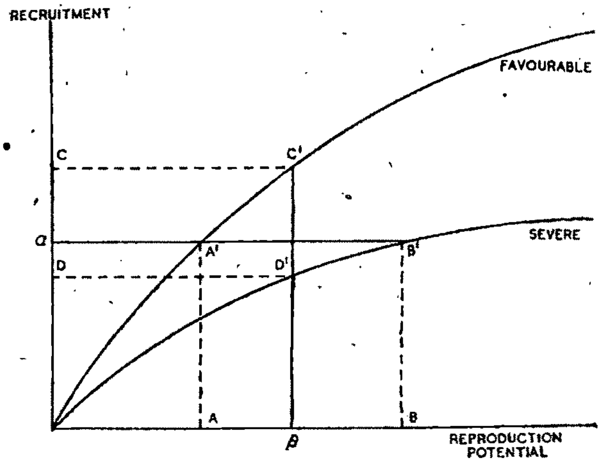
It does not appear to have been appreciated that the analysis of the stock can have greater meaning than hitherto has been seen in it. Its value is not so much for the primary result of revealing the relative numbers of various size, age, sex, gonad condition, feeding and other biological groups which characterize the population, nor even for the indication which it might yield of the possibility of depletion: its chief significance is as a means of measuring the dynamic properties of the population, interaction of which with the environment determines the compositional characteristics. The main properties are the potentials of growth (weight increase) and reproduction, and despite the work of Chapman[9] in presenting the original concepts in this work, the significance of these potentials has been neglected.

It has been argued[10] that no necessary relationship exists between the number of spawners of a particular stock in a particular year and the number of young fish eventually recruited to the fishery. There exists here some ground for misunderstanding: the vicissitudes to be suffered by spawners, eggs, larvæ, post-larvæ and young fish are such that the argument as to numerical relationship between any pair of the above links in the reproductive chain has little or no validity as between any other pair; yet this does not make it impossible to measure the successive relationships, in conjunction with observations upon the environment. The necessary analysis of these components has begun already in the work on plaice[11] and haddock[12], in which the strength of the spawning population has been estimated from egg abundance, and the dispersal and mortality of eggs have been measured. Further work on haddock[13] has attempted analysis of the relationship between strength of the mature population and survival of broods. The technical difficulties of this type of work, particularly in planktology, are not belittled; but it is held that they have already been shown to be not insuperable.

It is suggested that a first purpose of stock analysis is to yield a preliminary estimate of the likely abundance of eggs to be produced by the population, that is, the potential fecundity of the spawning population. From that point observational work should provide an estimate of the *effective* egg production, and eventually of the survival of eggs, larvæ and young fish. Theoretically the sequence should thus lead to an estimate of recruitment, the accuracy of which could be compared with the observed strength of the recruit class. Continuance of such work over a number of years would undoubtedly yield a fairly precise correlation between the three elements : (*a*) the spawning population ; (*b*) environmental conditions ; (*c*) recruitment. With refinement of technique and extension of sampling, such work should convert the preliminary relative estimates of (*a*) and (*c*) into reliably absolute ones, and after sufficient years the actual strength of each age (or other) group will be known from having been observed since its spawning. A schematic representation of these relationships is given in the accompanying illustration. The fact that the actual relationship between reproduction potential and recruitment might be quite other than the curvilinear one shown here does not detract from the generality of the argument presented. It is suggested that for any level of reproduction potential, say, on the ordinate, there exists a range of levels of recruitment between C and D on the abscissa marked off by the projection from the points C' and D' on the curves of relationship which delimit extremely favourable and extremely unfavourable environmental conditions. Such limits as these could be marked off in a scatter diagram; but it is recognized that the accumulation of sufficient material for this method would be a matter of considerable difficulty, and it is suggested as alternative that quantitative expression of environmental favourability should be attempted and the limits suggested in the illustration defined thereby. On the other hand, the relative position on a diagram such as this of point relationships between estimated reproduction potential and observed recruitment should indicate relative favourability of the environment and assist in assessing the significance of various environmental factors.

The significance of these suggestions in the general theory of fisheries exploitation is discussed below.

Growth curves measuring linear and mass increases have been prepared for very many species of fish. Since it is possible to measure the amount of growth which a fish of a given age is capable of accomplishing in a given period, it should also be possible to predict the amount of growth which numbers of fish of diverse ages should be able to accomplish in a similar period. Such growth would, of course, be dependent upon the amount of food available relative to the requirements of the population, and upon other environmental factors. Some experimental research has been carried out on the nutritional requirements of fish[14]; but it is not surprising, remembering the difficulties of experimenting with fish, that this work has not yet got very far. The observational work on conditions of growth of fish is also inadequate, particularly in connexion with the effect of population densities upon growth. There has been much controversy, for example, over the question of whether over-crowding reduces the growth-rate, and whether the converse, depopulation, is likely to lead to increase. However, observation of stock composition, estimates of related growth potential, and subsequent measurement of growth achieved should permit a correlation between growth potential and the environment, similar to that proposed between reproductive potential and the environment, and allow a useful prediction of the amount of increase in mass which may be expected from the population.



THEORETICAL RELATIONSHIP BETWEEN RECRUITMENT AND REPRODUCTION POTENTIAL

As offset to the increase in numbers (reproduction) and in mass (growth), natural and fishing mortalities operate to reduce the population. Many mathematical analyses have been made[15] of the relationships between hypothetical values of the terms fishing mortality, natural mortality, growth and reproduction; but it has yet to happen that anyone should prepare a formula which has validity over a wider range of years than that for which the formula was prepared. The formulæ so far presented to describe fish populations relate chiefly to the consequences of changes in the intensity of fishing operations. It is not, I believe, unfair to say that none of them has attempted to evaluate the actual properties of any fish population (even theoretically), or to conceive the measurement of the interaction of population and environmental properties, with the view of determining the basic reasons for mean levels of abundance and year-to-year changes of these levels. In point of fact, it has been a matter of some concern that the relationship between the fisheries biologist on one hand and the hydrological and planktological team on the other has at most times been somewhat tenuous. The results of the work of the latter group have been applied in biological analysis in a somewhat haphazard fashion : the boundaries of major water masses have been recognized and correlated with certain biological phenomena[16,17], and some correlations between occurrences of fish and wind[18] and phytoplankton[19] have been demonstrated; but these fall far short of the degree of integration which must be achieved to bring this science to the level of precision of which it is capable.

Of the formulations of the modern theory of fishing, Russel's[20] is probably simplest. According to this

$$S_2 = S_1 + (A + G) - (C + M),$$

where S_1 and S_2 represent the stock in successive years, A the recruitment, G growth, A and M catch and mortality. It will be recognized that this constitutes a useful symbolism, facilitating discussion, but is not an analytical weapon. Subsequent formulations have been presented by Graham[21], Thompson and Bell[22] and Thompson[23], and these have some continuity with the work of Baranov[24,25]. These theories have been mainly concerned with the effect of fishing upon the stocks, and have approached the matter by way of attempted theoretical equations for the gross elements of the system ; they have been based upon the recognition of a stock of fish as a self-reproductive system, the growth of which is demonstrably a simple exponential function. However, it has been necessary to assume values for the various elements, and by test to ascertain which combination of rates best fitted the observed conditions. Moreover, this work has been concerned with the population as a whole, and reproduction-rates, etc., employed have been assumed sum expressed rates for the population : that is to say, the technique presents a theoretical description of the population, but no analysis. One consequence of this approach to the population as an implied homogeneous whole has been a fallacy in respect of the significance of the point of inflexion of the sigmoid curve describing the growth of the population. Graham[26] has argued that since the rate of growth in an organism, or population, is greatest at the point of inflexion of the sigmoid curve which describes that growth, then the rate of growth at this point represents the optimum which may be expected from each population, and the catch which can be taken from a fish population at that point will prove to be the optimum. It is pointed out, however, that at the point of inflexion the high rate of growth represents the highest excess of reproduction over mortality (that is, of individuals of which the population under consideration is composed, whether cells or organisms) ; but actually reproduction will be greatest at some later point. Since a post-reproductive group has not yet been demonstrated in fish, it is presumed that both reproduction and mortality will continue to mount higher with the increase in the size of population, provided such numerical increase in population strength is not solely composed of young fish, with consequent decline in average age for the population.

The relationship between recruitment, mortality and intensity of fishing has lately been submitted to more detailed mathematical analysis, especially by Ricker[27,28].

It is the intention of this paper to submit that the approach to this problem has hitherto been insufficiently balanced. Raitt[29] has referred to the intricacy of the relationships involved in relation to reproductive capacity, and the work of Baranov[24] and Herrington[13] has considered the problems of nutritional limitations upon population growth. But these fill in detail of only part of the picture of a few populations. What is required is the comprehensively detailed analysis of the population to identify all the components of the system, and to measure the factors which operate upon these components. This will yield a better measure of the consequences of fishing, both the immediate effect of proportional removal and the later consequences to population properties of these removals. Further, this work will permit a more realistic approach than has hitherto been possible to the question of determining optimum catch ; that catch being defined as the quantity, from each particular population, which will ensure the fullest expression of the population's potentials of growth and reproduction. Definition in this form is necessary since the precise relation between the various terms is as yet unknown. I have recently[30] given a general discussion of the planning of this work.

RECENT ADVANCES IN CANCER RESEARCH*

By Dr. PEYTON ROUS
Rockefeller Institute, New York

EXPERIMENTAL cancer research is less than fifty years old, even younger than bacteriology ; a few of those who began it are still active. It started when the rewards of the close observational study of human cancer had become small. Then for the first time medical scientists paid attention to the fact that animals have tumours too—a fact known for some while. With the demonstration that these growths are true neoplasms (new growths) and the transfer of some of them from host to host, things got under way. At first hopes ran high that the cause of cancer would soon be found ; but then it became clear that the animal tumours maintained by transplantation carried the secret along with them. Nothing could be procured from the tumour cells which would cause other growths, and anything killing them, in even the most subtle way, brought the neoplastic process to an end. Furthermore, the transplanted tumours called forth no resistance of practical significance. The cultivation of cancer cells *in vitro*, though occupying many workers, contributed no deep-going enlightenment, and until 1915, when tumours were purposely induced by means of tar, workers were unable to get at the conditions determining the occurrence of neoplasms. Until then observations on the 'precancerous states' of man had been the sole reliance of the investigator, since the spontaneous growths of animals had progressed too far when first encountered to be informing. Now at last the conditions leading to cancer could be got at experimentally.

---

* Substance of the Ludwig Kast Lecture delivered at the nineteenth Graduate Fortnight of the New York Academy of Medicine during October 7-18.

This paper is concerned with recent advances. Perhaps the biggest step forward of the last few years has been the comprehension, gained very gradually during the busy production of tumours by experimental means, that cancer is not a separate neoplastic entity, standing by itself, but merely one among the immense group of the true neoplasms, all these exemplifying the same general principles however much they differ in cellular composition. Every worker knows that carcinogens call forth growths of all the main categories dealt with in the text-books on human neoplasms. A single chemical carcinogen may elicit the entire gamut of the tumours, the precise kinds which occur in any experiment depending upon the kinds of cells on which the agent is brought to bear; and the most widely different carcinogens may give rise to tumours of identical sort. Not only this, but they also call forth the leukæmias as well, and almost insensibly these latter have come to be acknowledged as within the neoplastic fold. Every now and then, indeed, leukæmias are met with or induced in animals, which are made up of cells capable of giving rise to local tumours if injected into the connective tissue instead of into the blood. The investigator who tackles the cancer problem really tackles the tumour problem as a whole, and he can hope that by studying one growth he may learn something about them all. From here on the words 'cancer' and 'tumour' will often be used interchangeably.

Long before the first tumour was induced in an animal, physicians were well aware that there are agents in the human environment which are capable of giving rise to neoplasms. But nobody had any conception of how many there are, or can be in the future—for chemists are now synthesizing new ones. Now we know them in bewildering variety, and must expect to encounter them more and more in the future as new physical and chemical processes of unplumbed capabilities are pressed into industrial service. We literally spend our lives among them—the very sunlight is carcinogenic—and the only reason any of us go free from cancer is because the action of most carcinogens (for that is still the word used) is episodic or weak. Two British workers, Prof. E. L. and Mrs. Kennaway, have lately found, on scrutinizing English statistics, that cancers of the skin, mouth, throat, œsophagus, and stomach, all the way to the pylorus, are more frequent the lower one looks down the social scale. Evidently the skin of poor people is more likely to be injured in ways that may bring on cancer than that of those who are rich, and perhaps what they eat and drink is more likely to contain carcinogens.

A far more difficult problem than the environmental carcinogens—since these can be warded off in proportion as we get to know them—is that of carcinogenic agents arising within the body. There are strong reasons for supposing that often they do so. Some years ago the fact was brought out that tar produced by the heating of human skin would give rise to cancers when painted on the backs of mice. Of course, this did not justify the conclusion that human skin elaborates tar: one might almost as easily suppose that because the body contains hydrogen, oxygen, and nitrogen, it produces fuming nitric acid. In the last few years the discovery has been made that extracts of some diseased human tissues are capable of producing tumours in animals. It might be argued that the chemical procedures employed in obtaining the extracts have resulted in the production of substances not existing under natural conditions. But control extracts made in the same way from the normal tissues seldom have a carcinogenic action. As already stated, it is not the presence of a carcinogen, but its presence in effective quantity, which determines whether a tumour will arise. The subject of endogenous carcinogens (substances formed within the organism and capable of producing tumours) is one of the pressing themes of the present day.

For some while it has been known that certain normal substances, namely, hormones, may give rise to tumours. These substances are not themselves carcinogenic, they do not themselves cause normal cells to be tumour cells, but they bring the tissues they act upon into such a disordered and excited state that neoplastic changes take place for reasons unknown. Nobody knows what kinds of tumours they may not give rise to next in animals if administered in sufficient amount, and the present uncertainty in this matter deserves stress because the œstrogens are the best studied of the hormones. A vast amount of new knowledge in relation to cancer waits upon further tests of this class of substances.

The more closely one looks into how 'spontaneous' tumours, so called, come into existence, the more clearly does one perceive that often they are the outcome of many influences and circumstances working together or consecutively, often through years. Even the smallest details in the previous history of cancer patients may prove vital for other human beings, as giving hints as to where the chain of determining factors can be broken which leads on to the disease. Too much pains cannot be spent in eliciting such case-histories. My own belief is that eventually there will be specialists in every cancer hospital whose main aim and ambition will be to learn precisely how each patient's tumour has come about.

For nearly seventy-five years medical men have been aware that cancers often arise at sites of chronic disturbance, yet mere chronic inflammation is not enough of itself to cause them. Some special influence there is which precipitates the neoplastic change. Some workers, notably Prof. A. Haddow, have concluded that the cells become neoplastic while they are faring badly, and that the chemical carcinogens act through the depression of cellular activities that they bring about. Certain it is that injection of some of these substances causes transplanted tumours to grow more slowly than in control animals. Just before the War, a German surgeon, led on by this finding, actually painted human cancers of the skin with a powerful carcinogenic hydrocarbon, heedless of whether it induced other growths later on. He reported that the tumours disappeared, and we will doubtless never know what happened later. Haddow himself has synthesized numerous hydrocarbons nearly related chemically to those of carcinogenic sort, in an effort to find some which would check established tumours while giving rise to none on their own account. His results in animals are encouraging to further work, and he has now begun to make clinical trials on inoperable cases. Laboratory observations made in the United States during the War on the effects of the 'nitrogen mustards' in retarding cell activity have led to the treatment with them of lymphoid tumours and leukæmia in human beings. There cannot be too many well-reasoned efforts such as these.

What can the cause of tumours be, the actuating cause which keeps cells in the neoplastic state ? One favourite idea was abandoned during the first years of experimentation with carcinogenic agents; the idea that cells run amuck, forming tumours because of a relaxation of some governing influence of the body which had kept them in order previously and doing what they should. The fact that tumour cells are no mere ordinary cells which have seized an opportunity to develop in a haphazard fashion is the basis for the present-day search for some distinguishing chemical trait of the neoplastic cell. Already remarkable differences have been discovered, and some day one that is crucial may be found.

All medical men realize that most of the agents which are highly effective in producing tumours, the roentgen ray and Bilharzia ova for example, cannot possibly be the real causes for these growths. Their part is played when they have produced neoplastic change; the tumour goes on just as a fire goes on which has been kindled in any one of a myriad ways. The fact that certain hydrocarbons have been found capable of inducing tumours has led workers to ask whether substances having similar effects may not be continually elaborated within neoplastic cells and maintain them in their pathological state. Even if this is not the case, a knowledge of precisely what the synthetic carcinogens do to cells may prove broadly enlightening. Chemists are concerning themselves with these possibilities, trying to learn precisely what radical, or bond, or configuration of the carcinogenic molecule is associated with its singular effect.

New opportunities have lately been provided for studies on tumour causation through a feat of the geneticists. Strains of animals have been procured with striking liabilities to spontaneous tumours of one sort or another and equally remarkable freedoms from such growths. A high percentage of the animals of certain breeds, in some instances every animal, may develop lung tumours or liver tumours or leukæmia after they grow up, or every ageing female may have mammary cancer ; while other strains almost or never have growths of the sorts mentioned. And behind the primary tumour liabilities there may be secondary ones ; an animal escaping the mammary tumour which kills most individuals of its strain may be prone to leukæmia later on.

What are the reasons for this state of affairs ? At first it was assumed that the tumour tendencies are passed on through the chromosomes, that they are hereditary ; and then workers in Holland and at Bar Harbor in Maine, studying hybrids between mice of strains having marked and slight liabilities respectively to mammary cancer, simultaneously found that the tendency to such tumours is handed down through the mother. There followed a startling discovery by Dr. J. J. Bittner, one of the Bar Harbor group. He took new-born mice away from mother mice of strains liable to mammary cancer, had them suckled by females devoid of this liability, and found that thus he had rescued them from having the disease in later life. Also, by carrying out the experiment in the opposite direction, the tendency to mammary cancer could be conferred upon mice of strains not having it ordinarily. In mice with the tendency to mammary cancer something is passed along from one generation to the next in the mother's milk—the 'milk factor' as it is now called. A single suckling after birth is enough to confer the tendency to cancer on not only the young nursing animal itself but also its descendants as well. *Per contra*, whole races of mice can be rescued from having mammary cancer by preventing the passage of the milk factor to the individuals from which they have descended.

The milk factor does not produce its effect at once. It reaches the mammary tissue from the gut, increasing in quantity as the glands develop, and one adenocarcinoma or several make their appearance in the breasts of the mice as they grow old, sometimes in every animal. Yet nothing can be obtained from the mammary tissue or from the cancers which will cause such growths directly on injection into other individuals, only the milk factor, though this in great amount. One-millionth of a gram of mammary tissue yields enough of it, on extraction, to confer the tendency to mammary cancer on an endless series of animals. A great deal has now been found out about the factor, and everything puts it in the category of the viruses save the fact that it does not induce disease directly. The most reasonable explanation for the way it works is that it is a harmless virus, flourishing and increasing in the mammary tissue, and liable to vary so that it becomes a tumour-producing virus when its cellular environment undergoes pathological alteration, as in the breast of mice which have grown old.

One cannot doubt that within the human species there are hidden liabilities to tumours which find individual expression now and again ; but statistics show that only very rarely is the layman's fear justified that there is 'cancer in the family'. Perhaps on the analogy of the inbred, pure-strain mice, brother and sister matings of human beings during a thousand years might result in pronounced familial differences as concerns the incidence of cancer ; but as matters stand we can be thankful that we are a mixed lot. Certain workers with the milk factor have lately urged that the babies of human families in which mammary cancer has occurred should be raised on the bottle ; but this is to subject the child to very real dangers because of fears which are ill-grounded, as the statistical evidence demonstrates.

The existence of the milk factor has given new support to the hypothesis that tumours in general may be due to viruses. Despite many attempts during the last thirty years, no viruses directly causing neoplasms have been obtained from rat or mouse tumours—the common currency of the laboratory—though a few out-of-the-way growths have yielded them. The great majority of workers on the cancer problem see little in the idea that most tumours are due to viruses, and recent experimental evidence speaks against the assumption that agents of this sort, passed from one animal to another, can be their cause. But decisive evidence in the matter may soon be available, for much can be expected of the new techniques for visibility now being worked out. With the electron microscope, Drs. A. Claude and K. R. Porter have already been able to obtain pictures of chicken tumour viruses within the cells of the sarcomas that they cause. Caspersson in Sweden is photographing cells of many sorts with ultra-violet light of special wave-lengths, and he has thus disclosed much that was not known concerning them.

It might be thought that we would now be possessed of a thorough knowledge of what tumours themselves are like through the diligent observations on human growths made during the last hundred years; but the very conception of what a tumour is has been proved far off the mark by a recent discovery. The long-accepted definition has been that a tumour is an autonomous new growth. But Prof. C. B. Huggin's demonstration that many prostatic cancers which have metastasized stand still or disappear after removal of the patients' testicles shows that even the cells of malignant growths, of cancers ordinarily fatal, may not be truly independent in their behaviour. The cells of these prostatic cancers have been spurred on by the male sex hormones elaborated within the testicles and responsible for the normal activities of the prostatic epithelium. When not thus urged they in some instances are unable to grow, and in others are incapable even of maintaining themselves.

The meaning of this discovery far transcends its practical application; for it means that thought and endeavour in cancer research have been led astray by the idea that tumour cells are anarchic. Medical scientists have long been aware that even the worst cancers nearly all make some attempt at the customary tasks of the body. But no one had shown that neoplastic cells making such attempts at function might also respond in line of duty to normal physiological influences such as the hormones exert. How far this principle finds expression in tumour behaviour has yet to be learnt, and how successfully it can be utilized in combating tumours. The course of events with prostatic cancer justified the expectation that many mammary cancers would regress when the influence of the female sex hormone was lessened by removal of the ovaries or by injections of testosterone. While the results with women have not been very promising thus far, the fact that cancers of the male breast yield to orchidectomy or to stilbœstrol provides encouragement, for it makes plain the existence of factors of critical importance which have still to be understood and pressed into service.

At the moment the role of the hormones in the production and behaviour of tumours occupies many of the best investigators, and scarcely a month goes by without some discovery. For example, certain transplantable testicular tumours in mice will grow only if the new hosts are given œstrogen. Lipschütz, working in Chile and following up a discovery made by Nelson, that uterine myomas appear in guinea pigs repeatedly injected with œstrogen, has now demonstrated that testosterone will prevent them from developing. Whether this has a practical bearing remains to be seen.

It is a curious fact that, while hormones play an important part in tumour production and behaviour, little has been found as yet that the vitamins do. This is not for lack of tests with them.

The dependence of some tumours on hormonal influences justifies the inference that the change of a normal cell to a tumour cell is far from meaning that a growth will arise; and direct proof on this point has for some while been available. It has been found that if the calorie intake of mice is cut down so slightly that the animals are only 5 per cent under weight, appearing fit instead of fat, carcinogenic agents induce no tumours on their skin. This is not because these agents have failed to bring about neoplastic changes; for if the animals are full-fed later, tumours start forth. The 'spontaneous' pulmonary growths to which mice of some strains are liable can also be prevented by cutting down the food. It would be worth while to know whether cancer has fallen off in the starving populations of Europe. At the moment much work is under way to learn whether modifications of the diet which involve no reduction of calories will hinder tumour growth.

But how shall the presence of hidden, incipient cancers be perceived? The hope that they may elaborate specific antigenic substances, and thus provide serological tests, goes back to the first years of immunology, and recently an antigen has been come upon; Kidd has demonstrated the existence of a distinctive antigenic substance in the Brown–Pearce rabbit carcinoma. No path has been opened as yet, though, by this discovery, for the substance has proved to be peculiar to the Brown–Pearce tumour, and serologically quite different from an antigen encountered in another kind of epidermoid carcinoma of the rabbit. On the basis of these findings one might perhaps look forward to a multitude of diagnostic blood tests, each for some tumour of special sort, but not to a single test which would help in the generality of human instances—those in which the doctor wants to know whether there is any tumour at all in his patient, its nature coming afterwards. Even the possibility of special tests is still problematic, since the production of antibodies in rabbits with the tumours just mentioned, a production necessary to serological tests, is inconstant despite the circumstance that every one of the growths themselves contains the specific antigen.

FREQUENCY-MODULATION IN BROADCASTING

FREQUENCY-MODULATION, or the technique of varying the frequency of radio waves for signalling purposes, has been known and used for many years; but it was not until Armstrong in the United States in 1936 pointed out the importance of wide-band frequency-modulation on ultra-short waves, combined with a means for noise suppression, that the practical possibilities of the system for broadcasting purposes were realized. A considerable amount of development work on frequency-modulation technique took place in the United States before the War, and a number of broadcast transmitting stations have been erected and are using the frequency band 40–50 Mc./s. (wave-lengths 6–7·5 m.). It was not possible during the War to obtain much first-hand information as to the practical results obtained in the United States; and so in view of the probable importance of the system in improving both the overall coverage and the quality of reception in broadcasting, the B.B.C. decided just before the end of the War to conduct field trials in Great Britain. A discussion of the relative merits of frequency-modulation for broadcasting purposes, and of the first results of these trials, is given in an article by H. L. Kirke in the *B.B.C. Quarterly* (vol. 1, No. 2, July 1946).

In frequency-modulation technique, the radio carrier-wave is varied in frequency by an amount depending upon the amplitude of the modulating oscillation and at the frequency of the modulation, which for sound broadcasting is within the normal audible range. At the greatest amplitude of modulation, the change in carrier frequency is termed the deviation, and the value of this as used for broadcasting in the United States and likely to be adopted in Britain is ± 75 kc./s. In contrast with this system is that of amplitude-modulation, which is used in normal broadcasting, and in which the amplitude of the carrier is varied at the modulation frequency from zero to twice its normal unmodulated value, the frequency of the carrier wave remaining unaltered during the modulation process. Any increase of modulation amplitude beyond the above maximum value would result in distortion both at the transmitter and at the receiver. In the case of frequency-modulation, there is no precisely defined point at which distortion sets in, so that if the transmitter and receiver circuits are suitably designed, a greater range of modulation can be achieved with the frequency- than with the amplitude-modulation system.

In order to render a frequency-modulated signal audible, the receiver uses a device known as a 'discriminator', which in effect converts it into an amplitude-modulated signal, which may then be detected by any of the usual methods. Since no change in amplitude of the carrier wave is required to convey intelligence, the transmitter can be operated under constant load conditions of high efficiency; and at the receiver a limiting device can be used to make it insensitive to amplitude changes, and thus limit the effects of receiver noise and electrical interference. While it would not be worth while using frequency-modulation on medium or long waves, because the band-width would have to be restricted, this does not apply to ultra-short waves, less than 10 metres in length; and the wide-band modulation can here be used to advantage with an extended audio-frequency range and improved quality of reception.

These advantages of the frequency-modulation system for broadcasting on ultra-short waves are discussed in some detail in the article referred to above, and illustrated by tabulated results and graphs applicable to frequencies of 45 Mc./s. (6·7 m.) and 90 Mc./s. (3·3 m.). For example, the electrical interference from motor-car ignition systems, which is a serious factor in the reception of ultra-short wave broadcasting, is much less serious with frequency- than with amplitude-modulation. Incidentally, in the course of experimental observations on this point made alongside a main arterial road, it was found to be extremely rare to get any interference from military vehicles, which have suitable radio-frequency suppressors fitted. The universal fitting of suppressors to motor vehicles would therefore increase the service area of a broadcasting transmitter very considerably. While the interference tests which have so far been made indicate that, on a frequency of 90 Mc./s., the field-strength required to give satisfactory reception in the presence of a given amount of interference is only about one-third that required on 45 Mc./s., it is to be noted that the field-strength obtained on the higher frequency may be less, due to greater attenuation and screening effects. The effective range is thus about the same on the two frequencies, and in both cases the use of horizontal polarization appears to be preferable.

The propagation of ultra-short waves is not greatly affected by the nature of the ground over which the waves pass, as is the case for medium and long waves; but the shorter waves are more affected by ground contour, hills casting shadows and thereby degrading the reception conditions in valleys. Considerable advantage is obtained by placing the transmitter on high ground, with as high an aerial as possible. The meteorological conditions in the atmosphere also affect the propagation of ultra-short waves, causing them to be refracted and so to reach greater distances than would otherwise be the case. The B.B.C. has carried out surveys of field-strength on both 45 and 90 Mc./s. from transmitters located at the Alexandra Palace Television Station and at its Research Department, near Oxford. Typical results described and illustrated in the paper show the effect of ground contour and the fading that is encountered when the receiving point is at or beyond direct optical range from the transmitter.

The latter portion of Mr. Kirke's article is concerned with the planning of an ultra-short wave broadcasting service, and tables are given showing the coverage area to be expected on each of the two frequencies considered, and for four grades of service between first-class reception in an urban area to second-class reception in quiet rural surroundings. Confirmation of these calculations is being obtained by the provision of practical data on the reception of frequency-modulation in the home, in the course of special tests in which members of the staff of the B.B.C. co-operate. It will thus be realized that active consideration is being given to the possibilities of ultra-short wave broadcasting with the view of relieving the present congestion in the medium and long-wave bands, and providing a satisfactory frequency-modulation service of high quality throughout Great Britain.

SCIENTIFIC CENTENARIES IN 1947

By ENGINEER-CAPTAIN EDGAR C. SMITH, O.B.E., R.N.

A REVIEW of the centenaries which occur in 1947 may well begin with a footnote to Prof. W. M. Smart's address to the Royal Astronomical Society on "John Couch Adams and the Discovery of Neptune", published in *Nature* of November 9, 1946. With the publication of the facts connected with the discovery, the controversy began to subside, and at the Oxford meeting of the British Association in June 1847, Adams and Le Verrier met. The latter had been invited to England by Airy; and J. D. Forbes recorded how he dined at Prof. Powell's with a small but excellent party including Airy, Le Verrier and Adams. Afterwards Forbes went to the Observatory to see Neptune. "Fancy the interest," he wrote, "of seeing the new planet for the first time in company with its two discoverers! Of course, there could be no going to bed without seeing it, and accordingly as it rose late, I did not get back to my college till very nearly two in the morning." A month later Le Verrier was at Cambridge, and so was Otto Struve, and Murchison wrote, "Whilst walking across the quadrangle of Trinity, Leverrier on one arm and Struve on the other, we saw the Duke of Wellington coming towards us in his red gown and I at once said to the two great astronomers, 'Now, gentlemen, here is the opportunity'. Struve was overjoyed, saying it was the thing of all others he wished; but Leverrier turned on his heel and left us saying, 'Pardonnez, c'est plus fort que moi; je suis Francais'."

That Oxford meeting was memorable for another reason, for it marked the beginning of the friendship of Joule and Prof. William Thomson, afterwards Lord Kelvin. To the Physics Section, Joule gave an account of his experiments on the mechanical equivalent of heat. His previous communications had not excited much interest, and this time the same thing might have happened had not "a young man . . . risen in the Section and by his intelligent observations created a lively interest in the new theory". The young man was Thomson, then twenty-three years old; Joule was twenty-seven. In a letter to Bottomley, Thomson said "that at first he thought Joule must be wrong but as he listened he recognised that Joule had certainly a great truth and a great discovery and a most important measurement to bring forward"; about a fortnight later, Joule and Thomson met in Switzerland, where Joule was spending his honeymoon.

Of the notable men of science born a century ago, there is no need to say much of Thomas Alva Edison, man of a thousand patents, who was born in Milan, Ohio, on February 11, 1847, and died at West Orange, New Jersey, on October 18, 1931; or of Alexander Graham Bell, who was born in Edinburgh on March 3, 1847, and died near Baddeck, Nova Scotia, on August 2, 1922. To them both could be applied the oft-quoted epitaph to Wren to be seen in the north transept of St. Paul's Cathedral. Bell's father, uncle, brothers and grandfather had taught the laws of speech in the Universities of Edinburgh, Dublin and London, and his own work was directly in line with theirs. Edison's forbears—colonists, farmers, merchants, men of exceptional physique, energetic and independent—had nothing to do with science, and in the boy's environment there was little to suggest that he would sit up all night poring over Faraday's writings, or become known as "the Wizard of Menlo Park".

In Edison's early days, telegraphy was the principal branch of electrical engineering, and it attracted many scientifically trained investigators. Among these was William Edward Ayrton, F.R.S. (1847–1908), inventor with John Perry of many electrical instruments and a promoter of technical education. He was president of the Institution of Electrical Engineers and of the Physical Society, and several times dean of the Central Technical College, London. The Russian electrician, Paul Jablochkoff (1847–94), was a telegraphist, and at the age of twenty-four was director of the telegraph between Moscow and Kursk. This post he gave up to work at electric lighting problems. His electric 'candles', patented in 1876, were shown in the East India Docks, London, in the following year, and in 1878 were used for lighting the Place de l'Opéra, Paris. Prof. Silliman of Yale was delighted with them, and wrote, "The effect is magnificent and at this moment there exists nothing in this city of splendid effects to compare with the magical scene. The vista is about two-thirds of a mile and the effect incomparably finer than any show of artificial illumination ever before seen." Alas! Jablochkoff's 'candles' had to give way to the lamps of Swan and Edison, and their inventor returned to Russia and apparently died in poverty. Electrical engineering was also furthered by the work of the distinguished engineer and educationist, Sir Alexander Blackie William Kennedy, F.R.S. (1847–1928). Kennedy started work in a Thames-side marine engineering shop; but at the age of twenty-seven was made professor of engineering in University College, London, where he founded the first laboratory for experimental work on an engineering scale. For twenty-five years he held his chair, and then he turned from civil and mechanical engineering to electrical engineering. His services were sought for many schemes, and he was president of both the Institution of Civil Engineers and the Institution of Mechanical Engineers—which body will in June fittingly commemorate the centenary of its foundation at Birmingham with George Stephenson as its first president.

At University College, Kennedy counted among his fellow professors another great London teacher, Sir Edwin Ray Lankester, F.R.S. (1847–1929), who held the chair of zoology from 1874 until 1890, and some time afterwards became director of the British Museum (Natural History). He was the son of Dr. Edwin Lankester, F.R.S. (1814–74), a physician, coroner and botanist, who at the time of his son's birth was secretary of the Ray Society, founded in 1844.

To these names of distinguished men whose centenaries fall this year may be added those of Thomas Andrews, F.R.S. (1847–1907), a Sheffield iron-master and an active investigator into the structure and properties of metals; William Denny (1847–87), of Dumbarton, the first private ship-builder to set up an experimental tank after the plans of his friend, William Froude; and James Ludovic Lindsay, twenty-sixth Earl of Crawford and ninth Earl of Balcarres (1847–1913), to whose munificent gift of astronomical instruments and books was mainly due the building of the fine Royal Observatory on Blackford Hill, Edinburgh.

The losses by death among men of science in 1847 do not appear to have been as numerous as they were in 1846, but geology and mineralogy were all the poorer by the passing of Alexandre Brongniart (1770–1847), long the associate of Cuvier. Brongniart was director of the porcelain factory at Sèvres and professor of mineralogy in the Museum of Natural History, Paris. With Cuvier he made many geological excursions into the country around Paris; after reviewing their joint labours, Geikie said that by their demonstration of the use of fossils for the determination of geological chronology, they deserve an honoured place among the founders of geology. Six months before Brongniart died, Mary Anning died, at the age of forty-seven. She was the daughter of a carpenter and vendor of natural curiosities of Lyme Regis; when a girl of only twelve, she found the fossil bones of an ichthyosaurus, and when twenty-one and twenty-seven respectively, discovered the first specimens in England of a plesiosaurus and a pterodactyl. She died on March 9, 1847, and fifteen years later the Geological Society erected a memorial window to her in the parish church of Lyme Regis. James M'Cullagh was the son of a small farmer, but he too made a name for himself. By intense application of his unusual powers, he rose to be professor of natural philosophy in Dublin and secretary of the Royal Irish Academy, his writings on the theory of light gaining for him in 1842 the Copley Medal of the Royal Society. Overwrought, he died by his own hand on October 24, 1847, at the age of thirty-eight. Last in this group is David Mushet (1772–1847), who died at the age of seventy-four. He is perhaps best remembered for his important discovery of the Black Band Ironstone through which many fortunes were made; but he did notable work in other directions, one authority writing that "He found the knowledge of iron, and of the ores from which the metal is derived, wrapped in the darkness of barbarism; he evolved and brought to light the true principles of both by a series of experiments, in which the most patient investigation and untiring bodily labour were combined".

At a time when so much thought is being devoted to technical education, it is worth recalling that the earliest modern technical colleges were those founded by the French Government in the eighteenth century. One of these was the École des Ponts et Chaussées, inaugurated just two hundred years ago by the administrator, Daniel Charles Trudaine, with the famous engineer, Jean Rodolphe Perronet (1708–94), "the Telford of France", as its director. The Corps des Ponts et Chaussées had been organised in 1716 for the maintenance of the roads, bridges, canals and harbours of France; and the School was for preparing likely candidates for the Corps. "The Corps and the School," said Mr. S. B. Hamilton, "closely associated, formed a professional body of men specializing in civil engineering, as distinct from military engineering, and from architecture. From this period, therefore, we may regard the separation of the three professions as having become effective." The School had many students who distinguished themselves, and one of these was Jacques-Élie Lamblardie (1747–97), who succeeded Perronet as director and held that position at the time of the Revolution, when for a time the School was merged in the École Centrale des Travaux Publics. He had previously done good work on the rivers and harbours of Normandy, erected a bascule bridge at Le Havre, and commenced a series of large-scale tests on timber, which were after his death continued by his colleagues.

Of never-ending interest is the period which saw the work of Huygens, Newton, Boyle, Leibniz and Hooke, and the founding of the Royal Society and the Academies of Sciences in Paris, Berlin and elsewhere. All these men and institutions are recalled by the lives of Denis Papin and Mårten Triewald. Papin was born three hundred years ago, and Triewald died two hundred years ago. At various times the assistant of Boyle, Huygens and Hooke, correspondent of Leibniz, curator of the Royal Society and the first to show how to construct an atmospheric machine having cylinder and piston, Papin once wrote to Leibniz in 1696: "The number of machines and new inventions which I have in my head becomes ever greater, and I have no stronger desire than to live to see their effect, which they will produce as soon as they can be properly constructed". One of the things Papin sought to do, Thomas Newcomen achieved, and part of Triewald's fame is due to the construction by him of the first Newcomen atmospheric pumping engine seen in the Swedish mines. His stay of ten years in England had made him known to Newton and Desaguliers, and back in his own country he lectured here and there on experimental science. He also made a collection of instruments still preserved in the University of Lund. An active, energetic and versatile man, he was one of the six founders of the Royal Swedish Academy of Science. A translation of his "Short Description of the Atmospheric Engine" (1734) was published by the Newcomen Society in 1928. Papin was born at Blois, France, on August 22, 1647, and died some time after 1712. Triewald was born in Stockholm, being baptized on November 21, 1691; he died on August 8, 1747. Papin is also remembered for his invention of the digester known by his name. It is recorded by Evelyn that Papin cooked a meal for some fellows of the Royal Society in his digester: "This philosophical supper caused much mirth amongst us and exceedingly pleased all the company".

In 1908 the tercentenary of the birth of Evangelista Torricelli was celebrated at Faenza. Later on, under the auspices of the municipality of that town, his collected works were published in three volumes; a review of them appeared in *Nature* of January 29, 1920. This year marks the tercentenary of his death, and also of that of his countryman, Bonaventura Cavalieri, who was born ten years before Torricelli. One has an assured place in the history of science for his discovery of the pressure of the atmosphere and his invention of the barometer; while the other is remembered among mathematicians for his method of indivisibles. The two men were friends of Galileo, through whom Cavalieri was appointed to the chair of mathematics in the University of Bologna. In France, the year 1647 saw the death of Claude Mydorge, an associate of Descartes and Fermat, and a member of the small society from which sprang the French Academy; while in Copenhagen on October 8, 1647, the death occurred of Christian Longomontanus, who worked during 1589–98 with Tycho Brahe at Uraniborg, and from 1605 until his death held the chair of mathematics at Copenhagen.

Finally, looking back yet another century, in 1547 Johann Schoner, the contemporary of Copernicus, died at the age of seventy. For many years he was a professor of mathematics in Nuremberg, and wrote on the globes, geography, dialling and astronomy. It was to him that the enthusiastic Rheticus wrote after visiting Copernicus: "Believe me, most learned Schonerus, that this man, my instructor, in all kinds of learning, and in the science of astronomy, is not inferior to Regiomontanus. I freely compare him to Ptolemy; not that I think Regiomontanus less than Ptolemy, but because my preceptor has a felicity in common with Ptolemy, that, by the Divine Assistance, he would finish the Reformation of Astronomy; whereas Regiomontanus, O cruel fate! died before he had erected his pillars".

OBITUARIES

Dr. Hugo Obermaier

WITH the death of Hugo Obermaier, which has recently taken place at Fribourg in Switzerland, prehistorians have lost a pioneer colleague of international reputation, the author of at least two widely known books and numerous important articles which have appeared in learned journals; his friends a figure beloved for the unselfish dignity and fidelity of his nature; and the Continent of Europe one of those, alas, now all too rare learned men to whom frontiers are unimportant. He was a good European —if a saddened one.

Born in 1877, the son of the civic librarian of Ratisbon in Bavaria, he studied in Vienna under Hoernes and others, and early developed a flair for prehistory, working at pleistocene geology with the famous Albrecht Penck. In 1904 he went to Paris, and there first met his life-long friend, the Abbé Breuil. The latter has told me the following anecdote of Obermaier at this time which is characteristic of his fine personality. It appears that he was hoping to be elected to a chair at Fribourg, not knowing that his new friend, too, had similar ambitions. When he learnt the position, he told Breuil at once that he was no longer a candidate, adding: "I indeed prefer your friendship to this chair".

In 1909 Obermaier was associated with Breuil and the late Prince of Monaco in excavating the great prehistoric home-site at Castillo in North Spain, and a few years later, when the Prince founded the Institut de Paléontologie humaine at Paris, he was named as one of the professors. He travelled much with Breuil at this time both in France and Spain, studying sections, home-sites and cave art. The fateful year 1914 found him concluding the excavations at Castillo, and he remained in Spain throughout the First World War, being granted a small post at Madrid. Later he accepted Spanish nationality. Between the wars he worked in Spain, until the Spanish civil war drove him to Switzerland, with the loss in Madrid of many valuable papers. When the Second World War broke over Europe, he was occupying a post in Fribourg, where he was laid low by a stroke some months ago, and has recently died. Like Breuil, he was a Roman Catholic priest, but, again like his colleague, he never held a cure of souls.

Prof. Obermaier's quaternary geological work, both in the Pyrenees and the Cordillera Cantabrica, was a real contribution to knowledge, as, too, were his numerous excavations and his work at the painted cave of Pileta in the extreme south of Spain. The personal impact of the tragedy of three wars in his learned life may perhaps have prevented the full stature of his mind from making itself felt as widely as it might otherwise have done; but those who knew him always felt and deeply respected the relentless integrity of his mental powers as much as they loved his personal qualities. They can only regret his passing—knowing that science has lost in him an honest and tireless investigator.

M. C. BURKITT

Prof. J. Bečka

THE November issue of *Chemické Listy* records the death at Mauthausen camp on February 25, 1942, of the biochemist, Dr. Jan Bečka, three days after his fifty-third birthday. Prof. Bečka graduated at Prague in both medicine and the natural sciences, and his first researches established the chemical and physical identity of certain types of keratin from various sources. In 1919 he became lecturer in chemistry at the Brno Veterinary College and was appointed professor in 1926, which post he held until the College was closed in 1939.

Bečka's later researches related to problems of ion exchange in pathological conditions, and he studied the effects of calcium and phosphorus in cases of narcosis. He was especially interested in mineral metabolism, and made elaborate studies of the effects of magnesium in animal metabolism. Most of his publications (eighty-six in all, or more than a hundred if those with students are included) appeared in Continental journals, and though some of his earlier researches were known to British colleagues, his last two books on the biochemistry of healing (1940) and the biochemistry of cancer (1941) probably remain unknown outside Czechoslovakia.

Bečka frequently visited Britain, Canada and the United States; he was responsible for introducing the use of insulin into Czechoslovakia.

J. K. Lubanski

JOZEF KAZIMIERZ LUBAŃSKI, a Polish physicist who was working at the Laboratory for Aero- and Hydrodynamics of the Technical University at Delft, died on December 8, at the age of thirty-two. After having obtained the degree of *magister philosophiæ* at Wilna in 1937, and worked for two years as an assistant in theoretical physics at Polish universities, Lubanski obtained a grant in order to travel to Holland and to work under Prof. H. A. Kramers at Leyden. His original intention was to go to Copenhagen in the following year; the War prevented this, and for some time he worked with Prof. L. Rosenfeld at Utrecht. A number of papers dating from this period, mostly in *Physica*, one in the *Arkiv för Matematik, Astronomi och Fysik*, deal with the properties of mesons and similar particles considered in relation to quantum mechanics.

Since the autumn of 1945, Lubanski had been assistant at the Laboratory for Aero- and Hydrodynamics of the Technical University at Delft. He studied with considerable success the theoretical aspects of this subject, but he had not yet published any of his work.

Lubanski's death is felt as a great loss by his many friends; he was much liked both for his personal character and for his scientific knowledge, as well as for that of philosophy and general literature.

J. M. BURGERS

Prof. J. G. Koenigsberger

NEWS has been received of the death of Prof. Johann Georg Koenigsberger, 33 Wildtalstrasse, Freiburg i. Breisgau (17B), French Zone, Germany, in his seventy-first year. Prof. Koenigsberger was well known for his work on the magnetic properties of minerals, and at the time of his death he was in communication with physicists in England with regard to the publication of a paper which he submitted in 1939 and which was held up during the War; the paper was concerned with changes of coercivity with grain size.

Prof. Koenigsberger was suspended from his chair in 1933 and dismissed from the University of Freiburg i. Breisgau in 1934 for having been republican deputy in the Diet of Baden and because of his partly Jewish ancestry. His daughter came to Britain in 1935 and served in the A.T.S. during the Second World War. Koenigsberger was reinstated as professor at the close of hostilities, and carried on theoretical research work under difficulties until the time of his death.

L. F. B.

WE regret to announce the following deaths:

Mr. William Barnicot, M.B.E., secretary of Rothamsted Experimental Station since 1920, on December 30, aged seventy-four.

Prof. Paul Langevin, For.Mem.R.S., director of the École de Physique et Chimie Industrielle, Paris, on December 19, aged seventy-four.

Prof. Edward L. Mark, emeritus professor of zoology in Harvard University, aged ninety-nine.

Mr. C. C. Robertson, formerly chief research officer and professional assistant to the chief conservator of forests, Department of Forestry, South Africa, on December 3, aged sixty-two.

Mr. R. N. Vyvyan, formerly engineer-in-chief of the Marconi Co., and one of the pioneers of radiocommunication, on December 14, aged seventy.

NEWS and VIEWS

New Year Honours List

The names of the following men of science and others associated with scientific work appear in the New Year Honours List:

O.M.: Field Marshal J. C. Smuts.

Hon. O.M.: Mr. John Winant.

Viscount: The Right Hon. S. M. Bruce, chairman of the International Emergency Food Council.

Baron: Sir Ernest Simon, for public services.

G.C.B.: Sir Alan Barlow, second secretary, H.M. Treasury.

K.C.V.O.: Evelyn C. Shaw, secretary to the Commissioners of the Exhibition of 1851.

Knights: Major G. St. J. Orde Browne, labour adviser, Colonial Office; Major-General H. C. Buckley, formerly principal of the Medical College, Agra; Dr. W. H. Coates, a deputy-chairman of I.C.I., Ltd., for services to Government departments; Prof. Kerr Grant, professor of physics in the University of Adelaide, for public services; Prof. W. N. Haworth, Mason professor of chemistry and director of the Chemistry Department, University of Birmingham; Prof. C. E. Hercus, professor of bacteriology and preventive medicine and dean of the Medical School, University of Otago; Dr. E. W. Smith, lately president of the Institute of Fuel; R. Thomas, agricultural adviser to the Government of Sind, and managing director of Sind Land Development.

C.B.: Air Commodore F. Whittle.

C.M.G.: Prof. P. A. Buxton, professor of entomology in the University of London and director of the Department of Entomology, London School of Hygiene and Tropical Medicine; A. D. Storke, for services in connexion with mineral resources in the Colonial Empire.

C.I.E.: A. P. F. Hamilton, inspector-general of forests, India; Colonel O. Slater, director of the Survey of India; Lieut.-Colonel W. J. Webster, senior assistant director, Central Research Institute, Kasauli.

C.B.E.: Prof. F. T. Brooks, professor of botany in the University of Cambridge; O. V. Guy, secretary of the Cambridge University Appointments Board; Prof. T. D. Jones, professor of mining in the University of Wales, and director of the Mining Research Laboratory, University College, Cardiff; Dr. F. C. Toy, director of the British Cotton Industry Research Association; Prof. T. Wallace, director of the Bristol University Agricultural and Horticultural Research Station, Long Ashton.

Indian Science Congress Association

The Indian Science Congress Association is meeting in Delhi during January 2–8 under the presidency of Pandit Jawaharlal Nehru. The general theme of the meeting is research and national planning. The executive committee of the Association has taken an initiative among Associations for the Advancement of Science in planning to make its annual meetings international occasions; strong delegations of men of science from a number of countries will attend the meeting at Delhi, and some will remain in India for a number of weeks visiting centres of individual interest, lecturing and advising. The British delegation, appointed by the Royal Society and the British Association, includes Prof. P. M. S. Blackett, Prof. W. Brown, Sir Charles Darwin, Sir Arthur Fleming, Prof. H. Munro Fox, Sir Harold Spencer Jones, Prof. L. J. Mordell, Prof. L. Dudley Stamp and Sir D'Arcy Thompson. The British party travelled from London Airport in company with the delegations from Canada, the United States and France.

Charles L. Mayer Award: Dr. C. Jayaratnam Eliezer

A Charles L. Mayer Award of 2,000 dollars, offered by the National Science Fund of the U.S. National Academy of Sciences for an essay on the nature of light, has been allocated to Dr. C. Jayaratnam Eliezer, for a paper on "The Interaction of Particles and an Electromagnetic Field". Dr. Eliezer, who is twenty-eight years old, is a native of Ceylon. After a distinguished career at the Ceylon University College, he entered Christ's College, Cambridge, and read for the Mathematical Tripos. He began research studies in quantum mechanics under the supervision of Prof. P. A. M. Dirac, and won an Isaac Newton Studentship and a Smith's Prize. During 1943–46 he was lecturing at the University of Ceylon, returning to Cambridge in 1946 as a research fellow of Christ's College. A second Charles L. Mayer Award was offered but was not awarded, no other essay received being considered suitable.

Sir Ben Lockspeiser

As announced in *Nature* of December 14, p. 867, Sir Ben Lockspeiser has been appointed chief scientist to the Ministry of Supply. Sir Ben, who is fifty-five, was at Sidney Sussex College, Cambridge. During the First World War he served in Gallipoli and Egypt. He afterwards worked at the Admiralty's Laboratory at Sheffield, and was for a time in the Inventions Department of the Ministry of Munitions. He joined the Royal Aircraft Establishment in 1921. His first work was to assist Dr. A. A. Griffith in investigations on phase complexity and on stress concentration in plastic crystals. He turned his attention, at the R.A.E., to a variety of aeronautical problems, such as wing flutter, instrument design, the design of windscreens and the prevention of ice accretion. Sir Ben was responsible, with Dr. Ramsbottom, for the development of the early form of chemical anti-icing device consisting of a porous wing nose-piece kept saturated with ethylene glycol, afterwards manufactured by the Dunlop Rubber Co. In 1936 he transferred to the Air Defence Department of the Royal Aircraft Establishment, where he was closely concerned with the development of the balloon barrage in the form in which it played an important part in defence during the Second World War, his work including theoretical aspects of the interception problem, practical trials and the effect of the employment of the barrage on aircraft design.

In 1939, Sir Ben moved to Air Ministry headquarters as assistant director of scientific research. In the Ministry of Aircraft Production he became in 1941 deputy director with responsibility for research on armaments, including fuses and aerial mine barrage schemes. He succeeded Dr. D. R. Pye as director of scientific research in 1943, and was made a director-general in 1945. He was knighted in January 1946.

Physical Society Awards:

Duddell Medal

The twenty-third Duddell Medal of the Physical Society has been awarded to Dr. Karl Weissenberg, of the Shirley Institute, Didsbury, Manchester, in recognition of his invention and development of X-ray goniometers, the first of which was described in 1924, when he was engaged in the Institute for Fibre Chemistry of the Kaiser Wilhelm Institut. In this instrument the rotation of the crystal is linked to the to-and-fro movement of a cylindrical photographic film parallel to its axis during the exposure. The diffracted spots are thus connected with the orientation of the crystal, are recorded without overlapping, and are readily indexed. The instrument was almost before its time, for the full value of photographic methods, and especially of the rotation method, was not then realized, except perhaps by Weissenberg himself. With the development of the method of the reciprocal lattice and of Fourier synthesis of complex structures, however, the Weissenberg goniometer has become almost indispensable. It is now widely used, and has been responsible for a great advance in our knowledge of crystal structure.

Dr. Weissenberg pointed out at the time that his design embodied only one possible combination of crystal and film movements; and that others, which he described, were likely to be useful. These have since been embodied in other designs; in the double Weissenberg goniometer comparison is made with a standard crystal, so that intensity measurements shall be on an absolute scale. But the original Weissenberg goniometer is still that most generally used. The presentation of the Duddell Medal will take place at a science meeting of the Physical Society at the Science Museum, South Kensington, on January 10.

Charles Vernon Boys Prize

The Council of the Physical Society has made the second (1946) award of the Charles Vernon Boys Prize to Robert William Sutton, superintendent scientist at the Admiralty Services Electronics Research Laboratory, Baldock, Herts, for his work in the development of receiving valves and cathode-ray tubes for radio and radar, notably the velocity-modulated local oscillators (the Sutton valve) for use on centimetric waves, and the Skiatron tube by means of which a picture can be produced from a radar beam. Sutton's research career began in 1929 at the Imperial College of Science and Technology, where he collaborated with Prof. G. I. Finch in a successful study of the induction coil. He afterwards went to Ferranti, Ltd., where he brought the valve factory into efficient operation, to E. K. Cole, Ltd., and to Scophony, Ltd., where he was primarily interested in television research. Early in 1939 Sutton was appointed a senior scientific officer at the Admiralty Signal Establishment (School at that time) and given charge of the research section of the valve division; he became principal scientific officer in 1944 and superintendent scientist in 1945. The award will be presented to Mr. Sutton at the meeting of the Physical Society on January 10.

British Council Science Office in China: Dr. R. A. Silow

Dr. R. A. Silow, until recently scientific officer of the Agricultural Research Council at the Plant Breeding Institute, Cambridge, has been appointed director of the British Council's Science Office in China, in succession to Dr. Joseph Needham, who is now with the United Nations Educational, Scientific and Cultural Organisation. Dr. Silow is a graduate of the University of Reading in agricultural botany. He did research in genetics at the Welsh Plant Breeding Station, Aberystwyth, during 1929–33. He then went to the Empire Cotton Growing Corporation's Cotton Research Station, Trinidad, B.W.I., remaining there until 1944. He was visiting professor of plant genetics at the Blandy Experimental Farm of the University of Virginia during 1944–45; after which he became scientific officer of the Agricultural Research Council, attached to the Plant Breeding Institute, School of Agriculture, University of Cambridge. His work has included investigations on Asiatic cottons in collaboration with the Chinese Agricultural Research Bureau at Nanking.

Trans-uranium Elements in Chemistry

Delivering this year's Harrison Howe Lecture on November 18 to the Rochester Section of the American Chemical Society, Prof. G. T. Seaborg referred to the importance which the newly discovered trans-uranium elements may achieve for general chemistry. Those of comparatively short life-time, and therefore high radioactivity, will always require special training for their safe handling; consequently, neither plutonium (element 94), nor americium (element 95), which only recently has been prepared in pure form, can be handled without certain precautions; neptunium (element 93), however, with a life-time of more than two million years, may eventually find its way into the ordinary chemical laboratory as one of the rarer elements. Curium (element 96), which so far occupies the last place in the Periodic System, is remarkable in being the element with the highest atomic weight; Prof. Seaborg expects that, in addition to the isotope 242, which is produced by the neutron bombardment of americium, still heavier ones with atomic masses up to 246 may be obtained.

British Association of Chemists: Annual General Meeting

R288

The twenty-ninth annual general meeting of the British Association of Chemists was held on December 7. Prof. R. G. W. Norrish, retiring president, presented the Hinchley Medal to Mr. C. S. Garland, and in doing so he paid tribute to the work which Mr. Garland had done for the Association over a long period of years and for the profession of chemistry. The following officers for the ensuing year were elected: *President*, Norman Sheldon; *Vice-Presidents*, Prof. R. G. W. Norrish, Dr. J. B. Matthews, J. Wilson and C. A. Wylie; *Hon. Secretary*, J. Stewart Cook; *Hon. Treasurer*, W. C. Peck; *Hon. Registrar*, H. L. Howard; *Hon. Editor*, T. Crosbie Walsh. Two proposed alterations to the rules of the Association were adopted. One gave authority to increase benefits, under the Unemployment Benefit Fund, and the other established the office of honorary life vice-president, to which Prof. E. C. C. Baly was elected, in recognition of the valuable work he had done for the Association during the past years. A resolution, from the Manchester Section, was adopted to put the Association's political fund into active operation. There would be no suggestion of assisting any particular political party; the object was to assist chemists to play their part in public affairs, and to let them feel that they had the goodwill of their fellows.

In assuming the office of president, Mr. Sheldon made a statement of policy. The British Association of Chemists is not, nor does it pretend to be, a qualifying body; but it is the only organisation which exists for the sole purpose of looking after the economic interests of the chemical profession. It gives members financial support from its Unemployment Benefit Fund, which has a reserve of more than £42,000; and it is exploring the possibility of setting up a superannuation scheme which will be transferable when a member moves from one firm to another. It is also hoped to extend the unemployment benefit scheme to cover loss of income through sickness or accident. A comprehensive appointments service is provided. The Association aims at recognition by industrial firms, Government departments and public authorities as the appropriate body with which all matters relating to the economic interests and the status of chemists should be discussed. To this end it is registered as a trade union; but it is not in any way associated with any particular political party. An important activity of the Association is the formation of student groups through which students of chemistry can take an interest in matters concerning their present and future economic welfare, and secure the co-operation and advice of the senior members.

New Culture Medium for *Penicillium notatum*

In the absence of supplies of penicillin in Hungary during the War, Dr. E. Rosenthal, of St. Roch's Hospital, Budapest, isolated two strains of what appeared to be *Penicillium notatum* Westling from which were prepared filtrates exhibiting antibiotic activity against isolated strains of *Staphylococcus albus*. Since glucose or other forms of sugar required for the usual culture media were extremely difficult to obtain, substitutes were sought. The urine of diabetic patients was ultimately found to provide a good culture medium for the mould, and, for the routine production of penicillin-active filtrates, was adjusted to contain 4 per cent of sugar. The acidity was adjusted to the usual *p*H of the Czapek-Dox medium and, after filtration and sterilization, the urine was inoculated with the spores of the mould. In comparison with the Czapek-Dox medium, diabetic urine produced in most instances accelerated development of the mould with the appearance of as much as three times the amount of antibiotic activity. Similar results were usually obtained with a medium prepared by the addition of 4 per cent of glucose to normal human urine. The addition to a culture medium of substances such as indol-acetic acid is known to stimulate penicillin production, and the results obtained with diabetic urine are probably to be ascribed to the presence therein of stimulating substances of this and other types.

Disappearance of a Mendel Manuscript

Dr. Jaroslav Kříženecký, of the Zootechnical Research Institute and College of Agriculture in Brno, Czechoslovakia, has informed Dr. Herbert C. Hanson, chief of the Agricultural Division, United Nations Relief and Rehabilitation Administration Mission to Czechoslovakia, that Mendel's manuscript "Versuche über Pflanzen Hybriden" has disappeared. This manuscript had been in the custody of the Natural History Society in Brno since 1910, when it was found by Prof. Hugo Iltis in a waste-paper basket in the Society's library. In 1939, when the Germans occupied Brno, Dr. Otto Richter, professor of botany in the German Technical College in Brno, took over the chair of plant physiology in the Faculty of Science in the Masaryk University. All the buildings and facilities of this University were turned over to the German College. Some of the Czech assistants were persuaded to remain under Richter. They have informed Dr. Kříženecký that Prof. Richter, after he had taken over the apartments of the Natural History Society, carried Mendel's manuscript about with him in his brief-case. Richter was also a student of Mendel's history and wrote several publications about Mendel during the War. When the Germans were evacuating Brno upon the approach of the Russians, Richter disappeared. It is thought that he may have taken Mendel's manuscript with him either to Germany or Vienna. So far, the whereabouts of Prof. Richter and of the manuscript are unknown. It is to be hoped that further official aid will be given in searching for this interesting document, which should be returned to Brno.

Tibetan Culture

Tibet has always been a mystery land, and even now little is accurately known of its story. Cheng Te-k'un and D. Michael Sullivan, in No. 6 of the Guidebook Series issued by the West China Union University Museum, Chengtu, Hwasipa, have produced a pamphlet of forty pages intended to supply this need. Much information is given, even if in a rather dull manner and without any illustrations. Anyone wanting to know something of the dry bones of Tibetan history will find much that he is seeking here.

Polar Exploration Exhibition

An exhibition illustrating the story of polar exploration to the present day is open to the public at the Royal Geographical Society's House (Exhibition Road entrance) during January 4–18 inclusive, 11 a.m. to 4 p.m. daily, except Sundays. The history of polar exploration is shown by paintings, prints, maps and photographs as well as personal relics of famous polar explorers; and a selection of modern equipment, including that used by the Royal Navy, the Army and the Royal Air Force, demonstrates modern technical developments.

Conference on Pulverized Fuel

A conference on pulverized fuel is being organised under the auspices of the Institute of Fuel and will be held in Harrogate during June 3–6. Some fifty papers have been promised from authorities in Great Britain, and contributions are also expected from South Africa, Australia, the United States, France, Holland and Germany. The papers are to be published in a book which will be sent four weeks before the opening session to all who take up membership of the conference. This book will contain, as well as the papers, an index to authors, an index to subjects, and the programme for each session. Each programme will set out the points to be discussed at that session with a cross-index to the comments of the authors upon them. Each session will be devoted almost wholly to discussion, following a short survey outlining the topics for that session. Membership of the conference will be open to anyone interested in pulverized fuel. Particulars can be obtained in due course from the Pulverised Fuel Conference Committee, Institute of Fuel, 18 Devonshire Street, London, W.1.

University of London : Appointments

The title of professor emeritus of physics in the University of London has been conferred on Dr. Sydney Russ on his retirement from the Joel chair of physics which he has held at the Middlesex Hospital Medical School since 1920. He has been succeeded by Dr. J. E. Roberts, formerly assistant physicist in the School.

The title of professor emeritus of Chinese art and archæology in the University has been conferred on Dr. W. P. Yetts on his retirement from the chair of Chinese art and archæology at the Courtauld Institute of Art which he has held since 1932.

Dr. Reinhold Fürth has been appointed to the University readership in theoretical physics tenable at Birkbeck College as from January 1. During 1931–39 he was professor of experimental physics and head of the Physics Department in the University of Prague, and since 1942 he has been on the staff of the University of Edinburgh as Dewar Research Fellow and part-time lecturer.

The title of reader in the University has been conferred on the following in respect of the posts they already hold: Dr. G. B. Brown (physics), University College; Dr. F. C. Champion (experimental physics), King's College; Dr. E. T. Davies (mathematics), King's College; Dr. Benjamin Dawes (zoology), King's College; Mr. M. B. Donald (chemical engineering), University College; Dr. M. S. Fisher (metallurgy), Imperial College of Science and Technology; Dr. G. W. Himus (fuel technology), Imperial College of Science and Technology; Dr. C. C. N. Vass (physiology), St. Thomas's Hospital Medical School; Dr. M. J. D. White (zoology), University College; Mr. E. W. Yeoman (metallurgy), Imperial College of Science and Technology.

The degree of D.Sc. has been conferred on Mr. E. E. Cheeseman, Imperial College of Science and Technology; Mr. C. W. Davies, recognized teacher at Wye College; Mr. R. L. Noble, Middlesex Hospital Medical School; Mr. J. M. Watson, recognized teacher at Northern Polytechnic.

Earth Tremor in Scotland

On December 25, soon after 5 p.m., an earth tremor was felt in the Lochaber district of Inverness-shire. It is reported to have begun with a faint rumbling noise, which increased to a loud roar and continued for some seven seconds. The earth tremor rattled crockery on the shelves in houses at Spean Bridge, and the shock was faintly felt at Fort William. No damage has been reported. The tremor was no doubt caused by slipping along one of the faults associated with the Highland boundary.

The Night Sky in January

Full moon occurs on Jan. 7d. 04h. 47m., U.T., and new moon on Jan. 22d. 08h. 34m. The following conjunctions with the moon take place: Jan. 8d. 12h., Saturn 4° S.; Jan. 16d. 13h., Jupiter 0·6° S.; Jan. 18d. 03h., Venus 4° N. Mercury is a morning star, rising at 7h. 23m. on Jan. 1, and is in superior conjunction on Jan. 23. At the end of the month the planet rises about quarter of an hour after the sun and is not then well placed for observation. Venus is a morning star, rising at 4h. 23m., 4h. 27m., and 4h. 42m. at the beginning, middle and end of the month respectively. The planet attains its greatest westerly elongation on Jan. 28. Mars, in conjunction on Jan. 6, is too close to the sun for favourable observation. Jupiter is visible in the early morning hours, rising at 4h. on Jan. 1 and 2h. 30m. on Jan. 31. Saturn is visible through the greater portion of the night, rising at 18h. 17m., 17h. 17m., and 16h. 06m. at the beginning, middle and end of the month respectively, and is in opposition on Jan. 26. The following occultations of stars brighter than magnitude 6 take place: Jan. 5d. 21h. 58m., 132 Taur. (*D*); Jan. 31d. 20h. 57·2m., ω Taur. (*D*); *D* refers to disappearance, and the latitude of Greenwich is assumed. The earth is at perihelion on Jan. 4, its distance from the sun then being 91,449,000 miles.

Announcements

Mr. Kenneth B. Disher has been appointed director of the Cleveland Museum of Natural History, Cleveland, Ohio. He was formerly executive secretary of the Allegany State Park Commission, New York, and prior to that associated with the National Park Service, U.S. Department of the Interior. Mr. Disher is a graduate of Pomona College and has also worked at Harvard University.

Dr. E. A. Stewardson has been appointed to the newly established chair of physics at University College, Leicester.

Dr. R. J. Sarjant, head of the Research Department of Messrs. Hadfield's, Ltd., known for his work on a wide range of fuel problems, especially those relating to the steel industry, has been appointed to the chair of fuel technology in the University of Sheffield; this chair has been vacant for several years.

Anticipating a further increase in advisory work in 1947, the Board of Greenkeeping Research has appointed Mr. J. H. Arthur as an additional advisory officer at the St. Ives Research Station, Bingley, Yorkshire. Mr. Arthur graduated at the University of Reading in 1946 after serving five years in the Army.

Mr. F. A. Fox, chief metallurgist of Magnesium Elektron, Ltd., is joining the British Welding Research Association as assistant director of research. Mr. Fox has been engaged in metallurgical research, particularly in the light alloys, since 1934, in both the ferrous and non-ferrous fields, and has had considerable experience in the organisation of this kind of work.

A course of twelve lectures on television practice will be given on Friday evenings at 7 p.m. commencing on January 17 in the Electrical Engineering Department, Northampton Polytechnic, St. John Street, London, E.C.1. The fee for the course is 15*s*.

A conference on "The Family at Work and Play", to be held at the Institution of Civil Engineers on January 16–17, is being organised jointly by the British Social Hygiene Council and the Town and Country Planning Association. The conference will be opened by a paper by Mr. Gilbert McAllister on "The Family and the Nation". Other papers will be given during the following sessions: "The Family at Home"; "The Family at School"; "The Family Growing Up"; "The Family at Work"; and "The Family at Play". Further information can be obtained from either the British Social Hygiene Council, Tavistock House North, Tavistock Square, London, W.C.1, or the Town and Country Planning Association, The Planning Centre, 29 King Street, Covent Garden, London, W.C.2.

LETTERS TO THE EDITORS

Technetium: the Element of Atomic Number 43

In 1937, Perrier and Segrè showed that radioactive isotopes of element 43 could be formed by neutron or deuteron bombardment of molybdenum[1]. Several chemical properties of element 43 were established at that time, and some nuclear properties of the spectral isotopes. These isotopes were found after nuclear bombardments by the 37-in. cyclotron of the Radiation Laboratory of the University of California.

Later on, Wu and Segrè found also element 43 among the fission products of uranium, a source from which relatively large amounts of 43 can be isolated[2].

It seems appropriate now to give a name to this element, as suggested by Paneth[3]; and we would like to propose the name of 'technetium', from the Greek τεχνητός, artificial, in recognition of the fact that technetium is the first artificially made element. The corresponding chemical symbol should be 'Tc'.

Astatine: the Element of Atomic Number 85

In 1940, we prepared the isotope of mass 211 of element 85 by bombarding bismuth with alpha particles accelerated in the 60-in. cyclotron of the Radiation Laboratory of the University of California[1]. At that time we established several chemical properties of element 85 and we made a fairly complete nuclear study of the isotope formed.

It has been pointed out to us[2] that a name should now be given to this new element, and following the system by which the lighter halogens, chlorine, bromine and iodine, have been named, namely, by modifying a Greek adjective denoting some property of the substance in question, we propose to call element 85 'astatine', from the Greek ἄστατος, unstable. Astatine is, in fact, the only halogen without stable isotopes. The corresponding chemical symbol proposed is 'At'.

British Universities and 'Secret' Theses for Degrees

In his presidential address to the Royal Society, Sir Robert Robinson is reported in *Nature* of December 7 (p. 825) as having said, "Nevertheless, the universities have preserved intact their precious liberty of action, and I see no signs of any attempt to curtail it. Surely this suggests a feasible line of demarcation in that extra-mural contracts, placed by Service departments with the universities, need not, and should not, contain any clauses restricting free publication of the results. Although it has sometimes been irksome, the refusal of many universities to accept theses that cannot be published is a step in the right direction."

Whatever the views and practices of the Defence Departments may have been in the pre-war and war-time years, it is certain that those now responsible for the organisation and direction of defence research in Great Britain are as genuinely interested as academic scientists themselves in the maintenance of complete independence and liberty of action for British universities in the field of scientific research. Within the last year, defence science representatives have met to pool their views on policy in the placing of extra-mural contracts, and were unanimous in deprecating any form of pressure on the universities to accept research contracts of the kind which seem likely to lead to unpublishable results.

But Sir Robert Robinson's commendation of the refusal of many British universities to accept unpublishable theses must not pass unchallenged. Since no scientific worker doing research in a university laboratory should be producing unpublishable results, there should arise no demand on universities to grant 'internal' degrees based on secret theses. The undertaking of research in a university laboratory is, however, not an invariable requirement for the award of higher degrees such as M.Sc., Ph.D., and D.Sc., and the refusal to award such degrees to 'external' scientific workers on unpublishable results deprives the young research worker entering a Government defence laboratory of any *assured* opportunity to submit the results of his research for a higher degree.

Non-acceptance of unpublishable theses by universities thus becomes a serious handicap to recruitment of scientific men for defence research. In addition, it is a potential handicap to the defence research worker whenever he may seek return to a university or industrial scientific career, for there is no denying that the possession of a research degree is an asset when seeking a scientific appointment, and it is likely to be the more needed if, for security reasons, one is prevented from describing one's research achievements in detail.

Bearing in mind how seldom it proves impossible to distil the scientific essence of a defence investigation from those operational aspects and implications which must remain secret, I would estimate that not more than four or five scientific men in defence establishments would wish to submit unpublishable theses each year to universities in Great Britain, and most, if not all, of these theses would become publishable within the space of a few years. The injury to national defence by refusal to accommodate these few scientific workers on an equal footing with colleagues in the academic and industrial world is surely disproportionate to any slightly harmful reaction upon the universities which the idealist may discern.

Sir Robert Robinson rightly points out that "it is inconsistent to praise our scientists for their outstanding contributions to the war effort and at the same time to suggest that they offend against our ethical code if they serve the country in a similar fashion during an uneasy peace". What ethical code would countenance freedom for all scientific workers but those in defence establishments to acquire professional qualifications ? To justify the universities' attitude, it must be shown that something in the process of examining the research work and secret thesis of a defence scientific worker must inevitably so react on the university as to be an infringement upon its scientific liberty and independence. What indeed are the reactions the universities fear, and, with goodwill, can no safeguards be evolved to allay such fears ?

If the realistic approach to this problem now unfortunately being followed by only one or two universities is condemned by scientific leaders, or indeed if it fails to be adopted by a wider circle of universities, it is certain to lead to an accelerated decline in the research talent of our defence laboratories and a degree of unpreparedness in defence that can only make an uneasy peace the more uneasy for us all. Before taking this responsibility on their consciences, universities should satisfy themselves that no compromise can be offered, and I would venture to suggest that the Royal Society might offer to mediate between the universities and the defence science departments in trying to work out some acceptable scheme. Any scientific worker in Great Britain should feel that he can count upon the active support of British science and British universities in alleviating so far as possible conditions which restrict his scientific freedom.

J. E. KEYSTON

Department of Research Programmes
and Planning, Admiralty.
Dec. 12.

THE assurance contained in the second paragraph of Dr. Keyston's letter is very welcome, and it will now be the fault of academic men of science and the universities themselves if the high ideal of unfettered research is not realized in practice.

The citation in the first paragraph shows that my remark about unpublishable theses was intended to apply to 'internal' students. It is clearly bound by juxtaposition and reference to the previous sentence. Thus in my opinion the refusal to accept secret theses from internal students is "a step in the right direction", because it underlines the desirability of freedom of scientific effort in the universities. Admittedly, however, the sentence, taken out of the context, would appear to cover the cases of scientific workers in defence establishments who wish to submit secret theses for higher degrees. A little earlier in the address quoted, it was recognized that such workers would not always be able to publish their results ; an unfortunate consequence of the present state of world affairs. I agree that, with proper safeguards, it might be possible to devise ways and means whereby such results could be examined for a degree.

The matter is nevertheless very complex, and it is certain that a single system has little chance of general adoption. The University of London insists that all theses must be deposited in the University Library, but will examine work by suitably qualified external students. The University of Oxford, on the other hand, has accepted a certain number of secret theses during the War as an emergency measure, but requires residence of three or six terms duration before leave is given to supplicate for the degree of B.Sc. or D.Phil. respectively. The D.Phil., for example, is not regarded merely as a certificate of technical proficiency ; it normally implies that its possessor has spent two years, under approved conditions, in an Oxford school of research. Provision is made for certain equivalents (see Examination Statutes, Statt. Tit. VI, Sect. vi, § 1, 2 and § 5, 2, 12).

These are but two examples of the different regulations in force, and in addition the variables on the side of the defence departments are numerous and include the questions of supervision and assessment of joint work.

I am in no position to estimate the probability of changes being made in the examination statutes, still less to forecast the direction of any such changes, but in view of the very varied circumstances, feel confident that, if the door is opened, each case will still have to be considered on its merits.

Furthermore, I think that there will be a general disinclination to award the higher doctorate on the results of unpublished work. Here again there may well be a few quite exceptional cases, and sufficient elasticity to deal with them is perhaps already provided. Thus at Oxford the Board of Faculties has power to vary the regulations subject to the approval of the General Board of the Faculties.

Where so many parties, interests and principles are involved, I doubt the feasibility of the mediation suggested by Dr. Keyston, and suggest that the problem must still be attacked in detail.

Finally, it should be added that the question affects categories other than scientific men in defence departments, and these include workers in Government laboratories generally, and in industrial research laboratories. These cases are especially important from the point of view of 'external', rather than from that of 'secret' work.

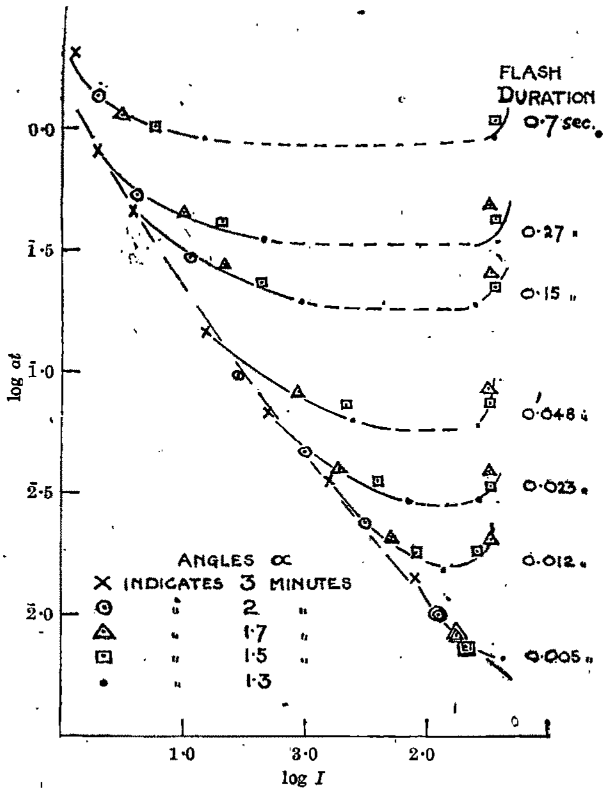
R. ROBINSON

Flash Visual Acuity

MOST published researches on visual acuity have assumed an unrestricted time of observation, but recent studies of the relations between intensity discrimination and acuity, and photo-chemical theories thereof, have indicated that the wandering of fixation plays an important part in the performance of the visual system. It appears that a study of visual acuity in relation to exposure time may throw additional light on the subject.

During the past year, we have conducted some exploratory investigations which we hope will be extended by other workers in this laboratory and published in full ; in the meantime, a note on the results so far obtained may be of interest.

The objects (shown in a dark field) were of the 'double star' type represented by two small equal and adjacent apertures which could be shown alternatively with a single aperture having double the area of a single one. Exposures ranged from 700 msec. to 2 msec., and intensities over a relative range of about 50 : 1. The observer used an artificial pupil, and had to report after a flash exposure whether the object was single or double. Fixation was assisted by the use of a faintly illuminated ring ; some measurements were also attempted for extra-foveal vision. The limiting angles of perception were estimated from a statistical analysis of this one observer's answers. Though many thousands of observations



were made, the results naturally show various uncertainties due to complex psychological factors. We consider that the choice of this type of object has considerable advantages over gratings, etc., for this method of observation, and the results have, moreover, some technical interest in regard to navigation and other signals.

Some of the most significant results, for foveal observations, are shown in the accompanying graph, in which the log of 'visual limiting angle *times* duration of stimulus' is plotted against the log of 'brightness of source'. Looking at the points for 3′ and 2′ visual angles (represented by crosses × and circles ⊙ respectively) there is an approach to a definite relation suggested by the broken-line curve. Results for the given exposure times are connected by other lines, and it will be noticed that the points for 1·7′, 1·5′, and 1·3′ angles do not conform to the same relation. Hence while there is some reciprocity between visual angle and minimum exposure time for the larger angles (the product being roughly a single-valued function of the brightness of the object), this does not generally apply to the smaller angles. The amount of light needed for a given improvement of visual performance, between 1·7′ and 1·3′, at a given exposure time is much greater than would be calculated from the function just mentioned, and the discrepancy increases with the time of the exposure. A similar set of curves has been obtained for observations in which the object appeared at an angle of 0·5° with the (attempted) direction of fixation.

Niven and Brown[1], using a small 'single line' object (the direction of which had to be recognized) found no significant departure from a relation, giving the above product in terms of brightness, derived from Hecht's revised photo-chemical theory[2]; our results are inconsistent with their equation. On the other hand, in investigating the product of the brightness-discrimination fraction and time as a function of intensity, Graham and Kemp[3] found that reciprocity only applied for exposures shorter than a critical value.

If our results are used to plot curves of log 'brightness *times* time' against log 'time' for given visual angles, it appears that there is an approach to reciprocity between brightness and time for the larger angles up to a stimulus duration of about 0·4 sec.; but the critical period, if it exists at all, is apparently smaller for the smaller visual angles.

When studying the effect of increasing the brightness of the field on observing our object with fixed separation and with a constant duration of the flash, it is found that (if the separation is within certain limits) the 50 per cent threshold of correct observations will in general become possible at some level of the field brightness; on further increasing the brightness, the percentage of correct observations will reach a maximum and thereafter decrease. However, the curves flattened at the minima for the longer flashes (see the accompanying figure) are probably caused by the limitation of the retinal structure; the experiments included trials with 1·1′ separations which were not resolved (50 per cent threshold) in these experiments for any level of the brightness. The limiting values at the higher brightness level are much less certain than those at the lower.

The results appear to be consistent with the accepted view that acuity is associated with intensity discrimination, but also lead back to the idea that this discrimination is associated with the production of some minimum difference of concentration of photo-products in adjacent areas of the retina. This would be consistent, for very short exposures, with the reciprocity between visual angle and time for a given intensity, and between intensity and time for a given angular limit. Longer exposures involve increased wandering of the stimulus area over the retina, due to eye movements; this will diminish the chance of setting up the associated liminal concentration difference with weak stimuli, and will conversely tend to prevent an 'over-exposure' effect if the stimuli are too strong.

The application of the above criterion to the usual photo-chemical equation[2] can be made to yield sets of curves similar to those in the figure, but it seems advisable to await the results of fuller experiment (with light-adapted eyes, etc.) before searching for the values of the constants which will represent the results most nearly. It may be remarked, however, that if the short-exposure effects are adequately represented by this equation, the longer-term effects of adaptation may require a modification of its form.

Origin of Radio Emissions from the Disturbed Sun

IN a recent communication[1] it was pointed out that thermal radiation from the solar corona should be detectable at wave-lengths as long as one or two metres. This source cannot account, however, for the much stronger emissions which are correlated with sunspots[2,3,4]. It has been shown[5,6] that the latter emissions probably come from the immediate vicinity of active sunspots, and would require impossibly high source temperatures of about 10^9 degrees for explanation in terms of thermal radiation.

It is natural first to seek an explanation in terms of the kind of electrical discharge which causes the familiar terrestrial radio noise, namely, lightning flashes; but it is difficult, if not impossible, to see how such discharges could be produced in the always highly ionized solar envelope.

There is, however, a way in which coherent radio waves could be emitted by the ionized gases above the chromosphere. J. J. Thomson[7] showed that an electron gas possesses a natural period of oscillation given by $T = \sqrt{\frac{\pi m}{Ne^2}}$, where m and e are the electronic mass and charge (E.S.U.) and N is the number of electrons per c.c. I have found that in the presence of a magnetic field the medium possesses two such natural periods, both defined by the condition that the dielectric constant of the medium is zero. In the absence of collisional friction, these oscillations could occur without radiation of energy, since the convection current is then exactly neutralized by the displacement current. The presence of even the small amount of such friction present in the solar atmosphere necessitates appreciable radiation. Calculation shows that in the 1–5-metre band radiation from one of the modes of oscillation (which by analogy with Appleton's magnetic-ionic theory of the ionosphere we shall call the 'ordinary' mode) is suppressed by absorption in the overlying layers. On the other hand, radiation from the 'extraordinary' mode will escape from the sun with appreciable intensity. This appears to provide a logical explanation of the observed polarization of this radiation, as previously reported[5].

Calculation shows that the observed radiation is likely to come from the borders of prominence material, which has a somewhat higher density and lower temperature than the surrounding coronal matter. This gives enhanced radiating power in these regions, while the sharp electron gradient reduces absorption of the escaping radiation.

In the regions above active sunspots there is no doubt more than one disturbing influence capable of setting the medium into oscillation. One type of disturbance, however, should be specially important on the borders of moving prominence material. In the presence of the magnetic field of the spots, the transverse motion of ionized matter is accompanied by the setting up of electric polarization on the side walls[8]. We know also that this flow is turbulent, so that eddies are constantly forming along these walls. The continual breakdown of polarization in these eddies can supply enough electrical energy to maintain the oscillation of the medium at the required amplitude.

An interesting but different theory of the abovementioned radiations has been propounded recently by Kiepenheuer[9], who considers that the free spiralling of individual electrons in the magnetic field will produce the observed radiation. It is difficult to see how such motions, which are thermal in origin, could give rise to radiation more intense than that from a black body. Moreover, it is possible to show that the absorption of this radiation must be so great that no appreciable amount can leave the sun. Fuller details of all the relevant calculations will be published elsewhere.

This work is being carried out on behalf of the Council for Scientific and Industrial Research, Australia.

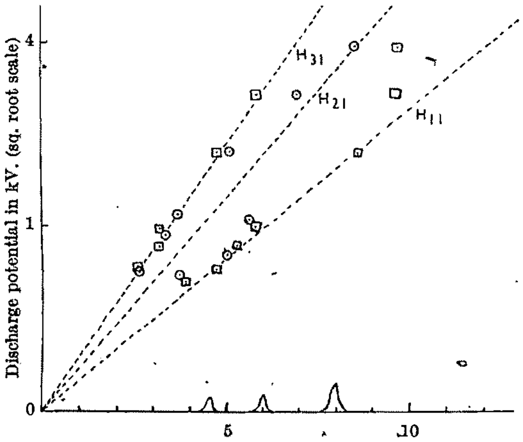
Triatomic Hydrogen and Doppler Effect in Hydrogen Positive Rays

J. J. THOMSON[1] discovered the triatomic molecule of hydrogen by the positive ray parabolic method. It was later confirmed by Dempster[2], Duane and Wendt[3], and several others. Its occurrence is very frequently noted in discharge tubes, but the optimum conditions are not well defined. While investigating the Doppler effect in hydrogen positive rays, using a Wien type of discharge tube, maximum Doppler displacements corresponding to H_3^+ molecules in the discharge space were observed. The accompanying graph gives the maximum Doppler displacements recorded in the $H\delta$ line of the Balmer series. A Steinheil three-prism glass spectrograph was used at two different dispersions, namely, 7·6 A. and 27·2 A. per mm. in the $H\delta$ region.



MAXIMUM DOPPLER DISPLACEMENTS IN THE $H\delta$ LINE, DISPERSION: ⊙, 7·6 A. per mm.; ⊡, 27·2 A. per mm.

The three dotted lines marked H_{11}, H_{21} and H_{31} passing through the origin of the co-ordinate system represent, as explained in an earlier publication[4], the theoretical maximum displacements corresponding to the light emitted by the neutral hydrogen atoms derived from H_1^+, H_2^+ and H_3^+ particles that had fallen through the full voltage applied to the discharge tube. The maximum displacements at each discharge potential used were measured from spectra obtained with graded times of exposure. Great care was taken to eliminate the many-lined spectrum while measuring the respective maximum edges of the Doppler bands.

Starting from a discharge potential of 0·5 kV. and going up to about 2·5 kV., two strips corresponding to H_{31} and H_{11} were measured. The H_{21} strip is not very distinct in this region. Beyond 3·0 kV. and in practice above 2·5 kV., however, the H_{21} strip appeared with increasing intensity, while the H_{31} strip was faint and could not be measured. This discharge potential, namely, 2·5 kV., corresponds in the present investigation to a pressure of 0·09 mm. in the discharge space. For pressures lower than 0·09 mm. the discharge potential would increase beyond 2·5 kV. Hence 0·09 mm. is the minimum pressure below which the H_{31} strip becomes faint. A comparison of the intensities of the H_{31} and H_{11} strips showed that at about 1,120 volts discharge potential they are of the same intensity.

The above results are in good agreement with the observations made by Hornwell[5] using the method of collisions. They differ, however, in certain respects, a discussion of which, along with the details for the rest of the Balmer lines studied, will be reserved for publication elsewhere.

The above work was done in the Positive Ray Laboratory of the Benares Hindu University, and I am grateful to Dr. B. Dasannacharya for his interest in the investigation.

Vacuum Sublimation of Ice in Bulk

AN ice sublimation or freeze-drying process will have maximum rate of vaporization per unit exposed area of frozen product at a specified temperature if the following conditions are satisfied: (i) The vapour pressure of ice sublimed on the condenser is negligible compared with ice at the product temperature. (ii) The condensing and product surfaces have a uniform and minimum separation. (iii) The permanent gas (usually air) pressure in the product-condenser interspace is a minimum. (iv) Mechanical obstruction (in the form of radiation shields, sterile caps, etc.) to vapour transfer from product to condenser is a minimum. (v) The product is of uniform and minimum thickness. The first four conditions follow from kinetic considerations and ensure that reversed vapour transfer, length of vapour path, and obstruction to vapour transfer are a minimum. The last condition is a consequence of the increase of drying-time with product thickness.

To satisfy these conditions, a plant has been constructed consisting of a tray and condenser within a 500-litre vacuum chamber. The tray and condenser are in the form of rectangular, stainless steel plates, 46 cm. × 76 cm., and are identical apart from the upturned edges of the tray. The horizontal plane of the condenser is 6 cm. above that of the tray. The condenser is maintained at − 80° C. and the tray at any required temperature between − 30° C. and + 60° C. The chamber is evacuated by means of an oil diffusion pump and backing pump, the vacuum line being baffled by the upper surface of the condenser in order to eliminate contamination of the condensing surface by diffusion pump oil and to reduce the mass of water vapour taken through the pumps. Product and other temperatures are measured by means of embedded thermocouples.

Up to 6 litres of liquid to be dried are poured into the tray and frozen to − 25° C. in 30 min. by contact with this surface at − 30° C. The condenser is now cooled to − 80° C. and the chamber evacuated to a permanent gas pressure of one micron of mercury. As in other drying plants[1,2], the tray or equivalent temperature is raised as drying proceeds in order to maintain a maximum vaporization-rate consistent with the nature and condition of the product.

The drying process may be divided into two clearly defined phases. The first is characterized by the uniform recession from the product surface of the horizontal plane of separation between upper partially dry product and lower frozen product. The plane recedes by approximately 1·5 mm. per hour, and this is equivalent to a constant vaporization-rate of 34 μgm. per sq. cm. per sec. This phase terminates when the receding plane of separation coincides with the tray surface. At this stage, 15 per cent of the original liquid bulk remains in the form of isolated ice crystals distributed throughout the partially dried product. Commencement of the second phase of drying is therefore characterized by a rapid fall in the rate of vaporization. The product temperature is now raised from − 10° C. to + 25° C. in 2–3 hours and maintained at this temperature for the remainder of the drying cycle. This is achieved by control of the tray temperature, a final product-temperature of + 25° C. requiring a tray temperature of + 50° C. Two additional hours per litre of initial volume are required for the complete vaporization of these ice crystals. Thus, for most biological fluids, a total drying time of 4 hr. per litre is required to obtain a residual moisture content of less than 1 per cent by weight. Lower moisture contents may be obtained by secondary desiccation over phosphorus pentoxide. At the conclusion of the drying cycle, the underside of the condenser supports an ice sheet of uniform thickness which consists of a mass of ice crystals orientated with the long axis normal to the condenser surface. The bulk density of this ice sheet is 0·7 gm./cm.³. No ice forms on the upper surface of the condenser.

It may be shown[5] that the maximum rate of vaporization from an ice surface into a perfect vacuum is given by the equation $G_{\text{max.}} = 0\cdot244 \dfrac{\alpha P_s}{\sqrt{T}}$ (gm. per sq. cm. per sec.); where P_s mm. mercury is the saturated vapour pressure in equilibrium with the ice surface at absolute temperature T and α is the condensation coefficient. Tschudin[6] has tested this equation for values of T between − 60° C. and − 86° C. and finds the condensation coefficient to be 0·94 ± 0·06. Observations by Alty[7] on water drops lead to a condensation coefficient of 0·04 between + 4° C. and − 8° C. If the equation is applied to vaporization from the plane of separation during the first phase of drying (that is, at product-temperatures between − 10° C. and − 30° C.) the mean condensation coefficient is 0·0024. This is equivalent to the statement that the theoretical vaporization-rate, on the assumption of a unit condensation coefficient, is 420 times greater than the experimental value. However, high rates of vaporization may lead to appreciable surface cooling and consequently a greater condensation coefficient. It is also probable that vapour transfer is obstructed by molecular collisions in the tray-condenser interspace. In view of the proportionality between initial volume and drying time, the obstruction to vapour transfer by the layer of partially dry product above the plane of separation is likely to be of secondary importance. The influence of these factors on vapour transfer is under further investigation.

Two freeze-drying plants due to Greaves and Adair[1] and Greaves[2], in which the average length of vapour path is ten times greater than in the tray drier here described, yield average vaporization-rates between 5 and 10 μgm. per sq. cm. per sec. These values are to be compared with the average vaporization-rate of 20 μgm. sq. cm. per sec. given by the tray drier under sterile conditions and a similar product-temperature cycle. It is interesting to observe that curves published by Greaves and Adair[1] for the drying of 5 litres of serum in 100 hr. support the postulation of two phases of drying. These curves show that the first phase of drying required 30 hr. at a product-temperature of about − 20° C. In this time 59 per cent of water had been removed, and on our calculation this is equivalent to a vaporization-rate of 10·9 μgm. per sq. cm. per sec. The average vaporization-rate over the total drying time of 100 hr. was 5·6 μgm. per sq. cm. per sec.

The tray drier was designed three years ago, and, with minor sterile modifications, has been used in the intervening period to dry human fibrin foam[3], human and cow's milk[4], sodium and calcium penicillin solutions, cyst fluid and other biological fluids. An industrial-scale drier based on this design and containing five interleaved tray-condenser units in each vacuum chamber has been erected by Imperial Chemical Industries, Ltd., for the freeze-drying of penicillin solutions.

Intrinsic Electric Strength of Polythene

THE work of Austen and Pelzer[1] on the use of recessed specimens for measurement of the electric strength of dielectrics suggested that with specimens of this type experimental verification of the theories of breakdown developed by Frohlich and von Hippel[2,3] might be possible. Frohlich's recent extension[4] of his theory predicts: (*a*) that the electric strength should be independent of thickness until the latter approaches the order of the electronic mean free path, when the electric strength should increase with decreasing thickness; and (*b*) that below a certain critical temperature the electric strength should either increase with temperature or be nearly independent of temperature, while above this critical point the electric strength should decrease with increasing temperature according to the relation $\log F \propto \frac{1}{T}$, where F is electric strength and T is absolute temperature.

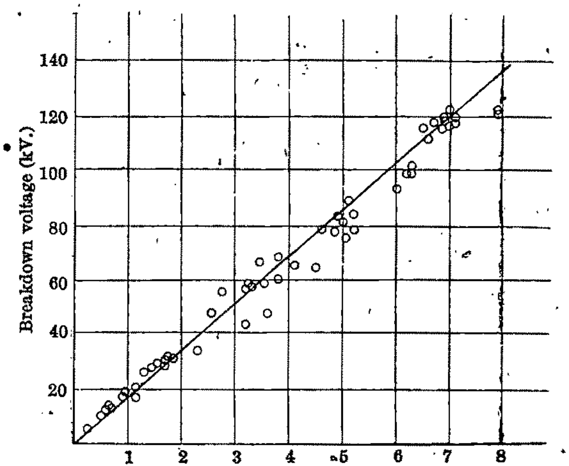

Fig. 1. D.C. BREAKDOWN VOLTAGE OF GRADE 20 POLYTHENE at 20° C.

Recent determinations of the D.C. electric strength of polythene show some measure of agreement with these predictions. For specimens varying in thickness from 0·0005 in. to 0·008 in., the breakdown voltage was observed to be an approximately linear function of thickness (Fig. 1). The mean breakdown stress derived from such a series of measurements was found to be substantially independent of time of application of voltage, radius of curvature of the specimen recess, polarity of the recess electrode, and the nature of the ambient medium. There was a small but significant difference between the value obtained with graphite electrodes and that obtained with silver electrodes, but otherwise it seems reasonable to assume that the mean breakdown stress so measured is an intrinsic property of the dielectric material.

The variation of the breakdown stress of polythene with temperature (Fig. 2) indicates that the critical temperature is about 25° C. The difference in shape between the experimental and theoretical curves is probably associated with the reduction in the crystallinity of polythene with increasing temperature. Frohlich's theory predicts that, as the crystallinity decreases, the critical point will be displaced to a

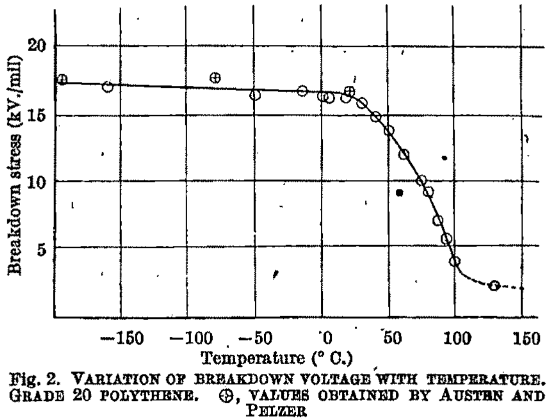

Fig. 2. VARIATION OF BREAKDOWN VOLTAGE WITH TEMPERATURE. GRADE 20 POLYTHENE. ⊕, VALUES OBTAINED BY AUSTEN AND PELZER

lower temperature, and that at temperatures below the critical point the electric strength will increase. Such a displacement of the electric strength temperature curve with decreasing crystallinity may possibly explain the S shape of the experimental curve in Fig. 2.

There is satisfactory agreement between the present results and those obtained by Austen and Pelzer on similar specimens of polythene at 20°, – 80° and – 195° C.

The experimental work involved was carried out in the Electrotechnical Laboratories, University of Manchester.

Determination of Limit of Proportionality of Wires

In connexion with the determination of the limit of proportionality of cold-drawn wire, the following technique, which so far as we are aware is novel, has been used with success. The wire itself is employed as a 'strain gauge', the increase of electrical resistance as the load is increased being measured. The electrical contacts near the grips of the tensile testing machine were connected to a Cambridge dial bridge on which the resistance was measured; gauge-lengths of 50 or 100 cm. were employed.

Typical curves are shown in Figs. 1 and 2, which refer respectively to mild steel containing 0·08 per cent of carbon and a nickel–copper alloy. In Fig. 1 the elastic range is clearly shown, the curve following very closely that obtained in the normal stress-strain test right up to the point of fracture. Fig. 2 shows the hysteresis loop obtained, both by the normal and the new method.

A point of some interest, for which, as yet, no explanation can be given, is that with some materials a distinct break has been observed in the stress-resistance curve at loads which will carry the material well into the plastic range, a point which is receiving further attention.

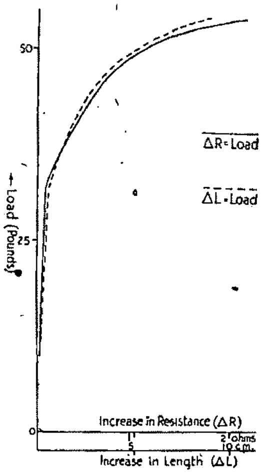

Fig. 1

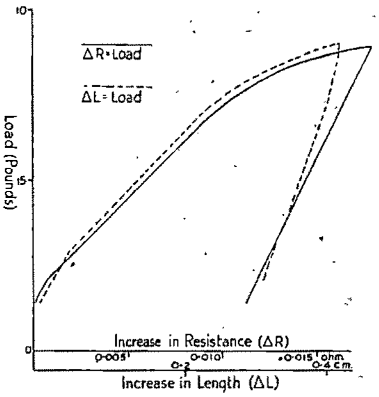

Fig. 2

The simplicity of the new technique, and its ready adaptability to the testing of wire in particular, seemed to justify this short communication.

The Problem of Classification and Distance Between Two Populations

The problem of specifying an individual as a member of one of many populations, and the classification of a number of populations themselves in some significant system based on the configuration of various characteristics, are of great importance in anthropological and biological research. We may find a collection of skulls with unspecified sexes, and the problem faced by an anthropologist is assigning proper sex to a skull. Judgment based on mere anatomical appreciation of a skull may not be altogether wrong, but is subject to criticism especially when objective methods are available. This problem has been solved by Fisher's *discriminant function*. If we have a collection of skulls grouped according to specified populations, the problem is to arrive at constellations of populations such that any two members of a constellation are closer to one another than any two belonging to different constellations. This problem can be solved by Mahalanobis's *generalized distance*.

In this communication an attempt has been made to present solutions satisfying a logical set of requirements to these problems of classification. The probability distributions considered are quite general and the results arrived at are capable of simple interpretation. Incidentally, this supplies a logical appreciation of intuitive tools introduced by Fisher and Mahalanobis.

Classification with assigned characters in a population. There are two populations π_1 and π_2 characterized by probability densities $f_1(x_1 \ldots x_p ; \theta_1 \ldots \theta_t)$ and $f_2(x_1 \ldots x_p ; \theta_1' \ldots \theta_t')$, where x's are variables and θ's are parameters. We shall denote them by ${}_pf_1$ and ${}_pf_2$, where p stands for the number of characters used, or simply by f_1 and f_2. If an individual can be represented by an ordered set of measurements on p characters or a point in a space of p dimensions, then the problem requires a division of space into mutually exclusive regions R_1 and R_2, and the rule of procedure of assigning the individual to π_1 if he belongs to R_1, and to π_2 otherwise. Let the probabilities of an individual I belonging to R_1 and R_2 when he is from π_2 and π_1 respectively be denoted by

$$P(I \subset R_1/\pi_2) = \alpha_1, \; P(I \subset R_2/\pi_1) = \alpha_2 ;$$

so that these supply the frequencies of errors in classification. If we suppose $\alpha_1 = \alpha_2 = \alpha$, then a logical requirement is that the regions should be chosen such that α is minimum. The problem is solvable by a lemma due to Neyman and Pearson, and the regions are given by $f_1 \geqslant \lambda f_2$ and $f_1 \leqslant \lambda f_2$ respectively, where λ is chosen such that $P(I \subset R_1/\pi_2) = P(I \subset R_2/\pi_1)$, the common value being the minimized value of α.

In some problems, we may require the regions such that $\alpha_1 + \alpha_2$ is minimum, in which case the regions R_1 and R_2 are defined as $f_1 \geqslant f_2$ and $f_1 \leqslant f_2$ respectively; that is, the individual is assigned to one population or the other according to the likelihood ratio of these two hypotheses.

In other problems we may require that α_1 and α_2 should have assigned values smaller than the values obtained above. In this case the space has to be divided into three regions R_1, R_2 and D, such that an individual belonging to D remains unclassified. A logical requirement of the problem, then, is to choose these regions such that the unclassified percentage of individuals in a collection with an unspecified proportion of mixture of members belonging to π_1 and π_2 is minimum. The regions R_1, R_2 and D are given by

$$\frac{f_1}{f_2} \geqslant \lambda_1, \frac{f_1}{f_2} \leqslant \lambda_2 \text{ and } \lambda_2 \leqslant \frac{f_1}{f_2} \leqslant \lambda_1, \text{ respectively,}$$

where λ_1 and λ_2 are chosen such that

$$P(I \subset R_1/\pi_2) = \alpha_1, P(I \subset R_2/\pi_2) = \alpha_2,$$

where α_1 and α_2 are assigned.

In the third case discussed above, the region of doubtful classification has been introduced to keep the wrong classifications at a desired level. If the problem admits the measurement of a large number of characters, we can in some circumstances make the frequencies of doubtful classification as small as possible. A sequential procedure is available, by following which the proportion of wrong classifications is kept at a desired level without making use of a large number of characters. This test has been derived from Wald's sequential theory by suitable extensions to multivariate analysis. Starting with p characters we define the regions ${}_pR_1$, ${}_pR_2$ and ${}_pD$ by

$$\frac{{}_pf_1}{{}_pf_2} \geqslant \frac{1-\alpha_2}{\alpha_1} \; ; \; \frac{{}_pf_1}{{}_pf_2} \leqslant \frac{\alpha_2}{1-\alpha_1} \text{ and}$$

$$\frac{\alpha_2}{1-\alpha_1} < \frac{{}_pf_1}{{}_pf_2} < \frac{1-\alpha_2}{\alpha_1}$$

respectively. If an individual belongs to ${}_pR_1$ or ${}_pR_2$, the conclusions are the same as before. If he belongs to ${}_pD$, we take measurements on *one* or r more characters, and construct these regions corresponding to $p + 1$ or $p + r$, and so on. The details of this test have been worked out in the case of multivariate populations of the normal type, and will be given elsewhere.

Distance between two populations. If we have a mixture of individuals belonging to π_1 and π_2 in equal proportion, then following the two procedures given above, the proportions of correct classifications are $1-\alpha$ and $1 - \frac{\alpha_1+\alpha_2}{2}$. We may take the first or the second as the distance between two populations π_1 and π_2. These are capable of simple interpretation, as α and $(\alpha_1+\alpha_2)/2$ stand for overlapping individuals who may be wrongly classified. It is interesting to observe that the distances defined by the above expressions obey the triangle law, namely, the sum of distances of a population from two different populations is not less than the distance between the two other populations. The distances defined are explicit functions of Mahalanobis's D^2 in the case of multivariate normal populations.

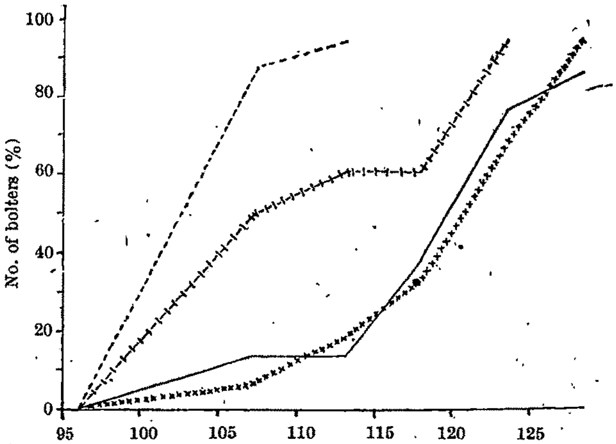
Vernalization of Lettuce

Gray[1] and Simpson[2] have both reported experiments on the vernalization of lettuce, and these observers agree that low (2–8°) temperature treatment of the swollen seeds for varying periods, while not affecting the date of heading, reduces the period for which the plants remain in the heated stage and accelerates flowering by fourteen to twenty days. Experiments carried out here indicate the importance of the timing of these vernalization treatments.

Four sets of Feltham King lettuce (a long-standing variety of summer cabbage lettuce) were sown outdoors on April 8. One set of seed (S) was soaked for twenty-four hours before sowing, and a second set (SX) for seventy-two hours, by which time germination had begun and the radicles emerged. Two other sets (V and VX) were similarly soaked, and after soaking held at 0–4° C. for twenty-four days before sowing. All four sets were sown together, all germinated and emerged from the soil satisfactorily and at apparently the same rate, and came to the hearting stage together. They showed, however, considerable differences in the rate at which 'bolting' occurred. In no set was any sign of bolting evident before July 20, and the percentage of bolters in each set after this date is shown graphically below.



Vernalization of lettuce: graphs continued to maximum values obtained

– – –, V ; —I—I—I, VX ; ——, S ; x x x, SX

That 100 per cent of bolters were never found was due to a small attack of *Botrytis cinerea*. The difference in appearance of the four sets of plants was most striking on July 30. On this date the majority of *V* plants were 45–60 cm. in height, and the *VX* plants 15–18 cm., while a few *S* and *SX* plants were just showing only the first signs of 'bolting'. Actual flowering dates were for the *V* plants Aug. 28, *VX* plants Sept. 2 and *S* and *SX* plants Oct. 1. The vernalization treatment of the swollen seed accelerated flowering by thirty-one days. This great acceleration was probably due in part to unfavourable weather during September, retarding the flowering of the *S* and *SX* plants. The chief point of interest is that the vernalization treatment given after radicle emergence had occurred was so much less effective than the treatment commenced after the seed had swollen for only twenty-four hours and before germination had begun.

A rather severe attack of *Botrytis* on a similar series of Webb's Wonderful lettuce was not sufficient to mask similar trends with this variety.

These observations serve to emphasize the importance of the timing of any vernalization treatments. They may not be without their practical significance. Early sowings of a number of crop plants (for example, beet, turnip, celery[3,4], etc.) are especially prone to flower prematurely, and this may be due in some cases[4] to a vernalizing effect on the swollen or germinated seed, or on the seedlings, of naturally experienced low soil or atmospheric temperatures in early spring. In so far as the effect is one on the swollen seed and not on the young seedling, the possibility of avoiding these undesirable effects by the sowing of already germinated seed is opened up.

Prevention of Oil Shock in the Orchard

THE use of a highly refined petroleum oil for application to orchard trees as an insecticide and acaricide is firmly established as a valuable pest-control treatment with citrus, but its use on deciduous trees in summer is limited by the fact that, under certain ill-defined conditions, severe leaf and fruit-drop has been known to occur following the use of a 'summer' petroleum spray.

During the seasons 1944, 1945, 1946, we have carried out field experiments in commercial apple orchards designed to determine whether the addition of the plant-growth regulator alpha naphthyl acetic acid to a white-oil spray would prevent the leaf- and fruit-drop which might otherwise be induced. Until this season we failed to produce leaf- or fruit-drop by the application of oil in trials in Kent, Sussex and Essex; but this year, on a farm in Essex, severe drop of both leaves and apples did occur in the case of the variety Cox's Orange Pippin after spraying with a white-oil emulsion used at 1 per cent (0·75 per cent actual oil). The base oil conformed to the official specification for horticultural white oils for orchard use. On adjoining plots alpha naphthyl acetic acid was added to the diluted oil emulsion as sprayed, so that the concentration of the plant-growth regulating substance was 10 parts per million. The spraying was carried out on June 19, 1946, the variety being Cox's Orange Pippin with Worcester Pearmain as pollinator. On August 28, 1946, a count of the fruits remaining on the Cox trees was made, and the average fruits per tree were as follows:

Control—unsprayed trees	44·2
White-oil spray alone	6·0
White-oil spray plus alpha naphthyl acetic acid	51·9

In this case, therefore, the alpha naphthyl acetic acid, a material which is commonly used for the prevention of pre-harvest drop of apples and pears, applied simultaneously with an oil spray, has modified or prevented the shock due to the application of oil and thereby prevented leaf- and fruit-drop.

We regard this result as important since a summer application of white oil to foliage is probably the best method of controlling the serious pest red spider mite (*Oligonychus ulmi* C. L. Koch) on apples, and hitherto oil has not been widely used for this purpose in Great Britain because of the risk of causing leaf- and fruit-drop.

Gaseous Sulphur Dioxide and Sodium Bisulphite as Preservatives of Citrus Concentrates

DIFFERENTIAL preservative efficiency between gaseous sulphur dioxide and sodium bisulphite, observed in citrus concentrates, became of practical significance during the War due to the difficulties in obtaining an adequate supply of gaseous sulphur dioxide in Palestine. Investigating the effect of acidity on the efficiency of various preservatives, Rahn and Conn[1] found that yeast is checked only by molecular H_2SO_3, and not by dissociated ions HSO_3' or SO_3''. According to Downer[2], quantities ranging between 2,000 and 2,500 p.p.m. sulphur dioxide are necessary for citrus juice concentrates (4 : 1), and even more are required for higher concentrations, in order to prevent fermentation. This has been explained by him as due to the fact that part of the sulphur dioxide combines with the aldehyde group of the sugar contained in the juice, leaving only part free to act as preservative.

In our experiments, increasing amounts of sodium bisulphite and parallel gaseous sulphur dioxide have been added to concentrated citrus juice (6 : 1), inoculated with a known number of wine yeast. The test mixtures, which have been examined periodically during three months, showed the bisulphite to be at least 30–40 per cent more efficient than sulphur dioxide.

The minimum quantity of sodium bisulphite to be added to the concentrate, in order to prevent fermentation, has been found by us to range between 1,000 and 1,200 p.p.m., equivalent to 600–700 p.p.m. sulphur dioxide, while 800–1,000 p.p.m. gaseous sulphur dioxide, equivalent to 1,300–1,600 p.p.m. bisulphite, are necessary to produce the same effect.

No significant difference has been observed in the *p*H of citrus juice concentrate containing either of the two preservatives. Both of them also show the same vitamin C content.

It is to be noted that tests with 1,000 p.p.m. sulphur dioxide gas (or 1,300 p.p.m. sodium bisulphite), and more, preserved the original colour almost to the very end of the experiment (more than three months), the test being carried out at 25–28° C. Control tests and citrus concentrates containing less than 1,000 p.p.m. sulphur dioxide darkened progressively with storage.

It seems to us that larger amounts of preservatives are required for colour preservation than for microbiological protection. The limit for the former has been found to be 1,000–1,200 p.p.m. sulphur dioxide gas, or 1,200–1,350 p.p.m. bisulphite solution (equivalent to 700 p.p.m. sulphur dioxide).

The relative efficiency of gaseous sulphur dioxide and sodium bisulphite solution may be explained by the different behaviour of the two forms of preservatives when dissolved in the citrus juice concentrate[3].

These experiments have been carried out in the Department of Biological and Colloidal Chemistry, Hebrew University, Jerusalem, with the generous co-operation of Prof. A. Fodor, director of the Department. We acknowledge with thanks the interest taken by the Scientific Advisory Committee, War Supply Board, Government of Palestine, which has also sponsored this investigation.

Vitamin Content of Tubercle Bacilli

MANY chemical compounds which inhibit the growth of certain bacteria are structurally related to compounds which are growth stimulators for the same bacteria. This relationship makes of interest the vitamin content of pathogenic bacteria grown on vitamin-free media, since this may give a clue to the structure of compounds which are important in the metabolism of the micro-organism under study and indicate a starting point for the synthesis of possible growth inhibitors. Thus, Ekstrand and Sjögren have reported on the production of *p*-aminobenzoic acid by the tubercle bacillus[1].

Recently we have had occasion to assay a tubercle bacillus culture for several vitamins by microbiological methods. The culture was an H37Rv strain of virulent human type tubercle bacilli (supplied by Dr. Guy P. Youmans, Northwestern University Medical School, Chicago) which had been grown for 21 days on Proskauer – Beck medium. Determinations were made on the carefully suspended whole culture and on the clear filtrate after removing bacterial cells by centrifugation. The results are indicated in the table.

Vitamins determined	Culture filtrate* (γ/c.c.)	Whole culture† (γ/c.c.)
Vitamin Bc	0·05	—
p-Aminobenzoic acid	—	0·0216
Pantothenic acid	1·04	—
Riboflavin	0·2	1·5
Nicotinic acid	37	61
Biotin	0·03	0·057

* Autoclaved 30 min. at 15 lb. pressure before assaying.

† Autoclaved 30 min. at 15 lb. pressure in *N* sulphuric acid before assaying.

A sample of the basal medium was also assayed for the vitamins indicated. Negative results, indicating less than 0·002 γ per c.c., were obtained for all except nicotinic acid. The amount of nicotinic acid found was 0·071 γ per c.c.

Of interest in these results are the rather high content of nicotinic acid and the low content of vitamin Bc and *p*-aminobenzoic acid. Ekstrand and Sjögren[1], using a chemical method of assay, also found only a small amount of *p*-aminobenzoic acid in tubercle bacilli. This is in contrast to a value of 0·63 γ *p*-aminobenzoic acid per c.c. which we recently obtained for a 17-hr. culture of *E. coli*.

Antibacterial Titre in Wood-destroying Fungi

FROM exploratory surveys of the production of bacteriostatic substances by wood-rotting fungi both in Great Britain and in the United States, it appears that the authors, Wilkins[1] and Robbins *et al.*[2], have tested the antibacterial activity of the metabolism-solution periodically up to a maximum of 30 days and 22 days respectively, and that their test-organisms have always been *Bacterium coli* and *Staphylococcus aureus*. On the basis of my experiences stated below, I suggest that: (1) this period of test should be extended, and that (2) some other organisms should also be employed as test-organisms from time to time.

In the course of my work on the antibacterial activity of 'polyporin' from a wood-destroying fungus, *Polystictus sanguineus*, I[3] have observed that the antibacterial titre persists for a much longer time (in some cases more than three months), with periodic rise and fall of the titre, and that the activity which appears very early in the course of a week or so goes down soon and does not seem so stable as the one which appears later. For example, in an inoculated flask where the composition of the medium was of $MnSO_4$, $FeSO_4$, pea seed-extract, KH_2PO_4 and 4 per cent glucose, the antibacterial activity of the fungus which appeared on the ninth day disappeared on the eleventh, while the activity appearing on the fifteenth day continued until the thirtieth, and the activity reappearing on the sixty-fifth day continued until the eighty-sixth; in another case I have a record of continuing activity from the seventieth to the ninety-eighth day, with five rises and falls from the initial start. Kent[4] has distinguished two kinds of substances in the metabolism solution, one as staling substances which appear earlier in the course of growth of the organism and are not very stable, and the other as inhibitors which are fairly stable and are slow in appearing in culture media. It has been further observed that a fungus inactive against *Staph. aureus* and *B. coli* forms substances antibiotic against other organisms (typhoid, cholera, etc.).

Sex in *Melandrium*

THE development of stamens in pistillate plants of *Melandrium* under the influence of *Ustilago violacea* (Pers.) Fuckel is well known. Recently, this action has been simulated by treatment of plants with the animal hormone testosterone, while the reverse change has been caused by œstrone[1,2]. None of the authors responsible for accounts of the reversal, whether natural or artificial, has remarked upon the fact that, when such a change from the pistillate to the staminate condition occurs, some characters of pistillate plants are replaced by those typical of staminate plants while others are not. Thus, the copious branching and diminution in size of the leaves which is produced in the region of the inflorescence, and the grouping of the flowers into more or less sessile clusters, all of which are characteristics of staminate plants, appear after infection. On the other hand, the calyx retains the inflated shape characteristic of pistillate plants and, although infection of originally pistillate and staminate plants reduces the length of the calyx-teeth, they retain the characteristic difference in shape, and those of the pistillate plants remain the longer. These characters are seen best in *M. album*, where the differences between pistillate and staminate plants are more extreme.

It appears that the differences in branching are secondary sexual characters while the differences in calyx-characters are completely sex-linked. One of the purposes of this note is to indicate the possibilities which such hormone studies hold out in discriminating between two otherwise inseparable types of character.

Infection by *Ustilago violacea* or, according to Löve and Löve[1,2], the application of the *single* chemical substance testosterone, can perform the *dual* function of promoting the formation of stamens and suppressing the formation of pistils. On the other hand, Westergaard[3,4] has postulated that these two functions are performed, normally, by two separate sets of genes on the Y-chromosome, and has produced considerable cytological and genetical evidence in support of this idea, including the removal of the 'female-suppressors', in which case the plants lacking them produce both stamens and pistils.

One modern tendency (see review by Löve and Löve[2]) is towards the assumption that the normal formation of staminate flowers is due to the genically controlled production of a substance resembling testosterone. This does not preclude the possibility of the simultaneous production of 'œstrone' in quantities insufficient to affect the morphology. It is not easy to reconcile this view with the *two specific* actions which Westergaard postulates for the sets of genes. This difficulty is important because Westergaard has made far-reaching deductions concerning the evolution of diœcism from his results.

It should be pointed out, however, that in interpreting the genetical data the idea of 'female-suppressors' in *Melandrium* has been introduced only because the effect of the *removal* of the genes concerned is to cause pistil development. Alternatively, it might be argued that a concentration of 'testosterone' just sufficient to promote the formation of stamens but insufficient to suppress pistil-formation might be produced under the influence of one set of genes, while an additional production of 'testosterone' caused by the other set of genes would induce the abortion of the pistil. Thus, the two sets of genes could have the same action and neither be specifically a 'female-suppressor' nor a 'male-promoter'. This view is supported by the fact that purely pistillate plants, when infected by *Ustilago violacea*, produce well-formed stamens, while the abortion of the pistil varies in extent and is never complete. A similar impression is gained from the diagrams by Löve and Löve[2] showing the effect of treating pistillate plants with testosterone.

In *Melandrium* the structure of the X-chromosome is not so well known as that of the Y, so that 'male-suppressors' or 'female-promoters' upon it are not known as yet.

Sweating in Sheep

DURING investigations on the humidity of the fleece atmosphere carried out in the summer of 1946, certain sheep were found to have a consistently higher relative humidity (70–90 per cent) close to the skin than at points farther out in the thickness of the fleece (25–50 per cent); humidity measurements being made with cobalt chloride papers, prepared as described by Solomon[1]. Strips of cobalt chloride paper were placed vertically in the fleece so that one end of each strip rested on the skin and the other lay about 1 in. away from the skin. Humidity differences were measured between the two ends of single papers so placed. In one healthy, undipped sheep, the high humidity found at the base of the fleece was confirmed by placing close to the skin *Lucilia sericata* (Mg.) eggs incubated to within half an hour of hatching; other eggs from the same batch were placed in the same part of the fleece, but one inch away from the skin. The eggs near the skin hatched immediately, indicating a humidity of at least 80 per cent, as shown by the work of Davies and Hobson[2]. The larvæ survived in this position and established a strike without any addition of moisture. Eggs placed one inch from the skin did not hatch, indicating a lower humidity at that point. The limiting factor for strike on this and other sheep used appeared to be the non-attraction of blowflies to oviposit on them. The existence of a population of gravid blowflies in the vicinity was shown by attracting flies to oviposit on some of the sheep, using the technique of Hobson[3].

It is concluded from the above evidence that certain sheep sweat to an extent sufficient to maintain humidities at the base of the fleece suitable for the development and survival of blowfly eggs and young larvæ. Under similar weather conditions, other sheep were found to have fleeces too dry throughout for strikes to develop successfully.

It was not clear from the above observations how far such sweating varied and depended on the activity of the sheep. Freney[4] attempted to find if sweating occurred in sheep after running; he found that the weight of moisture in wool samples from the base of the fleece did not increase after sheep had been run in hot weather. The following experiments were made, therefore, using cobalt chloride papers as described above, to discover how far moisture conditions at the base of the fleece depended on activity. The accompanying table gives readings of fleece atmosphere humidity for a single dry-fleeced Herdwick × Swaledale wether, 18 months old, before and after running for 10 minutes around a field on a sunny afternoon in August 1946 (air temperature, 16° C.).

% R.H. FLEECE ATMOSPHERE, AS MEASURED BY COBALT CHLORIDE PAPERS
(Papers reading 20–40% R.H. were not accurately read, but are recorded as 'below 40%')

Position in the fleece	15 min. before running		30 min. after running		2 hours after running	
	Skin surface	1 in. off the skin	Skin surface	1 in. off the skin	Skin surface	1 in. off the skin
Withers	below 40	below 40	55	48	below 40	below 40
Tailhead	below 40	below 40	57	—	below 40	—
R. crutch.	below 40	below 40	62	62	45	—

It is seen that after the sheep was run the relative humidity at the base of the fleece rose, clearly indicating that an increased rate of sweating had occurred. Further, the fall in humidity after two hours indicates that the effect was transitory. The experiment was repeated four times on the same sheep on different days with similar results. A single experiment on a Swaledale ram lamb also showed a transitory rise in basal fleece humidity after running.

The full results of fleece humidity measurements by cobalt chloride papers will be published elsewhere.

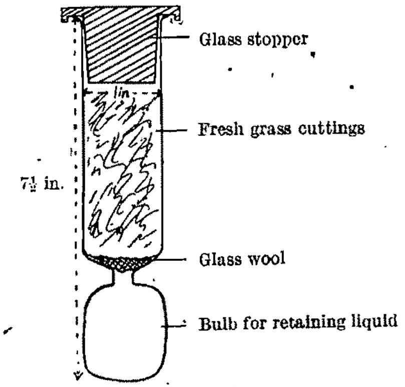
Activity of Thermophilic Bacteria in Composts of Fresh Green Material

DURING the course of an investigation on the microbiology of composts made from fresh grass cuttings, it was noticed that a dark brown liquid oozed from the material. A large volume of this liquid is produced, and it is very rich in ammonia nitrogen. Under normal conditions of composting it would be lost, and therefore some knowledge of its production is of considerable interest. The liquid first appears when the compost is at a temperature of 65°–55° C.

It has been found possible to reproduce the above phenomenon on a small scale in the laboratory. The arrangement illustrated has proved particularly satisfactory. Series of these tubes can be incubated in a thermostatically controlled water-bath at 65° and 55° C. From the results of experiments with these tubes, it is suggested that this dark brown liquid may be formed through the degradation of organic nitrogen to ammonia by thermophilic bacteria, and the subsequent hydrolysis of chlorophyll under the alkaline conditions produced by this ammonia.

At the temperatures mentioned above, a thermophilic bacterial flora has been found to develop both in the compost and in the tubes. In the compost it can be seen as a white coating covering the cuttings, particularly in the upper layers. Also the dark-coloured liquid produced in the compost and in the laboratory experiment is in both cases very rich in thermophilic bacteria. It was thought that there might be some relationship between the activity of the thermophilic flora and the production of the liquid. The following evidence supports this view.



(*a*) Fresh grass cuttings sterilized with 1/1,000 corrosive sublimate when incubated for five days at 65° C., followed by eight days at 55° C., failed to produce the typical dark brown liquid. The grass also retained its green colour and showed no evidence of decomposition.

(*b*) Unsterilized fresh cuttings under the same conditions of incubation gave the liquid, the grass changing its colour from green to brown, and obviously undergoing decomposition.

(*c*) Many isolates of the thermophilic flora have been made from both the compost and the tubes. True and facultative thermophilic bacteria have been found to be present. They are rod-shaped, spore-forming bacilli and are very strong ammonifiers. They do not attack chlorophyll in culture media.

(*d*) Chemical analyses have shown a marked increase in ammonia nitrogen when fresh grass is incubated at 65° C. This does not occur when the cuttings have been sterilized.

It would appear, therefore, that the thermophilic flora attacks organic nitrogenous material of the compost, liberating ammonia. As a result of this, it would be expected that conditions in the tubes and compost would become alkaline. Measurement of *p*H shows this to be the case.

It is well known that chlorophyll can undergo changes from green to brown when hydrolysed under alkaline conditions. In view of this, it seemed possible that the explanation of the dark brown colour might be connected with the production of alkaline conditions. Moreover, the thermophilic bacteria isolated did not attack chlorophyll in culture media.

The following experiment supports this hypothesis. Tubes with sterilized grass were set up, and into the bulb of each tube a few c.c. of strong ammonium hydroxide were introduced. The tubes were then incubated at 65° C. In a few days the grass began to change from green to brown, and the liquid which collected in the bulbs was very similar in appearance to that produced during composting.

Full details and further information on the microbiology of grass composting will be published in due course.

APPLICATION OF STATISTICAL METHODS TO FOOD PROBLEMS

STATISTICAL analysis and the logic of inductive inference are taking a part of increasing importance in many branches of scientific research and technology. Evidence of this is provided by the wide range of scientific journals and meetings in which there is frequent discussion of points of statistical technique. A few years ago, the statistical aspect of problems under consideration at scientific meetings was seldom mentioned; to-day there is a welcome tendency for societies to keep their members informed of developments in statistical methodology important to their field of study. At a well-attended joint meeting of the Society of Public Analysts and Other Analytical Chemists and of the Food Group of the Society of Chemical Industry, held on December 4, papers on "The Application of Statistical Methods to Food Problems" were read and discussed. The president of the Society of Public Analysts, Dr. G. W. Monier-Williams, was in the chair.

An introductory paper, "The Inevitability of Statistics", was given by Mr. D. J. Finney (University of Oxford). He said that since many types of measurement, in the physical as well as in the biological sciences, are not perfectly reproducible in repeated trials, the interpretation of numerical data is often impossible without using, explicitly or implicitly, statistical concepts. Even the calculation of a mean of several observations is a statistical operation, and from the dispersion among individual values the reliance to be placed on the mean may be assessed. A chemist should therefore have some knowledge of statistical principles, even though he need not concern himself directly with the computation of statistical analyses. Mr. Finney asked for close co-operation between analytical chemists and statisticians in the planning of investigations, as well as in the examination of results, since this would tend to increase the information obtainable from a specified amount of experimental work. He instanced the sampling of foodstuffs for the estimation of a constituent, including quality control with the aid of routine sampling, the design and analysis of experimental work in food production and in laboratory testing, and biological assay, as examples of the many ways in which statistical science can help in the elucidation of food problems.

Mr. W. B. Adam (Fruit and Vegetable Preservation Research Station, Campden) spoke on "The Use of Statistical Methods in Research on Food Canning". He emphasized the need for good experimental design and sound statistical technique in research into food technology; since the raw materials are very variable in composition, the relative effects of different treatments can be estimated from a reasonable amount of experimentation only if statistical science is exploited to the full. He then briefly described a number of problems from his own experience in which statistical methods had been of great assistance, and gave numerical results from typical experiments. Simple *t*-tests had been found useful in studies as varied as an inquiry into the effects of surface treatment and abrasion on the corrosion-rate of tinplate, and tests of the control of 'gumming' in plums by boric acid treatment of trees. In an investigation of the extent to which sulphur, phosphorus and copper in tinplate influence the formation of 'hydrogen-swells' during the storage of canned fruit, correlation and regression methods had been used for examining the inter-relationships of the many factors. Correlation methods had also shown a close association between seasonal rainfall and gum production in plums. Analysis of variance had been particularly valuable for data from field and orchard trials, such as those concerned with spraying for disease control. Mr. Adam pointed out that statistical analysis assists the critical appreciation of data, but should never be regarded as a substitute for accurate chemical analysis.

A paper by Dr. K. L. Blaxter (Ministry of Agriculture and Fisheries Veterinary Laboratory) on "The Evaluation of the Nutritive Value of Animal Feeding-Stuffs" was read by Dr. Allcroft. Dr. Blaxter stressed the great variation found in the constitution of feeding stuffs, in the ability of individual animals to utilize their food, and in the requirements of individuals for different nutrients. He mentioned the possibility of controlling animal variation by the selection of homogeneous groups for experimentation; this is less easy for farm animals than for small laboratory animals, but even where it is possible it may have disadvantages in limiting the applicability of conclusions. By careful planning (which must not be thought an excuse for shoddy experimental technique), a factorial design permitting the estimation of components of variation from different sources may be chosen. The measuring of variation is complementary, not antagonistic, to its minimizing; by its aid is obtained a wider basis for inductive reasoning from the results. He had found change-over designs, in which each animal receives each diet for some period of the experiment, to be capable of measuring comparatively small treatment-effects with precision, and yet to give data for estimating effects under a variety of conditions. Often herds may respond differently to treatment-variants, so that unless experiments are replicated over several herds there can be no assessment of the consistency of treatment-effects. The experimenter's ideal should be to discover the mechanisms of cause and effect underlying all variation. Until that knowledge was attained, Dr. Blaxter considered efficient experimental design and the reduction of the results by the best statistical techniques to be essential in the study of the complex problems of animal nutrition.

Mr. E. H. Steiner (British Food Manufacturers' Research Association), in a paper entitled "Application of Statistical Methods in Calculating Proportions of Ingredients in Certain Food Products", discussed a more specialized problem. He showed how knowledge of the natural variations in the composition of food ingredients can be used, in conjunction with the results of analysing a sample of a compound food, so as to provide an estimate of the range within which the proportion of a particular ingredient is likely to lie; an arbitrary standard of probability has to be chosen, and is usually 95 per cent. Mr. Steiner then gave tables showing limits of error under specified conditions of variability in the ingredients, and described how allowance can be made for the experimental error of analysis. He mentioned the application of this method to the estimation of meat in pork sausages, in which cereals also contribute to the protein content, and the proportion of animal protein has to be obtained. By widening the limits of error, the chance that a product is wrongly condemned is reduced; but, on the other hand, products below standard are then more likely to escape condemnation.

These papers provoked a spirited discussion. Mr. P. Lyle spoke of a rapid method for estimating the mean and standard deviation of a normal distribution from a table of frequencies. If a table of cumulative frequencies is formed, and the corresponding ratios plotted on specially ruled probability paper, the resulting points will lie approximately on a straight line; the 50 per cent value of this line gives the mean of the distribution, and the reciprocal of its slope is the standard deviation. He said that he had generally found methods of regression analysis to give a more readily understandable representation of results than the calculation of correlation coefficients. From a slightly different point of view, this matter was also raised by Mr. Clayson, who criticized the correlation between rainfall and percentage 'gumming' quoted by Mr. Adam; he said that since 'gumming' was caused by bacterial infection of the trees, no meaning could be given to the rainfall correlation. In reply, Mr. Adam stated that not all 'gumming' could be attributed solely to bacterial causes; he and other speakers also pointed out that the existence of a correlation does not imply a direct causal relationship, but may be due to the two variates being to some extent dependent upon common causes. Mr. Leibmann mentioned the danger of drawing misleading conclusions from spurious correlations.

Dr. J. G. A. Griffiths questioned the practice of using a normal frequency distribution to represent the distribution of a measurement the range of variation of which is not infinite. He was particularly concerned about the probabilities of extreme values, and described the difficulty of using a statement of probability as the basis for legal action concerning the constitution of a food product; the assertion that a sample analysed had only a very small probability of occurrence in random sampling from a product that was up to standard might be countered in court by the claim that a rare chance could occasionally happen. He would prefer to argue on impossibility rather than on low probability, and would therefore like to make use of a distribution with finite range. Mr. Finney replied that even though a measurement is known not to be able to take an infinite range of values, the satisfactory determination of the extremes is not easy. For many purposes the normal distribution has been found a sufficiently good approximation, as the true limits of the distribution are so wide that even the assumption of normality allows an exceedingly small probability of their being surpassed. Furthermore, it can be demonstrated that the distribution of a mean of several observations will generally be much closer to normality than that of a single observation, and usually decisions will be taken only on mean values. He stated that the statistician would use other forms of distribution function when these are found to be more appropriate, but that often it is impracticable to obtain positive evidence of any other distribution fitting the material more closely than the normal. Mr. A. L. Bacharach suggested that a statement of the analyst's experience that "a value so extreme has never been found for a product *known* to be of satisfactory quality" would often be a more effective way of presenting evidence than a quotation of probability levels. Mr. E. C. Wood reminded the meeting that the choice of 5 per cent significance level is arbitrary, and that, for the purpose of an action at law, a more stringent criterion might be desirable.

Dr. Nicholls inquired about the possibility of combining evidence that a product is below standard; statistical analyses of sample determinations of two or more different constituents might show each to be below standard, though not significantly so, and a composite test would be needed in order to summarize the weight of evidence against the product. Mr. Steiner suggested that a combined index might be formed which would be more sensitive to discrepancies than any one of the measurements used in forming it. Mr. Wood mentioned the use of discriminant functions.

Mr. Wood emphasized that the statistical analysis of data need not require a great amount of tedious calculation. Often a simple preliminary examination of the figures will readily indicate the answers to all the main questions, and no complete analysis will then be needed; this is particularly likely when efficient experimental designs are used. Occasionally the full analysis might mean all the difference between obtaining unreliable, or even misleading, information from an experiment, and obtaining a sound and detailed interpretation of the data; in an investigation for which the experimental work had taken a much longer time, a few hours of computing might be a small price to pay for valid conclusions.

As a simple example of the planning of experimentation, Mr. Wood said that the practice of combining a number of independent samples of a product into a single bulk, from which duplicate sub-samples are drawn for chemical analysis, leads only to an estimation of analytical variations; if, instead, the original samples are combined into two bulks, from each of which a single sub-sample is drawn, the difference between the sub-samples also estimates the true sampling variability of the product.

Mr. K. A. Brownlee spoke of the importance of ensuring that so-called 'duplicate' analyses are really based upon repetition of all the analyst's procedure, and are not merely obtained by simultaneous parallel chemical analyses of two sub-samples under practically identical conditions; for many purposes the co-operation of different workers, and even of different laboratories, is necessary if the true variability of an analytical technique is to be assessed.

D. J. FINNEY

FRENCH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

THE sixty-fifth meeting of the French Association for the Advancement of Science was held at Nice during September 9–14, 1946, under the presidency of Prof. Paul Montel. The opening meeting was held in the great hall of the Centre Universitaire Méditerranéen, which had been placed at the disposal of the Congress, and served as the general headquarters. Speeches of welcome were made by the Préfet of the Alpes Maritimes, the Mayor of Nice, and by Prof. Mario Roques, who pointed out that although Nice had the reputation of being a town of pleasure, it was also a town for meditation and study. Then followed addresses by representatives of the foreign delegates to the Congress, including H. Munro Fox (Britain), de Selys-Longchamps (Belgium), Wavre (Switzerland), Burgers (Holland), Bydzovsky (Czechoslovakia), Sergescu (Rumania), and Kepinski (Poland). Finally, Prof. Montel delivered his presidential address on the role of mathematics in the ordinary life of individuals.

The afternoon was devoted to certain inter-sectional meetings at the Centre Universitaire, and the organisation of sectional programmes at the Lycée de Garçons which had just been rebuilt. Tuesday, Wednesday and Friday were occupied mainly by the work of the sections, but the proverbial hospitality of Nice was shown in the variety of entertainments arranged by the municipality, including a reception at the Villa Masséna and a concert at the Opéra. Thursday was devoted to an excursion to Monaco, including visits *en route* to the Mont Gros observatory and the famous Augustus Monument and Museum at La Turbie.

At Monaco the afternoon was spent at the Oceanographical Institute, where the Director, Commandant Rouch, gave an account of the work of the Institute. Afterwards a visit was paid to the Jardins Exotiques with their extensive collection of cacti and other xerophytes.

Saturday, the last day of the Congress, concluded with an address by Commandant Rouch on French oceanographers, from Pythéas to Charcot; he recalled that it was exactly ten years since the *Pourquoi Pas* disappeared with Charcot and his crew.

A special feature of the Congress was the number of papers dealing with local problems, and excursions were arranged by many of the sections, including those of geology, botany, biogeography, agronomy and forestry. There was, for example, a valuable day excursion in motor coaches ascending the mountains inland from Nice to a height of 1,700 metres to view the successive altitudinal zones of the forests (at a number of places the excursionists were not allowed to walk off the road owing to unexploded mines).

The Congress was attended by many foreign delegates and also by representatives of more than forty French academies and scientific societies. The British Association was represented by Dr. Edward Hindle, one of its general secretaries, and Prof. H. Munro Fox.

It was decided to hold the Congress for 1947 at Biarritz towards the end of September. Dr. L. Fage, professor at the National Museum of Natural History, was elected president, and Dr. Lavier, professor at the Faculty of Medicine, Paris, was appointed secretary.

E. HINDLE

GROWTH OF MODERN PSYCHIATRY*

IN his three Salmon Memorial Lectures before the New York Academy of Medicine, Dr. D. M. Levy traced the growth of modern psychiatry and showed its influence on psychiatric thought. Dr. Levy commenced his career in the Illinois Institute for Juvenile Research in 1920. The study of delinquency was then very much under the influence of the work of Dr. William Healy, and was beginning to be applied to criminology. Healy himself was building upon the foundations laid by Meyer, Binet and Freud. Meyer had developed the view that behaviour is a reaction to environment, and under him psychiatry became the study of purpose and response. Binet had opened the way to the measurement of mental powers by his work on school-children, and Freud had stripped away illusions to show the real motivation behind conduct. The result of their impact upon Healy was his book, "Mental Conflict and Misconduct".

Dr. Levy showed the development of child guidance and demonstrated it by an interesting recital of a case which attended the clinic where he then worked. The different approaches to the child's problem were studied with earnestness and enthusiasm, so that one feels, as he said, that these were exciting days and even the smallest discovery was fascinating. He showed how the environmentalist exploited milieu psychology and the impact of social forces upon the child's behaviour; the psychometric testing revealed the individual's intellectual capacities, and the organic approach showed underlying physical disease. Although all these were rival methods, and to some extent still are, they have been integrated into teamwork which reveals the whole. Yet in spite of all its advances, child psychiatry is still in a formative phase.

In his second lecture, Dr. Levy discussed delinquency, and pointed out that here, on the whole, psychiatry has not made notable progress. This is partly because of the legal difficulties and the lack of institutions suitable to exploit the psychiatrist's recommendations.

Psychotherapy may be useful for the criminal, but it is prolonged, and an impractical treatment with present resources. The correction of environment is helpful, and group psychotherapy offers promise. Foster homes are useful in certain cases. When institutions are used, every member of the staff should have an understanding, non-authoritarian attitude. Delinquent children previously exposed to disciplinary measures are confused when they breathe this new air. They suspect trickery, try to discover the weak spots, attempt to escape or run amok. Finally they settle down and the remedial aspects of the new method appear.

Dr. Levy traced the gradual advances from dungeon to prison, from prison to reformatory, and showed that this was an evolution of society's attitude to the criminal from primitive vengeance, graded punishment according to the seriousness of the offence, then the acceptance of some responsibility for the delinquent behaviour, and at last to the attempt to reform him. Modern psychiatry regards crime as something curable, something from which the criminal suffers. Reform in Britain has progressed farther than in the United States, but America leads in psychiatric study and treatment. He deplored the fact that psychiatry is so often neglected, and pointed out that many penitentiaries still have no psychiatric service.

Dr. Levy discussed the inroads which lay-psychotherapists are making into psychiatry; he fears that they will cause a permanent lowering of standards.

In his last lecture, Dr. Levy demonstrated that psychiatry is progressing through various phases. At first the psychiatrist dealt only with the severe neuroses and psychoses. Then he tended to be consulted regarding personal problems by labour and management. The third phase would be an integration with industry, but it remains a remote possibility. He gave various interesting points regarding the relationship between foremen and workers. These have shown a gradual transition in behaviour. The first and most primitive type of relationship was when the foreman gave an order categorically. Dr. Levy called this authoritarian. A further step was when the foreman gave an order and explained the reason for it. This he designated transitional. Finally, when the foreman consulted the worker, asking for criticism and advice, this was a participating relationship. The older the factory and the closer the union between foreman and worker, the more the relationship tends to be a participating one.

---

* Substance of the Salmon Memorial Lectures delivered at the New York Academy of Medicine by Dr. David Mordecai Levy, director of the Information Control, Division Screening Centre, U.S. Army, Germany, on November 6, 13 and 20.

Dr. Levy then turned to military psychiatry. This served its apprenticeship in the First World War, and in the Second World War was used much more extensively. Greater reliance was placed on sedation and abreaction. Many soldiers were saved in numerous useful capacities. Group therapy was possible, and better organisation of social contacts and recreation. Dr. Levy felt that this was distinctly an American contribution, although British psychiatrists have made it an essential part of therapy.

He then discussed personnel selection in Germany and the school where Germans are trained as interpreters, secretaries, investigators, clerks, etc. More than eight hundred have received training there. He pointed out that this gave a unique chance to observe the damage the Nazi regime had done to the national character and personal adjustments. The differences in the family environment between Nazis and non-Nazis were observable.

Dr. Levy believes that the field of political psychiatry is just emerging and will be helpful in the selection of leaders in the new Germany.

FORTHCOMING EVENTS

*(Meeting marked with an asterisk * is open to the public)*

Monday, January 6

Institution of Post Office Electrical Engineers (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2), at 5 p.m.—Mr. H. R. Harbottle: "The Provision of Line Communications for the Fighting Services".

Society of Chemical Industry (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Dr. G. M. Bennett: "Nitration with Mixed Acids".

Tuesday, January 7

Royal Institution (at 21 Albemarle Street, London, W.1), at 3 p.m.—Prof. H. Hartridge, F.R.S.: "Colours and How we See Them" (Christmas Juvenile Lectures, 5) (succeeding Lecture on Thursday, January 9).*

Institution of Chemical Engineers (at the Geological Society of London, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Dr. C. C. Hall and Mr. A. H. Taylor: "Chemical Engineering Aspects of the Fischer-Tropsch Process".

Wednesday, January 8

Society of Chemical Industry, Microbiological Panel of the Food Group (joint meeting with the Society for Applied Bacteriology, at the Medical Society of London, 11 Chandos Street, London, W.1), at 2.15 p.m.—Dr. J. G. Baumgartner: "Fermentation of Vegetables for Pickle Manufacture"; Dr. T. Richards: "Bacterial Lipolysis and Rancidity in Fats"; Dr. H. H. Evers: "Curing and Fermentation of Tobacco".

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Dr. J. H. Partridge: "The Story of Glass" (Dr. Mann Juvenile Lecture).

Royal Society of Medicine, History of Medicine Section (at 1 Wimpole Street, London, W.1), at 2.30 p.m.—Dr. A. P. Cawadias: "Clinical Science in the Light of History".

Manchester Statistical Society (at the Reform Club, King Street, Manchester), at 5 p.m.—Mr. W. B. Reddaway: "The Census of Production".

Institute of Petroleum (at Manson House, 26 Portland Place, London, W.1), at 5.30 p.m.—Mr. L. W. Leyland Cole: "Petroleum Products in Agriculture—The Role of Petroleum in Plant Protection".

Royal Institute of Chemistry, Newcastle-upon-Tyne and North-East Coast Section (joint meeting with the Local Sections of the Society of Chemical Industry and the Institute of Fuel, in the Chemistry Lecture Theatre, King's College, Newcastle-upon-Tyne), at 6.30 p.m.—Dr. H. E. Crossley: "The Inorganic Constituents of Coal".

Institution of Electrical Engineers, London Students' Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 7 p.m.—Mr. A. Mason: "Radio Transmitting Valves".

Thursday, January 9

Women's Engineering Society, Manchester Branch (at the Engineers' Club, Albert Square, Manchester 2), at 6.30 p.m.—Miss F. B. Fairbrother: "Heating and Ventilation".

Pharmaceutical Society (at 17 Bloomsbury Square, London, W.C.1), at 7 p.m.—Mr. F. A. Robinson: "Recent Developments in Chromatography".

*Society of Dyers and Colourists, West Riding Section (at the Great Northern Victoria Hotel, Bradford), at 7.15 p.m.—Dr. E. G. H. Carter: "Testing as an Aid to Efficient Finishing".

Chemical Society (at Burlington House, Piccadilly, London, W.1), at 7.30 p.m.—Mr. B. C. Saunders: "Toxic Fluorophosphonates and related Compounds"; Mr. N. J. Cartwright and Mr. R. D. Haworth: "Some Aspects of the Oxidation and the Dimerisation of Propenylphenols".

Chemical Society, Manchester Section (joint meeting with the Local Section of the Royal Institute of Chemistry, in the Chemistry Department, The University, Manchester), at 7.30 p.m.—Dr. J. H. Schulman: "On Molecular Interaction at Oil/Water Interfaces".

Friday, January 10

Textile Institute, Lancashire Section (at 16 St. Mary's Parsonage, Manchester 3), at 1 p.m.—Mr. W. E. Swale: "Public Electricity Supply and its Application in the Cotton Textile Industry".

Institution of Chemical Engineers, North-Western Branch (in Reynolds Hall, College of Technology, Manchester), at 3 p.m.—Annual General Meeting. Mr. C. E. Rowe: "Aspects of Pilot Plant Development".

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Scientific Papers.

Physical Society (in the Lecture Theatre, Science Museum, Exhibition Road, London, S.W.7), at 5 p.m.—Presentation of the 23rd Duddell Medal to Dr. Karl Weissenberg; Presentation of the 2nd Charles Vernon Boys Prize to Mr. Robert W. Sutton; "Kelvin, Master of Measurement" (sound film).

Institution of Mechanical Engineers (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Dr. D. M. Smith: "The Development of an Axial Flow Gas Turbine for Jet Propulsion"; Mr. K. Watson Todd: "Practical Aspects of Cascade Wind Tunnel Research".

Oil and Colour Chemists' Association, Manchester Section (at the Engineers' Club, Albert Square, Manchester), at 6.30 p.m.—Mr. A. Hancock and Mr. T. F. Brown: "Paint Settling—a Suggested Method for Determining the Settling Properties of Paints".

Institute of Physics, Manchester and District Branch (joint meeting with the Institution of Electronics, N.W. England Section, in the New Physics Theatre, The University, Manchester), at 7 p.m.—Prof. D. R. Hartree, F.R.S.: "Recent Developments of Calculating Machines in U.S.A.".

Textile Institute, Bolton Branch (at the Municipal Technical College, Bolton), at 7.30 p.m.—Mr. G. K. Hughes: "Textiles and their Launderability".

Institute of Physics, Midland Branch (at the Imperial Hotel, Birmingham).—Prof. J. M. Meek: "The Nature of the Electric Spark".

Saturday, January 11

Association of British Zoologists (at the Zoological Society of London, Regent's Park, London, N.W.8), at 10 a.m.—Twelfth Annual Meeting; at 10.45 a.m.—Papers on "Careers in Zoology—Possibilities and Training".

Institute of Physics, Electronics Group (joint meeting with the South Wales Branch of the Institute of Physics, in University College, Cardiff), at 3.30 p.m.—Dr. F. A. Vick: "Contact Potentials".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant Structural Engineer (temporary) in the Ministry of Finance—The Assistant Secretary (Establishments), Ministry of Finance, Stormont, Belfast, quoting S.B.202/46 (January 10).

Assistant Technical Secretary (male) by the Iron Making Division of the Association—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, endorsed 'Iron Making Division' (January 11).

Head of the Department of Horticulture at the Yorkshire Institute of Agriculture, Askham Bryan, York—The Joint Clerk, Yorkshire Council for Agricultural Education, County Hall, Beverley, Yorks. (January 11).

Editorial Officer for the Society's Journal and other publications—The Hon. Secretary, Society of Dyers and Colourists, 32–34 Piccadilly, Bradford, Yorks., endorsed 'Editorial Officer' (January 11).

Graduate Masters for Government Secondary Schools, Seychelles Islands, to teach (*a*) Biology and General Science, (*b*) Mathematics up to School Certificate standard and Junior General Science, (*c*) Geography, History and Civics—The Director of Recruitment, Colonial Service, 15 Victoria Street, London, S.W.1 (January 11).

Professional Foresters in the New Zealand State Forest Service—The High Commissioner for New Zealand, 415 Strand, London, W.C.2 (January 12).

Lecturer in Humanity in the United College, St. Andrews—The Secretary, The University, St. Andrews (January 15).

Director of Research—The Secretary, British Baking Industries' Research Association, Wellington House, 125–130 Strand, London, W.C.2 (January 15).

Head of the Department of Agricultural Economics, and an Assistant Agricultural Economist—The Principal, Midland Agricultural College, Sutton Bonington, Loughborough (January 15).

Lecturer (male) in Agriculture, and an Assistant Poultry Instructor (male or female)—The Director of Agriculture, School of Agriculture, Houghall, Durham (January 15).

Secretary—The Secretary, School of Agriculture, Cambridge (January 15).

Lecturer (Senior Assistant) in Structural Engineering—The Principal, Dudley and Staffordshire Technical College, Dudley (January 17).

Chemist for development work, preferably with experience of chemical engineering, a Research Chemist with experience of plastics, and a Research Chemist with experience of sterols—The Secretary, Wool Industries Research Association, Torridon, Headingley, Leeds 6 (January 18).

Lecturers (2) in the Department of Chemistry of the Leeds College of Technology—The Director of Education, Education Offices, Leeds 1 (January 18).

Head of the Mechanical Engineering Department at the School of Engineering and Navigation, High Street, Poplar, London, E.14—The Education Officer (T.1), County Hall, Westminster Bridge, London, S.E.1 (January 18).

Lecturer in the Electrical Engineering Department of the South-East London Technical Institute, Lewisham Way, London, S.E.4—The Education Officer (T.1), County Hall, Westminster Bridge, London, S.E.1 (January 18).

Senior Assistant in Bacteriology, and a Senior Assistant in Pathology, at the University of Cape Town—The Secretary to the High Commissioner for the Union of South Africa, Trafalgar Square, London, W.C.2 (January 20).

Principal of Grantham Technical College—The Director of Education, County Offices, Sleaford, Lincs. (January 21).

Lecturer in the Department of Engineering of East Ham Technical College—The Chief Education Officer, Education Office, Town Hall Annexe, Barking Road, East Ham, London, E.6 (January 25).

Senior Chemist (male)—The Clerk of the Board, Metropolitan Water Board, New River Head, Rosebery Avenue, London, E.C.1 (January 31).

Statistician to the Nuffield Department of Industrial Health—The Professor of Industrial Health, King's College, Newcastle-upon-Tyne (January 31).

Assistant Curator at the Essex Museum of Natural History, Romford Road, West Ham—The Principal, West Ham Municipal College, Romford Road, Stratford, London, E.15 (January 31).

Research Assistant in the Department of Marine Engineering and Naval Architecture—The Registrar, King's College, Newcastle-upon-Tyne (January 31).

Lecturer in Applied and Industrial Chemistry in the University of Cape Town—The Ministry of Labour and National Service, Technical and Scientific Register, Room 572, York House, Kingsway, London, W.C.2, quoting F.1450A.O. (February 8).

Professor of Engineering—The Registrar, University College, Singleton Park, Swansea (February 8).

Lecturer in Bacteriology—The Registrar, The University, Sheffield (February 15).

Principal—The Secretary, West of Scotland Agricultural College, 6 Blythswood Square, Glasgow (February 28).

Chair of Mining and Metallurgy in the Faculty of Engineering, University of Adelaide—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1 (March 1).

Reader in Marine Engineering at King's College—The Registrar, University Office, 23 St. Thomas Street, Newcastle-upon-Tyne (March 1).

Professor of Agricultural Chemistry—The Registrar, The University, Reading (March 17).

Lecturer in Colonial Agriculture—Prof. Blackman, Department of Agriculture, Parks Road, Oxford (April 20).

Lecturer in Anatomy in the University of Queensland, Brisbane—The Agent-General for Queensland, 409 Strand, London, W.C.2; The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.2.

Junior Research Officer for work on cloth geometry and related fields—The Director, Shirley Institute, Didsbury, Manchester 20.

Lecturer in Physiology, and a Demonstrator of Physiology—The Dean of the Medical College, St. Bartholomew's Hospital, West Smithfield, London, E.C.1.

Laboratory Technician for Physics Laboratory—The Secretary, University College Hospital, Gower Street, London, W.C.1.

Indexer and Abstractor (woman) of technical publications relating to mineral resources—The Establishment Officer, Imperial Institute, South Kensington, London, S.W.7.

Associate Professor of Chemistry and Physics at the Royal College of Medicine, Baghdad, an Expert in Entomology, an Entomologist, and a Soil Technologist—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.13724.

Medical Biologist, Tanganyika (with experience in medical zoology, including parasitology, applied entomology and the epidemiology of parasitic and insect-borne diseases)—The Director of Recruitment, Colonial Service, 15 Victoria Street, London, S.W.1.

ECONOMIC STATUS OF MEN AND WOMEN IN THE PROFESSIONS

SCIENTIFIC workers who are bold enough to glance through the two hundred pages of the report of the Asquith Commission on Equal Pay will not find it easy at first to discern its exact bearings on their own activities. A brief chapter on the professions, and the sections on the non-industrial Civil Service and the Post Office in that on the Central Government Service, the chapters on the teaching service and on the local government services other than teaching, are the portions of the factual survey forming Part 1 of the report which obviously closely concern particular categories of men of science. Another chapter in the same part reviews equal pay in the United States of America, in Australia, in France and the Union of Socialist Soviet Republics. In Part 2, where the implications of the claim of equal pay for equal work are considered at length, the physiologist and psychologist may find something of interest in the discussion of the natural factors responsible for the prevailing differences in the remuneration of the labour of men and women and of the psychological effects of equal pay, as well as of the effects on the health and efficiency of women as workers. It is, however, on these explanations of the prevailing differences that there is a memorandum of dissent by Dame Anne Loughlin, Dr. Janet Vaughan and Miss L. F. Nettlefold, and there is a further reservation by Lord Justice Asquith, Sir Jasper Ridley and Prof. D. H. Robertson on the question of over-strain.

It is accordingly no surprise to find that the only approach to a summary is a paragraph directing attention to passages in which the conclusions of the Commission are briefly crystallized, and that these conclusions are limited to the social and economic effects of applying equal pay to the Civil Service, to teachers and to local government officers other than teachers. The general implications for industry are left open to debate, and although the consequences of its application, which in the Commission's view are common to all spheres, are considered at large in a further chapter, on one point raised the Commission was not unanimous. The purely financial consequences of equal pay are discussed in a final chapter, in which it is estimated that introduction of equal pay in the non-industrial Civil Service on the basis of 1939 figures would involve a gross annual cost of £4 millions, or £13 millions on the basis of the October 1944 numbers and sex-distribution. The probable increase when the Civil Service has settled down to its peace-time strength and sex-composition might lie between £5 millions and £10 millions. For England and Wales, the Ministry of Education estimates that the annual cost of raising the salaries of women teachers to the men's level would be about £14·5 millions, while for other employees of local authorities the Commission estimates the annual cost at about £750,000.

Turning now to the factual part of the report, which since the report is rather the opening chapter of a new volume of discussion than the basis for action—in any event until ample time has been allowed for digestion—is probably the more important, no evidence was submitted of women with professional status charging lower minimum fees than men with the same status. Evidence from some professional bodies showed that their recognized scales provide for the charging of identical fees by men and women. As regards salaried posts, a broad distinction is drawn between employment in the public service and employment outside. In the Civil Service, women medical and dental practitioners receive the same salaries as men; but the principle of equal pay has not been accepted as yet for other professions, although the Royal Institute of British Architects is pressing the case for equal pay for men and women architects in the Government service.

Some witnesses suggested that outside the public services there was no differentiation between men and women as regards remuneration, and evidence submitted to the Commission indicates that professional men and women actually receive equal salaries for the same work, outside employment in central and local government, when practising as medical practitioners, dentists, physiotherapists, radiographers, university teachers and journalists and librarians in technical or specialized libraries in industry. Women pharmacists working for hospitals or for wholesale and manufacturing chemists are also stated to receive, in general, the same rates as men. A small section of the evidence submitted, however, indicated discrimination in salaries between men and women; for example, in retail pharmacy, welfare work and personnel and labour management. A table giving the numbers of men and women in certain professions shows the extreme variations of the sex distribution, from about 3,000 women out of 6,000 librarians, according to an estimate made by the Library Association, 7,198 women out of 44,341 medical practitioners, 2,667 women out of 25,224 pharmacists, 549 out of 15,404 dentists, 325 out of 9,700 architects and 261 women out of more than 9,000 chemists.

Passing now to the few conclusions drawn in the report, the Commission states that there is no reason to suppose that the grant of equal pay in the Civil Service would have as corollary a change in the policy of recruitment designed to restrict the employment of women, and while the present system of recruitment remains in force it is unlikely that equal pay would have the effect of increasing to any important degree the proportion of women in the Civil Service, although some increase may naturally be expected. Such increase is likely to be most marked at the administrative level, and is likely to be accompanied by an improvement in the quality of the persons recruited. The consequences are only likely to be important—and adverse—if the common rate is not held at a level at which it competes effectively with the rates payable outside the Service to men of the type and quality which are required. The effects in the local government service, other than teaching, are considered as likely to be broadly similar but slightly less impressive.

As regards teaching, the Commission considers that any risk that the quantity or quality of male recruits would be adversely affected by a system of equal pay would be more than offset by the natural effect of such a system in attracting more or better women to enter the teaching profession. It also emphasizes that the grant of equal pay would redress a sense of injustice which the majority of teachers, men as well as women, rightly or wrongly entertain.

It is not easy in reading this report 'to see the wood for the trees', and there are many points which cannot well be viewed in their proper perspective against the scanty conclusions already noted. Discussing, for example, the marriage bar in relation to equal pay, the Commission observes that in the professional, administrative and technical classes of the Civil Service, the bar is harmful so far as it increases the natural wastage, and results in a further shrinkage of the pool from which women in whom much training and experience has been sunk can be made available for filling the highest posts. Against this, of course, has to be set the risks of inconvenience and embarrassment to the public service from endeavouring to retain in employment women who may require considerable spells of maternity leave, and whose domestic duties may restrict their mobility and their availability for the long hours of work which may be required at times of crisis and pressure.

The report makes it abundantly clear that, for most professional and administrative workers, the change-over to a regime of equal pay for the two sexes involves a serious clash of equities and social purposes. Some of those may be resolved by Government social policy as regards children allowances, income taxation and the like outside the terms of reference of the Royal Commission; but their existence tends to reinforce the argument which the Commission displays for Government initiative. It is argued with force that, if equal pay is to be introduced immediately and as an act of deliberate policy in any sphere, the 'area' of its introduction should be confined to those same spheres of non-industrial Government employment to which the Commission's own conclusions have been restricted. That step might well be justified at the moment as helping to meet the need for trained man-power and woman-power at the administrative level; and although as indicated in the report there are considerable difficulties in the way of adoption of an equal pay policy in private industry and commerce, it is almost certain that Government initiative in the spheres indicated would be followed at least tentatively by many sections of industry in corresponding fields.

Whatever is done in any part of this field may be expected to have strong reactions elsewhere, and in directing attention to the probability that private industry would probably follow a Government lead, the Commission comments mildly on the argument put forward by the Treasury against the Government taking action independently of employers in Britain generally. The Treasury, it seems, fears that changes in the large field of employment which it controls in the non-industrial field would have too large an effect on outside practice. At the same time, however, the Treasury resisted the introduction of equality in the Government's industrial establishments because, before the War, they covered such an extremely small part of the industrial field that the Government could not attempt to exercise a dominant influence in the sphere of industrial wages. This unconvincing attempt to make the best of both worlds and do nothing might well have received more pointed rebuke. It may be wrong, for reasons given in the report, to argue from the consequences of establishing equal pay in the public service to the consequences of establishing it in private industry; but there is a strong case for throwing the example and influence of the Government on the side of reducing the gap between the pay of men and women at the present time. If the adjustment is to be faced, it is well for it to be done while the relationships of costs, selling prices and the value of money are still in flux; and as a recognized instalment of social justice and an increment to the labour force, there are immediate benefits to be set against the cost.

There are, therefore, chapters of this report which scientific and other professional workers will do well to ponder, and the absence of definite conclusions should not prevent them from forming their own as to the effect and implications of the adoption of equal pay in the Civil Service, and probably also in commerce, following a Government lead. The factors to be weighed are duly set forth, and the minority report, which seeks to distinguish more clearly between opinions and evidence, reflects a more advanced and buoyant attitude than that of the majority, although it might have been more fully and cogently displayed. Both majority and minority reports, however, are a distinct contribution to clearer thinking on the many issues involved, and they deserve in particular careful study by all professional associations concerned with the economic status of their members. On what is said as to career value and the relative turnover of women as compare withd men staff; the trend towards the substitution of mechanical for muscular power; and the truism that no material object or human quality derives value merely from the fact that it is uncommon, but only from the fact that it is scarce relative to the demand for the services which it is capable of rendering, there is room for further objective thinking by such bodies, as well as by individuals, before action is taken even on the limited findings of the Commission.

THE FUNCTIONAL *A PRIORI*

The *a Priori* in Physical Theory

By Arthur Pap. Pp. xi+102. (New York: King's Crown Press; London: Oxford University Press, 1946.) 13*s*. 6*d*. net.

THE King's Crown Press is undertaking the admirable task of making the contributions of scholars more readily available than they might otherwise be if they always had to carry the full 'editorial attention' of Columbia University. There is no diminution in quality; rather it is a case of 'high thinking and low living', but with a somewhat tempered austerity, altogether appropriate to a monograph on a philosophical theme.

Dr. Pap will be known in Great Britain by his lucid paper on "Indubitable Existential Statements" (*Mind*, p. 234, July 1946); in the present context he appears as the expositor of a certain doctrine, namely, the functional, of the *a priori*, both in its historical aspect and in its application to classical physics. In both these domains he is strongly under the influence of C. I. Lewis and of Poincaré, though he does not hesitate to launch out on his own into deep water as opportunity offers.

Before making any detailed comments, it may be permitted to invite those seriously interested to have a copy of Prof. E. A. Milne's "Fundamental Conceptions of Natural Philosophy" (Scott Lecture, Royal Society of Edinburgh, 1943) before them when they tackle the thesis now under review. The point is this. Milne devotes considerable attention to classical physics, comparing them closely with his new theoretical edifice in process of construction. The core of the whole adventure, however—for it is nothing less—is an insistence upon the supreme significance of epistemology, and upon the need to use it properly. Now this is just what Dr. Pap has done, and done very well. In fact, whether he had this in mind or not when writing his manual (for he is silent on the question), the conjunction could scarcely be better. In parallel or in series, these contributions form a natural pair, which is not because they are alike; it is because for both it is the epistemology that matters.

From here, as from a springboard, we may well take off to follow up this new work. In Part 1, as already indicated, the treatment is largely historical, and in Part 2, in application to Newtonian mechanics. The discussion seems to be airborne from the start: the groundwork is good, but the reader is soon given wings. This applies both to the text itself and to the footnotes. The latter contain much valuable material, not clogging the machinery, but acting, as it were, as a lubricant.

Some early paragraphs show Lewis as a pragmatist, so far as the *a priori* is concerned. It is difficult to see what difference there is between his view and the essentially 'John Blunt' statement that *a priori* means 'true, no matter what'. This may well be, but he rejects, as Kant did, the *tabula rasa*; the mind does not start for Lewis with a clean sheet; but he will have none of the "*a priori* forms of induction", nor of the "synthetic *a priori*" either. Altogether, this seems a trifle 'queer'—to use an adjective which the Harvard philosopher employed in another connexion. Dr. Pap's *a priori* is rather gentler and, as he says, "may well be viewed as susceptible of *degrees*". The impact of Poincaré's "La Science et l'Hypothèse" on the writer is more profound, and brings about a certain axiological orientation almost amounting to a species of requiredness. At the same time, there is a strong leaning towards physics, as indeed there must be if Poincaré's thought is to bear fruit.

Alongside, another notion is ably handled, namely, that of 'real definition'. A quotation from John Stuart Mill follows, which, if taken in its original context, makes the position most intriguing. Mill had, in fact ("System of Logic", 1, Chapter 8, Section 5), just been discussing Archbishop Whately's "Logic", in which real definition is taken to contain more than is implied in nominal definition, whereas De Morgan held just the reverse (always assuming, of course, that the content is enough for distinction), his real definition having a smaller content than the nominal. Real definition seems fundamentally afflicted with a certain fuzziness: it is interesting to compare the two for the case of formal implication, remembering that 'nominal' refers to notation. Thus, in the usual symbols:

$$(\mathrm{F})(\mathrm{G})[[\mathrm{F}(x) \supset_{x} \mathrm{G}(x)] \equiv (x)[\sim \mathrm{F}(x) \vee \mathrm{G}(x)]] \ldots \text{(real)},$$

and

$$\mathrm{F}(X) \supset_{X} \mathrm{G}(X) \ldots \text{(nominal)}.$$

One might almost see in this a perpetual distinction between the methodologies of the mathematical and classificatory sciences, the former, as Dr. Pap points out, favouring definition by postulate (unknown to Mill), and the latter explicit definition, that is, the traditional *definiendum* → *definiens*. As a long footnote explains, unambiguous discriminants between the two can be obtained. More generally, Whately's charming Aristotelianism may again find favour in our day, though doubtless in a rather different dress.

Meanwhile, a few pages ahead, a somewhat crucial state of affairs is reached for *definiendum* and *definiens*, in virtue of the synthetic-analytic shift of meaning and the consequential generalization by selective abstraction. Naturally enough, the old anthropomorphism of force appears here, and a reference is given to the Kasimir Ajdukiewicz concept known as the *Begriffsapparatur*. This is a kind of language pattern, tightly connected and bounded with respect to meaning. But for once, what Dr. Pap has in mind about this is not entirely clear. Now Ajdukiewicz has three kinds of rules—axiomatic, deductive and empirical; what exactly they, and they alone, have to do with the difference between force (synthetic) and force (analytic) is hard to see. It may be that the text suffers from excessive condensation; but the truth behind this distinction is of the greatest significance in view of the close correspondence between Poincaré's 'principles' and 'conventions' with the first and third rules of the *Begriffsapparatur*. In point of fact, Ajdukiewicz considers that our whole outlook is a function of language as well as of experience.

Thus far for the functional *a priori* itself: we now approach its application to Newtonian mechanics. Dr. Pap begins by reminding us of the relations and *Grundsätze* of Kant, and their assumed position with regard to Newton's laws of motion; namely, the principle of the permanence of substance, the principle of causality, and the principle of reciprocity on one hand, and the law of inertia, the law of the proportionality of force to acceleration, and the law of action and reaction on the other. One illustration, from the law of inertia, must suffice to illustrate the structure of the author's thought. Here it is argued that, in general, the fundamental laws of Nature contain an experimental element and a conventional element; or, otherwise expressed, there is a dichotomy into an *a priori* component and an *a postiori* component. As an example of this dual character, the first law of thermodynamics, $dU = dQ - dW$ is mentioned. Mathematically, this merely amounts to defining internal energy in terms of measurable quantities; the physical significance appears when dU is established as a perfect differential, for this means the usual conditions and result for, say, a Carnot cycle. It looks as if much of the difficulty commonly encountered in mastering classical thermodynamics is traceable to the undue haste with which the subject is usually presented, lacking a clear epistemological basis, while the perfect differential emerges as a species of *deus ex machina*.

Whether or not it would be strictly germane to the author's purpose, the impression remains that this section would have been enriched by a discussion of Carathéodory's axiomatic thermodynamics, either in the original form or in the more readily grasped version given later by Prof. Max Born. The objection, supposedly, would be that an analytic, quasi-geometrical conception is not in the spirit of Newtonian physics, at least in the traditional setting. But perhaps nothing would mirror with less distortion the main tenets of Dr. Pap's philosophy. This is not a criticism, only a plea.

While on these subjects, a word or two upon what the writer calls "the graphical idealization of distributions of experimental values", or the principle of uniformity. This, of course, is a well-known assumption revived, namely, that a functional relation connecting verified data will hold for values not actually measured, and which, moreover, may never in fact be measured. In practice, it has not infrequently been necessary to rescue the principle of uniformity from disruption, and one way is to increase the number of parameters of a simple analytic function, say, the general gas law, $pV = RT$. In brief, we start with $f(p,V)$, then suspecting that temperature is the culprit, we write $f(p,V,T)$; lastly, we save the situation by increasing the dimensionality, thus putting $(p+a/V^2)(V-b) = RT$, so retaining our continuous function.

Some such process is involved when efforts are made—as they occasionally are—to set up a natural philosophy of 'real' substances in contradistinction to the simplified bodies necessarily envisaged in academic science. Alternatively, it may be desirable to approximate to a widespread imperfection (or defect), such as that manifested by 'real' crystals. But the fundamental importance of a grasp of the principle of uniformity remains; otherwise there is a grave risk of becoming profligate, and inviting due retribution from Occam's razor.

These topics, and many more, form the raw material out of which Dr. Pap has fashioned his last chapter, that on idealization in physics. They all tell the same story—the need for a sound epistemology and for the will to use it.

An adequate set of notes and a bibliography provide a final reminder of the wide field covered by this monograph, and of how much yet remains to be brought under the plough. F. IAN G. RAWLINS

SCIENTIFIC BASIS FOR SYLVICULTURE

Forest Soils and Forest Growth

(Plant Science Books, Vol. 18.) By Assoc. Prof. S. A. Wilde. Pp. xxii+242+7 plates. (Waltham, Mass: The Chronica Botanica Co.; London: Wm. Dawson and Sons, Ltd., 1946.) 5 dollars.

DR. WILDE'S book is written for practical foresters and forestry students, whose success or failure in their work will be judged by volume and quality of crop production combined with maintained soil fertility. His main theme is summed up in his preface: "an understanding of the forest lies just as much below as above the ground"; but in the text more space is given to a consideration of soils than vegetation. From the point of departure he passes, after an introductory chapter, to a discussion of the genesis and classification of forest soils, followed by a series of short chapters on forest cover, soil properties, soil survey, sylviculture and forest nurseries. The great virtue in the author's treatment of these subjects lies in his conception of soils as dynamic systems. Each type has its own morphological structure and pedological activity which is integrated completely with the structure and activity of the living community dependent upon it. He does not use Prof. Tansley's term 'ecosystem'; but the concept is clear. The virgin forest, the exploited forest, the plantation and even the forest nursery are viewed as possible systems of this kind maintained either by natural or anthropogenic forces. The aim of the forester is to extract from such systems the maximum volume and quality of his product while maintaining by suitable treatment stability or rhythmic change within it. By a combined study of pedology, ecology and physiology, Dr. Wilde has attempted to find a scientific rationale for sylvicultural and nursery operations.

Such is the impression given by a complete reading of the book as a whole; but equal justice is not done to all parts of the subject, and one is left with a profound feeling of disappointment. The material presented was based originally upon a series of lectures given to a heterogeneous group of students, and this origin seems to have determined the mode of presentation. It is doubtless also responsible for the inclusion of most of the less-important material. The size of the subject, as defined in the title of the book, is huge; and alone would have been sufficient to fill the two hundred pages available. Nevertheless, chapters or sections are included on the purely technical or elementary aspects of soil survey, tree-felling, mensuration, extraction and parasite control which are sufficient only to whet the appetite of the reader or to distract his attention. The omission of some of this material would greatly have improved the balance and order of the all-important remainder. The most regrettable feature is the restriction of the discussion on the biological structure of forest cover to one short, inadequate chapter of eight pages in which the interdependence of sylviculture, ecology and soil science is included. This defect is partly rectified by a valuable later chapter on soil-forest types in which a comparison is made between communities of the United States and those of other parts of the world. Surely these two chapters might have been more closely related to one another and to that upon soil organisms, which again is somewhat simplified and placed among chapters on soil properties. In short, the book is so composed and constituted as to make it very difficult for the reader to obtain a clear panorama of the whole subject.

The treatment of soil genesis and classification contrasts sharply with the remainder, both in its detail and in its arrangement. It will be to this part of the book that one will return for reference. The classification of forest soil types is summarized by a table in which each 'macro-climatic-soil-forest zone' is subdivided into its principal genetic types on the basis of degree of leaching. In the following text each type is described with examples of structure, analysis and associated tree species in most cases. The author stresses that there is a dearth of accounts correlating pedological and ecological observations upon soils of the lateritic group. He has, however, produced an outline of the forest soils of tropical regions which is worthy of further consideration.

As has been suggested, much of the detail of the last eighty pages might better have been omitted so that the sylvicultural and nursery principles and practice could have been more closely related to the fundamentals laid down in the first part of the book. Each of the short chapters in these pages is in itself a clear account of some practical operation, even though it is not closely related to the general text.

The book is printed and bound to conform with the sister volumes of a new series of *Chronica Botanica* publications, and it is illustrated with clear black-and-white figures in the text. The plates, which are interleaved with the index, are often too small and too crowded, but the tail-pieces to the chapters are delightful. To sum up, it must be realized that Dr. Wilde has undoubtedly approached his subject from a new angle, and that the book is a step towards the consolidation of the many branches of academic study which unite in the practical subject of scientific forestry. J. L. HARLEY

X-RAY AND ELECTRON DIFFRACTION IN FLUIDS

The Diffraction of X-Rays and Electrons by Free Molecules

By Dr. M. H. Pirenne. (Cambridge Series of Physical Chemistry.) Pp. xii+160. (Cambridge: At the University Press, 1946.) 12*s*. 6*d*. net.

THE present monograph is intended to give an account of the phenomenon of diffraction of X-rays and electrons by gases and the methods for determining the structure of atoms and molecules based on the observation of this phenomenon. But it also deals to some extent with the scattering of X-rays by crystals and by liquids in so far as these phenomena can be used for the same purpose.

The first part of the book deals with the classical and quantum theory of the coherent and incoherent scattering of X-rays and the mechanism of the fluorescent radiation of atoms, the experimental measurement of the scattering by monatomic gases and crystals, and the comparison of the results of these measurements with theory. The scattering of fast electrons is then treated in a similar way. Next the diffraction of X-rays by free rigid molecules is considered theoretically and the theory verified by experiments on gases consisting of simple molecules. This is followed by considerations on the effect of the mutual interference of molecules in dense gases and especially in liquids, owing to the existence of a radial distribution function. The next part of the book deals with the refinement of the theory by taking into account the internal thermal movement of the atoms within the molecule and the distortion of the electronic clouds of the atoms connected with the chemical bonds. This is followed by a discussion on the use of X-ray and electron diffraction measurements on free molecules for the determination of their geometrical structure and, in particular, the use of Fourier analysis of diffraction patterns for this purpose. Finally the experimental methods for the measurement of X-ray scattering functions of gases are described in detail, especially the methods developed by the author himself. A list of molecules studied by these methods, a table of atomic scattering functions and a bibliography are added.

The book is in the first place written for scientific workers who wish to engage in research on the structure of molecules. There is therefore no attempt to derive the theoretical formulæ from first principles, and at every step the theory is put to the test by comparison with experiment. The virtues of the different methods, the errors to be avoided and the corrections to be applied are very thoroughly discussed; but perhaps a little too much space is taken up by the detailed description of the author's own work as compared with the work of others. Those readers who wish to use the book as a source of general information on the subject would have preferred to find a short systematic theoretical treatment of the scattering of X-rays and electrons on the basis of quantum mechanics, which would greatly help towards a better understanding of the connexions between the different forms of the scattering phenomenon.

There are a few minor errors; for example, the statement on p. 21 that the frequencies in the spectrum of the incoherently scattered radiation are all smaller than the primary, or the statement on p. 26 that in coherent scattering the primary photon is first captured by the atom and then re-emitted again in its entirety. The discussions on pp. 12 and 28 on the quantum mechanical wave function are incorrect as they omit to take into account that these functions are complex and not real. The explanation of the resonance effect produced by the K-frequencies on the dispersion of the atomic scattering factor on p. 38 is also misleading.

Apart from these minor defects the book is very lucidly written and accompanied by a great number of clear diagrams and illustrations. It can be warmly recommended. R. FÜRTH

CHEMISTRY AND LIGHT

The Chemical Aspects of Light

By E. J. Bowen. Second edition revised. Pp. iv+300. (Oxford: Clarendon Press; London: Oxford University Press, 1946.) 15*s*. net.

MR. BOWEN writes in his preface that "the second edition of this book has the same aim as the first: to present modern ideas of matter and light as far as possible in non-mathematical form. . . . Wave mechanics is a difficult subject which cannot by its intrinsic nature be conveyed in a pictorial form, yet such a theoretically unsound task is what is attempted here". There can be no doubt that Mr. Bowen has succeeded in his task; moreover, the task itself has increased in magnitude since the first edition was published; and, in general, wave mechanical topics have been treated more deeply in the second edition.

The arrangement of the book remains approximately the same; but the text has been largely rewritten and extended. The early chapters on light and waves, and light and light sources remain sensibly unchanged. Chapter 3 on the absorption and emission of light has been considerably enlarged. The main addition is a discussion of molecular orbitals, and their construction from and relation to the corresponding atomic orbitals. In the course of this, carbon–carbon single and multiple bonds, and conjugated systems, including benzene, are dealt with. There follows a very interesting account of 'colour', in which the position, shape and intensity of absorption bands are related to molecular structure, molecular orbital and resonance methods being used. Chapter 4, on the transformation of absorbed radiation, now includes a discussion of the kinetics of the quenching of fluorescence in solution, and the information which may be obtained by a study of quenching about reactions in solution with high velocity constants.

Typical additions in the remaining chapters are the discussion of a number of photochlorinations, and geometrical isomerizations (Chapter 6) and the recent Russian work on photosynthesis (Chapter 7). There are also two additional appendixes: one on filter solutions, and a comprehensive list of "Experiments with Light of Chemical Interest".

For readers who are not familiar with the first edition, it may be stated that the book is written in an extremely lucid and attractive style, and will be useful not only to students as an introduction to several aspects of chemical physics, but also to practical photochemists. The author is to be congratulated on adding substantially to the value of an already excellent book. It is a pity that references to original papers have been omitted from the second edition.

The price is very reasonable.

C. H. BAMFORD

LEGENDRE POLYNOMIALS

British Association for the Advancement of Science

Mathematical Tables. Part-Volume A: Legendre Polynomials. Prepared by the Committee for the Calculation of Mathematical Tables. Pp. A42. (Cambridge: At the University Press, 1946.) 8*s*. 6*d*. net.

THIS is the first of a post-war series of mathematical tables published for the British Association, in response to the ever-growing demand arising from research work in mathematics and physics.

It is designated Part-Volume A, and appears in conjunction with a companion volume on the Airy integral. Unlike the other recent publications dealing with the tabulation of Legendre functions, this book makes no reference to the associated functions and is concerned only with the polynomial solution of Legendre's differential equation:

$$(1-x^2)\frac{d^2y}{dx^2} - 2x\frac{dy}{dx} + n(n+1)y = 0,$$

for integers n ranging from 2 to 12 inclusive.

In the first section, tables of $P_n(x)$ for $n = 2$ to 6 are provided for the range $x = 0$ to 6 at intervals of 0·01. The entries are, in general, accurate to seven significant figures, and second differences are supplied.

The second section deals with the next three functions with similar accuracy, fourth differences being included where necessary. The remaining three functions are tabulated in the final section.

The whole production has been supervised by Dr. L. J. Comrie and is prefaced by his introduction, which describes the material on which the tables are based, together with the methods used in their construction. With his characteristic thoroughness, Dr. Comrie has provided means for ensuring the complete accuracy and legibility of every figure, and one can look forward with confidence and pleasure to future publications of a similar nature. J. H. PEARCE

INTERNATIONAL CONTROL OF ATOMIC ENERGY*

STATEMENT FROM THE COUNCIL OF THE ATOMIC SCIENTISTS' ASSOCIATION

THE United Nations Atomic Energy Commission has before it the two alternative proposals by the American delegate (Baruch plan) and by the Russian delegate (Gromyko plan). Mr. Philip Noel-Baker stated in the House of Commons on August 2 that there is no fundamental clash of principle between these two plans, and that they need to be fused; we share his belief that efforts must be continued to find a workable scheme acceptable to all countries.

We have come to the conclusion that the points on which the nature of the disagreements has been brought out most clearly are concerned with the stages by which an ultimate solution is to be approached.

A. Immediate Action

The most important objection to the Baruch plan from the point of view of other nations is probably that it envisages in its first stages measures which may be construed as maintaining the dominance of the United States in the field of atomic energy, whereas the concessions which are to be made by that country appear mostly in the later stages. If these later stages are not to be ratified until the previous ones have been achieved, technically Congress could withhold ratification at any stage.

(1) It appears to us essential that the Baruch proposals be amplified by making it clear that a definite succession of steps should be laid down from the outset and be accepted by each nation participating in the scheme. Each step is to come into effect upon a decision by the Atomic Energy Commission, or other agency of the United Nations, that the conditions laid down for the stage have been realized. In this respect, once the charter for the authority has been adopted, there should be no need for further ratification of each step by each country. The refusal by any member nation to implement these decisions would then be equivalent to a violation of the agreement setting up the Atomic Development Authority (A.D.A.).

(2) Notwithstanding the solemn undertaking already made by signatories to the United Nations Charter to refrain from all acts of aggression, it is not unreasonable to ask these nations in addition to reaffirm the undertaking with special reference to atomic weapons and all other weapons of mass destruction.

(3) Another point of difference is that the Russian proposals require the destruction, within a limited period, of existing stocks of weapons, whereas the American proposals would postpone this stage until an effective system of safeguards has been established. On this question it is easy to understand the reasons for either point of view, but we think it would be reasonable to ask at least for a declaration by all countries of the amounts of fissile materials in their possession and of the production-rates in existing or projected plants. Such a declaration might materially contribute to a spirit of confidence, while not appreciably impairing the security of the United States. We hope, in particular, that it may be possible to make these valuable materials available for productive uses rather than to destroy them. It is unlikely in any event that nations would agree to the destruction of the precious fissile materials, and without this the mere dismantling of existing bombs would be of no value, since the fabrication of bombs from the fissile materials is not likely to be the bottleneck in the production of weapons.

(4) If it is decided that the first step should consist of a complete survey and control of raw materials, it should be understood that during this first phase all nations should still be free to proceed with the construction of plants and the use, in such plants, of the raw materials accessible to them. The aim would be to submit these plants and any materials produced by them to the control of the A.D.A., at the same time as such control takes effect for the plants and stocks now existing in the United States.

(5) We believe that the chance of agreement and the rate of development of the beneficial uses would, in fact, be greatly improved if a generous view were taken of the definition of 'basic scientific knowledge' which can immediately be exempted from secrecy rules. We also suggest that it would be a generous and helpful gesture if the nations now possessing the most advanced knowledge of atomic energy were to offer to other nations collaboration in setting up small atomic reactors, which are of little use for military purposes but are valuable for the purposes of scientific research and for the production of tracer elements for research in medicine and other fields. Collaboration in the construction of such small reactors should not only consist in a transmission of the necessary data but also in exchange of scientific and technical personnel, and might involve the sale or loan of certain special materials of construction as far as the supply of such materials is available. This step, we believe, would offer immediate advantages to all the nations concerned which would far outweigh any contribution they make to the dissemination of technical experience of some value also for military applications.

B. Nature of Ultimate Control Scheme

(6) Turning now from the immediate action to the features of the ultimate control scheme, the point that has given rise to most controversy is the question of the veto. We think it unfortunate that this point should have reached such prominence in the early phase of discussion, before other features of the plans had been adequately considered. We believe that the relations of the A.D.A. to the rest of U.N.O., and in particular to the Security Council, have to be specified more clearly than was done in the Baruch proposals. It is clear that there cannot be two independent bodies responsible for the enforcement of international agreements, and that since the

---

* The final version of this memorandum was determined on November 28; it was supported by most members of Council of the Association, but two members felt unable to support the whole of it.

A.D.A. cannot supersede the Security Council, the A.D.A. has to be subject to the direction of the Security Council in matters of policy, and that A.D.A. cannot take upon itself the function of defining and punishing a violation of the agreement. As long as the U.N.O. charter provides for the right of veto in certain decisions of the Security Council, we do not see how the application of sanctions in matters which concern the A.D.A. can be made independent of this right. While definite provision for the veto exists and is likely to remain an essential part of the charter, it is, of course, essential that procedure be developed which limits the use of the veto to matters of fundamental importance without unduly hampering progress in the work of the Security Council. This point, the relevance of which is by no means limited to problems connected with atomic energy, is now being discussed by the permanent members of the Security Council.

(7) On the other hand, if A.D.A. is to carry out effectively the control of raw materials and is to own facilities for development and production, it will have problems of day-to-day management in which progress is impossible unless it possesses a certain degree of autonomy over such matters, which leaves it free to take decisions without referring each question back to the Security Council, and without the possibility of being blocked by a veto over technical matters. The line between administrative problems which are the province of the A.D.A. and policy problems to be settled by the Security Council is, of course, difficult to draw and, while rules can be framed after careful study of the situations likely to arise, there remain borderline cases in which the question of procedure will have to be settled by the Security Council, or possibly by the General Assembly of U.N.O.

(8) It is an important feature of the Baruch plan that all 'dangerous' production facilities, that is, all those that are easily adapted to the production of military weapons, should be owned by A.D.A. On this point the Gromyko plan makes no specific proposals, although points (2) and (3) of the terms of reference of the second committee proposed in that plan provide for discussions which might possibly lead to a scheme of the same general type.

What precisely is meant by 'ownership' is not very clearly specified, either in the Baruch plan or in the Lilienthal Report. Full ownership, in the usual sense of the word, would meet with difficulty, since it would give A.D.A. the right to decide whether power plants could be built in any country and the right to withhold the use of the power produced in such a plant or to place conditions on the supply of such power. Such restrictions would give the possibility of interference in the economic life of each country to a degree not essential to the purpose of preventing the abuse of atomic energy for destructive purposes. On the other hand, it would appear essential, in order to conform with the spirit of the Lilienthal proposals, that A.D.A. should take over the operation of such plants with the right of ensuring that any dangerous products were consumed in power plants and that no excessive stockpile be produced. We have no perfect solution to offer to this problem, but we feel that a careful study of the precise meaning of A.D.A. ownership should lead to a scheme that would be free from objections and that would provide both a safeguard against the accumulation of dangerous materials without the approval of A.D.A. and the opportunity for nations to take the initiative in building up within their territory efficient atomic power plants to supplement their other resources of power.

A scheme which, in this way, would circumscribe the powers of A.D.A. over national plants could minimize the difficulties arising from suspicion of interference with the economic structure of a country.

An alternative and less ambitious suggestion is to limit the function of A.D.A. to the inspection of plants and control over the distribution of products. In this connexion, however, we are impressed with the strength of the case made in the Lilienthal Report for giving to A.D.A. positive responsibility for production and ownership and with the difficulties outlined there of maintaining an effective inspection under any conditions. There is considerable doubt as to whether a control scheme not containing this feature would offer sufficient security.

(9) The positive functions of A.D.A. will be further strengthened if it is accepted that the Authority should itself undertake research on all problems of atomic energy. Its research organisations should be strong enough to ensure for A.D.A. a lead in knowledge of all scientific and engineering aspects of the problem and to make it desirable for most countries to call in its help in setting up and designing new plants. The existence of A.D.A. research organisations need not exclude national research, provided the latter is carried out openly and its results made available to A.D.A. In fact, the closest co-operation could be expected between the Authority and national research. At the very least, an A.D.A. research organisation should carry out the function of an essential clearing house of all information on the technical problems and should help to disseminate and co-ordinate the results of national research institutions.

(10) One of the key factors of control is that of raw materials, and here it is not sufficient to leave national initiative unimpaired, since in the absence of a free market the access to raw materials must be covered by international agreement. This problem is related to the general problems of access to raw materials other than atomic fuels; but it is outstanding among them because of the supreme military and future economic importance of atomic fuels. A solution to this problem should be sought in relation to the more general problem as well as in relation to the general agreement for the control of atomic energy.

(11) We do not believe that it is necessary to class research on atomic explosives as a dangerous activity; the danger does not come from research as such, but from the application of the results. The object of a control scheme is to ensure that the results of such research would never be used for destructive purposes; but, in addition to any engineering uses of atomic explosives, the knowledge of the possibilities of atomic weapons is essential to make effective plans for preventing their illicit manufacture or use. We believe that it would be a sufficient safeguard to ensure that research agencies not directly owned by U.N.O. should have no access to dangerous amounts of material, except under the supervision of A.D.A., and to require that all such research be carried out openly and that any relevant results be immediately reported to the A.D.A.

(12) A further important question is that of inspection. We have stated previously that the problem would be made easier if all dangerous plants were owned by A.D.A.; but there remains the problem of ensuring that they are indeed the only existing dangerous installations. If nations were prepared to rely on each other's good faith, the whole problem of control of atomic energy would not arise. As things are, they can feel secure only if there exists some form of inspection. It is desirable that the right of inspection should be circumscribed so far as possible and should not be a means of excessive prying into legitimate industrial or other activities. This is a question which can only be settled by extensive discussion. One might contemplate a procedure similar to a search warrant which would give the right of entry upon certification by A.D.A. that there exist reasonable grounds for suspicion. But one has to bear in mind that the discussion of the question whether in any given case there are reasonable grounds for suspicion may well lead to so much friction as to hamper seriously the work of A.D.A. We feel that the kind of inspection that merely aims at satisfying itself that any given mine or chemical plant is not handling large quantities of uranium or thorium ore, or that any given factory is not a separation plant or pile, is so different in type and order of magnitude from the kind of inspection that would disclose manufacturing secrets that it ought to be possible to work out a scheme which allows the one and prevents the other.

One key feature in preventing illicit production plants is the control of all natural uranium and thorium, and it seems to us essential that A.D.A. should have access to and control of all such material at the source. One cannot, however, rely on this measure exclusively on account of the possibility of some future discovery, such as an economic method of extracting uranium from low-grade ores, since in this way it might become possible to produce uranium as a by-product of other mining operations.

As a result of these discussions, it seems to us that the suggestions we have made ought to be considered as a basis of a workable scheme which in some measure surmounts the objections raised against the earlier proposals, and that, while they will no doubt have to be modified so as to adapt them to the views of the countries concerned, a discussion based on similar lines would give hope of finding a scheme that, of all possible control systems, has the greatest chance of being acceptable to everybody.

Conclusion

It must be admitted that an effective system of control acceptable to all concerned is a very doubtful proposition in the present state of distrust between nations, since it must contain, at least in embryonic form, a measure of world government. It is felt by some of our members that we can scarcely expect any effective agreement on the control of atomic energy at the present time. The above suggestions have been put forward in the hope that they will clear ideas with regard to a plan which we can only hope will be a feasible proposition before long. Some of the suggestions might, however, be put into effect immediately, mainly some of those we have listed under "A. Immediate Action". These might help in creating a favourable atmosphere for a workable system of control.

SILVER JUBILEE OF THE BRITISH CAST IRON RESEARCH ASSOCIATION

By J. G. PEARCE

Director of the Association

THE British Cast Iron Research Association was among the last of that early group of research associations to be established after the First World War, and, without departing from the basis of voluntary adhesion by interested and eligible firms, has raised its annual income from some £3,000 to last year's record of £40,000. The Association is concerned with the iron-founding industry, its raw materials, equipment, processes and products, together with their applications, and it endeavours to improve quality, facilitate manufacture and extend the uses of cast iron.

The material commonly termed 'cast iron' is, in fact, a range of iron–carbon alloys technically highly complex and readily differentiated from the steels, for they contain more carbon. Cast irons have an extraordinarily wide use in industry, including building and architecture, the engineering, chemical and metallurgical industries and domestic life. Before the Second World War, the industry had an output of some 2·5 million tons a year and employed about 100,000 people. It is anticipated that the demand will rise to 3·5 million tons by 1950. While cast iron is the cheapest of the ferrous alloys, its widespread use is due not only to low first cost and, under normal conditions, to comparatively rapid delivery, but also to the fact that for certain purposes it is unsurpassed. Engine crankshafts and camshafts constitute its most recent applications, for which it has proved highly successful. Foundry pig iron, the blast furnace product which forms the major raw material of the industry, is, metallurgically, a cast iron.

The properties of cast iron are determined in part by composition and in part by structure, which is not wholly determined by that composition. When the carbon in the metal remains combined as the hard, brittle carbide of iron, the resulting white iron casting has these properties. White irons can be annealed to give the product malleable cast iron, which is ductile. The bulk of the output, however, is of machinable grey cast iron, in which the task of the ironfounder and of the metallurgist is to adjust composition and section so that a small proportion only of the carbon remains combined, the balance being deposited as free carbon or graphite, usually in the form of microscopically visible flakes. In malleable cast iron the graphite is deposited in a nodular or spheroidal form known as temper carbon, and annealing in the solid state is the only way hitherto known of producing this structure.

Between the World Wars, iron-founding passed from the stage of craftsmanship to the possibility of scientifically controlled production, and as a result of investigations in various countries, notably Britain, the United States and Germany, the strength of cast iron was doubled. This was mainly accomplished by improving the metal matrix through reduced silicon and carbon contents, alloy additions, thermal treatment, and by better melting techniques and improved understanding of moulding sands. While the use of graphitizing ladle additions became popular, giving more uniform graphite, its flake form remained unaltered. Remarkable advances were also made in the production of special-duty, as distinct from high-duty, or mechanically strong, cast irons for service conditions involving heat-, corrosion- and wear-resistance. The British Cast Iron Research Association, in exploring the causes of growth and scaling, evolved[1] the heat-resisting iron known as 'Silal', containing about 5 per cent silicon, and, later[2], the austenitic cast iron 'Nicrosilal'. Austenitic irons have found a number of industrial uses[3]. They are characterized by their relative ductility, non-magnetism, and corrosion- and wear- as well as heat-resistance. The mode of failure of ingot moulds for steel ingot, an exceptionally severe service, was also explored[4].

Ordinary cast iron has a mixed ferritic–pearlitic matrix, and the engineering irons are usually fully pearlitic. They may be annealed to the ferritic state for rapid machining. They may be stress relieved without structural change, or they may be submitted to quench and temper heat-treatments in the same way as the steels. To-day, practically any other desired structure, austenitic, martensitic or cementitic, of the metallurgical matrix can be made to predominate in cast iron. Furthermore, by alloying, a ferritic matrix can be made highly resistant to mineral acids, in the high silicon irons, and to heat and corrosion in the high chromium irons.

Development. Early in its life the British Cast Iron Research Association recognized the importance of accompanying the creation of new knowledge through research with means for its application in industry through what is conveniently termed 'development', and with means for its dissemination through information and intelligence. Development, in addition, covers treatment of a wide range of problems arising from technical and practical foundry difficulties, which keep the staff in close touch with the industry. Considerable improvements have been made in the cupola furnace, the industry's universally used melting unit. Of one type evolved by the Association, the balanced blast cupola, more than three hundred have been installed, with an aggregate melting capacity of 2,400 tons an hour, half in Great Britain and the remainder in some twelve countries overseas. The development side is actively concerned with casting design, that is, the economical disposition of material. During the War it dealt with the anti-glare problem for the industry's furnaces, together with the technical aspects of the fuel situation. A number of research contracts were also carried out for official departments.

The research and development staffs are aided by a group of specialized laboratories, chemical, spectrographic, physical, metallographic, mechanical testing, sands and refractories, as well as by an experimental foundry.

Research. The research programme can be divided roughly into two parts. The first comprises what Sir Edward Appleton has aptly termed "objective fundamental research", that is, exploratory work designed to increase background knowledge for the industry served by the Association. The second part comprises investigations aiming at specific and clearly defined ends, either necessary to the fundamental programme or needed by the industry. To illustrate this section, reference may be made to the evolution and evaluation of new and improved methods of testing and control, and the application of new instruments and apparatus to the materials and processes of the industry. The metallurgical complexity of cast iron—the number of elements involved is never less than six and may reach twice that number—makes this a difficult task. Methods of testing and control of moulding sands and other foundry materials, methods of testing and specification of the product, wet analytical methods, application of the spectrograph and the photo-electric absorptiometer, have all been covered. For the future, X-ray diffraction, the electron microscope, radiographic and gamma-ray examination for defects, supersonic testing, polarographic and micro-chemical methods must be considered. Much *ad hoc* work comprises the determination of mechanical and physical properties needed by the engineering designer at ordinary, sub-normal and elevated temperatures[5]. Early work in this connexion has included the rationalization of the widely used transverse test for cast iron and the relationship between toughness of the material and the plastic component of transverse deflexion[6]. Various grades of grey cast iron can be obtained to national specifications in British Standards Specifications 321 and 786.

It is necessary to confine a brief review to metallurgical work, and as an illustration of work on the fundamental side the mechanism of graphite formation may be chosen. This has been pursued over a period of years, interrupted by the War, in the conviction that the fullest potentialities of cast iron can only be realized if the size, form and distribution of graphite can be controlled, and that such control can only derive from an understanding of the mechanism of formation.

Graphite formation. The characteristic flake form in grey iron and the temper carbon or nodular form in malleable cast iron have been mentioned. Another form of very finely divided graphite was known, although the circumstances of its formation were obscure. It was established, however[7], that this form was encouraged by allowing the melt to undercool, and it is therefore called 'undercooled graphite'. Later it was found that flake and undercooled graphite formed in melts of otherwise similar composition were produced by varying the conditions of melting[8], which were more important, in fact, than composition variations. A major step forward took place when the undercooled form was produced at will from a melt that would otherwise solidify in flake form, by ensuring the presence of a small amount of titanium in the melt, and treating it while molten with carbon dioxide[9]. Structures exclusively composed of undercooled graphite were produced in cast iron which without treatment conformed to the ordinary flake pattern, and which could be made to revert by treatment of the melt with hydrogen. This work gave considerable impetus to the theory that flake graphite formed on pre-existing non-metallic oxide or silicate inclusions, but direct microscopic examination revealed that pig and cast iron showed no traces of such oxides or silicates[10], while chemical examination gave values too small to support any superstructure of theory[11]. It was, in fact, shown that pig and plain cast irons are more free from oxides and silicates than the steels, while the only non-metallic inclusions of consequence comprised the sulphides. A recently published study has confirmed this[12] in respect of the alloyed cast irons containing nickel, copper, chromium, molybdenum and other elements. These results directed attention to the influence of gases and to a more fundamental examination of the position.

In recent years the theoretical metallurgist and the physicist have done much work in studying elements related in the Periodic Table and in electronic structure. The value of the predictions of the physicist has been realized and studies were made of the nickel–carbon and cobalt–carbon alloys to see whether their behaviour would throw any light on the iron–carbon alloys as exemplified in the cast irons. The results of the work of Morrogh and Williams are being published by the Iron and Steel Institute, and embody a complete statement of the phenomena which require to be explained by a comprehensive theory of graphitization. In addition, the work provided the necessary lead towards the production of nodular graphite in as-cast material; and since the completion of this report it has proved possible to obtain nodular graphite in cast iron as also in the nickel–carbon alloys.

Although the nodular graphite produced directly in the mould resembles that obtained in malleable cast iron, the new structure does not have the properties of malleable cast iron (for example, as in British Standards Specifications 309 and 310), which has a comparatively low carbon content and the advantages of a lengthy homogenizing anneal. Nevertheless the new structure does have a small but measurable elongation and area reduction, together with static tensile and transverse properties and impact strength double or treble those of the same material in the untreated state. In fact, ordinary hæmatite pig iron can be melted and treated to give the mechanical properties of what are now regarded as high-duty cast irons. Thus, a hæmatite iron gave, in the untreated and treated states, tensile strengths of 15·5 and 26·5 tons per square inch, transverse strengths of 29·4 and 47·9 tons per square inch, and impact strengths of 13 and 47 ft.lb. (a British Standards Specification for the cast iron impact test is pending) respectively. In a 4·0 per cent carbon hæmatite, of one hundred bars cast, ten chosen at random had their tensile strengths between 23·8 and 24·3 tons per square inch, and Brinell hardness numbers between 198 and 203, indicating a very high degree of uniformity.

The presence of phosphorus in foundry pig irons makes the influence of this element of particular importance in practice. Phosphorus up to the amounts studied does not interfere with the new structure, although in high-phosphorus irons, the phosphorus must be expected to exercise its dominating effect on strength.

The austenitic irons lend themselves well to the new treatment. A 'Niresist' of 10 tons tensile and 30 ft.lb. impact strength gave, on treatment, a tensile strength of 20–25 tons per square inch and 120 ft.lb. (unbroken) impact. A 'Nicrosilal' iron in the untreated and treated states gave a transverse deflexion of 0·75 in. and 3·5 in. (unbroken) respectively.

These preliminary results require amplification before a more complete statement is possible; but there is little doubt that this is the most significant advance in the metallurgy of cast iron in the present century, and that the new material will lift ordinary cast iron to a new plane, as well as forming a base for the production of still stronger high-duty irons. The pursuit of this work, both in respect of its theoretical basis and its industrial application, must form a major item in the Association's future programme.

TIMIRIAZEV, FOUNDER OF SOVIET GENETICS

By Dr. G. H. BEALE
John Innes Horticultural Institution

KLIMENT ARKADIEVICH TIMIRIAZEV is to-day regarded by Soviet botanists as one of their chief authorities, mainly on account of his life-long support for Darwinism. In Great Britain, however, his work is but little known, apart from a few references in text-books of plant physiology. We are therefore interested to see L. S. Tsetlin's short account of Timiriazev's life and work[1], which has recently appeared in the Soviet Academy of Science's popular scientific series of biographies. Having read this book, one can well appreciate why the name of Timiriazev is now so highly esteemed in the Soviet Union.

Kliment Arkadievich was born in 1843 in St. Petersburg. His father, a government official, came of an ancient Russian noble family; but, we are told, "held republican views, and had a revolutionary temperament"; his mother was English, and no doubt it was from her that he acquired his great interest in England. Already at the age of fifteen, in order to earn money, he was daily reading *The Times* for a Russian paper, and translating Dickens and other English novelists into Russian. He remained an Anglophile all his life. He is quoted as having said: "Of all civilised nations, the English are the most remote from scientific conceit and pedantry", and "it was no accident that it was amongst the great English people that there appeared a thinker who has made evolution the corner stone of modern thought".

Timiriazev was elected a foreign member of the Royal Society in 1911, eight years after delivering the Croonian Lecture; and it was not only British science which he admired, for he is reported to have expressed a fondness for the English landscape, and the paintings of Constable, Gainsborough and Turner.

In 1861, Kliment Arkadievich entered the University of St. Petersburg but was soon obliged to leave, on account of student unrest, and he finished his course in 1866 as a private student in natural sciences. This was the time of the liberation of the serfs in Russia, and Timiriazev states that the enthusiasm for progressive movements which he gained during the 'sixties remained with him for his whole life.

After spending two years abroad, in Heidelberg and Paris, he was appointed in 1870 a teacher (later professor) at the newly founded Petrovsky Academy of Agriculture and Forestry in Moscow (now the Timiriazev Academy), and engaged in teaching and research in plant physiology until 1892, when he was expelled. From 1877 he was also a professor of plant physiology in the University of Moscow, until 1901, when he was likewise excluded from its professorial body. Evidently his views on "free scientific thought, freedom of instruction, and autonomy of places of higher education", did not accord with those of the educational or ecclesiastical authorities, and consequently he was never made a full member of the Imperial Academy of Sciences.

In 1909, Kliment Arkadievich had an apoplectic fit, and became paralysed. However, he retained possession of his mental faculties for another ten years. He died in 1920.

Apart from some early work in 1867 on the effect of mineral fertilizers on rye and oats, practically all Timiriazev's research was concerned with photosynthesis. Thus he made some experiments on the relative effects of different parts of the spectrum on photosynthesis, and attempted to prove, in accordance with his materialist views, a proportionality between photosynthesis and the amount of energy absorbed by the plant in the form of light.

Timiriazev's views on plant physiology are summarized in a book called "The Life of the Plant", an English translation of which appeared in 1912. The material for this book was originally taken from a course of lectures delivered in 1876 in Moscow, and embraces a wider range of topics than is now included in plant physiology. The first chapter is called "Science and Society", in which Timiriazev expresses the view that "the physiology of plants will develop in the schools of agriculture in the same way as the physiology of animals developed in the schools of medicine", and "obviously the physiology of plants must be made the foundation of agriculture". In these views Timiriazev was many years ahead of his times. In the last chapter, devoted to the "Origin of Organic Forms", he states: "naturalists hail Darwin's theory as the crowning of the stately structure of modern physiology".

In 1864, five years after the appearance of Darwin's "Origin of Species", Timiriazev published an article entitled "Darwin's Book, its Critics and Commentators", and from that time until the end of his life never ceased to be an enthusiastic propagandist for Darwin. Timiriazev's "Struggle for Darwinism" (as L. S. Tsetlin calls it) took the form, in the main, not of original observations and experiments, but of polemics with various of his compatriots. The two principal Russian anti-Darwinians were (1) N. Ya Danielevsky (1822–85), "one of the reactionary epigones of slavophilism", who published in 1885 and 1889 two massive volumes purporting to reduce Darwinism to an "amorphous heap of rubbish", and (2) N. N. Strakhov (1828–96), a "naturalist philosopher and publicist". Timiriazev also ventured to differ, with respect, from the great Tolstoi, who in his novel "Anna Karenina" and elsewhere had attacked the principles of natural selection. Such criticism of Darwin in nineteenth-century Russia, based on nationalism, ethics, or a non-materialist philosophy, is now, however, of little scientific interest in comparison with the violent controversies which raged after the re-discovery of Mendel's famous paper in 1900.

On the subject of Mendelism, Timiriazev expressed himself with characteristic vigour. Thus, in the prefaces to the fifth, sixth and seventh edition of his book, "Charles Darwin and his Work" (1905, 1908, 1919 respectively, and reprinted in 1941), Timiriazev writes [reviewer's translation]:

"I demonstrated the failure of the attempts to refute Darwinism by the clerics and metaphysicians, and, in Germany, by the nationalist Chauvinists. The ungifted, obstinate Bateson has continued to act as leader of the clerical anti-Darwinian movement in England. . . . As is known, he has greatly exaggerated the significance of Mendel's work, endeavouring to obscure the importance of Darwinism with the over-inflated glory of a catholic monk", and so on.

Notwithstanding this onslaught, it is of great interest to note that Timiriazev at the same time saw no inconsistency in pointing out certain virtues in Mendelism. Before the discovery of Mendel's laws, the theory of natural selection had been exposed to criticism on account of the then widely held assumption of blending inheritance. Thus Fleeming Jenkin, professor of engineering in the University of Edinburgh, had, in 1867 [2], pointed out that if a plant or animal should arise, deviating by an amount n from the normal, then, with cross-fertilization, members of the next generation would show a deviation of only $n/2$, and the next after that only $n/4$. Consequently, there would be a 'swamping effect' on every newly arising variation, and the chance of natural selection acting on such variations would be extremely slight. (This has been pointed out in more recent times by Fisher in "The Genetical Theory of Natural Selection".) Apropos of this, Timiriazev, in a speech delivered in 1909 [3], fifty years after the publication of the "Origin of Species", said:

"The answer to Jenkin's objection was given already two years before the appearance of his article. In 1865, a completely unknown Augustinian monk named Mendel published a paper . . . showing that characters do not blend, but are preserved unchanged, and are distributed between various descendants. . . . *Thus, Mendelism removes the most dangerous objection which, in the words of Darwin himself, was made against his theory*".[3] [My italics.]

It is greatly to his credit that Timiriazev should here put aside his anti-Mendelian prejudices, which were doubtless due partly to his dislike of religion in general and consequently of Mendel for his clerical association, partly to the fact that Mendelism was taken up in a distorted form by the German so-called race theorists, and partly again to the hostility towards natural selection felt by Bateson and other Mendelian enthusiasts.

Timiriazev's incorporation of Mendelian segregation into the theory of natural selection is correct according to the views of modern genetics. It is, however, contrary to the teachings of the Lysenko[4] school, at present dominant in the U.S.S.R., and Lysenko is described by Tsetlin as Timiriazev's "ideal pupil". It is therefore the more regrettable that Tsetlin in his book fails to direct attention to this inconsistency, and merely points out that "Timiriazev acknowledged Mendel's undoubted merit".

As is well known, Darwinism has been accepted as part of the official *Weltanschauung* of the U.S.S.R. Karl Marx, writing to Engels in 1860 about the

"Origin of Species", said: "This book gives a natural-historical basis to our views", and since then the parallelism between "Das Kapital" and "The Origin of Species", which appeared within eight years of each other, has often been drawn. Tsetlin adds: "in widely spreading propaganda for Darwinism, Timiriazev was preparing among his numerous pupils and readers a favourable soil for the planting of dialectical materialism".

Shortly before Timiriazev's death in 1920, there appeared a volume of his more political writings, collected under the title "Science and Democracy", in which he welcomed the Bolshevik regime. For this he received a letter of hearty thanks from Lenin himself.

Tsetlin, in the preface to his book, states that his purpose is to follow the progress of Timiriazev's views "from bourgeois democracy to communism, through the medium of his own particular science". A good case is certainly made out for this; but it is a pity that Timiriazev is misrepresented in at least one important respect (that is, concerning Mendelism). Indeed, Kliment Arkadievich Timiriazev was, in the view of the present writer, a greater man than perhaps appears from Tsetlin's book.

OBITUARY

Prof. F. M. Rowe, F.R.S.

Frederick Maurice Rowe, born at Stroud, Gloucestershire, in 1891, died at his home in Leeds on December 8. One of a long line of Clothworkers' Scholars from Marling School, Stroud, he entered the Department of Tinctorial Chemistry and Dyeing of the University of Leeds in 1908, graduated with first-class honours in tinctorial chemistry in 1911, and was president of the University Union during 1911–12.

After a period of research with Prof. A. G. Green on nitrohydrazo compounds and *o*-nitroamines, Rowe joined the research staff of Messrs. J. Crosfield and Sons, Ltd., of Warrington, in 1913, and was sent to study colloid chemistry with Freundlich at the Technische Hochschule, Braunschweig, Germany. In 1916, however, he resumed his association with Green, who had been appointed director of the newly established Dyestuffs Research Laboratory at the College of Technology, Manchester. Two years later, he became head of the Laboratory, where he remained until 1926. During this period, the work on *o*-nitroamines was continued, and the properties of certain azo dyes derived from hydrogenated naphthalene derivatives were investigated. He also examined tars obtained from the low-temperature carbonization of coal, and elucidated the constitution of certain yellow pigment colours, for example, the Hansa Yellows, and the composition of some rapid fast printing colours and products used in the production of insoluble azo colours. For these and other investigations he was awarded the degree of D.Sc. by the University of Leeds in 1921, and the fellowship of the Institute of Chemistry in the same year.

This was a period of re-birth for the dyestuffs industry of Great Britain and, conscious of his special responsibilities to the industry, Rowe accepted the invitation of the Society of Dyers and Colourists to undertake the heavy task of compiling and editing an authoritative work of reference on colours, their composition, method of manufacture, properties and uses. The "Colour Index" was the result, and of all Rowe's achievements it is the one most closely associated with his name. He was awarded the Gold Medal of the Society of Dyers and Colourists in 1934 in recognition of his "exceptional services to the Society and to the tinctorial industries as Editor of the *Colour Index*, 1924, and the *Supplement*, 1928".

After being appointed reader in tinctorial chemistry at the College of Technology, Manchester, in 1925, Rowe was elected to the chair of colour chemistry and dyeing at the University of Leeds in 1926, on the retirement of the late Prof. A. G. Perkin. His subsequent research was in two main fields. The first arose out of the observation that phthalazine derivatives are formed by the action of excess sodium hydroxide on the diazosulphonate derived from diazotized *p*-nitro-aniline and β-naphthol-1-sulphonic acid. On extending the work to diazosulphonates derived from other nitroamines and their derivatives, results of such interest and importance were obtained that the series of papers increased to twenty-five, some of which, though written, await publication. In addition, he undertook research on the preparation and properties of intermediates for dyes and related products.

The second main line of investigation was concerned with the application of dyes, and ranged over a wide field. Among the subjects studied were the effects of after-treatment on the aggregation, location, shade and fastness properties of insoluble azo dyes on the fibre; the reduction and dispersion of azoic dyes in presence of Lissolamine A; and the fading of dyeings on cellulose acetate rayon, due to the action of oxides of nitrogen in the atmosphere. In later years, particular attention was paid to the dyeing of wool with chrome mordant dyes. Starting with a study of the peculiar dyeing properties of wool which had been exposed to the action of light and air, the work was extended to include fundamental work on the chroming of wool and an exhaustive study of the metachrome process.

Rowe's distinction as a research worker was recognized by the award of the Worshipful Company of Dyers' Research Medal on five occasions, and by his election to the fellowship of the Royal Society in 1945. He was admitted to the livery of the Worshipful Company of Dyers in 1932, and to the honorary freedom and livery of the Worshipful Company of Clothworkers in 1944. Such distinctions were the reward of a life characterized by a high sense of duty: duty to his students, whose subsequent careers he followed with close personal interest; duty to the University, where his wise counsel will be sorely missed in a period of reconstruction and development; and duty to the industry, of which he was the academic focus. It was typical of the man that, despite these many responsibilities, he should accept a commission in the Home Guard at the time of its formation. The accumulated burden was then too great, and his health gave way in 1943. Yet indomitable courage enabled him to continue academic work to the very end of his days.

NEWS and VIEWS

Physics at Middlesex Hospital Medical School: Prof. Sidney Russ, C.B.E.

PROF. SIDNEY RUSS, as announced in *Nature* of January 4, has recently retired from the Joel chair of physics, attached to the Middlesex Hospital Medical School, and been appointed emeritus professor of physics in the University of London. Prof. Russ was the doyen and one of the most distinguished members of the group of hospital physicists who have played an important part in developing the science of medical radiology. After a brilliant career as an undergraduate at University College, London, he was appointed demonstrator in physics at the University of Manchester. Here he became one of Rutherford's earliest research associates, and with the late Prof. W. Makower investigated the phenomenon of the recoil of atoms undergoing radioactive disintegration. His interest in radiology led to his appointment in 1910 to a Beit Memorial Fellowship tenable at the Middlesex Hospital, a connexion with this institution which remained unbroken until his retirement in September last. On the expiry of his fellowship he was appointed physicist to the Hospital, and later, in 1920, was appointed to the first chair in physics at a London medical school.

As an investigator and administrator, and also as a lecturer possessing great charm and lucidity, Prof. Russ has exerted a considerable influence on medical radiology. Probably his most notable contribution to the subject is the book which he published in collaboration with the late Dr. H. A. Colwell entitled "Radium, X-Rays and the Living Cell". This pioneer work attracted many to this field of investigation and stimulated the interest of a much wider circle. Later, again in association with Colwell, he published another work, "X-Rays and Radium Injuries", and was joint author with his colleagues, L. H. Clark and B. D. H. Watters, of the well-known "Physics in Medical Radiology". He also contributed a succession of original papers on the influence of radiation on living cells, organs and tumours. In addition to being honorary secretary of the Radiology Committee of the Medical Research Council, the first scientific secretary to the National Radium Commission, and radium adviser to the King Edward Hospital Fund, Prof. Russ was for many years a member of the British X-Ray Units Committee and of the British Committee for X-Ray and Radium Protection. The present international recommendations relating to X-ray units and to radiation protection are largely based on the work of the British Committees and owe much to Prof. Russ's knowledge, zeal and wisdom.

Prof. J. E. Roberts

DR. J. E. ROBERTS, who has been elected to fill the Joel chair of physics at the Medical School of the Middlesex Hospital, University of London, is a graduate of Leeds. He has for some years been associated with hospital physics mainly in connexion with radiotherapy. His work with Prof. W. V. Mayneord at the Royal Cancer Hospital resulted in his appointment about ten years ago to the Middlesex Hospital. His main research in the field of pure physics has been an attempt to formalize the energy distribution in the gamma-ray spectrum of radium B and C.

American Association of Physics Teachers: Award of Oersted Medal

THE Oersted Medal of the American Association of Physics Teachers has been awarded to Prof. Duane Roller, professor and head of the Department of Physics of Wabash College, Crawfordsville, Indiana. The award is made annually "for notable contributions to the teaching of physics". Through the *American Journal of Physics*, which he has edited since it was founded in 1933, Prof. Roller had made a notable contribution to the teaching of physics at the college and university levels. Prof. Roller was educated at Culver Military Academy and at the University of Oklahoma. He was later, for thirteen years, on the staff of the University of Oklahoma, during which period he received a doctorate at the California Institute of Technology. Afterwards he became a research associate at Columbia and an associate professor at Hunter College. During the First World War he was a pilot, and during the Second World War he was chief technical aide of the National Defense Research Committee. The formal award will be made at the annual meeting on January 31 of the American Association of Physics Teachers, to be held at Columbia University. In his address of acceptance Prof. Roller will discuss one of his chief professional interests, physical terminology, another field in which he has made notable contributions, both to the teaching of physics and to the science itself.

British Medical Journal: Retirement of Dr. Gerald Horner

THE news that Dr. Gerald Horner retired under the age limit from the editorship of the *British Medical Journal* at the end of 1946 will be heard with regret by all those who have benefited, during the last nineteen years, from his able editorship. The editing of a leading medical journal, which is also the official organ of the British Medical Association, has always been a high responsibility. During recent years it has carried with it an increasing preoccupation with the health and well-being, not only of the people of Great Britain, but also with that of great and harassed populations elsewhere. If, indeed, we seek a measure of the achievement of Dr. Horner, we shall find it in the fact that the whole world looked to the *British Medical Journal* for guidance and leadership.

Formerly an assistant editor of the *Lancet*, the staff of which he joined in 1911, Dr. Horner became editor of the *British Medical Journal* in January 1928. Under his editorship the circulation of the journal has increased so considerably that he cannot but have felt, when he left the editorial chair, that his labours have been well rewarded. It has fallen to his lot to edit the journal throughout the very difficult period of the recent War, when the paper shortage, air raids and a multitude of other difficulties coincided with the necessity of providing, every week, a journal well filled with news and informative and research articles. Among the latter were the records of noteworthy results of British war-time research; and their publication and the issue of a great deal of other information was an essential part of our war-time effort. How efficiently Dr. Horner discharged this task is well known; as are also his kindly and helpful influence and personality. During the later months of his editorship, the British Medical Association planned and launched no less than eight new specialist medical journals, each with its own editor. His experience must have been an invaluable aid in the planning of these additions to medical literature. His advice must have been essential also to the successful planning of the two new abstracting journals which began publication by the British Medical Association this month under the general direction of the editor of the *British Medical Journal*. These new journals, namely, *Abstracts of World Medicine* and *Abstracts of World Surgery, Obstetrics and Gynœcology*, are modelled on the *Bulletin of War Medicine*, which under the able editorship of the director of the Bureau of Hygiene and Tropical Diseases, Dr. Charles Wilcocks, and the publications officer of the Medical Research Council, Dr. F. H. K. Green, gave, until its publication was discontinued in 1946, so remarkable an epitome of medical work during the War.

Dr. Hugh Clegg

DR. HORNER has done a great work. It will be a satisfaction to him—and to everyone else—to know that the journal which he has so ably edited will now be in the hands of Dr. Hugh Clegg, who has been, since 1934, assistant editor. Dr. Clegg brings to his task a vigour of character, a broad outlook and an experience of medical journalism which make it certain that the great traditions of the *British Medical Journal* will be maintained. Everyone will wish him success in a work which may well have, during the period upon which we are now entering, a greater influence upon the health of the public and of the individual than medical journalism has ever had before.

Biology and Human Affairs

THE autumn issue of this useful journal maintains the high standard that teachers of biology and others interested in the broader aspects of biology (including social biology and human affairs) have now come to expect. Edited and produced by officers of the British Social Hygiene Council, the journal has also the advantage of a strong board of editorial consultants—Profs. F. A. E. Crew, J. Ryle, T. H. Pear, S. Zuckerman, and Dr. A. I. Richards, Mrs. E. M. Hubback and Mr. L. G. Troup.

The current number deals with science and ethics as a follow-up of the Conference on Science and Ethics organised by the British Social Hygiene Council last July. E. J. H. Corner, of the Botanic Gardens, Singapore, contributes a stimulating article dealing with tropical biology as an international problem. Sir John Megaw discusses over-population as a world problem. Sir John gives much food for thought, especially when discussing the possible effect on population problems of the World Food Plan envisaged by the Food and Agricultural Organisation. The report of the Council's Summer School held at Wadham College, Oxford, reveals the value that teachers and local authorities are attaching, to an increasing extent, to these gatherings. An informative article on the biology of twins is contributed by F. Whitwam Jones; and one on democracy and museum zoology by the keeper of zoology, National Museum of Wales (Colin Matheson), is provocative and suggestive. Book reviews play an important part in this journal—an excellent publication which should be read by all biologists interested in the teaching and social implications of their subject, and especially by school teachers. It is published by the British Social Hygiene Council, Tavistock House North, Tavistock Square, London, W.C.1.

New Scientific Journals

THE newly founded Society for General Microbiology is to issue the first number of its journal—the *Journal of General Microbiology*—during January (Cambridge University Press). The journal will be edited by B. C. J. G. Knight and A. A. Miles; the associate editors are G. C. Ainsworth, W. B. Brierley, T. Gibson, A. T. R. Mattick, Kenneth Smith, A. W. Stableforth and D. D. Woods. For the time being there will be three numbers a year, the annual subscription being 50*s*. Further information can be obtained from the Cambridge University Press, Bentley House, 200 Euston Road, London, N.W.1.

The Nutrition Society is also to produce a new journal—the *British Journal of Nutrition*—which will be issued quarterly. It is hoped to publish the first number during the first half of 1947. The editorial board is as follows: D. P. Cuthbertson, J. N. Davidson, R. C. Garry, G. Graham, J. Hammond, E. M. M. Hume, S. K. Kon (chairman), I. Leitch, W. C. Miller, B. S. Platt, J. A. B. Smith and F. Yates. This journal is also to be published by the Cambridge University Press, from which further particulars can be obtained.

British Association

SIR HENRY DALE, who succeeded Sir Richard Gregory as president of the British Association on January 1, was formally installed at a meeting held at Burlington House on January 3, and addressed a joint meeting of sectional committees assembled to consider the programme for the meeting of the Association in Dundee next autumn. For the first full post-war meeting of the Association, the Council has adopted a general theme 'Swords into Ploughshares', and prominence will be given in the programmes to papers and discussions on the positive contributions which science has made, and can make, towards the well-being of mankind.

Carnegie United Kingdom Trust

THE thirty-second annual report of the Carnegie United Kingdom Trust, for the year ended December 31, 1945 (from the Trust, Dunfermline), states that the Trustees have decided to revert to the pre-war system of arranging the business of the Trust in certain main groups, and for this purpose have reconstituted standing sub-committees of the Executive Committee dealing, respectively, with arts, community services, education, youth services and finance and general purposes. The accounts of the Trust, which are now again printed as an integral part of the report, show a total expenditure on grants of nearly £75,000 or about £3,500 more than in 1944. Of this, £30,343 is for youth services, £23,733 for community services, £10,634 for the arts and £8,731 for education. The expenditure for youth services was represented chiefly by capital grants in aid of equipment of youth clubs and hostels, but the Trustees have decided against an extension of the bursary scheme for training men for club leaders and in favour of assisting the National Association of Boys' Clubs to provide a residential institution for standardized training. Another grant of £10,500 was made to the Warwickshire Rural Community Council towards the acquisition, equipment and furnishing of Westham House, Barford, as a Town and Country College to bridge the present and ever-widening gap between townsman and countryman. The Trust has continued to meet the whole cost of maintaining the Irish and Scottish Central Libraries for Students and has maintained its grant in aid of the National Central Library.

The concluding part of the report deals with the plans of the Trust for the quinquennium 1946–50, and a statement of policy forms an inset to the report. The oldest of the major policies of the Trust still extant at the outbreak of war was that of assisting the provision and improvement of village halls. At the date of the review 585 such schemes had been assisted, and the Trustees propose to allocate a further £100,000 for this purpose during the next five years. An allocation of £30,000 for museum services is also proposed, and £150,000 for a comprehensive music and drama policy, to administer which the Carnegie Committee for Music and Drama has been established. While the Trustees are terminating the scheme of making grants in aid of the equipment of local youth clubs, they propose to allocate £40,000 towards the equipment required for residential purposes in youth hostels and camps under detailed conditions, and as an exceptional measure £25,000 has been set aside to help the National Federation of Young Farmers' Clubs to bridge the transitional period between the present system of direct grant from the Ministry of Education and the new system of grants from local education authorities. Provision of a sum of £150,000 is also proposed towards the establishment and maintenance of the Bureau of Current Affairs to provide for the general populace the kind of information service given during the War by the Army Bureau of Current Affairs and the Civil Defence Welfare Services. The inset already mentioned gives the addresses where inquiries regarding particular activities should be made.

Degaussing

The October number of Part 1 of the *Journal of the Institution of Electrical Engineers* (Vol. 93, No. 70) contains three papers which were read at the first session of a symposium on degaussing held during April 4–5, 1946. The first paper, by H. W. K. Kelly, gives a historical survey of developments prior to the start of the campaign against the magnetic mine. The others, by D. H. Parnum and R. J. Gossage, deal respectively with underwater measurements of magnetic field, and the use of ship models, magnetically to scale, in degaussing work.

The November issue of the *Journal* contains four papers on the same subject. The first, by W. C. Potts, surveys the study of the magnetic fields produced by ships constructed during the war period, and indicates, schematically, how degaussing coils were placed for the purpose of neutralization. The electrical engineering aspects of these arrangements are then discussed in detail in a paper by Messrs. I. S. Fraser, A. A. Read and B. E. Vieyra. A further paper, by S. H. Ayliffe, describes alternative measures to that of coiling used as means of affording protection, namely, the processes known as 'wiping', 'flashing' and 'deperming'. The first of these processes was developed mainly for the purpose of providing compensation for the vertical magnetism of those ships which have insufficient power to energize a coil system. That of 'wiping' is based on the principle of magnetizing ferrous materials by stroking with a magnet or current-carrying conductor, and consists in practice of wrapping a cable temporarily around the vessel in the horizontal plane and moving it up and down while a heavy current is passed through it; while that of 'flashing' consists in surrounding the vessel with a horizontal cable near the water line and in passing a heavy current through it momentarily. The term 'deperming' is used to cover any form of treatment, to which the vessel is temporarily subjected, designed to remove or compensate permanent longitudinal or athwartships magnetism. In its final form, the process involved wrapping the hull with a cable solenoid through which short-duration current pulses were passed. Finally, a paper by Messrs. H. C. Wassell and D. A. Turner discusses the effect exercised by degaussing coils on ships' compasses and describes the compass-corrector equipment which was developed. The publications are followed by a summary of the discussion at the Institution and the authors' replies (see also *Nature*, May 18, p. 646).

Metallurgical Research

Vol. 71 (1945) of the *Journal of the Institute of Metals* contains the report of the Council, which shows a total membership of the Institute of 2,686. Twenty-eight original papers are included, together with discussions, and occupy 654 pages. It is of interest to note how large a proportion of the volume deals with the light metals and their alloys, papers on magnesium and aluminium representing about half the total number. Copper and its alloys are dealt with in some half-dozen papers, which include a valuable contribution on the "Computation of Rolling Load, Torque, and Roll-Face Pressure in Metal Strip Rolling" by Dr. M. Cook and E. C. Larke. Three papers refer to the precious metals, while constitutional work (always an important section of the Institute's interests) is dealt with in six. The May Lecture by Sir Thomas Holland dealt with "The Supply of Accessory Metalliferous Minerals", and Dr. R. Seligman discusses "The Organisation of Metallurgical Research". An interesting account is given by Mr. H. A. Sloman of "The Application of the Vacuum-Fusion Method to the Determination of Oxygen, Hydrogen and Nitrogen Contents of Non-Ferrous Metals, Alloys and Powders". The corrosion of metals, as one expects, is dealt with in more than one paper. To those familiar with this *Journal*, all that need be said is, that it fully maintains the high standard of previous issues, a standard which in view of the present difficulties is eminently praiseworthy. The plates, of which there are forty-seven, are excellently produced.

Vol. 12 of "Metallurgical Abstracts" follows the lines which we now expect. 424 pages of abstracts and 88 of indexes give an idea of the care with which the ground is covered. To the metallurgist, both theoretical and practical, as well as to chemists, physicists and engineers, these volumes have become essential.

Test Papers for *p*H Values

We have received from Messrs. Johnson and Sons, Manufacturing Chemists, Ltd., Hendon, London, N.W.4, samples of two kinds of test papers. These are made up in small books like litmus papers. The Universal Test Paper for the measurement of *p*H values provides ten colour matches in steps of 1 *p*H from 1 to 10, with an accuracy of 0·5 *p*H, the appropriate colours being printed inside the covers of each book. The Comparator Test Papers provide a higher degree of accuracy, to 0·3 *p*H, inside narrower ranges, in four kinds from *p*H 3·6 to *p*H 10, the colours being again printed inside the cover. The papers can be dipped into the solution, or the latter applied by a glass rod. We have tested both kinds of papers with buffer solutions and have found the colour changes to be as stated. They should be very useful to chemists, biologists, physicians, and workers in various industries, when a rapid and reasonably accurate method of measuring *p*H is desired. Messrs. Johnson also make a wide range of other test papers and supply a special grade of litmus in the form of granules free from the usual fillings of gypsum or calcium carbonate and requiring only extraction with water to produce an indicator solution. The firm is investigating supplies of lichens from various parts of the world in attempts to produce a high-quality litmus. It is interesting to note that the firm was established so long ago as 1743.

Plant Health in the Argentine

PROF. J. B. MARCHIONATTO has prepared a study of plant health in the Argentine from the colonial period in 1810 down to 1943. (Fac. Agron. y Vet., Univ. Buenos Aires). It is divided into four parts, the first of which is almost entirely historical, giving a description of the development of plant life and also a short account of the work of some of the outstanding men who have devoted their time to this subject. The second part describes the conditions in the Department of Agriculture when Prof. Marchionatto took charge of the Laboratory of Plant Pathology. It also includes a survey of the work that was carried out between 1923 and 1932, when the Division of Phytopathology was formed; Prof. Marchionatto's small laboratory was moved to the new Division, and in 1935 was transferred to the Bureau of Plant Health. Part 3 deals with the organisation of the official services in connexion with the health of plants, the discharge of fiscal duties, the sanitary examination and control of the Department of Agriculture, etc. Part 4 contains an account of progress in the investigation of diseases of plants, and the work and results in the regional laboratories are described.

Government Museum, Trivandrum, Travancore

THE administration report of the Government Museum at Trivandrum for the year 1944–45 is prefaced by statements which imply an unusually strong official confidence in a museum's service. It is somewhat startling to read, for example, that this Museum "has . . . enlarged the minds of the visitors by multiplying their interests, trained their tastes and tended to develop in them an appreciation of the beautiful". Nevertheless, the attendance figures brought forward to support these and other claims certainly indicate a service which is of strong appeal to the people. It is noteworthy that during the year the smallest number of visitors to the Museum on any one day was 589, while the largest number was 12,947. Casts (made by a member of the staff) of sculptures in the temple at Suchindrum are now on exhibition in the Museum; they are described in detail on p. 2 of the report. Dr. J. H. Cousins has prepared a new guide to the Art Museum, which is issued free to visitors, and a small catalogue of the metal images is also available.

Recent Earthquakes

DURING September, nineteen strong earthquakes were registered by the observatories in Switzerland. The earthquake of September 10 had its epicentre near V. Camonica in the Italian Alps; that of September 12 in the Shansi province of China, and those of September 29 and 30 in the Solomon Islands and Peru respectively. During October, fifteen strong earthquakes were registered in Switzerland. That of October 23 occurred in the Karnische Alps near Trieste, and that of October 30 in the Aleutian Islands. During the first half of November, there were six strong earthquakes in various parts of the globe. That of November 1 occurred in the Aleutian Islands and that of November 2 was destructive in the Uzbeck and Kirghiz districts of the U.S.S.R. The earthquake of November 3 had its epicentre approximately on the equator at long. 17° W., whereas that of November 4 had its epicentre near lat. 40° W., long. 53·5° E. near the Caspian Sea. Epicentres of the above earthquakes in November have been obtained, using instrumental reports from observatories, by the U.S. Coast and Geodetic Survey, in co-operation with Science Service and the Jesuit Seismological Association, as well as by the International Seismological Office at Strasbourg. The U.S. Coast and Geodetic Survey has also determined the epicentres of the earthquakes of November 10 and 12. The former was destructive near Sihuas, about 225 miles north of Lima in Peru, and the latter occurred near lat. 21° S., long. 173° W.

Economic Reconstruction in Great Britain

THE Council of the Royal Society of Arts has decided to devote eight of the remaining ordinary meetings during the present session to a series of eight lectures, dealing with various aspects of economic reconstruction in Great Britain. The lectures will be given at the Society's House in John Adam Street, Adelphi, London, at 5 o'clock, on Wednesdays, the first being on January 15, and will be followed in all cases by an open discussion. The topics to be dealt with include the relation of Britain to the world trade situation, scientific approach to labour problems, materials, finance, craftsmanship, production, distribution and economics.

Announcements

MR. W. C. F. HESSENBERG, chief officer of the Liaison Department of the British Non-Ferrous Metals Research Association, has been appointed head of the Mechanical Working Division of the British Iron and Steel Research Association, and will take up his new post in a few months time.

IT is announced by British Drug Houses, Ltd., that Dr. F. Hartley, Dr. C. Ockrent, Mr. H. G. Rolfe and Mr. G. F. Williams have joined the board of the company. Dr. F. H. Carr and Mr. R. R. Bennett have retired from active participation in executive work, but Dr. Carr will continue as chairman of the company and Mr. Bennett as director.

ERRATUM.—Miss Mariam George, writing with reference to the communication "Synergic Action of Penicillin and Bacteriostatic Dyes" (*Nature*, November 16, 1946, p. 709), states that in the two tables, the minimum inhibiting concentration of dyes should be $\frac{1}{1\cdot75} \times 10^{-6}$, $\frac{1}{2} \times 10^{-4}$, etc., instead of $1\cdot75 \times 10^{-6}$, 2×10^{-4}, etc.

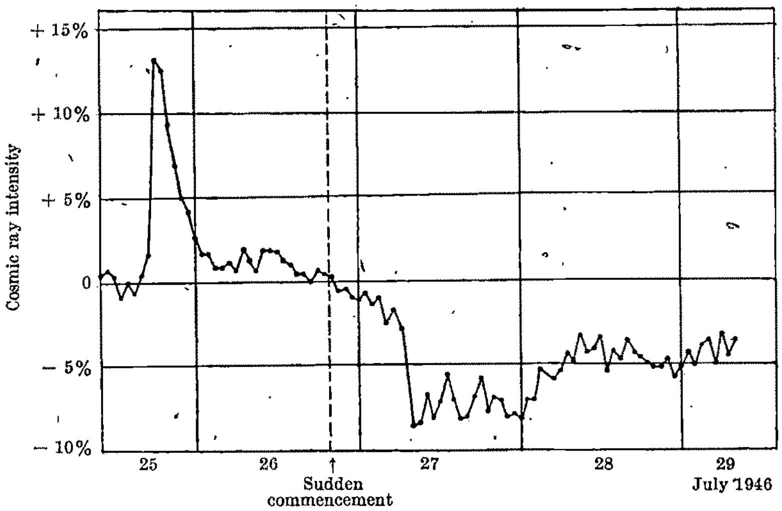
Cosmic Ray Intensity at Manchester and Solar Disturbances of July 25, 1946

RECENT correspondence in *Nature*[1,2,3] has directed attention to phenomena connected with the great sunspot and solar flare of July 25, 1946, onwards, including a large increase in solar noise and a great geomagnetic disturbance.

The accompanying figure shows a cosmic ray disturbance which was recorded in Manchester at this time. The amplitude of the positive-going peak of about 13 per cent above normal hourly rate makes this disturbance unusual.

Three independent intensity recorders are in operation at Manchester, and the main features of the storm were reproduced in each. Two of them count at the rate of 65,000 three-fold coincidences per hour, and the third at the rate of 30,000 two-fold coincidences per hour. As the hourly rates for the first two were for the intervals 16 hr.–17 hr., etc., and for the third recorder for the intervals 16.30–17.30, etc., it is possible to deduce half-hourly rates for the rise of the peak. This gives the maximum as occurring between 18.00 and 18.30 G.M.T., and of amplitude 17 per cent above the normal half-hourly rate.



According to detailed information kindly supplied by the Astronomer Royal, the magnetic disturbance had ceased by about 10 hr. on July 27. At this time, however, the cosmic ray intensity was still about 8 per cent below normal. A very slow recovery, as usual, resulted in more than a week elapsing before the pre-storm level was regained.

No unusual effect was recorded in Manchester corresponding to that reported from Lahore[4].

The only previously reported peaks appear to have been those associated with the cosmic ray storm of February 28–March 10, 1942. An amplitude of about 8 per cent above normal bi-hourly rate was measured for each of the two peaks that occurred then[5,6].

On these two occasions, when sudden increases in cosmic ray intensity have been recorded, they have occurred some hours before the commencement of the magnetic disturbance. This period was 17 hours for the 1942 storm[5] and 25 hours for the 1946 storm considered here.

Measurements of Changes of the Phase-Paths of Radio Waves in the Ionosphere

MEASUREMENTS of the heights of reflexion of short radio waves returned from the ionosphere have usually been restricted to measurements of the 'group' or 'equivalent' path travelled by the waves. The group path, P', is given by

$$P' = c\int_{\text{path}} \frac{ds}{U}, \quad . \quad . \quad . \quad . \quad (1)$$

where U is the group velocity of the waves over the distance ds. Measurements of P' are most easily made by pulse methods. It is possible also to define the 'optical' or 'phase' path of a wave by

$$P = c\int_{\text{path}} \frac{ds}{V}, \quad . \quad . \quad . \quad . \quad (2)$$

where V is the phase or wave-velocity of the wave over the distance ds.

Several authors[1] have described modifications of the pulse technique whereby changes of phase-path may be measured, but these methods do not provide a means of distinguishing between an increase and a decrease of phase-path. Appleton[2] has described how the frequency-change method may measure both the rate of change of phase-path and the sense of the change. The purpose of the present note is to describe a modification of the pulse method, which allows of the determination of both the magnitude and the sense of a change of phase-path.

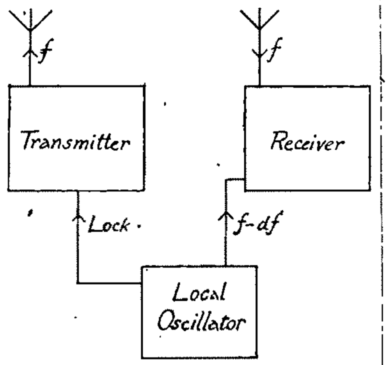

Fig. 1. BLOCK DIAGRAM OF THE METHOD USED FOR DETECTING CHANGES OF PHASE-PATH

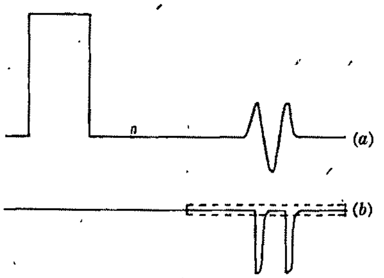

Fig. 2. (a) THE FORM OF AN ECHO RETURNED FROM THE IONOSPHERE BEATING WITH THE LOCAL OSCILLATOR. (b) MODIFIED FORM OF (a)

The usual arrangement of a transmitter which emits a regular succession of pulses is used. These pulses are received and displayed on a linear time-base which is synchronized with the emission of the pulses. This arrangement is modified, as is shown in block form in Fig. 1. A local oscillator injects a signal of frequency about 15 kc./sec. less than the frequency of the transmitter, through an attenuator, into the first circuit of the receiver. The local oscillator is started by the same pulse that starts the transmitter; but the oscillator then continues to oscillate for about 10 millisec., while the transmitted pulse lasts for only 150 microsec. This method of starting the local oscillator and the transmitter ensures that the radio-frequency oscillations in each start in the same phase.

The down-coming pulse from the ionosphere arrives at the receiver together with the signal from the local oscillator, and the two beat together, since they differ in frequency. The amplitude of the signal injected from the local oscillator is adjusted by the attenuator to be always about the same as that of the down-coming pulse. The beat frequency is displayed on the linear time-base, where it has the appearance shown in Fig. 2 (a). If the phase-path of the wave which travels to the ionosphere is constant, then the pattern remains stationary on the time-base. If the phase-path increases by one wave-length of the transmitted frequency, the pattern moves to the right by a distance equal to the distance between successive crests of the pattern. If the phase-path decreases by one wave-length of the transmitted frequency, the pattern moves to the left by a distance equal to the distance between successive crests of the pattern.

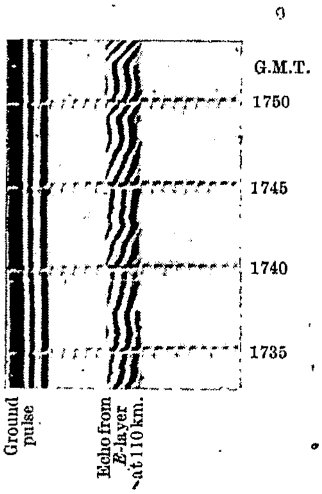

Fig. 3

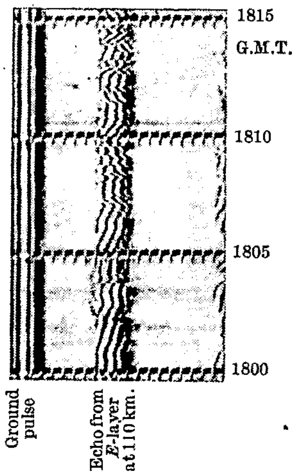

Fig. 4

Fig. 3. SPECIMEN RECORD OBTAINED FROM THE E-REGION OF THE IONOSPHERE, WHEN THE REGION IS 'QUIET'

Fig. 4. SPECIMEN RECORD OBTAINED FROM THE E-REGION OF THE IONOSPHERE, WHEN THE REGION IS 'DISTURBED'

To enable the total change of phase-path to be recorded, the pattern of Fig. 2(a) is transformed by electrical means into that of Fig. 2(b). This trace is then photographed through a slit on to a strip of paper which moves perpendicularly to the trace at a constant speed. The type of record obtained is shown in Fig. 3. Decreases of phase-path of one wave-length appear as white lines sloping downwards from left to right; increases appear as white lines sloping upwards from left to right. The total change of phase-path is obtained by counting the number of wave-lengths by which the path changes, and multiplying this number by the wave-length of the transmitter.

This method has been used to study the changes of phase-path of pulses returned from the E- and the F-layers of the ionosphere. Wave-lengths of 150 metres and 75 metres have been used. Although the method is sensitive to changes of path of less than one wave-length, the accuracy is, in fact, limited by the stability of the frequency of the transmitter and of the local oscillator. At present, changes of path which occur in a few minutes can be measured to an accuracy better than 100 metres.

On twenty occasions during the observations of pulses returned from the E region, Dellinger fade-outs have occurred. In all these occurrences, the start of the fadeout has been marked by a rapid reduction of phase-path, taking place in about a minute, and being of the order of one kilometre in size. The recovery of the echo after the fade-out has been associated with a slower increase of phase-path, usually of the same size as the initial decrease.

One possible explanation of this change of phase-path is that it is caused by the change in phase-velocity of the radio waves in the region causing the increased absorption of echoes during the fadeout. If this explanation is adopted, and if the change in echo amplitude associated with the change in phase-path is known, it is possible to estimate the collisional frequency of the electrons with the neutral atoms in the region causing the fade-out. Values for this quantity for the twenty fade-outs vary from $1\cdot6 \times 10^5$ per sec. to $5\cdot5 \times 10^5$ per sec., with a mean value of $3\cdot6 \times 10^5$ per sec.

The behaviour of region E is not always such as to give the record of changes of phase-path illustrated in Fig. 3. Such records are generally obtained when the region is 'quiet' in the sense used by Best, Farmer and Ratcliffe[3]. When the region is 'disturbed' the type of record shown in Fig. 4 is obtained. The echo fades and shows discontinuous changes of phase-path. Sometimes parts of the echo show very different rates of change of phase-path from the rest. Qualitatively these results could be explained by the E region, when disturbed, having local irregularities in ionization density.

Relativistic Wave Equations

DIRAC'S wave equation of a free electron may be expressed in the form

$$(i\alpha_\mu\partial^\mu + \chi)\,\psi = 0, \quad . \quad . \quad . \quad (1)$$

where the matrices α_μ ($\mu = 0, 1, 2, 3$) obey the commutation relations

$$\alpha_\mu\alpha_\nu + \alpha_\nu\alpha_\mu = 2g_{\mu\nu}. \quad . \quad . \quad . \quad (2)$$

The usual notation is used, and $g_{\mu\nu}$ is the metric tensor for flat space-time given by $g_{00} = 1$, $g_{11} = g_{22} = g_{33} = -1$, the other components vanishing. The commutation relations (2) are such that from the first-order equation (1) one may deduce the second-order equation

$$(\partial_\mu\partial^\mu + \chi^2)\,\psi = 0. \quad . \quad . \quad . \quad (3)$$

In Kemmer's theory of the meson there are used certain matrices β_μ ($\mu = 0, 1, 2, 3$) which satisfy the commutation relations

$$\beta_\mu\beta_\nu\beta_\rho + \beta_\rho\beta_\nu\beta_\mu = g_{\nu\rho}\beta_\mu + g_{\mu\nu}\beta_\rho, \quad . \quad (4)$$

which ensure that the first-order equation

$$(i\beta_\mu\partial^\mu + \chi)\,\psi = 0$$

is consistent with the second-order equation (3).

The relations (4) are not symmetrical in all the suffixes, unlike in (2) where there is complete symmetry. Let us suppose that there exist $\varepsilon_\mu(\mu = 0, 1, 2, 3)$ which satisfy the symmetrical relations

$$(\varepsilon_\mu\varepsilon_\nu + \varepsilon_\nu\varepsilon_\mu - 2g_{\mu\nu})\varepsilon_\rho + (\varepsilon_\nu\varepsilon_\rho + \varepsilon_\rho\varepsilon_\nu - 2g_{\rho\nu})\,\varepsilon_\mu + (\varepsilon_\rho\varepsilon_\mu + \varepsilon_\mu\varepsilon_\rho - 2g_{\mu\rho})\varepsilon_\nu = 0. \quad (5)$$

It is readily seen that α_μ and β_μ both satisfy (5). That is, the matrices α_μ and β_μ are possible representations of ε_μ. It would be of interest to see if, apart from α_μ and β_μ, there exist other representations of ε_μ, and if so whether they may be used to formulate a theory of particles. If we assume for a moment that a representation of ε_μ exists, we should then see whether the commutation relations satisfied by ε_μ are such that the first-order equation

$$(i\varepsilon_\mu\partial^\mu + \chi)\,\psi = 0, \quad . \quad . \quad . \quad (6)$$

leads to the second-order equation (3). It is easy to show that the commutation relations (5) satisfy this requirement. We operate on (6) from the right by $(\varepsilon_\nu\varepsilon_\rho + \varepsilon_\rho\varepsilon_\nu)\,\partial^\nu\partial^\rho$, and use (5). Then from (6) we obtain $\chi(\partial_\mu\partial^\mu + \chi^2)\,\psi = 0$, which is equivalent to (3) when χ is not zero.

Now we come to the question of the representations of ε_μ. So far as I am aware, the possible general representations of ε_μ given by (5) have not been investigated. It appears to me likely that the general relations (5) alone may not be sufficient to ensure a finite representation. More stringent requirements may be necessary. These extra conditions should be consistent with (5) and also should be relativistically invariant. Examples of such conditions are (2) and (4), which give the known representations α_μ and β_μ respectively. It is not impossible that there may be other conditions which give new representations of ε_μ different from α_μ and β_μ.

This question is being investigated further and will be dealt with in a later communication.

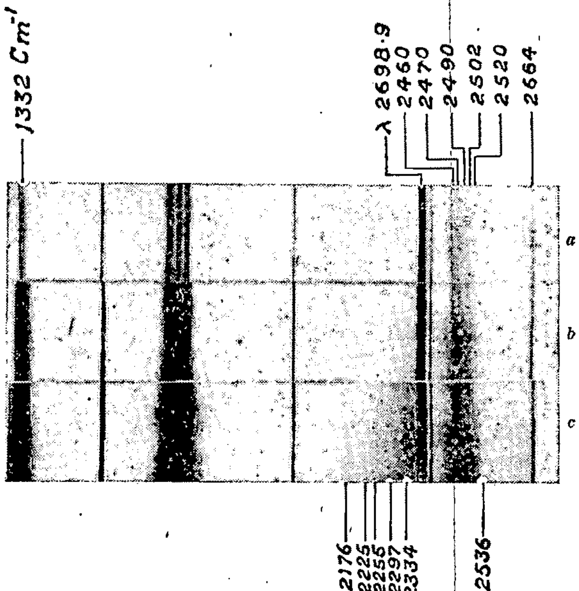
Raman Spectrum of Diamond under High Resolution

USING the λ 2536·5 radiation of the mercury arc as the exciter and a Hilger 'Intermediate' quartz spectrograph, the faint second-order Raman spectrum of diamond was first successfully recorded by me[1]. Later investigations[2,3] with somewhat larger diamonds and with a more powerful instrument, namely, a Hilger 'medium' quartz spectrograph, resulted in a notable improvement in the clarity of the recorded spectra. I have now succeeded in obtaining a satisfactorily exposed picture with a 'large' Hilger quartz spectrograph. The expectation that the greater dispersion and resolution given by this instrument would enable the true nature of the spectrum to be exhibited unambiguously has been fulfilled. Three prints of varying depth enlarged from the original spectrogram are reproduced herewith. The principal feature noticeable in the spectra is the appearance of a whole series of sharply defined Raman lines clearly resolved from each other. Twelve of the most prominent of these lines have been marked with their respective frequency shifts in wave-numbers from the exciting radiation. The width of the individual Raman lines, as is evident from a comparison with the lines of the mercury arc, is no greater than that arising from the instrumental and photographic factors. Besides those marked, there are other fainter lines just discernible in the spectrogram against a fainter unresolved background of apparently continuous spectrum.



The experimental results shown in the spectra are obviously of great interest in relation to the fundamental problem of the nature of the vibration spectrum of a crystal lattice. The largest observed frequency shift in the second-order spectrum, namely, 2664, is clearly the octave of 1332 appearing strongly in the first order. This suggests that all the other lines observed in the second-order Raman effect are likewise either octaves or else allowed combinations of discrete vibration frequencies of the crystal lattice which are Raman-inactive in the first order. This interpretation is supported by a large body of experimental evidence, for a detailed discussion of which reference should be made to some recent papers[3,4,5].

The main point which emerges from the experimental facts now established is that the vibration spectrum of the diamond lattice in the infra-red region is a discrete one made up of a finite set of monochromatic frequencies. Combinations of these with the non-discrete or continuous spectrum of elastic-solid vibrations in the lower range of frequency would account for the fainter unresolved background observed in the recorded spectra.

'Thermal Wedge' Theory of the Parallel Surface Thrust Bearing

Messrs. M. C. Shaw and C. D. Strang[1] have criticized the 'thermal wedge' explanation of the parallel surface thrust bearing put forward by A. Fogg in his paper[2] describing his experimental work.

A mathematical treatment of this bearing has been made using the 'thermal wedge' idea, that is, the equation of continuity becomes

$$\frac{\partial}{\partial x}[(1-\gamma\theta)q_x] + \frac{\partial}{\partial y}[(1-\gamma\theta)q_y] = 0,$$

where q_x, q_y are the rates of flow in the x and y directions and the density $\rho = \rho_1(1-\gamma\theta)$, where ρ_1 is the inlet density, θ the rise of temperature from the inlet and γ the factor of proportionality. This paper will be published in due course in the *Proceedings of the Sixth International Congress of Applied Mechanics*. As all the heat in this theory was assumed to be carried away by the oil, the figures produced for the coefficient of friction were too low. It is hoped in a subsequent paper to give the extended theory with viscosity varying across the thickness of the film and heat loss by conduction as well as convection.

Transport of Heat and Other Properties by Atmospheric Turbulence

THE theory of the turbulent transfer of heat in the atmosphere, based on the concept of the 'mixing length', was introduced by G. I. Taylor[1] in 1915. Modified by D. Brunt[2] to be applicable to a compressible atmosphere, the theory requires that the flow of heat is in the direction of the gradient of potential temperature, and thus is normally downward. From these treatments a close analogy can be drawn between molecular transfer and the larger scale of eddy transfer.

There is, however, a distinct difference between these two mechanisms of transfer for any property the distribution of which itself affects the flow, for example, through the action of buoyancy forces. The possible consequences of this difference with reference to heat transfer in the atmosphere are discussed in a paper which will be published elsewhere.

In this paper it is shown that a component of heat flux, for which the name 'convective turbulence' is suggested, must result from the buoyancy forces. This is always directed upwards, and is thus in general opposed to the downward transfer by mechanical turbulence.

Records of the fluctuations in temperature at fixed levels up to 6,000 ft. which have been made at Cardington with a sensitive quick-response thermometer confirm the importance of convective turbulence, and show that it may at times completely dominate the heat flow. This conclusion is supported by consideration of the heat interchange between the air and the ground over short periods of time in certain types of weather situations. Furthermore, the heat flux due to convective turbulence estimated from the temperature traces on these occasions is sufficient to maintain the interchange of heat between the air and the ground.

Convective turbulence has further important applications in helping to explain the increase of potential temperature with height in the troposphere, and the temperature distribution in the stratosphere.

Although the work which has been done so far is concerned only with the transfer of heat, the distinction between eddy and molecular processes has important applications in the transfer of other properties, for example, water and dust content in the atmosphere, salinity of the ocean and possibly momentum.

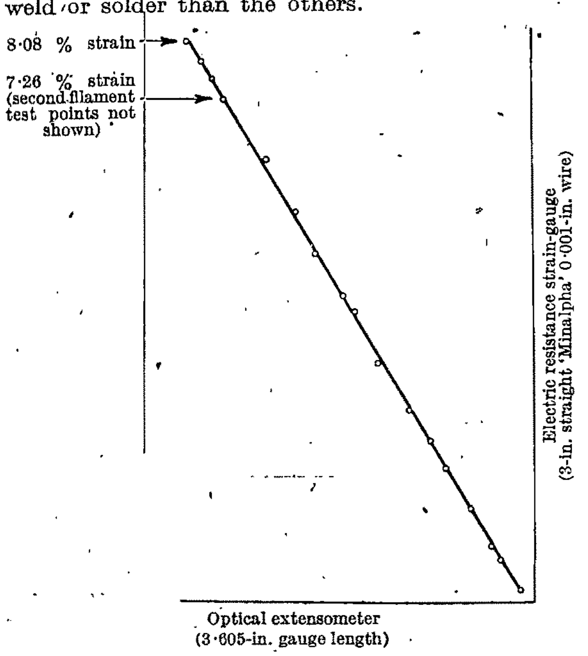
Electrical Resistance Wire Strain-Gauges to Measure Large Strains

I WISH to direct attention to the performance of 'Minalpha' wire as supplied by Johnson Matthey when used as the filament in an electrical resistance wire strain-gauge, and also to indicate the effect of the connexion between the filament wire and the stout wire used to connect it to the measuring bridge.

This type of strain-measuring gauge uses a very fine metal filament (50 gm. 0·001-in. diameter is usual) stuck to a paper base with cellulose cement. The paper, which acts as the insulator for the filament, is stuck to the surface on which the strain is to be measured. As the filament wire is strained, its electrical resistance changes and is measured on a suitable bridge. Calibration of the resistance change gives a measure of the strain.

I wished to find a material and the conditions necessary for satisfactory operation of gauges at large strains. A lightly stretched strip of condenser tissue was hung vertically, and then the various 0·001-in. diameter wires, each with a tension of about 2 gm., were hung in front of it. 'Durofix', diluted one-to-one with butyl acetate, was used to stick the wires to the paper. The paper had been prepared with flapped holes through which the stout connecting wires could be soft-soldered or spot-welded to the fine filaments. All gauges used were made in one strip in this manner to ensure that they were as nearly similar as possible. The filaments were in pairs of the same material. One filament of each pair was $2\frac{3}{4}$ in. between the outside circuit connecting wire joints, whereas the other one was $3\frac{1}{4}$ in. between connexions. Bending the paper base along transverse lines 3 in. apart and between the joints ensured that the joint connexions of one filament would be strained while those of the other filament would be unstrained after cementing to the specimen and loading. Thus the strain performance of each material with and without a joint under strain could be studied. Each paper had three materials—two commercial copper-nickel alloys and 'Minalpha'—and thus held six gauges. On the flat simple tensile specimen used, one such group of gauges was used on each face. Cementing was with dilute 'Durofix'. 'Minalpha' was found to have the best working properties because it stayed straight, whereas the other two wires curled up like 'fuzzy' hair when unreeled without any tension on the free end. Also 'Minalpha' is slightly easier to weld or solder than the others.



As regards the relative performance of the materials and types of construction in connexion with the maximum strain at which the gauge still operated, it was found that for a given material the strain range is doubled by not straining the joint between the filament and the connecting wire. Again, broadly, on these tests at least, 'Minalpha' has double the strain range of the other materials. Thus by using 'Minalpha' wire with an unstrained joint, the strain range of electrical resistance wire strain-gauges may be increased about four times the best available hitherto, since they have been made with a strained joint. This may be seen as a considerable step forward in British electric resistance wire strain-gauge practice, which until recently used nichrome wire with an ultimate strain less than 0·6 per cent, whereas 'Minalpha' operates up to 7–8 per cent strain.

The remarkable linearity of 'Minalpha' electrical strain measurement against optical strain measurement right up to open circuit of the filament is illustrated by the graph. The material is adequately sensitive for use in the small strains range at which these gauges are frequently used. A provisional patent specification has been filed.

Clearly, further work must be done to examine the consistency of performance of 'Minalpha', since only two pairs of gauges have been tested up to the present. However, the present results may stimulate manufacturers and research workers to do further work. My research on post-yield stress and strain causes me to regard gauges as a tool and not as a line of research; but I shall be glad to hear of the experiences of others in this field.

The consequence of finding that 'Minalpha' has such a large strain range is that now strain measurements can be made from zero upwards, since comparator methods, such as photo-grid, can take over when the electric gauge breaks. I can now undertake accurate examination of my post-yield stress-strain theory[1].

Hybridization in the Methyl Radical of CH_3X Molecules

IN order to interpret the anomalous dipole moments observed in methyl halides, Mulliken[1] has assumed that the *s,p* hybridization of the carbon atom is modified in the different compounds.

Recently, de Hemptinne and Doehard[2] have recorded the Raman spectra of deuterated methyl halides and methyl alcohol in the liquid state. On the basis of certain frequencies assigned to some of the normal modes of these molecules, they have computed the magnitude of others very accurately. This indicates that the form of the potential function is adequately chosen, and makes it practically certain that the numerical values of the force constants given below are correct.

We summarize in the accompanying table the results obtained by these authors, and we include those obtained by us for methyl thiol[3]. The values given for the latter are probably less accurate than the others. But the fact that we have used the same type of potential function makes such a comparison possible.

The symbols for the force constants and distances used in this table are those adopted by de Hemptinne and Doehard. The units are respectively 10^5 dynes and angströms.

		f_{CX}	f_{CH}	d_{CX}	d_{CH}	k	S_{CX}	S_{CH}	
I	CH_3Cl	3·30	4·89	0·240	0·436	0·406	1·71	1·093	72° 30′
	CH_3Br	2·75	4·93	0·174	0·430	0·340	1·90	1·093	72° 30′
	CH_3I	2·28	4·96	0·114	0·429	0·301	2·20	1·093	72° 30′
II	CH_3OH	4·92	4·68	0·432	0·436	0·412	1·43	1·093	72° 30′
	CH_3SH	3·65	4·73	0·360	0·430	0·573	1·82	1·1	72° 30′

Certain features of these results are sufficiently striking to merit special attention. They concern particularly the behaviour of the valency force constant f_{CH} and of the bending force constant d_{CH}.

The former increases by about six per cent with decreasing electronegativity of the adjacent atom, whereas the latter decreases by about one and a half per cent in both groups of compounds[4]. If the decreasing electronegativity is responsible for this effect and tends therefore to strengthen the CH bond, it would be expected that the CH force constant in

CH_4 would be an upper limit for compounds like CH_3X. The value 5·04 given by Herzberg[5] is in agreement with this point of view.

These systematic deviations of the force constants in the CH_3 group could be partly explained by assuming that the changes of electronegativity of the adjacent atom produces changes in the hybridization of the *s* and *p* orbitals of the carbon atom. If so, the fact that d_{CH} decreases with the electronegativity, which implies a greater amount of *s* orbital in the same way, proves that the strengthening of CH is due to the increasing of the *s* orbital in CH_3 and, therefore, of the *p* orbital in C—*X*. This is exactly the hypothesis reached by Mulliken in another way. Our development gives a new and direct support to this hypothesis, which is now extended to alcohols and thiols. It should be noted that the substitution of bromine for one hydrogen in methane lowers the CH bond energy by about 2–3 per cent[6]. The parallelism with the change of the valency force constants is particularly impressive. Furthermore, Penney[7] has shown how the structure of CH_3X compounds is modified by the ratio of mixing *s*—*p* of the carbon atom. In taking into account the fact that *s* increases in CH_3 from CH_3F to CH_3I, one finds immediately that CH_3 tends to become more plane with increasing electronegativity. In regard to the slight changes of hybridization indicated by the above results, we may expect only small but regular deviations from the tetrahedral angle in the series of CH_3X compounds. The ionic character of the carbon-halogen link must also be considered and tends to favour similar deviations, as shown by Penney[7]. Unfortunately, even now the experimental data are not known with sufficient accuracy to test these conclusions. However, we believe that there may be deviations of some degrees.

Nevertheless, a more exact knowledge of the molecular structure is needed to explain the surprising discrepancies between the small changes of hybridization and the considerable perturbations observed in the behaviour of the dipole moments, in particular the large moments of CH_3I (1·59 *D.*) and CH_3SH ($\sim$ 1·39 *D.*). The selectivity effect of the increasing electronegativity on the *s* orbital should also be cleared up.

It is perhaps worth while pointing out that such a small effect could play an important part in chemical reactions with low activation energies, in particular in biochemical processes. Furthermore, its influence should also be emphasized in the derivatives of conjugated systems. However, further theoretical investigations would be needed for such an extension of our development which, up to the present, can be applied only to carbon atoms in the sp^3 condition.

I am very much indebted to Dr. C. A. Coulson for discussions on certain points.

Function of Volutin (Metaphosphate) in Mitosis

VOLUTIN is a cytological entity which has long been recognized as an important constituent of the yeast cell. After fixation with formaldehyde and over-staining with methylene blue, it retains the stain when treated with dilute acids. I have devised a staining mixture which makes volutin directly visible in yeast cells; it contains 1·5 c.c. of glacial acetic acid, 4 c.c. of saturated aqueous toluidine blue and 20 c.c. of formalin. Volutin does not contain nucleic acid; ribose nucleic acid granules in the cytoplasm are often referred to as 'volutin', but this is incorrect[1]. Wiame[2] has defined volutin chemically as metaphosphate, thus confirming my view that it is not a nucleoprotein.

The volutin-rich structures in the vacuole of the yeast cell have been identified as chromosomes by their structure and behaviour; they are paired, there is a maximum of twelve of these bodies in each vacuole, and their mitotic division occurs without a visible spindle. It is not possible to find chromosomes regularly in every cell of all preparations. However, I have determined (independently of Wiame) the conditions controlling the appearance and disappearance of volutin. They are as follows: most non-dividing preparations contain volutin in only a few cells (*Torulopsis utilis* is a conspicuous exception to this rule, for its cells retain a considerable amount of volutin at all times). From a few minutes to several hours after non-dividing cells have been placed in an adequate nutrient, containing sources of nitrogen, carbohydrate, and accessory substances, every cell will contain enormous volutin chromosomes in the vacuole, depending on the aeration and the specific culture. As division proceeds the amount of volutin diminishes; in rapidly growing cultures on poor medium the volutin may disappear from the chromosomes of nearly every cell. If the culture is growing rapidly in a very good medium, volutin may be visible on the chromosomes throughout the period of division. Cultures differ in the speed with which volutin disappears, but this may occur shortly after growth ceases in a very rapidly dividing, well-aerated culture. These rules hold for several *Schizosaccharomyces* and *Saccharomycodes* tested, as well as for different species of *Saccharomyces*. *Torulopsis utilis* rarely loses all its volutin, while *T. datilla* loses it readily.

In my earlier paper on yeast chromosomes[1], it was concluded that they were composed of volutin instead of desoxyribose nucleoprotein. Rafalko[3] has since shown that the yeast chromosomes contain desoxyribose nucleic acid and are apparently conventional in this regard. There is another well-recognized desoxyribose nucleoprotein body in the yeast cell. This is the centriolar body which is attached to the outer wall of the nuclear membrane. Lindegren and Lindegren[4] have proposed that the desoxyribose nucleoprotein in the centriole is the equivalent of the heterochromatin in cells of higher organisms, while the vacuolar chromosomes are composed of euchromatin.

The present data indicate that volutin coats the euchromatic chromosome previous to division. This suggests that volutin (metaphosphate) is essential for division, and that only chromosomes coated with volutin are capable of division. This is consistent with Wiame's view that metaphosphate may be a source of energy through its content of energy-rich phosphate bonds. Once volutin has been metabolized, it must be replaced before the chromosome can divide again. Since the cells of many cultures lose their volutin after division ceases, a lag period occurs when dissimilated cells are introduced into a fresh medium.

When spores are produced, volutin appears in the epiplasm. This may be explained by assuming that volutin is formed in the cytoplasm of normal vegetative cells when adequate nutrients are available, and passes through the nuclear membrane into the vacuole, where it is deposited on the chromosomes. When the cytoplasm is cut off from the nuclear vacuole by the spore wall, volutin accumulates in the epiplasm.

This work has been supported by grants from Anheuser-Busch, Inc., Washington University, and the American Cancer Society.

Synthesis of Cellulose by Resting Cells of *Acetobacter xylinum*

IN plants, cellulose is formed intracellularly, by a process the chemistry of which is completely unknown. Microscopic evidence adduced by Farr suggests that the conditions of cellulose formation in green plants are very complex[1,2]. But in cultures of the bacterium *Acetobacter xylinum*, true cellulose[3,4,5,6] in the form of a mesh of beautifully defined microscopic fibrils occurs as an extracellular product[7,8]. In view of the success which has attended application of bacterial tools to the elucidation of the mechanism of biosynthesis of several polysaccharides[9,10], employment of *A. xylinum* in the study of the mechanism of cellulose formation would seem to be an obvious consideration.

An overwhelming majority of cells in a culture of *A. xylinum* lies immobilized within the tough cellulose pellicle which covers the surface of the fluid. The cells are held tenaciously by this matrix, and they are, therefore, difficult to prepare by usual methods in the form of a free cell suspension. Study of the metabolism of *A. xylinum*, and in particular of the enzymes which enable it to convert an impressive range of substrates[11,12] into cellulose, has been hindered by this circumstance. Recently, however, a method has been found for the conversion of the *A. xylinum* pellicle into a colloidal suspension of cellulose fibrils and cells[8]. It has been found that if this product is run through a cheese-cloth, the latter retains the fibrils but the bacteria pass. A means of obtaining metabolically active cellulose-free cells in good yield from young *xylinum* pellicles is thus afforded. Washed cell suspensions obtained in this way can be stored in a refrigerator for several days without noticeable loss of activity.

When the washed fibril-free cells are added in a high concentration to a solution of glucose (2 per cent) in phosphate-buffer (*m*/60) of *p*H 5·0 and the mixture is allowed to stand undisturbed in a thin layer (2 mm.) at 37° C. in a Petri dish, a striking reaction can be observed: after about an hour, macroscopic thread-like formations appear; after 2–4 hours, the turbidity of the fluid is reduced, the threads are no longer visible, and instead the bottom of the dish is overlain by a coherent membrane which presents the consistency of a slimy gel. This reaction does not occur in absence of added substrate (glucose).

Under the microscope, the formed gel is seen to consist of a hyaline matrix within which lie numerous bacteria. Treatment of the material with hot 1 per cent sodium hydroxide dissolves the bacteria but not the extracellular matrix. The latter is recovered after the treatment with alkali in the form of a colourless soft translucent mass. The properties of this material (staining reactions, solubility, chemical composition) are those of a cellulose. At the temperature (37° C.) of this experiment, *A. xylinum* completely fails to multiply even in an optimal nutrient solution. Both from this and other reasons it follows that in the conditions described glucose is polymerized to extracellular cellulose in entire absence of cell proliferation.

The ability of the resting cells rapidly to form cellulose in a medium of defined simple composition is by no means limited to the case of glucose substrate. Cells suspended in phosphate buffer formed coherent cellulose membranes within a few hours from fructose, mannitol, and sorbitol, as well as from glucose. In 20 hours they formed membranes also from the following: glycerol, galactose, lactose, sucrose and maltose. In the same conditions the cells completely failed to form a membrane from any of the following: sorbose, mannose, cellobiose (!), erythritol, ethanol and acetate. Since *A. xylinum* oxidizes mannitol to fructose, it is simplest to suppose that this product is a primary intermediary of cellulose formation from mannitol. In the case of sorbitol, on the other hand, it is evident that the reaction of cellulose production must follow a path other than that of oxidation of a C_2 group, since it has been shown that sorbose itself does not serve as a substrate of membrane formation.

In connexion with these experiments, the effect of baker's yeast on the process of cellulose formation from polyhydric alcohols is instructive. Baker's yeast, as expected, completely prevented accumulation of fructose in the mannitol solution but not accumulation of sorbose in sorbitol solution; yet, surprisingly, failed in both cases to inhibit membrane production from either of the alcohols. It follows that the process of cellulose production in these cases does not involve any fermentable sugar molecules in the external medium of the cells. It is logical that the large fully formed cellulose entity cannot pass through the cell membrane. Thus it becomes necessary to postulate at least two distinct steps in cellulose production: an intracellular step in which a precursor (possibly a glucosan) of relatively low weight is formed, and an intercellular step in which the high polymer is produced.

Some properties of the overall reaction may be noted briefly. The reaction optimum is found to be at about *p*H 5·5. The reaction-rate varies in the usual way with substrate concentration, and, within limits, with the cell concentration. Oxygen is essential to the realization of the polymerization, since the cells fail in a nitrogen atmosphere to form a coherent membrane. The dependence on oxidation is further demonstrated by the finding that poisons (cyanide, azide) which inhibit respiration by *A. xylinum* suppress already in low concentration formation of the cellulose membrane. Fluoride, too, inhibits the reaction, but does so apparently by a different mechanism, since it markedly depresses cellulose production even at a concentration (*m*/100) in which it does not affect the respiration-rate. It should be noted that the reaction of cellulose production is independent of the specific addition of phosphate to the medium of the cells; but this does not, of course, exclude the possibility that the synthesis is dependent on intracellular presence of phosphate.

It is intended to discuss implications of these findings for the mechanism of cellulose biosynthesis at a future opportunity. Because cellulose production is linked with respiration, the possibility is being further examined whether similar energy transfer systems are involved in production of cellulose, as in production of starch or glycogen from plain glucose.

Vitamin C in English Apples

THE restrictions in the national diet during recent years have encouraged the search for foodstuffs rich in particular nutrients, and considerable attention has been paid to sources of vitamin C. But while many rare or unusual fruits and plants have been examined, the typical English fruit, the apple, has been practically neglected. For it has been generally assumed that most varieties, with the exception of Bramley's Seedling, are very poor sources of the vitamin. For example, the value given by the Medical Research Council tables[1] is only 5 mgm. ascorbic acid/100 gm. of edible tissue. The tables of Fixen and Roscoe[2], however, quote values lying within the wide range 0·1–31·8 mgm./100 gm., and even higher values have recently been reported for Bramley's Seedling and Sturmer Pippin[3,4,5].

Tests on a limited number of apple varieties were made at Long Ashton in 1945, and the results have already been described[6]. Values higher than 10 mgm./100 gm. were only given by some of the culinary and cider varieties, the latter being richest in ascorbic acid with values up to 34 mgm./100 gm. for the whole fruit. During the 1946 season, more comprehensive tests have been carried out on freshly picked samples, and the values for the dessert and culinary varieties are shown in the accompanying table, expressed as mgm./100 gm. whole fruit. In addition, twenty-nine cider varieties have been tested and their contents of ascorbic acid found to lie within the wide range 7·5–39 mgm. These values are considerably higher than those generally assumed for English apples. Moreover, a number of seedling varieties raised at this Station gave values comparable with those in the table; for of sixteen varieties tested nine came within the range 15–27 mgm./100 gm.

Dessert varieties	Ascorbic acid (mgm./ 100 gm.)	Culinary varieties	Ascorbic acid (mgm./ 100 gm.)
Miller's Seedling	7·9	Golden Noble	6·9
Laxton's Superb	13·9	Edward VII	8·5
Cox's Orange Pippin	14·4	Early Victoria	10·8
Allington	15·0	Crawley Beauty	11·8
Ellison's Orange	15·5	Newton Wonder	14·6
Worcester Pearmain	16·0	Arthur Turner	15·3
Lord Lambourne	17·2	Lane's Prince Albert	15·4
Blenheim Orange	18·4	Bramley's Seedling	22·3
Rival	22·5		

As the highest concentration of ascorbic acid is in the skin of the fruit, the values found after peeling are always lower than those for the entire fruit; for example, the pulp of Bramley's Seedling was found to contain 15·5 mgm./100 gm. as against 22·2 mgm. for the unpeeled fruit. Taking into account such losses on peeling, it is still evident that the apple can be a fairly good source of ascorbic acid and one easily accessible. The actual level of the vitamin in a given variety will naturally depend on many factors still be to determined, while the effect of storage must also be considered: there is evidence, however, that storage losses need not be large[3,4].

Although the ascorbic acid is readily oxidized when the juice is pressed out of the fruit, the loss is not excessive in the ordinary methods of baking or stewing (with or without sugar). Tests on samples drawn from a batch of Bramley's Seedling showed that from a half to two thirds of the vitamin remained in the cooked fruit, a value similar to that found by Olliver[7]. No evidence was found for the production of appreciable amounts of interfering reducing substances during cooking.

Nitrogen Fixation by Farmyard Manures

IN previous communications[1] it was reported that the value of farmyard manure (cow dung) is due not only to its nitrogen content but also to its power to fix nitrogen of the air. Our field experiments show that when wet, fresh collected cow dung is added to soil at the rate of 25 tons per acre, 33 lb. of nitrogen present in the cow dung is added and 135 lb. of nitrogen per acre is actually fixed from air, while in the dark the fixation is 65 lb. per acre.

These experimental results regarding the fixation of nitrogen by cow dung appear to be supported by the field trials at Rothamsted[2] and at Woburn[3]. In the Rothamsted field experiments, no combination of artificial fertilizers has been found to be so effective as farmyard manure in steadying crop-yields from year to year, and there was an increase of soil nitrogen to about three times its original value when farmyard manure was used for more than sixty years, while with ammonium sulphate or sodium nitrate the soil nitrogen remained practically stationary.

In the Woburn experiments, with farmyard manure added at the rate of 105 lb. of nitrogen per acre for thirty years and 82 lb. of nitrogen per acre for twenty years since 1876, the total nitrogen present in the soil in 1876 was 0·156 per cent and in 1927 in the barley plots it was 0·151 per cent, showing a small loss of only 0·005 per cent. In this period 4,790 lb. of nitrogen were actually added to the soil, and the crop grown on the soil absorbed approximately 2,450 lb. at the rate of 49 lb. of nitrogen per year. Hence the soil lost 2,450 lb. of the added nitrogen and about 124 lb. of the soil nitrogen, that is, 51·4 lb. of nitrogen per year. In the five years 1927–32, no farmyard or other manure was added to these plots, and three crops were withdrawn; the soil nitrogen fell from 0·151 to 0·123 per cent, showing a dead loss of 114 lb. of nitrogen per acre. It appears, therefore, that the less-marked loss of soil nitrogen in presence of farmyard manure is due to the fact that the loss is actually compensated by fixation of atmospheric nitrogen in the presence of farmyard manure.

Moreover, the Woburn experiments with the dung obtained by feeding decorticated cotton cake, containing 6·6 per cent nitrogen and maize-meal, with 1·7 per cent nitrogen, did not reveal any superiority of the cake-feeding over corn-feeding in the manuring of wheat and barley.

These observations have not yet been explained; but it appears to be clear that the dung of animals having maize-meal and containing smaller amounts of initial total nitrogen fixes atmospheric nitrogen; this makes up for its deficiency of total nitrogen due to the greater percentage of carbon in the maize-meal and its oxidation.

Chromosome Numbers of British Species of the Genus *Rorippa* Scop. (part of the Genus *Nasturtium* R.Br.)

FOUR species of the genus *Rorippa* occur as members of the British flora, one of them (*R. austriaca*) being an alien[1]. Like many British plants, however, their chromosome numbers have only been determined from European material. These counts are given in Table 1.

TABLE 1

Species	Chromosome number *n*	Chromosome number 2*n*	Author
R. sylvestris (L.) Besser		32	Manton[2]
R. islandica (Oeder) Borbás	8		Jaretzky[3]
R. islandica (Oeder) Borbás	16		Scheerer[4]
R. amphibia (L.) Besser		32	Wulff[5]
R. austriaca (Crantz) Besser		16	Manton[2]

Thus the genus includes both diploid and tetraploid species, and one species, *R. islandica*, has both diploid and tetraploid forms.

In connexion with a survey of the possible relatives of diploid and tetraploid watercress (*Nasturtium officinale* and *N. uniseriatum*)[6], I have counted the chromosome numbers of British specimens of *Rorippa* species. These counts are given in Table 2.

TABLE 2

Species	Chromosome number *n*	Chromosome number 2*n*	Locality
R. sylvestris	24	48	Newry, etc.
R. islandica		32	Thames bank wall, Kew
R. amphibia		16	Thames bank wall, Kew
R. austriaca		16	Waste ground by Thames (Chiswick).
× *R. erythrocaulis* Borbás		24	Thames bank wall, Kew

The discrepancy between the two counts for *R. sylvestris* have been previously discussed[7]. The specimen of *R. islandica* of which the chromosome number was counted was of the type with fruits of normal length. It would be interesting to know whether the type of this species with short fruits (var. *microcarpa*)[8] is the form with a somatic chromosome number of $2n = 16$. My count for *R. amphibia* disagrees with the previous count, and it appears that this species also includes diploid and tetraploid forms, as does *R. islandica*.

The hybrid × *R. erythrocaulis* has been determined from its morphology[9] to be *R. amphibia* × *R. islandica*. Its somatic chromosome number of 24 confirms the suggestion that it comes from the cross *R. amphibia* ($n = 8$) × *R. islandica* ($n = 16$), and it is interesting to note that both the parents still occur in its vicinity. Pollen mother-cells of this hybrid showed 7–8 bivalents and 10–8 univalents.

My thanks are due to Mr. N. Y. Sandwith of Kew for collecting the specimens, and to Mr. V. Chapman for making the cytological preparations.

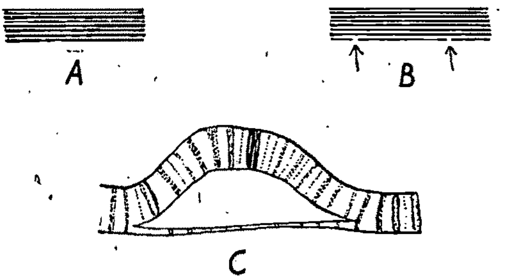
Production of Structural Changes in Somatic Chromosomes of *Drosophila melanogaster*

AUERBACH[1,2,3,4] reported that the exposure of adult males to the vapours of allyl isothiocyanate increases the mutation-rate in *Drosophila melanogaster*. About a fifth of the lethals thus produced were found by Slizynska and Slizynski[5] to be connected with cytologically detectable deficiencies, and in addition, there were about 7 per cent of gross structural changes. Auerbach[2] found also that the same chemical treatment of female embryos leads to high frequency of mosaicism, which is almost solely due to somatic crossing-over.

In this connexion an experiment has been carried out using a method described by Slizynska and Slizynski[6] for the production of somatic structural changes observable in salivary gland chromosomes. Freshly laid eggs were divided into three lots. The



Mechanism of origin of partial somatic structural changes in salivary gland chromosomes. *A*: salivary gland chromosome at a stage of 8 chromonemata. *B*: the agent produced breaks or other changes excluding the part between the arrows from the continuity of multiplying chromonemata. *C*: The fully developed salivary gland chromosome with a side connexion formed by the union of two ends. The diagram illustrates the origin of partial deficiency

first lot received no treatment, the second lot was treated with X-rays (400 r.) 5–12 hours after being laid. The third lot was exposed at the same time and age to the vapour of allyl isothiocyanate. I am indebted to Dr. J. M. Robson of the Department of Pharmacology, University of Edinburgh, for carrying out the chemical treatment.

The salivary gland chromosome of the fully grown larvæ was examined in order to detect somatic structural changes. From earlier work on the irradiation of young embryos, it was known that these changes when produced during early stages of the development of salivary gland chromosomes usually appear as narrow connexions between more or less distant parts of the same or different chromosome. They may be interpreted as deficiencies, inversions, etc., affecting only a part of the whole bundle of chromonemata constituting the salivary gland chromosome. The hypothetical mechanism of their origin is schematically represented in the accompanying drawings.

The results of cytological examination of forty-two slides, each with the salivary gland of a single larva (containing on the average 15–20 well-spread nuclei which were examined), are shown in the accompanying table.

FREQUENCY OF SOMATIC STRUCTURAL CHANGES INDUCED BY VARIOUS TREATMENTS

Treatment	Number of larvæ examined	Number of somatic structural changes found
Control	12	—
X-rays	9	55
Allyl isothiocyanate	21	79

The data clearly show that allyl isothiocyanate is very effective in producing somatic structural changes in chromosomes of salivary gland nuclei of *Drosophila melanogaster* when applied during their development, but since the dose given could not be compared with that of X-ray series, nothing can be said about the relative power of this agent in producing somatic structural changes.

Labilization of the α-Hydrogen of Amino-acids in the Presence of Aminopherase

It has been shown previously in experiments with crude glutamic aminopherase, α-deuterio-alanine and α-ketoglutarate that enzymatic transamination involves dissociation of the α-hydrogen of the original amino-acid and its replacement, in the newly formed amino-acid, by a hydrogen ion derived from the aqueous medium[1]. In the non-enzymatic transamination reaction of Herbst, associated with decarboxylation of the NH_2-donating amino-acid, there occurs no dislocation of labelled α-hydrogen (Herbst and Rittenberg[2]). The reaction mechanisms have been discussed by Herbst[3] and Braunstein[4].

Our studies on the dissociation of α-hydrogen in the presence of aminopherase have been extended to other amino-acids, and the role of α-keto-acids and components of the enzyme system has been investigated. The methods of Schoenheimer and associates[5] were used in labelling *l*-glutamic acid, *dl*-alanine, *l*-leucine, *l*-aspartic acid and glycine with deuterium in the α-position. The enzyme was a highly purified preparation of glutamic-alanine aminopherase[6]. Transamination-rates were measured by colorimetric determination of pyruvate[6], and α-hydrogen dissociation by densimetric estimation of the amount of deuterium passing into the aqueous medium upon incubation[1]. Some of the experimental results are shown in Table 1. (In enzyme-free controls, variations of deuterium-content of the water did not exceed 0·0010 atom per cent; higher excess values are significant.)

Upon incubation of α-deuterio-*l*-glutamic acid with aminopherase, both in the presence of pyruvate or α-ketoglutarate, *and in the absence of α-keto-acids*, that is, when there is no transamination, the α-hydrogen undergoes dissociation, and most of it is recovered in the aqueous medium. In the case of α-deuterio-*dl*-alanine, *there is no dissociation without added keto-acid*. However, approximately half the α-hydrogen (that is, that of one stereoisomer) is labilized, and passes into the water in the presence of ketoglutarate or pyruvate. (In the latter instance the system contains no dicarboxylic reaction partner, known to be essential for transamination proper.) Equilibrium distribution of deuterium is reached even with low amounts of pyruvate (25 μM per 900 μM *dl*-alanine). Acetone fails to replace the α-keto-acids.

With aminopherase solutions inactivated by boiling (15 min.) identical results were obtained: in contrast to the thermolabile catalysis of NH_2-transfer, α-hydrogen labilization is a thermostable function of the enzyme.

In reaction mixtures containing α-keto-acids it has not been possible to detect inhibition of transamination by carbonyl reagents (Vyshepan[7]). With labelled glutamic acid in the absence of α-keto-acid, participation of a catalytically active carbonyl group of the enzyme in α-hydrogen labilization is demonstrated by the total suppression of the reaction by $M/500$ phenylhydrazine, and 50 per cent inhibition by $M/500$ hydroxylamine. The prosthetic group of transaminating enzymes has recently been identified with phosphopyridoxal[8,9,10,11]. In absence of the protein moiety of the enzyme, synthetic phosphopyridoxal[12], added to deuterioglutamic acid (with or without pyruvate), failed to induce α-hydrogen labilization in our experiments (Table 2).

TABLE 1. DISSOCIATION OF α-HYDROGEN FROM α-DEUTERIO-*l*-GLUTAMIC ACID (1·0 ATOM PER CENT D) AND α-DEUTERIO-*dl*-ALANINE (1·28 ATOM PER CENT D) IN THE PRESENCE OF GLUTAMIC-ALANINE AMINOPHERASE (25 LENARD – STRAUB UNITS[6]). SAMPLES (TOTAL VOLUME, 6 ML.) INCUBATED 2 HR. AT 38° C.

Preliminary experiments have been made with active or boiled glutamic-alanine aminopherase and labelled di- or mono-carboxylic amino-acids *not available for transamination* with this enzyme (aspartic acid, leucine) or with any known transaminating system (glycine). It appears that the α-hydrogen of these substrates is dissociated as readily as in alanine when α-keto-acids are present, while there is no labilization in their absence. It seems also that α-keto-isocaproic acid and glyoxylic acid, though inadequate as NH_2-acceptors in transamination, are able to induce enzymatic labilization of the α-hydrogen of monocarboxylic amino-acids.

Dislocation of α-hydrogen in glutamic acid can be interpreted as due to reversible condensation of the amino-group with the carbonyl in the prosthetic component of aminopherase to form a prototropic system (Schiff's base)[3,4], but it is not clear at present why alanine and the other amino-acids tested, except glutamic, fail to react unless a keto-acid is present.

It appears from the reported data that (*a*) labilization and dissociation of α-hydrogen, and (*b*) transfer of NH_2-groups (and electrons) are two distinct and successive enzyme-catalysed stages of transamination. Reaction *a* is an independent, relatively non-specific and heat-resistant function of aminopherase, prerequisite for, but not necessarily followed by, reaction *b*.

On the assumption that there exists no enzyme-catalysed exchange of 'stably bound' hydrogen, replacement of the α-hydrogen of amino-acids in isotope experiments with living organisms has been interpreted in several instances as evidence for reversible deamination, especially for dehydrogenation at the α-carbon of the amino-acids[13,14,15,16]. Our data cast a doubt on the validity of this interpretation and suggest a different mechanism for the intravital replacement of α-hydrogen in amino-acids.

A full account of this work, and discussion of its broader implications with regard to enzymatic hydrogen translocations in general, will be published elsewhere.

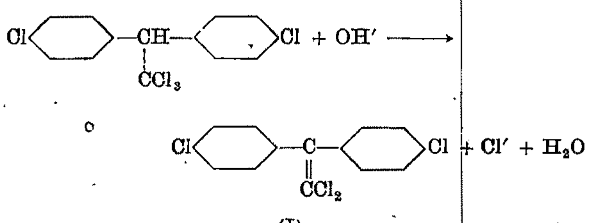
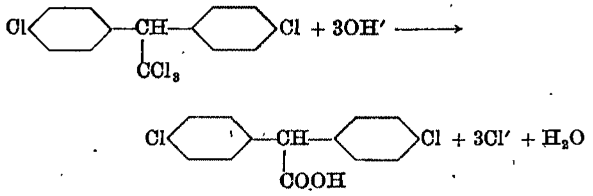
Dehydrohalogenation of *p*,*p*′-D.D.T.

THE dehydrohalogenation of 2,2-*bis* (*p*-chlorophenyl)-1,1,1-trichloroethane (*p*,*p*′-D.D.T.) to form 2,2-*bis* (*p*-chlorophenyl)-1,1-dichloroethylene (D.D.X.), readily brought about by refluxing with alcoholic alkali[1], has been utilized[2-7] for its estimation.



(I)

Such methods are usually based on the determination of chloride ion present in the products of this reaction; and it has hitherto been accepted that under the conditions used, dehydrohalogenation proceeds quantitatively as in the above equation. Our results indicate that this is not so. Thus, when p,p'-D.D.T. is refluxed for 30 minutes with N alcoholic potassium hydroxide (compare Gunther[2]), some 1·04 chloride ions per molecule of p,p'-D.D.T. are liberated, and in addition to D.D.X., *bis* (p-chlorophenyl) acetic acid can be isolated from the reaction mixture. Although this acid can be readily prepared from both p,p'-D.D.T. and D.D.X. by more drastic treatment with alcoholic alkali[8,9,10], D.D.X. is almost completely stable to the action for 30 minutes of boiling N alcoholic potassium hydroxide. This suggests that D.D.X. is not normally an intermediate product in the formation of the acid from p,p'-D.D.T., but that this arises from a direct hydrolysis of the —CCl_3 group to —COOH, a reaction in which three chloride ions are liberated.



(II)

Similar results have been obtained by Cristol and Haller[11] with 2-o-chlorophenyl-2-p-chlorophenyl-1,1,1-trichloroethane (o,p'-D.D.T.). These workers also showed[11] that o,p'-D.D.T. treated with alcoholic sodium hydroxide at room temperature loses approximately one molecule of hydrogen chloride per molecule, although some formation of the corresponding acid occurs when the reaction is performed under reflux.

Our results indicate that although treatment of p,p'-D.D.T. with $0·1\,N$ or N alcoholic potassium hydroxide at room temperature can lead to the formation of *bis*(p-chlorophenyl) acetic acid, the amount is too small materially to affect the analytical result. It is, therefore, suggested that such conditions approximate more nearly to those required for the quantitative estimation in accordance with equation I.

Details of this work will be published elsewhere.

A Marine Bed in the Coal Measures of Northumberland

The absence of true marine horizons—apart from occurrences of *Lingula*—in the Northumberland–Durham Coalfield has long been a matter of surprise to geologists generally. In 1939, however, Mr. Tonks described some small goniatites in calc-ironstone bullion (found in a cabinet of rock-specimens in the Hancock Museum, Newcastle) which had been collected during the sinking, 1858–59, of the Ryhope Shaft, Co. Durham, and, in his paper[1], expressed the hope "that some future pit sinking will yield the rich fauna of the Mansfield–Skipsey band". This discovery by Mr. Tonks indicated the probable existence of such a band, approximately 500 ft. above the High Main Coal seam, which is the boundary on Geological Survey maps between the Upper and Middle Groups of the Coal Measures.

Much of the Northumberland–Durham Coalfield is comparatively shallow, and it is only in isolated parts, due to faulting, or along the east side of Durham—mainly beneath the Permian—that sufficient cover of strata is obtained to include beds 500–1,000 ft. above the High Main. Such areas, for economic reasons, are seldom penetrated by bores or sinkings from the surface; moreover, in the unconcealed part of the coalfield, these outcrops are completely masked by boulder clay. Nowhere in Northumberland has an opportunity occurred for a great many years back to examine these very high Coal Measures strata. This year, however, the Ashington Coal Co. Ltd., started a boring programme, and one bore east of Ashington near the southern boundary of 1-in. Geological Survey Sheet 10 commences in strata approximately 600 ft. above the High Main.

Among the highest strata cored in the above bore is a dark-grey, poorly bedded shale, 1 ft. 5 in. thick, with marine fossils. The shale is at 90 ft. 5 in. below the surface and, as near as can be determined from underground levels, 492 ft. above the High Main. In the bore this shale overlies a 2-in. bituminous coal and is surmounted by a 5-in. ironstone band, also containing traces of shells. The fossils found in the shale are reported as follows:

Productus (*Dictyoclostus*) *craigmarkensis* Muir-Wood.
Productus (*Dictyoclostus*) cf. *retiformis* Muir-Wood.
Productus (*Productus*) *carbonarius* de Koninck.
Lingula sp. (fragments).
Anthracoceras cf. *hindi* Bisat.
Goniatite, gen. et sp. nov. (as described and figured by C. Duncan from Skipsey's Marine Bed[2]).
Metacoceras aff. *cornutum* Girty.
Orthocone nautiloid (probably *Pseudorthoceras* sp.).
Posidonia sulcata (Hind)
? *Parallelodon* sp.
Hindeodella sp.
Streptognathodus sp.
Pleurophorella ?
Small pyritized gastropods and fish debris.

Dr. C. J. Stubblefield and Mr. F. W. Anderson, who determined these, are of the opinion that the 'Ashington Marine Bed' is the Skipsey Marine Bed of Scotland and the Bolton marine horizon of Cumberland. Until the boring programme is completed, however, it is not desirable to go into greater correlative detail.

This preliminary announcement is made with the permission of the Director of H.M. Geological Survey.

DILATANCY AND THIXOTROPY

A DISCUSSION on the subjects of dilatancy and thixotropy, arranged jointly by the Faraday Society and the British Rheologists' Club, was held on December 10 at the rooms of the Royal Society of Arts. Sir Charles Goodeve, in opening the discussion from the chair, said that the gap between the colloidal chemist and the physicist is being bridged by the rheologist. Mr. R. L. Brown, of the British Coal Utilisation Research Association, gave a survey of researches on the phenomenon of dilatancy; this was followed by a survey of thixotropy by Dr. E. W. J. Mardles.

We owe the term 'dilatancy' to Osborne Reynolds (1885), who established the classical conditions for the onset of turbulence in fluids. The ideas of Reynolds number and of dilatancy apparently arose in an attempt to formulate a mechanical theory of the ether. Reynolds originally observed that a tightly packed mass of sand enclosed in a flexible envelope and subjected to a deformation expanded or dilated (the footprint-on-wet-sand effect). This dilatation is a well-known geometrical necessity for spheres in close packing, the spheres having centrally directed forces between them; but where frictional forces are involved, the expansion takes place along a line of slip and not by a general motion of each particle to a more expanded position. Furthermore, even if the initial arrangement is disordered or if the particles are irregular, lines of slip appear with shear, a co-operative movement of particles occurring whereby whole groups of particles slide where the packing is loose.

Sir Lawrence Bragg[1] has shown in beautiful experiments with soap bubbles in contiguity that the system contains ordered regions which do not mesh perfectly with one another and show an intercrystalline boundary. During dilatation, particles in contact may become separated by gaps; and as forces cannot be transmitted across these gaps, the particle pattern determines the stability of the packing. The pattern of the gaps is the obverse of arching and bridging. Golder[2] sheared, at constant rate of strain, sands and clays contained in a box split along a horizontal plane; and he found that a dense sand dilated, the shear stress rising to a maximum and falling to a constant when dilatation is complete. A loose sand contracted, and the stress rose to a constant value; while brittle clay expanded slightly on shear, and a plastic clay behaved similarly to loose sand.

Freundlich and co-workers, Williamson and Heckert, and others have found with pastes, muds and other concentrated suspensions that dilatancy (indicated by increase in apparent viscosity, consistency or strength with increase in rate of shear) is dependent narrowly on concentration of the solid, being 40–45 per cent for starch or silica. Sheets[3], working with clay slips, found a critical concentration of 60–70 per cent corresponding to close packing, so dilatancy here is in the Reynolds sense, or may be due to the packing characteristic of anisometric particles.

Williamson and Freundlich attribute dilatancy in pastes and suspensions to a 'snowplough' effect: at about 40 per cent concentration, mutual interference of particles occurs and the pattern of flow becomes important. Presumably, the particles become stratified, with clear medium between.

The word 'thixotropy', meaning change by touch, designating the reversible loss of apparent viscosity, consistency or strength of a system, accompanying the application of a shear or the increase in the amount of the applied shear, was first used by Freundlich and Peterfi in 1927 to describe the behaviour of some colloidal systems and suspensions of gypsum, slate powder, etc., which they found to liquefy when shaken or touched and to regain their original solid state after resting. The phenomenon must have been long familiar to those working with plastic masses, sludges and precipitates: v. Kuhne (1863) recorded that a nematode wandering through a muscle cell caused liquefaction with subsequent resetting after rest, and Beilby (1921) in a long series of elegant experiments showed that the surface layers of metals, crystals, etc., could be temporarily liquefied by gentle rubbing. He mentions that barium platinocyanide crystals change from a yellow solid to a brown liquid by pressing them lightly. The range of thixotropic materials extends from the hardest solids, through doughs and pastes to liquids such as blood or milk, which liquids show a reversible decrease in viscosity on movement. Familiar materials, such as furniture cream, cod liver oil emulsion, mayonnaise, greases, clays and muds, quicksands, heather honey, dairy produce, etc., have afforded workers with material for thixotropic study.

Thixotropy is usually a desirable property. It allows of the sharpening of a steel razor by gentle stropping, when liquefaction of the surface layer occurs; although a soap-thickened oil remains rigid in the grease cup, when submitted to shearing stresses in a bearing it liquefies, and its apparent viscosity approaches that of the oil medium itself. Printing inks under the pressure of rollers liquefy and wet the paper, while the spread film solidifies when pressure is released. Thixotropy is of significance in biology: when a sea-urchin egg undergoes division, the fluid protoplasm becomes converted into two jelly-like, semi-solid masses which can be liquefied by jerking with a micro-needle. After removal of the needle, the original jellied condition slowly returns and the division of the egg proceeds normally.

The query whether systems with immediate re-solidification after shear liquefaction should be regarded as thixotropic in the same sense as those which require an appreciable time of several minutes or hours for recovery has been raised; but it has been found convenient to consider them as thixotropic as Freundlich did with a 10 per cent silica/carbon tetrachloride suspension, which is liquid on shaking but shows no signs of flowing when the containing tube is inverted immediately after shaking. When a liquid possesses an apparent viscosity which decreases with an increase in the rate of shear, this thixotropy, because of its being associated with stress increase, has been termed 'stress thixotropy', while that associated with strain increase has been termed 'strain thixotropy'. When after shearing there is a loss of consistency but with no return to the original state, this non-reversible behaviour can be termed 'shear breakdown' or 'rheodestruction'. A system showing a decrease in consistency without reaching the fluid state completely has been regarded as possessing false body by Pryce Jones, but such systems are regarded as thixotropic in the sense that a complete transformation from solid to liquid is not a prerequisite for thixotropy; a partial transformation is all that is necessary.

A material can behave both as a rigid solid with measurable rigidity and as a liquid, according to the amount of stress applied; with increase in shearing stress, the threshold at which the material begins to pass from a rigid solid to liquid is called the 'yield value' or 'yield stress'. As Beilby pointed out, the rigidity of a system is a consequence of the molecular aggregation, and Goodeve[4] has considered the yield value in terms of structure to be given by the strength and number of links per unit volume. D/τ diagrams, relating τ, the shearing stress, and D, the rate of shear, form the basis for classification of rheological systems; and this relation of Newton to which rheology owes much of its advance is a convenient form of analysis. The thixotropic time of recovery on D/τ diagrams has been shown by a hysteresis loop when a rising and falling rate of shear has been used.

Thixotropy is especially associated with asymmetric particles. Needles, rods or plates in suspension tend to become orientated in the flow stream, with a consequential lowering of viscosity. Asymmetric particles can form by flocculation a three-dimensional structure at very low concentrations which is easily damaged by shear. Non-spherical particles favour thixotropy, since they will not satisfy the condition of closest packing so necessary for dilatancy.

Thixotropy found with systems of spheres or grains such as precipitated silica appears to be due in the main to flocculation: when flocculation bonds are broken by movement, they tend to heal on resting. The phenomenon of flocculation is not clearly understood, but is closely related to the dispersive power of the medium, which in turn is related to the interfacial activity.

Dr. A. S. C. Lawrence spoke on the temperature coefficient of thixotropy in relation to the rate of flocculation influenced by Brownian movement and viscosity, and mentioned that thixotropy in emulsions with deformable droplets is due to particle asymmetry reaching an axial ratio as high as ten to one.

Mr. J. Pryce Jones gave instances of suspensions altering completely their flow behaviour on the addition of small quantities of colloids and materials which affect wetting; or when the concentration or the rate of shear was increased. The rheology of suspensions is fundamentally dependent on the dispersion coefficient of the medium. Prof. D. H. Bangham, dealing with two properties of solid/liquid interfaces, namely, the heat of wetting and equilibrium contact angle, which appear to have an important bearing on the properties of suspensions, pointed out differences between these two criteria of wettability. Film configurations and 'ghost' interface properties of fine particles become significant or even dominant in dense suspensions where the number of molecules in close proximity to the solid surface is relatively great. Dr. Scott Blair spoke on the sigma phenomenon; a satisfactory explanation was obtained by using a summation equation, allowing for the size of particles relative to the radius of the tube, instead of the integration for a continuum.

Mr. A. de Wael discussed the kinetics of thixotropy, the appearance of yield values in cellulose/ether systems by the change in solvent and the dilatancy of lecithin/glycerol systems with large irregularly dispersed particles. After some discussion on definitions, there was agreement that the time-dependent solid–liquid–solid form of thixotropy, as noted by Freundlich and Peterfi in colloidal systems, forms part of a larger phenomenon when time of recovery to the original state may be immediate. Sir Charles Goodeve, in conclusion, summarized the several important factors responsible for anomalous flow behaviour. He emphasized the need for using carefully designed instruments, pointing out that many 'anomalies' were due to faulty instrumentation. A rational approach to flow problems, he said, is the kinetic one of the time-dependence of linkage-breaking per unit volume; the elastic behaviour of some liquid systems still needs exploration.

CHEMICAL ENGINEERING AT THE UNIVERSITY OF LEEDS

FOLLOWING the institution of degree courses in chemical engineering by the University of Leeds in 1942, the Department of Coal Gas and Fuel Industries has been acquiring additional items of chemical plant to equip a special laboratory for the study of unit operations. Despite the difficulties imposed by the War and post-war periods, equipment covering most of the principal chemical engineering operations has now been obtained.

The units are sufficiently large to ensure a performance and technique of operation similar to that of commercial plant, and in addition are provided with a full range of measuring instruments. Installations include a double-effect evaporator, still and fractionating column, rocking crystallizer, centrifuge, filter press and rotary vacuum filter, jacketed pan, heat interchanger, tray drier, double-drum film drier, kneading type mixer and a super-centrifuge. Extreme congestion has necessitated housing some of the equipment in outbuildings, but most of it is accommodated in an annexe to the main building which has been named the Charles Brotherton Chemical Engineering Laboratory. The present location is temporary, and when conditions permit, the whole of the equipment will be transferred to an adequate and permanent building.

On December 12, the second Brotherton Lecture of the Society of Chemical Industry was delivered in Leeds by Dr. D. T. A. Townend, and the opportunity was taken of arranging for the temporary Chemical Engineering Laboratory to be formally opened prior to the Brotherton Lecture.

Members of the gas, coking and chemical industries were present. More than a hundred visitors assembled in the Chemistry Lecture Theatre of the University to hear the Vice-Chancellor (Mr. B. Mouat Jones) pay tribute to the many friends represented at the gathering, whose generosity had made possible the implementation of the schemes for chemical engineering training. Once again, he said, the University is indebted to Mr. Charles Brotherton and Messrs. Brotherton and Co., who had provided £55,000 towards the cost of a new building when this became possible, as well as gifts for chemical engineering equipment and endowments to provide staff. The Department had also received most generous and continued support for general equipment from the gas industry, through the Joint Standing Finance Committee of the Institution of Gas Engineers, the

National Gas Council and the British Commercial Gas Association. He also expressed thanks to the many industrial firms for financial support, or for equipment provided either free of charge or under most favourable terms.

Dr. D. T. A. Townend (director, British Coal Utilisation Research Association, and formerly Livesey professor in the University) then gave a brief history of the Department. He paid tribute to the foresight of the late Prof. W. A. Bone, who established courses of training on such a broad basis that they were, in effect, largely chemical engineering. Any doubts there might have been about the need for chemical engineers are now completely resolved by the great and growing demand for such men and, consequently, for their training. For completion, the Leeds courses had needed more facilities for the study of unit operations; now that these were available, although the plant was most inadequately housed, the University could offer with confidence a full and balanced course in the subject.

Visitors then proceeded to the Department of Coal Gas and Fuel Industries, where the brief formal ceremony of opening the Laboratory was performed by Mr. George Brotherton-Ratcliffe, in the unavoidable absence of Mr. Charles F. R. Brotherton. A brief tour of inspection of the Chemical Engineering Laboratory and the Department as a whole was then made.

JAPANESE EARTHQUAKE OF DECEMBER 21, 1946

At about 04.20 hr. on December 21, 1946, an earthquake of considerable severity originated in the Pacific Ocean some 100 miles off the coast of Wakayama, Japan. The shock was recorded on seismographs throughout the world and was felt, causing some apprehension, in Tokyo. Buildings were shaken, causing damage throughout the island of Shikoku, and on much of the surrounding mainland, including the towns of Hiroshima, Kure, Kobe, Osaka, Kyoto, and Wakayama. The area severely shaken was more than 400 miles long and 150 miles wide, and railway lines were blocked throughout Shikoku. Several villages, including Singu, were severely damaged by fire caused when household fires were scattered about the wooden buildings.

The earthquake was probably accompanied by a sudden alteration of the floor of the ocean in the neighbourhood of the epicentre, because a seismic sea wave or *tunami* resulted, and this caused much damage around the coast. At Koshi, a coastal town with a population of 100,000, and at nearby Takoaka, the wave was a few feet high, and in some places advanced up to five miles inland before retreating. As the wave advanced up the Kii-awadi Straits between the island of Shikoku and the mainland, it became higher until at Osaka, a coastal town with a population of 3,000,000, it attained a height of nearly 10 feet. Kushimoto, a fishing village at the southern tip of Wakayama, was inundated, and the people of Kainan, who climbed on to their roofs and balconies after the first shock, watched the *tunami* roll in a few minutes later, wrecking many houses with a thunderous roar.

Altogether, the official Japanese radio report states that 1,026 people lost their lives, many more were injured and thousands of others rendered homeless. More than 1,400 fishing vessels were wrecked.

This is not the first time that a *tunami* has affected Osaka, lying as it does at the head of an elliptically shaped bay. One followed the great Nankaido earthquake of August 3, 1361, another on October 28, 1707, and yet a third after the Nankaido earthquake of December 24, 1854. These *tunamis* have a speed in some cases of as much as 30 ft. per second, and damage is thus caused by both their height and their speed. Prof. A. Imamura and others have suggested ways of mitigating disasters caused by these seismic sea waves.

The present shock had some of the characteristics of the Kwanto earthquake of September 1, 1923, but was nothing like so severe. On that occasion the first epicentre was in Sagami Bay, causing a vertical displacement of the sea bed of more than 300 ft. and a *tunami* 36 ft. high at the head of the Bay. Tokyo and Yokohama were largely destroyed, and the scattering of the household fires practically burned out what was left of the lower section of Tokyo and nearly all Yokohama. Nearly 100,000 people were killed. The railway bridge spanning the River Banyu-Gawa received a horizontal shaking of intensity equal to half its weight and collapsed, and the whole of the Kwanto earth block tilted a few metres, the south-east rising and the north-west sinking. As a result of the Kwanto earthquake unshipping the earthquake recorders, the Seismological Institute of Tokyo Imperial University later installed a seismograph with a minification of a half. Now, unless an earthquake has a range of motion greater than 13 in., this instrument will record it.

E. TILLOTSON

TIMBER DECAY AND ITS CONTROL

Leaflet No. 39 entitled "Timber Decay and its Control" (Pp. 12), issued by the Forest Products Research Laboratory, Princes Risborough, commences by discussing the methods of growth and general appearance of fungi and the large number of spores usually produced. Since it only requires one or two spores to infect a piece of wood, means must be found to prevent spores germinating and infecting wood. Conditions of growth are then considered and the nature of the decay.

Fungal decay of wood is in reality a chemical decomposition which is brought about by the ferments and acids secreted by fungi. The wood is, as it were, digested by the fungus, and part of it is transformed into liquids which are absorbed by the fungi as nutriment. Wood in an advanced stage of decay represents the residue which is of no use to the fungus, or which has not yet been utilized. Two main types of decay in wood may be distinguished.

1. *Brown Rots*. In these, the wood eventually becomes a dark brown, and in the final stages tends to break up into brick-shaped pieces as a result of cracking along and across the grain. Wood severely attacked by a brown rot can be readily crumbled under the fingers. The most important decays of softwoods are 'brown rots'. Chemically speaking, brown rots are distinguished by the fact that only the cellulose and the associated carbohydrates are attacked, whereas the lignin is left practically unchanged.

2. *White Rots*. Darkening of the wood is sometimes the first indication of the white rot, but eventually it becomes very much lighter in colour than normal.

This lightening in colour may be general or it may occur in patches, causing a white 'pocket' rot. Even in an advanced stage, wood attacked by a white rot does not crumble into powder under pressure, although it may disintegrate into a lint-like material. Most of the decay in felled hardwoods is caused by various types of white rot. The chemical action of a white rot is more complicated than that of a brown rot, since all the constituents of the wood are attacked, the lignin as well as the cellulose being broken down.

Rot in wood is often spoken of popularly as of two types—'wet rot' and 'dry rot'. This is a rather unsatisfactory division, since the two types are both caused by fungi which can only attack the wood when it is definitely damp. Dry rot has, however, come to acquire a rather specialized meaning, as the rot of timber in buildings that is brought about by one or two species of fungi such as *Merulius lacrymans*. This type of rot eventually leaves the wood in a dry, friable condition, but the fungus requires damp, ill-ventilated places in which to flourish, and it cannot attack really dry wood.

The diagnosis, effect and prevention of decay are discussed fully. The leaflet is well illustrated.

FORTHCOMING EVENTS

Saturday, January 11

Botanical Society and Exchange Club of the British Isles (at the Randolph Hotel, Oxford), at 3.30 p.m.—Dr. P. W. Richards: "The Biological Flora".

Tuesday, January 14

Institution of British Agricultural Engineers (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2), at 2 p.m.—Mr. A. P. Bevan: "The Mechanical Requirements of the Small Grower and Horticulturist".

Illuminating Engineering Society (at the E.L.M.A. Lighting Service Bureau, 2 Savoy Hill, London, W.C.2), at 6 p.m.—Dr. W. D. Wright: "Colour in Illuminating Engineering".

Society of Chemical Industry, Food Group (joint meeting with the Liverpool Section of the Society, at the University, Liverpool), at 6.30 p.m.—Mr. P. N. Williams: "Synthetic Fats".

Society of Chemical Industry, Plastics Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Dr. H. P. Staudinger: "Vinylidene Chloride and its Polymers".

Society of Instrument Technology, North-West Section (at the College of Technology, Manchester), at 7.15 p.m.—Mr. J. D. Tallantire: "Continuous Process Measurement in Dirty Fluids".

Wednesday, January 15

Geological Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Mr. Douglas Wallace Bishopp: "The Scope and Future of Geology in Ireland".

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 5 p.m.—Sir Charles Lidbury: "Economic Reconstruction, 1, Great Britain in relation to the World's Trade Situation".

Institution of Electrical Engineers, Radio Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Dr. B. Bleaney, Mr. J. W. Ryde and Mr. T. H. Kinman: "Crystal Valves".

Sheffield Metallurgical Association (joint meeting with the Yorkshire Section of the Institute of Fuel, in the Lecture Hall, Central Library, Surrey Street, Sheffield), at 6.15 p.m.—Dr. J. H. Chesters and Mr. M. W. Thring: "Factors in Open Hearth Design".

Royal Institute of Chemistry, London and South-Eastern Counties Section (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1), at 6.30 p.m.—Dr. A. C. Monkhouse: "Recent Advances in Atmospheric Pollution Research".

Society of Chemical Industry, Newcastle-upon-Tyne Section (in the Chemistry Lecture Theatre, King's College, Newcastle-upon-Tyne), at 6.30 p.m.—Mr. J. M. Pirie: "Silver and Platinum in Chemical Plant Construction".

Textile Institute, Lancashire Section (at 16 St. Mary's Parsonage, Manchester 3), at 7 p.m.—Mr. J. A. McWilliam: "Corrosion Resisting Steels for the Textile Industry".

Textile Institute, Macclesfield, Leek and District Section (at Nicholson Institute, Leek), at 8 p.m.—Dr. F. C. Toy: "Some Impressions of my American Tour".

Thursday, January 16

Royal Society of Arts, India and Burma Section (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Mr. A. E. Foot: "The Doon School".

Institution of Mining and Metallurgy (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5 p.m.—Mr. H. L. Talbot: "The Development of Metallurgical Practice for the Treatment of Nchanga Mixed Oxide-Sulphide Ores".

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W.1), at 5 p.m.—Prof. J. M. Whittaker: "Series of Polynomials".

Institution of Electrical Engineers (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Dr. H. A. Thomas: "Industrial Applications of Electronic Techniques".

Society of Chemical Industry, Road and Building Materials Group (at Gas Industry House, 1 Grosvenor Place, London, S.W.1), at 6 p.m.—Short Papers on "Recent Developments in Testing Methods for Road and Building Materials".

Royal Photographic Society (joint meeting of the Scientific and Technical Group and the Colour Group, at 16 Princes' Gate, London, S.W.7), at 7 p.m.—Mr. A. Marriage and Mr. D. C. Gresham: "Masking and its Method" ("How it Works in Colour Photography", 3).

Textile Institute, Yorkshire Section (at the Midland Hotel, Bradford), at 7 p.m.—Mr. A. W. Robertson: "Glass Fibres, Yarns and Cloths".

Textile Institute, Belfast Branch (at the College of Technology, Belfast), at 7.30 p.m.—"Plastics Appertaining to the Textile Industry".

Thursday, January 16—Friday, January 17

British Social Hygiene Council (joint meeting with the Town and Country Planning Association, at the Institution of Civil Engineers, Great George Street, London, S.W.1).—Conference on "The Family at Work and Play" (to be opened by Mr. Gilbert McAllister).

Friday, January 17

Institution of Mechanical Engineers (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Mr. H. Knowler: "Recent Developments in Flying Boats" (Nineteenth Thomas Lowe Gray Lecture).

Society of Chemical Industry, Chemical Engineering Group (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Mr. W. D. Jones: "Flame Spraying of Metals and Plastics".

Institute of Physics, Industrial Radiology Group (at the E.L.M.A., 2 Savoy Hill, Strand, London, W.C.2), at 6.30 p.m.—Mr. R. Meakin: "Sonic Methods in Non-Destructive Testing".

Society of Chemical Industry, Birmingham Section (at the Chamber of Commerce, Birmingham), at 6.30 p.m.—Mr. J. E. B. Randles: "Applications of the Cathode Ray Oscillograph to Polarography".

Institute of the Plastics Industry, North-Western Section (joint meeting with the Manchester Section of the Institution of the Rubber Industry, at the Engineers' Club, Albert Square, Manchester), at 6.45 p.m.—"German Plastics Industry". Dr. T. Love: "Thermosetting"; Mr. J. H. Rooney: "Thermoplastics".

Institute of Economic Engineering (at Cowdray Hall, Henrietta Place, London, W.1), at 7 p.m.—Annual General Meeting.

Paper Makers' Association (Technical Section), Northern Division (at the Engineers' Club, Albert Square, Manchester), at 7 p.m.—Mr. C. Brown and Dr. H. Ainsworth Harrison: "Organic Mercurials for Slime Prevention".

Chemical Society, Cambridge Section (in the University Chemical Laboratory, Cambridge), at 8.30 p.m.—Prof. M. Stacey: "Macromolecules Synthesised by Micro-organisms" (Tilden Lecture).

Institution of Structural Engineers, Lancashire and Cheshire Branch (at the College of Technology, Manchester).—Mr. Leonard C. Howitt: "Architecture Related to Structural Engineering".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Senior Assistant with qualifications and experience in Chemical Engineering, at the Bradford Technical College—The Director of Education, Town Hall, Bradford (January 18).

Assistant for miscellaneous duties connected with a scientific information service and an abstracting journal—The Director, Imperial Bureau of Dairy Science, Shinfield, Reading (January 18).

Lecturer in Electrical Engineering in the Ashington County College and Mining School—The Director of Education, County Hall, Newcastle-upon-Tyne 1 (January 18).

Research Specialists (2) in Applied Physiology at the Royal Air Force Institute of Aviation Medicine, Farnborough, Hants.—The Under-Secretary of State, Air Ministry (S.2q), Cornwall House, Waterloo Bridge Road, London, S.E.1 (January 20).

Lecturer in Physical, Organic, Inorganic and Industrial Chemistry, a Lecturer in Diploma Mathematics (Post Matric. standard), a Lecturer in Diploma Physics (Post Matric. standard), a Lecturer in Electrical Engineering, a Lecturer in Mechanical Engineering, and a Lecturer in Civil Engineering, in the Technical Education Branch of the Department of Public Instruction, New South Wales—The Official Secretary, New South Wales Government Offices, 125 Strand, London, W.C.2 (January 25).

Lecturers (2) in the Department of Chemistry, Leeds College of Technology—The Director of Education, Education Office, Leeds 1 (January 25).

Lecturer in Chemical Engineering, and a Lecturer in Physical Chemistry, at the West Ham Municipal College—The Education Officer, Education Department, 95 The Grove, Stratford, London, E.15 (January 27).

Medical Research Bacteriologist—The Clerk of the Board, Metropolitan Water Board, New River Head, Rosebery Avenue, London, E.C.1, endorsed 'Medical Research Bacteriologist' (January 31).

Assistant Lecturer in Electrical Engineering—The Registrar, College of Technology, Manchester 1 (January 31).

Lecturer in Geology—The Registrar, King's College, Newcastle-upon-Tyne (January 31).

Lecturers (Grade III and Grade II) in the Department of Inorganic and Physical Chemistry—The Registrar, The University, Liverpool (January 31).

Assistant Lecturer (Grade III) in the Department of Physics—The Secretary, The University, Edmund Street, Birmingham 3 (January 31).

Lecturer in Physiology—The Secretary, The University, Edmund Street, Birmingham 3 (January 31).

Medical Artist—The Dean, British Postgraduate Medical School, Ducane Road, London, W.12 (January 31).

Assistant Government Chemists, Nigeria—The Director of Recruitment, Colonial Service, 15 Victoria Street, London, S.W.1 (February 1).

Assistant Lecturer (Grade III) in Oceanography (Applied Mathematician)—The Registrar, The University, Liverpool (February 8).

Senior Lecturer in Electrical Engineering at Canterbury University College, Christchurch—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1 (February 14).

Lecturer in Chemistry (to deliver lectures in Physical or Inorganic Chemistry), at Auckland University College—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1 (February 15).

Assistant Physicist—The Secretary, Sheffield National Centre for Radiotherapy, Broom Cross, Tree Root Walk, Sheffield 10 (February 17).

Chair of Design in the School of Architecture, Auckland University College—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1 (February 28).

Posts as Director in the Imperial Agricultural Bureaux of Animal Breeding and Genetics, and of Forestry—The Secretary, Imperial Agricultural Bureaux, 2 Queen Anne's Gate Buildings, London, S.W.1 (March 1).

Wilde Readership in Mental Philosophy—The Registrar, University Registry, Oxford (March 8).

University Graduates and qualified teachers for short service commissions in the Education Branch of the Royal Navy—The Director, Education Department, Admiralty, London, S.W.1.

Entomologist, Bermuda—The Director of Recruitment (Colonial Service), 15 Victoria Street, London, S.W.1.

Lecturer in Chemistry, and a Lecturer in Electrical Engineering, at the Cardiff Technical College—The Director of Education, City Hall, Cardiff.

Technical Assistant—The General Secretary, Textile Institute, 16 St. Mary's Parsonage, Manchester 3.

Parasitologist, and an Organic Chemist—The Director, Ontario Research Foundation, 43 Queen's Park, Toronto 5, Canada.

Research Chemist—The Director of Research, Cereals Research Station, Old London Road, St. Albans.

Biochemist (university graduate with experience in clinical biochemistry and familiar with optical method of analysis) in the Ministry of Health Area Laboratory—The Medical Superintendent, City Hospital, Hucknall Road, Nottingham.

Lecturer in Chemistry—The Clerk, Northern Polytechnic, Holloway, London, N.7.

Technician (skilled) as a Physics Research Assistant, and Trainee Technicians for the Departments of Physiology and Pathology—The Secretary, Medical College, St. Bartholomew's Hospital, West Smithfield, London, E.C.1.

Research Assistant in the Mechanical Testing Section—The Secretary, British Non-Ferrous Metals Research Association, Euston Street, London, N.W.1.

RESEARCH ASSOCIATIONS IN GREAT BRITAIN

IN reply to a question in the House of Lords on December 4, Lord Chorley stated that preliminary discussions had taken place with the wool, building, iron-foundry and silk industries regarding the use of the Defence (Services for Industry) Regulations, 1945, to further industrial research. In general, the development of arrangements of this kind had awaited the reports of the Working Parties set up by the Board of Trade, and all the reports so far received recommend the use of a compulsory levy to support scientific research. He stated that the proposals of these Working Parties on this, as on other matters, would be dealt with under the legislation announced in the King's speech, and which was intended to supersede the Defence (Services for Industry) Regulations.

This statement will be regarded with some uneasiness by most of those concerned with research, whether on the industrial or the scientific side. Of the Working Parties which have already reported, only those for the pottery and the cotton industries showed clear conceptions of the nature of research, and it was the latter report which, recognizing that the research associations had important functions to perform as central research institutes, suggested that it would be useful to review the experience of the whole research association movement. Since that report appeared, those from the Working Parties for the boot and shoe industry and the furniture industry have emphasized the soundness of the judgment of the Cotton Working Party that the right answers are not yet clear to such questions as the nature and scope of the functions of a research association, how they can best be exercised, by what means their exercise can be made of the fullest possible value to industry and how they should be correlated with the functions of individual firms.

The report from the Pottery Working Party in general supports this attitude, although it was concerned rather with one particular research association than with the general question. None the less, it points out that dissatisfaction with a research association might be due to a false conception of its proper functions, and that any vigorous industry with private research establishments moves rapidly ahead of its co-operative research association in knowledge of the application of scientific work. Furthermore, the Pottery Working Party points out that day-to-day problems requiring investigation can be dealt with much more easily and effectively by a competent technical manager or research staff in the factory itself, and it recommends firmly that the research association itself should distinguish its day-to-day technical consultation from its fundamental research, and should on no account fail to make provision for the latter. Finally, after admitting that a very small levy for co-operative research may be a proper charge on every substantial firm in the industry, particularly if a research association limits its work to fundamental problems, it is reiterated that a research association cannot justify itself until an adequate body of research workers is employed privately by manufacturers to form a bridge between the association and the industry.

No such clear conceptions characterize the report of the Working Party for the furniture industry. It is admitted that the industry in the past has paid insufficient attention to research, that the vast majority of the firms have no research organisation within their factories, and that this neglect has been one of the causes of the stagnation in design. It is recommended that a research association for the industry be established, and also that individual firms should, wherever possible, set up their own research units; but the functions suggested for the proposed research association demonstrate a very inadequate conception of research. The research association, it is suggested, should have as its main functions the formulation of the industry's research problems, and undertaking them or placing them with appropriate outside organisations. Next, it should take steps to bring to the notice of the industry the results of all research work undertaken on behalf of the industry. It should also be responsible for examining scientific publications for information likely to be of interest or of use to the industry, and for bringing such information to the attention of its members. Finally, the research association should be responsible for running the independent testing station connected with the proposed minimum standards scheme, as well as for carrying out the research required to establish standard performance tests.

The contrast between these views and those urged by the Pottery Working Party is seen finally in the contention by the Furniture Working Party that the function of a research association is primarily technological and secondarily 'fundamental'. Admittedly the Furniture Working Party was concerned with an industry where the organisation and equipment for research have largely to be established, and it rightly has in mind the possibility of utilizing the existing laboratories and institutions of the Department of Scientific and Industrial Research, for example, the Forest Products Research Laboratory and the textile research associations, especially while the new association is formulating its programme and building up its own facilities. The formulation of a research programme is the first stage, but is largely a matter for the industry itself; and only when such a programme has been formulated at least in broad outline can it be clearly seen what contribution a research association could make, how far the problems to be solved involve co-operative effort and investigations into the fundamental sciences on which the industry must draw, and what facilities must be provided to supply those needs.

No definite proposals for financial support of a research association can well be put forward until a research programme is available, and this is all the more important in an industry which relies so much on tradition. Here the experience of the building industry, another 'traditional' industry, may prove of some help. What must be remembered is that an educational campaign will be necessary to secure the requisite support for a research association scheme. To inform the industry is a first task, and although an information department is an important and indeed essential element in the working of a research association, its functions must be directed primarily to the service of the research department's own needs and not to the broadcasting of information to the industry as a whole. The task of extracting and circulating items of interest from published information requires the help of information officers, if not sections, within the individual firms themselves, and until firms are equipped, at least by the presence of sufficient scientific and technical men and women on their own staff, to utilize the available information presented to them, the efforts of a research association in selecting and circulating such material are likely to be of little value. This preliminary task of education is of fundamental importance.

In an article on "Cultural Understanding and Appreciation of the Scientific Approach" in *Science* of October 11, 1946, R. H. Ojemann makes a point which is often overlooked in this connexion. He presents evidence that the function of research is not well understood either by leaders of the community or by students leaving school, and although he is concerned primarily with the fact that research is not in consequence considered as an important function in society or regarded as a valuable method of solving social problems, his main point is of wider significance; namely, the absence in the community of sufficient knowledge of the nature of scientific research, of the probability character and limits of knowledge, and of the constant changes in our knowledge, constitutes a grave danger to the support of scientific research in a democratic society.

While this condition obtains, there is not only difficulty in obtaining adequate support for research, but also a continuing risk that such support may be suddenly and capriciously withdrawn. The bearing of this on what may be termed scientific information services is rarely appreciated. The dissemination of information is commonly directed to the circulation of information on scientific findings. Too few attempts are made to promote understanding of how dependable knowledge is obtained, what it costs in effort, as well as money, to establish scientific results, and the handicaps imposed by the present limits of knowledge.

It is on such points as these that the educational work preceding the establishment of a new research association should be concentrated; if more effort were directed to such ends rather than to the mere dissemination of scientific knowledge, we should be nearer to finding the right answers to the questions emphasized by the Working Party for the cotton industry. Moreover, the research associations themselves would be in a much better position to make their full contribution to industrial efficiency; and they should in fact become the more conscious of their great responsibilities so long as misconceptions persist in the community as to the contribution which research can offer to the solution of such problems as the housing shortage, the coal shortage, or the restoration of the cotton industry to a condition to meet future world competition.

There is, in fact, no need for the research associations to adopt the defensive attitude which characterized contributions to a recent conference in Manchester on "Research and the Smaller Firm". Co-operative research on certain aspects of industrial problems needs no defence. The universities should not, and the Government laboratories cannot, engage in research work of the usual *ad hoc* industrial type, which has as its prime motive the desire of the participating firm to increase its competitive position. But the research association is only one of the ways in which industrial research can be prosecuted, and indeed depends for its full effect, as the Working Parties have realized, upon the existence of active research departments in the individual firms themselves.

There is here another factor to be considered. While there may be other means to be explored besides the research association method for prosecuting research which a firm has neither the staff nor the equipment to carry out in its own laboratories, there is an undoubted *prima facie* case for pooling resources in a central research association for ambitious, long-term projects of fundamental and probably highly speculative type. In order to gather the full fruits of such pooling, however, the central research body must be competent to conceive and plan the approach to targets in such fundamental research; and the subscribing firms must be provided with research units at the points of production, so as to facilitate the proper application of the results.

Now in industry the ability to plan successfully long-term research has only evolved gradually, from experience in the conduct of less ambitious projects. If, therefore, a research association is to plan such research, and select appropriate objectives and the men to carry out the projects, leaving them to carry out their investigations with the minimum of interference or 'management', it will require to be as strong on its technological as on its scientific side. Here lies the critical problem before the research associations to-day, namely, commanding the services of research workers of the requisite experience, energy and creative powers. It is a question of man-power, of having available scientifically and technically educated men capable of taking the highest positions in each of the three primary functions of industry—research, production and selling.

That much has been clearly grasped by the Working Party for the jewellery and silverware industry. While its comments on the indifference or even hostility of the industry to research and design, and its recommendations regarding its proposed design and research centre, which the Board of Trade and the Department of Scientific and Industrial Research are already engaged to support, are broadly parallel with those of the Furniture Working Party, this report proceeds: "It is also plain to us that the close and sensitive contacts required between the Centre and the many firms engaged in commercial production will not be established and maintained, unless a good number of these firms can be induced to recruit and absorb men of broad scientific education and wide technical training in positions of good standing".

No Working Party has yet stated explicitly, however, that the criterion of progressive industry is the ability at board level to direct its research work with the same acumen and efficiency as are applied to production and sales. On this point it might be suggested that leaders in some of the industries which have hitherto been unmindful of research might study with profit the early history of such an industry as the dyestuffs industry, in which research is admittedly a keystone in its structure. It is probably with the idea of assisting in training men with a scientific outlook and experience in research, and the permeation of industry with them until they reach the top, that the Cotton Working Party was led to recommend the establishment of industrial research fellowships and associateships, a plan for which was set forth in some detail in an annexe to its report. The ultimate object of the scheme is to establish a body of experienced research workers within the industry itself, although it visualizes a research foundation having on its staff research fellows and associates whose services could be made available to firms requiring them.

While it is essential for the research associations themselves to secure both an inflow and an outflow of trained research workers, moving between the associations and the industries they serve, there is little evidence in current discussions that either the research associations or the Department of Scientific and Industrial Research are sufficiently alive to the importance of this matter. To accelerate the training of such men and to facilitate the permeation of industry by them are the vital tasks: a system of liaison officers is dilettante trifling with the issues. The Department of Scientific and Industrial Research has indeed already assisted many science graduates of the universities to undertake the post-graduate training which should fit them to undertake research; but there is still much to be done on these lines before the status of some of the technical faculties is raised to that of research schools. If the Department, through its research associations and in other ways, is prepared to assist such developments and to try new ideas and new methods, it will promote a flow of men with a research outlook and a technical background, it will bring new knowledge to the technological field, and will also infuse new vitality into the research associations themselves and place them on the firm foundation of proved service rendered to the industries with which they are linked. Every consideration which increases the importance of a wise and efficient use of our limited resources of scientific man-power makes it the more imperative that, before any large new schemes involving the employment of numerous scientific workers either in research or in other capacities are launched, we should do our utmost to expedite this interchange between industry and the universities and other institutions where fundamental research is pursued. In this way we can ensure that industry is fully prepared to utilize the new knowledge which a new organisation might provide.

SCIENCE AND STOCKBREEDING

Animal Breeding

By Dr. A. L. Hagedoorn. (Agricultural and Horticultural Handbooks.) Second edition. Pp. 304+15 plates. (London: Crosby Lockwood and Son, Ltd., 1946.) 15*s.* net.

The Milch Cow in England

A Plea for Constructive Breeding. By E. R. Cochrane. Pp. 348+16 plates. (London: Faber and Faber, Ltd., 1946.) 16*s.* net.

DR. HAGEDOORN'S book is a second edition of one first issued in 1939, reprinted four times, and now emerging as a further contribution to the field of genetics applied to livestock improvement; Miss Cochrane's is an entirely new analysis of problems of cattle-breeding in Great Britain. The texts are alike in that they are intended to stimulate, and the authors' techniques are somewhat similar in that they both attack some of the vested beliefs and interests in stockbreeding and, rather unfortunately, find it necessary to repeat statement and argument too much and too often. But there resemblance ceases, and the effects of the stimuli differ; Dr. Hagedoorn sets out to be educative and ends in being provoking, Miss Cochrane to be critically provocative and becomes distinctly educative.

Moreover, the authors' backgrounds are in great contrast. Dr. Hagedoorn has come by what might fairly—nowadays—be called the easy road to an exposition of applied genetics: from small-animal breeding, via poultry, past some view-points of possible applications in the larger animals to a stance from which an almost complacent dogmatism can be readily enunciated for the benefit of stockbreeders and students eager to add something from the new science to the old art. The process of instruction is to some extent simplified, if the results of recent work and their implications are not appreciated; and the clarity of presentation becomes more superficial. Now, in one sense Dr. Hagedoorn has served a useful purpose. In 1939 there were few simple texts available to arouse the practical man's interest in applied genetics, and his almost conversational, almost inconsequential, style held attraction to the acquisitive reader. His book was, is, and this new edition no doubt will be, widely read. There lie the dangers.

Even allowing for the difficulties and the distressing isolation under which Dr. Hagedoorn has pursued his own work since 1939 (and from which we, together with many other animal breeders and geneticists, welcome his safe reappearance), it must be said fairly that the slight annotations by which this edition differs from the first do not remove its weaknesses, confusions and misleading statements. These are too numerous to specify here; however, the insistence on the presence and absence idea was inept even in 1939, and to use the reduction in number of ancestors as a measure of inbreeding is outmoded, to say the least; the discussion of domestication and adaptation is confused and not always plausible. Further, the author's own arguments for progeny-testing and his 'nucleus scheme' of breed improvement on the basis of genetic uniformity are not very convincing or acceptable, and should be re-examined in the light of recent genetical work and practical requirements. Dr. Hagedoorn's text, therefore, provokes not only criticism at many points but also serious concern that, having been widely read, it has apparently been accepted by many readers as a completely authoritative statement of modern genetics in relation to stockbreeding.

Fortunately, Miss Cochrane is not one whose approach is limited to that signposted by Dr. Hagedoorn. She has come by the hard road from dearly bought experience in pedigree cattle-breeding, through the doubts and disappointments of hoping that pedigree and practice might give performance and efficiency, to a point at which a critical exploration of many routes was needed. She has obviously made wide reconnaissance of the possibilities of collecting material for a sound path for the future from the fields of physiology, economics, nutrition, genetics and practice. Here is a frankly personal, often outspokenly critical, but always well documented, inventory of what she has found so far and hopes may come.

The result is extremely provocative; the reactions are bound to be varied in intensity as well as kind, according to the reader's vested interest or predilection. But surely, no matter how annoyed, disturbed or sensitive, no one should accuse Miss Cochrane of complacency, of intellectual dishonesty, or of narrow-mindedness, except in so far as she is determined to improve the average cow of the average breeder in England (and Scotland and Wales and everywhere!), perhaps too quickly, but ultimately. No two readers will agree. Her own criticism is given, so that she obviously invites it, in her turn, especially if it can be constructive and would help her to rewrite in some future edition the last three chapters ("Enterprise and the Breeder"; "Security and the Farmer"; "The Responsibility of the State").

Unity of aim, absence of humbug and close cooperation of scientific workers, administrators, breed societies, breeders and the State, she sees as essentials towards the establishment of a sound progressive (*not* static), efficient and satisfactory cattle industry. We are confident that Miss Cochrane herself would be well satisfied if she could find the average great-great-granddaughter of the present average English cow a higher producer of a better quality milk over a longer, healthier life-time, even if she had to withdraw some of the contentious and perhaps extravagant conclusions she now makes. Meantime, we feel that the almost impetuous presentation of the case should not be met with any impetuous reaction, but should be widely read and considered as indeed "a plea for constructive breeding". J. E. NICHOLS

METALLURGICAL ATOMS

Atomic Theory for Students of Metallurgy

By Dr. William Hume-Rothery. (Institute of Metals: Monograph and Report Series, No. 3.) Pp. viii+286. (London: Institute of Metals, 1946.) 7*s.* 6*d.*

"EXPERIENCE has shown," Dr. Hume-Rothery cautiously remarks, as though introducing a statement which would arouse incredulity, "that students of metallurgy are greatly interested in the new theoretical work [on the structure and properties of metals and alloys] but are often quite unable to understand the papers or text-books written by mathematical physicists." In this book, therefore, he has attempted to provide a bridge by means of which the student of metallurgy may be led to an understanding of the general ideas on which the modern theory is based. He can be assured that students of metallurgy, though they may sometimes suffer from the peculiar disadvantages of unimaginative and narrowly conceived technological types of training, are not alone in their misfortunes. An easy path through difficult terrain is likely to be gratefully used by many others than those for whom it was primarily made. The path here is skilfully constructed, and it affords an admirable view of many of the most interesting superficial features of the region, as well as occasional glimpses of details of the underlying structure.

The book gives the most comprehensive survey of the modern electronic theory of metals that has yet been made with so limited a use of mathematical technique and symbolism. The thirty chapters are grouped in six parts, the first three of which, dealing with the general background, the structure of the free atom, and assemblies of atoms, outline the basic atomic theory. After a very brief review of the classical and the original Bohr theory of atomic structure, the presentation is almost entirely from what may be called a descriptive wave mechanical point of view. Considerable attention is given to methods of representation of electron-cloud density, and when 'pictures' of atoms are given, their limitations are adequately stressed. There is an excellent chapter on the soft X-ray spectra of solids, a field of investigation the potential importance of which is not yet widely appreciated. This first half of the book may be commended to all those who wish for a non-mathematical introduction to modern atomic theory. Only occasionally is there a looseness of phraseology, to which the supersensitive might make the objection that a wrong impression could be conveyed. It will be sufficient to give, without comment beyond italicizing, one example taken from p. 52, where it is stated, "It might at first be thought that the normal state of every atom would be such that all the electrons occupied the lowest quantum state. Actually, however, this is not the case, *owing to the effect of* what is known as the Pauli Exclusion Principle."

The second half of the book is concerned with the application of the general ideas to the theory of metals. Fermi–Dirac statistics and the free electron approximation are described, and a good general account is given of the Brillouin zone treatment. In the last part a systematic survey is made of the bearing of the theory on the interpretation of the properties of the metals of the first column of the periodic table and their alloys, of representative metals of higher valency and crystal structures other than cubic, and of the elements of the first transition series. Sections are included on a number of special topics, among them being specific heat, Pauling's theories, and electron bands in iron. The concluding chapter gives a brief account of magnetic properties. Throughout this part of the book the author's discussion and assessment of the achievements of wave-mechanical theory is of particular interest and value owing to his wide and detailed knowledge of alloy systems, to the clearer understanding of which his own work has contributed so substantially.

Almost every paragraph of this book bears evidence of the care and thought which have been expended to write of the basic ideas of wave-mechanical theory and of its application to the interpretation of the properties of metals in a way that shall be intelligible to an honours student of metallurgy of limited mathematical attainments. The author has carried out admirably the plan he seems to have had in mind, and for this reason the book is rightly assured of a wide welcome.

The book should not be regarded as a substitute for the more mathematical text-books, but rather as a commentary on them. It would be most unfortunate if a student of metallurgy, or any other reader, were to gain the impression that an understanding of the essentials of the quantum mechanical theory of metals could be gained by a perusal of this book alone; yet there is practically no guidance, even by reference, to the now fairly numerous good text-books on the theory of a more mathematical but still fairly elementary character. Hume-Rothery, in attributing the inability of the student to understand such books to "the failure of the mathematician to appreciate the difficulties of the non-mathematical reader", overlooks two much more essential points: first that it is the physical world which it is so difficult to understand, and second that the nearest approach to understanding is that provided by a theory which is most conveniently expressed in mathematical language, and which must be so expressed if effective development is to be possible. Those who wish to understand the theory must be prepared to make the effort necessary to acquire at least a reading knowledge of the language. They should not be led to suppose that an appreciation of some of the highest flights of human genius in the scientific exploration of the world can be gained by an approach as effortless as might be required for 'a bed-time story for tired metallurgists'. This book is certainly no bed-time story, but it does share some of the characteristics, including the good ones, of a Lamb's Tale. It may well have been thought that the title would indicate sufficiently the degree of adaptation.

E. C. STONER

NUCLEAR PHYSICS

Fisica nucleare

Dalla pila di volta alla pila atomica. Per Plinius Campi e Aldo Rusconi. Pp. viii + 215. (Milano: Ulrico Hoepli, 1946.) 400 lire.

La scissione nucleare dell'uranio

Fenomenologia generale. Per Dott. Emidio Prata. Pp. 160. (Milano: Ulrico Hoepli, 1946.) 250 lire.

THE arrival of scientific books from Italy is a welcome sign of the return, in some measure, to more normal conditions in scientific life. It is apparent that the production of the two books under review must have represented a considerable effort in the face of shortages.

It is therefore particularly sad to discover that the contents of the book on nuclear physics are scarcely worth such an effort. The authors deserve congratulations for the ingenious sub-title: "From the Volta pile to the atomic pile", but the praise has to end there. Between the first chapter on Volta (which does not explain Volta's pile) and the last one on atomic energy (which contains a very misleading account of the atomic pile and atomic bomb), an assortment of chapters, some philosophical, some popular descriptions, range over a variety of subjects. Mixed up in them is a new theory, due to one of the authors, according to which space consists of points and antipoints; this theory, we are told, leads to a geometric interpretation of quantum mechanics. A large number of minor and major errors indicate that the authors are not too familiar with modern theoretical or experimental physics.

Dr. Prata's book on fission is on a different level altogether. It attempts to summarize the work published on this subject up to 1943, to which is added a brief abstract of the Smyth report. While the preface does not explain the history of the book, one gains the impression that the manuscript must have been ready some time before the news of the atomic bomb was released, and that the final chapters were added later. However that may be, this book is not one of the many superficial accounts that are trying to exploit the publicity value of atomic energy; it is a serious piece of work intended for the physicist who has kept up to date in modern developments and wants to collect the information on fission without going through all the original papers. A first historical chapter reconstructing the steps leading to the discovery of fission is followed by chapters on fission products, on the energies and masses of the fragments, their passage through gases. A chapter on the theory gives a very readable account of the stability calculations and an outline of the Bohr–Wheeler theory which is somewhat less successful. A chapter on secondary neutrons, a brief mention of Feather's proof of instantaneous fission, and a discussion of data on cross-sections conclude the review of the older literature. The rest of the book consists of a short summary of the Smyth report on the American project, and an almost complete bibliography up to 1943.

This bibliography and the comparative discussion of the early papers will remain useful even though the release of American, British and Canadian work from secrecy is bound soon to make this book obsolete as an account of current knowledge. The author has missed a few points in the Bohr–Wheeler theory and one or two major ones in the Smyth report, but otherwise the book is instructive, and, for the physicist with some knowledge of nuclear physics, very readable.

R. E. PEIERLS

BIRDS OF NORTH AMERICA

Audubon Bird Guide

Eastern Land Birds. By Richard H. Pough. (Sponsored by National Audubon Society.) Pp. xxxvii+312+48 plates. (New York: Doubleday and Co., Inc., 1946.) 3 dollars.

ORNITHOLOGICALLY speaking, North America is divided into four areas—western, eastern, middle America and the West Indies, the largest being the eastern one that includes the Atlantic seaboard. Mr. Pough writes of the birds of this area under the title of "Audubon Bird Guide—Eastern Land Birds". He deals with the 275 species of land birds found in eastern North America in a concise manner, most helpful to the recent recruit to ornithology. His remarks under the heading of "Identification" are excellent, for he seizes on the outstanding characteristics of each species and tells the field worker what to look for. The colour portraits are also good and helpful, though it is to be regretted that no indication of scale accompanies them. If one did not know otherwise, one might imagine that the snowy owl is no bigger than the English sparrow, the picture of which is most life-like; however, in most cases all birds on a plate are drawn to the same scale.

The foreword will be read with appreciation by ornithologists of both New and Old Worlds, for it contains much of interest and many practical common-sense hints for the beginner, also he who no longer comes under this heading. The remarks on psychology and behaviour give food for thought. "The study of birds has been greatly handicapped by a tendency to interpret their behaviour according to human standards: This is a mistake. Birds are creatures of instinct, and the whole pattern of their lives is determined in advance by their inheritance. They have no power of thought as we understand it. Apparently a newly hatched bird inherits everything it needs to carry out every step in its life cycle, even when it includes long migration flights, elaborate nest-building, or any one of hundreds of other equally complex performances." The author goes on to say, "Birds are no less fascinating because they act like automatons; that is, like birds instead of people".

Although Mr. Pough is certainly correct regarding the birds' inherited patterns of behaviour, maybe his generalizations are somewhat too sweeping. For example, anyone who has had dealings with a tame raven will find it difficult to dispense with the word 'intelligence' in any analysis of its conduct. Is it automatonism when it tweaks the cat's tail?

FRANCES PITT

PLANT TISSUE CULTURE

Une voie nouvelle en biologie végétale

La culture des tissus. Par R.-J. Gautheret. (L'Avenir de la science, No. 21.) Pp. 202+32 plates. (Paris: Libr. Gallimard, 1945.) 190 francs.

THE technique of culturing animal tissue *in vitro* has, on many occasions, received considerable publicity. No comparable public interest has been centred on the cultivation of plant tissues, yet in many ways the results have been at least as important. In animal tissue culture the media used have normally contained tissue extracts and serum, and attempts to produce purely synthetic media have so far met with little success. Media used in plant tissue culture, on the other hand, have in the main been synthetic, and it is not surprising, therefore, that successful continued proliferation of undifferentiated plant tissues *in vitro* have been achieved only within the last eight years. Most of the successful advances have been made in France or the United States, and in the former country the technique has been developed primarily by R.-J. Gautheret. It is, therefore, with considerable interest that one turns to his account of the subject.

After a historical introduction, the writer discusses the principles and problems of the techniques used, and then goes on to consider the morphological characters of the cultures obtained. Chapter 4 deals with the problems of the physiology of the growing tissues, and the final chapter with the possibilities of the technique.

The account of the methods and results is admirable, and the work is well illustrated with excellent plates and good figures; but the deliberate omission of references detracts considerably from the book and tends to damp interests stimulated by the text. Gautheret has made it abundantly clear that the cultivation of plant tissues has immense possibilities, and although many difficulties remain to be surmounted the future of the technique is assured.

ALAN BURGES

HISTORY OF ALCHEMY AND EARLY CHEMISTRY*

By Prof. J. R. PARTINGTON, M.B.E.
Queen Mary College, University of London

THE history of alchemy should properly begin with a survey of the technical arts of the ancient nations. Archæological discoveries show that these arts were highly developed about 3500 B.C., so that they must have arisen earlier. Later on they declined, and in Egypt, by the beginning of the Christian era, had mostly deteriorated into an imitative technique, although in some cases, as in the manufacture of glass, there had been advances. The precious metals and gems had been replaced by base alloys and coloured pastes.

Alchemy is a growth which appears suddenly in Egypt about the beginning of the Christian era, and at first sight seems to have no roots. Its origins were long surrounded by a veil of mystery. Its earliest name, the 'Divine Art', points to its supposed origin in a divine revelation by fallen angels, a tradition embellished in Jewish works like the Book of Enoch, and in some Greek alchemical texts. In the latter, it also appears as a revelation by the god Hermes Trismegistos, the Hellenistic form of the ancient Egyptian god Thoth, and hence alchemy was sometimes called the 'Hermetic Art'.

In its earliest period, and for long afterwards, alchemy meant the practical art of making gold and silver. It had also certain theories, or dogmatic rules, the most important being a belief in the essential unity of matter, and the possibility of converting one form of matter into another by suitable treatment. These theories originated in the speculations of Plato and Aristotle.

The view that the chemical elements are permanent and unchangeable was only generally adopted, on an experimental basis, at the end of the eighteenth century, the possibility of transmutation having been accepted, for example, by Boyle and Newton. The doctrine of the permanence of the elements was a necessary step in the development of chemistry, and the alternative view could not receive any experimental basis until quite recent times.

The atomic theory, another achievement of Greek genius, is unfavourable to alchemy, since it pictures the elements as aggregates of particles of different species which are permanent for all time; and it is noteworthy that the early alchemists make no use of it. Although Demokritos, the founder of the atomic theory, may be said to be also the founder of modern chemical theory, the master of the alchemists was Plato.

So far as is known, Western alchemy arose about the beginning of the Christian era in Alexandria, from the joining of two streams of knowledge; the first of these was the ancient Egyptian art of working metals, and the second the theoretical views on the nature of matter taught by Greek philosophy.

In A.D. 296 the Roman Emperor Diocletian issued in Alexandria an edict ordering the books of the Egyptian forgers teaching the preparation (that is, imitation) of gold and silver to be burnt whenever they could be found. One such book appears to be the Papyrus of Leyden, found in 1828 buried with a mummy in Egypt. It was written in Greek about Diocletian's time, and contains the working notes of a fraudulent goldsmith. It deals with the imitation of precious metals so as to 'deceive the expert', as it says, including the plating of copper or silver with gold (by treating with gold amalgam and heating to drive off the mercury), and with making imitation silver from tin. Another part of the same work, the Stockholm Papyrus, treats mostly of the imitation of gems and valuable dyes, such as purple. Some Assyrian cuneiform tablets of 650 B.C. also describe the imitation of lapis lazuli by blue glass coloured with cobalt, some specimens of which have been found.

In these papyri there is no suggestion that the products were more than clever imitations. Alchemy, which assumed that real gold and silver could be obtained, arose from Greek philosophical ideas. These, as understood by the alchemists, postulated a primary matter, or *hulē*, on which a form, or *eidos*, could be impressed so as to give a specific body such as lead or gold, which was an association of primary matter and form. If lead could be divested of its specific form, and the form of gold impressed on the primary matter (the same in lead and gold), then gold would result.

A subsidiary idea of Chaldæan and Persian origin supposed that metals are formed in the earth by the action of rays or effluences from the seven planets, each producing a particular metal. Astrology, which has been described as an organised body of error, thus became the sister of alchemy; but in practical alchemy its influence was mainly confined to the use of the planetary names and symbols for the metals: gold and the sun, silver and the moon, copper and Venus, and so on.

Suitable starting materials for transmutation were supposed to be lead, which was easily 'mortified'; or a yellow alloy of lead and copper (a lead bronze, known in ancient Egypt and Babylonia), called *molybdochalkos*; and also mercury, since Plato had taught that metals are formed from water, and this *hydrargyros*, or silver-water, was thus very near the primary matter of metals.

The earliest alchemical texts are in Greek, and go back to the first two or three centuries A.D. In them the subject is called the 'Divine Art'. The name 'chemistry' (χημεία) came somewhat later, about 300 A.D. It is probably derived from the old name for Egypt, *Chem*, found in hieroglyphics and known to Plutarch, which means black, from the black colour of the alluvial soil. The texts abound in obscure words, and what is worse, in common words used in a very uncommon sense. We are told to take "the bile of the serpent which is the divine water"; but in another place this is said to be made by boiling sulphur with milk of lime. The divine water (θεῖον ὕδωρ) is a solution of calcium polysulphides.

The earliest author is Demokritos—not the old Greek philosopher, Demokritos of Abdera, but a writer of the first century A.D. His main work, "Physical and Mystical Matters", begins with some recipes for imitating purple in the style of the Stockholm Papyrus, but suddenly breaks into a story of an invocation of the shade of the dead master, the Persian Ostanes, and the subsequent discovery of an inscription revealed by the opening of a pillar in a temple. This inscription merely said: "Nature rejoices in nature, Nature conquers nature, Nature overcomes nature". "We were much surprised," says Demokritos, "that he had comprised all his teaching in so few words." These words may express the fundamental alteration of specific property (φύσις, nature) by what Aristotle had already recognized as chemical change, and distinguished from mechanical mixture. No chemical apparatus is described.

---

* Based on three lectures at the Royal Institution on October 31, November 7 and 14, 1946.

Two other early authors are Maria the Jewess, probably a real person from Jerusalem, and Cleopatra the Egyptian, who is otherwise known as a writer on weights and measures and on cosmetics. Maria, probably in the first century A.D., invented the earliest apparatus for distillation, and an instrument called the *kerotakis*. The *ambix*, used for distillation, was originally a kind of spouted jug. She describes the making of an *ambix* from thin sheet bronze, "in thickness little more than that of a frying pan for cakes", comprising a vertical tube, a head, and three outlet pipes, all carefully soldered. This piece, later called the helm or head, was luted to a glass or earthenware body, called a *lopas*, later called the *cucurbit*, or *aludel*, and the whole was heated by lamps or a small fire, the products of distillation being received in small phials. The *kerotakis* apparatus comprised a small brazier such as was used by encaustic painters for keeping the coloured wax melted (hence the name), and a small heated plate with cup-shaped depressions, such as was, and is, used for cooking eggs, but was probably the palette used by encaustic painters. The apparatus was used for sublimation, the vapours being condensed on a small bell-jar inverted over the palette. So cinnabar was made by sublimating sulphur and mercury, white arsenic obtained by roasting the red and yellow sulphide minerals, and called 'white alum'; the element arsenic itself was formed by reduction, and called the 'second mercury'.

Cleopatra's work, called the "Chrusopoiïa", or the making of gold, is a page of symbolic drawings. The dragon Ouroboros, engaged in eating his own tail, surrounds the legend: ἓν τὸ πᾶν ("one the all"); and the planetary symbols share the space inside concentric circles with the maxim in Greek: "One is all, and through it is all, and by it is all, and if you have not all, all is nothing". The distillation apparatus appears.

The process of transmutation was effected by a powder called *xerion* (ξηρίον), the contemporary meaning being a cosmetic or dusting powder. The name became the Arabic *al iksir*, or *elixir*, another name for the Philosophers' Stone. The transmuting process was also likened to dyeing, or a tinctorial process, and the Philosophers' Stone was called the *tincture*.

The most copious Greek alchemical author is Zosimos of Panopolis, A.D. 250–300, of whom a commentator admiringly says: "His words are as abundant as the ocean". His twenty-eight treatises were addressed to his 'sister' Theosebeia, a lady of rank, "clothed in the purple", and probably a member, or 'sister', of a small study-circle. Zosimos classifies things into *bodies* (metals), and *spirits* (πνεύματα), "certain substances which are by reason of their nature invisible", namely, the vapours of mercury, arsenic, and sulphur, which he also calls 'vapours' or 'smokes', as do later Arabic authors. He came near the recognition of gases. His works contain some remarkable visions which have engaged the attention of the psychoanalysts.

Besides the Demokritan school, there are traces of others: Zosimos sends his malicious regards to a priest Neilos, and his 'sister' Paphnutia, who wasted a day in roasting a mineral in a common kitchen fireplace instead of in a *kerotakis*, and got nothing but a heap of ashes. They had omitted the bell-jar to receive the sublimate.

After Zosimos, the treatises are mostly commentaries. The last author is Stephanos, a court professor at Constantinople, whose works are largely rhetorical.

The Saracen conquests of the seventh century A.D. shifted the stage of alchemy to Syria and Mesopotamia, where it was known as *al kimiya*, the old name being retained. The Greek works of Demokritos and Zosimos appeared in Syriac translation, some of which are extant.

Saracen alchemy is mainly linked with the names of Jābir ibn Hāyyan, known in the West as Geber, about A.D. 750; al-Rāzī, known in Europe as Rhases, a Persian physician, A.D. 866–925; and the physician ibn Sina, or Avicenna, A.D. 980–1036. The Latin works attributed to Geber, which long passed as a translation from Jābir, belong to a later date, and even the authenticity of the quite different Arabic works of Jābir has been called in question.

An Arabic work on alchemy, the "Secret of Secrets", attributed to al-Rāzī, has been translated by Ruska. An important Latin work on alchemy, the "de Anima", attributed to Avicenna, was known to Roger Bacon. It seems to have been compiled in Spain from Arabic sources about A.D. 1140. Avicenna was really a critic of alchemy. In a genuine work, the "Book of the Remedy", he says it is not in the power of the alchemists to bring about any true change of metallic species. They can produce imitations so as to deceive even the most expert, yet in these the essential nature remains unchanged.

This criticism was often added to the fourth book of Aristotle's "Meteorology" in Latin translations from Arabic, and was often attributed to Aristotle himself. The passage attracted the attention of the Schoolmen of the thirteenth century, and alchemy became a subject of interest to them.

Albertus Magnus (1193–1280) gives a good summary of alchemy in his "de Mineralibus", in which he mentions the frauds of Paris alchemists. He says alchemical gold, although it stood six or seven ignitions in the fire, was at last turned into dust. Albert, like Roger Bacon, believed in the possibility of alchemy on philosophical grounds; but the treatise on alchemy called "Semita Recta", or the "Straight Path", attributed to him and printed in his works, is spurious.

Roger Bacon (1214–92) divided alchemy into: (i) theoretical or speculative, which treats of the generation of things from elements, and of all kinds of metals, minerals, etc., of which Aristotle and the Latin authors were ignorant; and (ii) practical or operative, which teaches how to make gold and other things better by art than in Nature, and also powerful medicines by sublimation, distillation, etc. Bacon, and also Arnald of Villanova (1240–1311), emphasized the importance of chemistry in medicine long before Paracelsus. Ramon Lull, or Raymund Lully (1233–1316), attacks fraudulent alchemy in his works; a large alchemical literature attributed to him perhaps originated in his school soon after his death. St. Thomas Aquinas, who also had spurious alchemical works attributed to him, discusses in his genuine works the propriety of proffering alchemical gold in payment of debts, concluding that it is lawful if the artificial gold will pass the tests of the goldsmith.

Although the Schoolmen soon lost interest in alchemy, which most of them regarded as fraudulent, the less learned were much attracted by it, and great numbers of people began to study it practically. The paintings of the Dutch schools, especially, show the alchemists at work. Numerous works on alchemy appeared in the fourteenth and fifteenth centuries. Many of these works treat of the supposed mystical aspects of alchemy, a branch which seems to have owed much to Jewish sources, with their preoccupation with anthropocentric diagrams, and the mysteries of the macrocosm and the microcosm.

The "Mirror of Alchemy", wrongly attributed to Roger Bacon but probably almost contemporary, says: "Alchemy is a science which teaches how to make a certain medicine called elixir, the which when it is cast upon metals or imperfect bodies fully perfects them by mere projection. . . . The natural principles of mines are mercury and sulphur. All metals and minerals, of which there are many kinds, are begotten of these two; . . . Nature always intends and strives to the perfection of gold, but many accidents coming between change the metals. . . . For according to the purity or impurity of the two aforesaid principles, mercury and sulphur, pure and impure metals are engendered."

This theory appears in the Saracen authors, and has been attributed to Jābir. It is almost implied in, and seems to be based on, a passage in Aristotle's "Meteorology", in which the formation of metals from two vapours in the earth is expounded.

The alchemists, with their green dragons, red lions, black crows, roses, lilies, and salamanders, feature in literature as well as in art. Chaucer (1345–1400) and Ben Jonson (1572–1637) have much to say about them. English alchemical writings were Thomas Norton's "Ordinal of Alchemy", in verse, supposed to have been written in 1477, and Ripley's works in verse. These are included in Ashmole's "Theatrum Chemicum Britannicum" (1652). Davy correctly says of Ripley's poems that "there is nothing in them which can instruct or amuse an intelligent reader".

Although some alchemists were charlatans, others were sincere, and by experiments, although they never made gold, discovered many useful things like the mineral acids, and pointed the way to a richer knowledge.

Alchemy also flourished at an early date in China, the most celebrated Chinese alchemist being Ko Hung, in the fourth century A.D. Distillation was known, and the Philosophers' Stone, called the *tan*, was supposed to be the elixir of life. Great interest was taken in the synthesis of red cinnabar from mercury and sulphur. Alchemy was also studied in India, where the atomic theory was taught at a fairly early date.

Although Roger Bacon and Arnald of Villanova in the thirteenth century had emphasized the use of chemistry in medicine, this first became important with Paracelsus, born in 1493 at Einsiedeln in Switzerland. After a wandering life, in which he acquired information on alchemy and medicine, he occupied the chair of medicine at Basle for the single session 1527–28. Thereafter he led an unsettled life, dying at Salzburg in 1541. He was a reformer of medicine, and his contributions to chemistry are slight. He believed in the four elements, but thought they appeared as the three principles, or *tria prima*, of salt, sulphur, and mercury, the first being added by him to the two alchemical principles to denote the principle of fixity and incombustibility. Paracelsus gave the name 'alcohol' to spirit of wine.

Van Helmont (1577–1644), of Brussels, whose writings were published by his son in 1648, adopted some views of Paracelsus, but criticized others. He believed that water is the fundamental element, and tried to prove this by growing a tree from a weight of 5 lb. to 200 lb., supplying it only with water. He overlooked the carbon dioxide in the atmosphere, although he was the first to recognize this, calling it *gas sylvestre*, and inventing the name 'gas', which he says he derived from 'chaos'. He thought a gas could not be kept in a vessel, for he corked up limestone and acid in a bottle, which soon burst. Van Helmont mentions nitric oxide gas from metals and nitric acid, and an inflammable gas which he calls *gas pingue*. He made quantitative experiments, and showed that when a metal is dissolved in an acid it can be recovered again with its original weight from the solution. He recognized that digestion is effected by some kind of ferment in the stomach. Van Helmont believed in a universal solvent, called *alkahest*, but does not explain how he was able to keep it. Boyle had a high opinion of van Helmont, who, in spite of some credulity, was a highly original thinker and a clever experimenter.

Chemistry proper appears about his time, and its first text-book is the "Alchemia" of Libavius (1597), which included the teachings of Paracelsus, but criticized his absurdities. It is a well-arranged work. Libavius describes zinc, and discovered anhydrous stannic chloride, afterwards known as "Libavius's fuming liquor".

Glauber (1604–70), another German, was a skilled practical chemist. In his book, "New Philosophical Furnaces" (1646–49), he describes the preparation of spirit of salt (hydrochloric acid), and by dissolving metals in it he prepared many new salts, the metal chlorides. Sodium sulphate is still known as 'Glauber's salt'. He made malt extract, and another of his experiments is the 'chemical garden', made by putting bits of metallic salts in a solution of water glass.

A popular text-book was the "Cours de Chymie" of a Frenchman, Lemery, first published in 1675, which went through a large number of editions and translations. It divides bodies into animal, vegetable, and mineral, and uses the corpuscular theory, explaining properties by the different forms of the particles, acids having sharp-pointed particles which prick the tongue, and tear apart and dissolve metals.

Tachenius, a German who worked for a time in a soap factory in Venice, in his "Hippocrates Chimicus" (1666) defines a salt as composed of an acid and a base. Kunckel, an alchemist in the service of Frederick William of Brandenburg, the Grosse Kürfürst, in Berlin, independently discovered phosphorus and gold ruby glass. His "Laboratorium Chymicum" was published in 1716, after his death in 1703. He admits that he failed to transmute metals into gold.

Chemistry assumed a new dignity, and became scientific, by the work of Robert Boyle (1627–91), who insisted that it was worthy of independent study, and was not merely the handmaid of alchemy or medicine. In his "Sceptical Chymist" (1661) he shows that the true elements are not the four elements, or the three alchemical principles, since none of these can be extracted from bodies. He believed in the atomic (or as he calls it, the corpuscular) theory, and suggested that different bodies result from the different motions and mutual actions of the small particles of matter. The famous Boyle's law was stated in 1662, and many experiments were made with an air pump, with which it was shown that combustion would not proceed in a vacuum, unless the combustible were mixed with nitre or saltpetre, which led him to suspect that this salt contains something also present in the air. This theory was elaborated by Hooke and Mayow, both of whom worked with Boyle in Oxford.

John Mayow (1641–79), born in Cornwall, was later a physician in Bath and London. His "Tractatus Quinque" (1674) describes fundamental experiments on combustion and respiration, both of which he says are maintained by a part of the atmosphere present in a fixed state in nitre, and which he called the 'nitro-aerial spirit'. He showed that antimony gains in weight when calcined in air, and supposed that this is due to absorption of nitro-aerial spirit. The increase in weight of tin and lead on calcination in air had been described by a French physician, Jean Rey, in 1630, who suggested, not very clearly, that air is fixed in the process.

The study of combustion and calcination by Boyle and Mayow, if pursued, would have led to a correct theory, but it was interrupted by the appearance of a theory which long retarded the progress of chemistry. This was the famous phlogiston theory of Becher and Stahl.

Becher, born in 1635 at Speyer in Germany, was for a time in England, where he is said, on not very good authority, to have died in 1682. In his book "Physicæ Subterraneæ" (1669), he gives as constituents of bodies, air, water, and three earths, one of which is inflammable (*terra pinguis*), the second mercurial, and the third fusible or vitreous. These earths correspond with sulphur, mercury, and salt.

Stahl, born in Anspach in 1660, studied medicine at Jena, where he lectured on chemistry; he became in 1694 professor of medicine at Halle, but left in 1716 to become physician to the King of Prussia in Berlin, where he died in 1734. His first statement of the phlogiston theory was in his "Zymotechnia Fundamentalis" (1697). It was extended in his edition of Becher's "Physica Subterranea" in 1703, and in his "Fundamenta Chymiæ" (two editions in 1723 and 1746–47). All combustible bodies and metals were supposed to contain a common and identical principle, to which Stahl gave the name *phlogiston*. This was similar to Becher's *terra pinguis*, and could be transferred from one body to another. A metal on calcination loses phlogiston and becomes a calx (an oxide), which when heated with oil or charcoal takes up phlogiston again and reverts to metal. A metal is thus regarded as a compound of its calx (an element) and phlogiston. The known fact that the calx weighs more than the metal was a difficulty, explained (when it was thought worthy of consideration at all!) in various unsatisfactory ways, one being that phlogiston had a negative weight. The phlogiston theory was generally accepted during the eighteenth century, but Boerhaave, professor at Leyden, does not mention it in his famous text-book, "Elementa Chemiæ" (1732), each genuine copy of which is signed by the author.

It was only after the discovery of oxygen that a correct theory of combustion could be formulated. Oxygen was discovered independently by Scheele in Sweden about 1772 and by Priestley in England in 1774, but both continued to believe in the phlogiston theory. The correct explanation of their experiments was first given by Lavoisier.

Between the enunciation of the phlogiston theory by Stahl, and its overthrow by Lavoisier, many distinguished chemists had made important discoveries: Black, Priestley, and Cavendish in Britain; Bergman and Scheele in Sweden; Macquer and Baumé in France; and Marggraf (the discoverer of beet sugar) in Germany. Cavendish and Priestley made great progress in the discovery of gases, the latter using the familiar pneumatic trough for collecting them in jars over water. Soluble gases were collected over mercury.

Lavoisier overthrew the phlogiston theory, and put the new theory in its place, largely by the use of the balance, and the earlier work of Black was also founded on quantitative experiments; Lavoisier, although not always giving enough credit to his predecessors, emphasized the importance of Black's work, which he says he took as a model for his own.

Joseph Black, born in 1728, in Bordeaux (where his parents had emigrated to set up a wine business), studied medicine and chemistry in the University of Glasgow, where in 1756 he succeeded Cullen as professor of chemistry. In 1754 he became M.D. of Edinburgh with a dissertation on magnesia, published in an enlarged form in 1756. In 1766 he succeeded Cullen at Edinburgh as professor of chemistry, where he remained until his death in 1799. Black's lectures attracted large audiences and were illustrated by excellent experiments. The lectures were published in two volumes in 1803 by his pupil Robison, and were also translated into German. Before this, many manuscript copies were in circulation, and several still survive. One copy, interesting on account of its early date (1767–68), was made by Thomas Cochrane, and is illustrated by some clever drawings of Black.

In Black's time, two fixed alkalis, potash and soda, and a volatile alkali, ammonia, were known both in so-called mild forms, and in the caustic forms obtained from these by boiling with water and slaked lime, made from quicklime and water. The quicklime was changed into limestone or chalk, and the alkali became caustic. The phlogistic chemists explained this as due to the passage of a fiery or caustic principle (which the limestone had taken up on burning) from the quicklime into the mild alkali, which became caustic. Thus, quicklime was a compound of limestone and the fiery principle (called *acidum pingue* by Meyer), and caustic alkali a compound of mild alkali and acidum pingue. Black showed that limestone when burnt to quicklime, and a mild alkali when it becomes caustic, both lose weight. On burning limestone, a gas escapes. This is what Van Helmont called *gas sylvestre*; Black called it 'fixed air'; it is carbon dioxide. Limestone is thus a compound of quicklime and fixed air, and mild alkali a compound of caustic alkali and fixed air. On boiling mild alkali with quicklime, the latter takes fixed air from the alkali, leaving it caustic, and is itself converted into limestone. All this Black proved by exact weighings. Black knew that fixed air is evolved from the lungs on expiration.

Scheele and Priestley obtained oxygen in several ways, notably by heating red oxide of mercury, or red precipitate. They found it to support combustion much better than common air; and Scheele that the whole of the oxygen gas is used up in the process, whereas common air left four-fifths of its volume of a gas which did not support combustion or respiration.

Antoine Lavoisier, born in France in 1734, was carefully educated and, having ample means, devoted himself to science. His most important work was begun in 1770, and continued until his death on the guillotine in 1794, when he suffered the penalty of a *Fermier général*, or tax collector, although he had discharged this office honourably and honestly, as well as doing much important work in the service of the State.

Lavoisier learned of the isolation of oxygen in 1774 from Priestley himself in Paris, and soon saw that it was a part of the air concerned with combustion and calcination, which resulted from a combination of oxygen with the combustible or metal, and not from a loss of phlogiston. In the course of further work, he confirmed this conclusion, which he stated fully in 1783.

Since non-metals such as sulphur, phosphorus and carbon, on combustion in oxygen, form acids, Lavoisier proposed the name *principe oxigine*, from the Greek meaning 'producer of acids'. He drew up a list of elements, these being substances which, so far, had not been divided by chemical processes into any simpler bodies, and in 1789 he published his famous text-book, "Traité Élémentaire de Chimie". In this he describes an experiment in which mercury is heated in a confined volume of air, when it slowly takes up oxygen to form some red oxide, and the air contracts to a limiting volume. On heating the red oxide, oxygen is evolved, in volume equal to the contraction suffered by the air. Lavoisier also showed that oxygen is absorbed in the blood in respiration, as Mayow suspected, and carbon dioxide evolved, the oxidation of material containing carbon being the source of animal heat. With Lavoisier, chemistry entered its modern phase. Only one further step remained, and this was taken by John Dalton by the introduction of the atomic theory.

The atomic theory goes back to the old Greek philosopher Demokritos, about 450 B.C., was revived in the Epicurean philosophy, and made into a poem by Lucretius. It was never lost sight of, but was notably revived by Gassend early in the seventeenth century. Newton made extensive use of it, and an early application to chemistry was by William Higgins in 1789, who recognized that combination occurs in multiple proportions by successive addition of 1, 2, 3, etc., particles of one element, say oxygen, to one particle of another, say nitrogen. Higgins's work was appreciatively mentioned by Davy. Richter, in Germany, from 1791, had introduced the idea of combining weights.

John Dalton was born in 1766 in Cumberland, his parents being Quakers, to which society he himself belonged. His circumstances were modest, and he supported himself all his life by teaching, being appointed professor of mathematics and natural philosophy in New College, Manchester, in 1793. The College later moved to York, but Dalton remained in Manchester, earning his living as a private tutor, until his death in 1844. One of his pupils was the great physicist Joule. Dalton's main characteristics were plainness, modesty, and perseverance, united to genius.

Dalton's atomic theory arose from the influence of Newton, whose writings he had carefully studied. He took from Newton the theory that a gas exerts a pressure because of repulsive forces between its particles, the latter being at rest. The kinetic theory, postulating that pressure is due to bombardment by moving particles, although proposed by Bernoulli in 1738, had dropped out of sight. Dalton supposed that the repulsion was due to atmospheres of heat, which Lavoisier supposed was an imponderable material element called 'caloric', surrounding the material atoms.

In 1801–2, Dalton read several important papers to the Manchester Literary and Philosophical Society, describing the law of partial pressures, the solubilities of mixed gases, and the vapour pressures of liquids; and in 1803 he read a paper on "The Proportions of the Several Gases or Elastic Fluids Constituting the Atmosphere", to which, when it was first printed in 1805, the first table of atomic weights had, in the interval, been added. He was in possession of this theory before 1804, since in August of that year he explained it to Thomas Thomson, who published an account of it in 1807. The theory, and atomic symbols, are used in Dalton's notebooks of 1803.

Dalton seems to have been led to the atomic theory on physical grounds in attempts to explain the properties of mixed gases. He calculated the relative weights of the atoms, taking the weight of the lightest atom, that of hydrogen, as 1. In order to do this, he made assumptions about the numbers of atoms combining; for example, he supposed that water contains one atom each of hydrogen and oxygen, whereas we now know that it contains two of hydrogen and one of oxygen. The theory explained the facts of chemical combination, including the law of multiple proportions, and the results found by Richter. Dalton's theory was first made known by Thomas Thomson, professor at Glasgow, who gave an account of it in his "System of Chemistry" in 1807. The first volume of Dalton's "New System of Chemical Philosophy" appeared in 1808. Dalton used curious symbols, that for hydrogen being ⊙, like the Bohr atom; the modern chemical symbols were introduced by Berzelius in 1813.

Dalton's atomic theory is the great guiding principle of modern chemistry. It has suffered slight modification, since all the atoms of a given element are not of identical weight, as Dalton thought; and also, as Newton suspected, it has proved possible to divide atoms experimentally into simpler parts, so that the atoms are formed of a small number of primary particles, and the artificial transmutation of elements is now a fact. If anything, however, the atoms have become more real than they were even for Dalton, who saw them clearly in the eye of the mind.

With Dalton, chemistry had become a modern science, and a history of alchemy and early chemistry ends; he brought the science to the beginning of the road it has followed ever since.

EARTH MOVEMENT RESULTING FROM AN ATOMIC BOMB EXPLOSION

IN 1904, Horace Lamb published[1] solutions of elastic wave equations, and predicted the wave pattern at a distant point from waves generated by an impulsive force applied vertically at the earth's surface. From this work he suggested that the general to-and-fro movement characteristic of a seismogram might be due either to a succession of primitive shocks or to instrumental imperfections.

On Monday, July 16, 1945, Lamb's conditions of a single initial vertical ground impulse were met experimentally for the first time at the test of the atomic bomb in Jornada del Muerto Valley, New Mexico. On that occasion the source of the earth tremors was a simple single instantaneous vertical impact on the ground produced by the explosion of an atomic bomb 100 ft. above the surface. There was no succession of primitive shocks to explain unpredicted oscillations, and the three-component Leet seismograph orientated in three mutually perpendicular directions, (*a*) horizontally from point of observation to point of explosion, (*b*) horizontally at right angles to (*a*), and (*c*) vertical, was magnetically damped about 0·7 critical, so there was no question of instrumental self-oscillation. The magnitude of the ground vibrations has not yet been made public, but the qualitative analysis of the records has just been published by L. Don Leet[2].

The seismograms showed continuous oscillation. The first waves to arrive were P_2, refracted compressional waves, on the longitudinal and vertical seismograms, followed by S_2, refracted shear waves, on the transverse seismogram. After these came the P_1, direct compressional waves on the longitudinal and vertical components. Coupled waves on all components succeeded these, and were followed by H, hydrodynamic waves, on the longitudinal and vertical components. Surface shear waves arrived at the point of observation shortly afterwards and were recorded on the transverse seismogram. The latter ones of these were accompanied by horizontally polarized surface compressional waves on the longitudinal seismogram. The remaining part of the seismograms had Rayleigh waves on the longitudinal and vertical components and surface shear waves on the transverse seismogram.

P_2 was the standard bodily compressional wave. Leet states that from its angle of emergence as well as its velocity, the wave must have been refracted through material capable of transmitting waves of higher velocity than the surface layer could. P_1 travelled through the earth's surface layer. S_2 was an independent transverse wave assumed to have been a refracted body wave because of its velocity and period. Leet noted transverse motion from the very beginning of the record. C has been called the coupled wave. It was not predicted by standard elasticity theory, but was observed by Leet in 1939[3]. The diagnostic characteristic of this wave is that a particle in its path moves along the diagonal of a rectangular frame facing in the longitudinal direction. This results in simultaneous maxima and minima on all three components of the seismograph registrations. A novel feature of this wave on the atomic bomb record was that it was twinned. There was a C wave of period 0·4 sec. arriving at the same time and co-existing with one of period about 1·0 sec. The motion of a particle was left up push – right down pull. Q, the surface shear wave, arrived on the transverse component just as C was dying out. H, the hydrodynamic wave, was new to seismology. The wave caused a particle in its path to move in a longitudinal–vertical plane, clearly independent of motion on the transverse component at the same time. Leet states that the unique and significant thing about the H motion is that it is the opposite of that of the Rayleigh wave, and the particle at the top of its inclined elliptical orbit moves forward as for a wave on water. He is of the opinion that it seems reasonable to attribute the existence of the H wave to special properties of the material at the surface of the Jornada del Muerto Valley, namely, alluvial sands and gravels. A similar wave has been observed by Leet from a small dynamite shot in an area having a surface layer of sand 55 ft. thick underlain by clay 165 ft. thick. In both cases the horizontal component of H dominated the vertical, and the major axis of the elliptical path was inclined at an acute angle to the horizontal plane. R, the Rayleigh wave, caused particle movement in an elliptic orbit with the minor axis longitudinal and the major axis vertical. At the top of its elliptical orbit, the particle moved towards the source. The vertical component was larger relative to the horizontal than for H, but not in the classical ratio of vertical : horizontal = 1·5 : 1. The coupled wave carried an appreciable portion of the energy in the ground waves, and the hydrodynamic wave produced the greatest displacements on the record.

Leet's paper represents an important advance towards the solution of the seismological problem of establishing observationally the types of waves which can be supported by earth materials in their natural position.

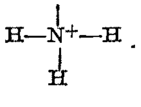
RELATIONSHIP BETWEEN STRUCTURE AND ACTION IN DRUGS WITH CURARIFORM ACTIONS

By P. E. B. HOLMES, D. J. JENDEN
AND
DR. D. B. TAYLOR
Departments of Physiology and Pharmacology,
King's College, London

ING and Wright[1,2], in two comprehensive papers, presented the results of the measurement of the curariform activity of an extensive series of onium salts. Later, Ing[3] reviewed the literature up to 1936. Since that time much interesting work on the subject has appeared, the three papers by Raventos[4], Clark and Raventos[5] and Raventos[6] being of special interest from the theoretical point of view.

We can start with a consideration of the differences between the structure of the ammonium ion according to the classical theory of valency and the structure of the same ion according to quantum mechanics. Classical theory assigned the structure



$$\begin{array}{c} \mathrm{H} \\ | \\ \mathrm{H{-}N^{+}{-}H} \\ | \\ \mathrm{H} \end{array}$$

to the ammonium ion, and tacitly assumed the charge to be localized to the nitrogen atom. The development of quantum mechanics has, however, led to a reconsideration of this structure, and Pauling[7] has pointed out that resonance between ionic and covalent bonds of the type $A{-}B \rightleftarrows A^{+}\,B^{-}$ will result in a distribution of the positive charge in the ammonium ion. He points out that sixteen structures have to be considered, one completely covalent structure

$\begin{array}{ccc} & \mathrm{H} & \\ & \cdot\cdot\,{}^{+} & \\ \mathrm{H}: & \mathrm{N} & :\mathrm{H}, \\ & \cdot\cdot & \\ & \mathrm{H} & \end{array}$ four such as $\begin{array}{ccc} & \mathrm{H} & \\ & \cdot\cdot & \\ \mathrm{H}: & \mathrm{N} & :\mathrm{H}^{+}, \\ & \cdot\cdot & \\ & \mathrm{H} & \end{array}$ six such as $\begin{array}{ccc} & \mathrm{H}^{+}_{-} & \\ & \cdot\cdot & \\ \mathrm{H}: & \mathrm{N} & :\mathrm{H}^{+}, \\ & \cdot\cdot & \\ & \mathrm{H} & \end{array}$ four such as $\begin{array}{ccc} & \mathrm{H}^{+}_{=} & \\ & \cdot\cdot & \\ \mathrm{H}: & \mathrm{N} & :\mathrm{H}^{+}, \\ & \cdot\cdot & \\ & \mathrm{H}^{+} & \end{array}$ and one completely ionic structure $\begin{array}{ccc} & \mathrm{H}^{+}_{\equiv} & \\ & \cdot\cdot & \\ \mathrm{H}^{+}: & \mathrm{N} & :\mathrm{H}^{+}. \\ & \cdot\cdot & \\ & \mathrm{H}^{+} & \end{array}$ He concludes that the unit ionic charge is distributed approximately equally among the five atoms, the nitrogen atom, therefore, being left with only + 0·2 charge.

Further, according to Pauling's view, the ionic contribution to the bond $[R_3X—R]^+$ in an onium ion (and hence the charge-distributing effect) will depend on the relative electro-negativity of the group *R* and the atom *X* and, other things being equal, on the ionic radius of both *R* and *X*. From these considerations alone it is difficult to avoid the conclusion that curariform action, a property of onium ions in a very widely different series of compounds, will be affected by the intra-ionic positive charge distribution. In attempting to apply these ideas, we will consider the compounds of the ammonium series first and then inquire into the effect of replacing the nitrogen atom by sulphur, phosphorus and arsenic, and finally try to assess the influence of complex molecular structure on the distribution of the central positive charge.

We can attempt to determine the influence of the group *R* in $[R_4\mathrm{N}]^+$ in two different ways. First, a comparison of the dissociation constants of acids of the series *R*COOH should give us an indication of the order of relative electro-negativity of *R*. In comparing the series *R*COOH and $[R_4\mathrm{N}]^+$, it is clear that the relative effects of the series on the charge on the nitrogen atom will be magnified because four *R* groups act on it as compared with one in *R*COOH. Secondly, consideration of the dissociation constants of the corresponding primary, secondary and tertiary amines should be of interest. Here the dissociation constants are a measure of the reactions

$$[R\mathrm{H_2N—H}]^+ \rightleftharpoons R\mathrm{H_2N} + \mathrm{H}^+$$
$$[R_2\mathrm{HN—H}]^+ \rightleftharpoons R_2\mathrm{HN} + \mathrm{H}^+$$
$$[R_3\mathrm{N—H}]^+ \rightleftharpoons R_3\mathrm{N} + \mathrm{H}^+$$

and hence their magnitude will be influenced by the charge on the central nitrogen atom.

TABLE 1

Group *R*	Curariform activity of R_4NI	$K_A \times 10^5$ of *R*—COOH	$K_B \times 10^5$ of R_3NH(OH)	$K_B \times 10^5$ of $R_2\mathrm{NH_2}$(OH)	$K_B \times 10^5$ of $R\mathrm{NH_3}$(OH)
$\mathrm{CH_3}^-$	5·8	1·753	5·45	52	43·8
$\mathrm{C_2H_5}^-$	No action	1·338	64	126	56
$\mathrm{C_3H_7}^-$	11·5	1·542	55	102	47
$\mathrm{C_4H_9}^-$	6·25	1·380			

Curariform activity[3] is expressed in minutes required to paralyse frog sartorius.

TABLE 2

Onium ion	Curariform activity of onium ion	Corresponding single bond with H	Dipole moment × 10^{18} of bonds in previous column
$[(\mathrm{CH_3})_4\mathrm{N}]^+$	5·8	N—H	1·31
$[(\mathrm{CH_3})_3\mathrm{S}]^+$	16	S—H	0·68
$[(\mathrm{CH_3})_4\mathrm{P}]^+$	17	P—H	0·36
$[(\mathrm{CH_3})_4\mathrm{As}]^+$	No action	H—As	0·10

Curariform activity is expressed as in Table 1. The dipole moment for As—H is in the opposite direction to the others, hence it is shown as H—As. The dipole moment values are from Pauling[7].

These lines of approach are limited by the lack of reliable values for the dissociation constants required.

In each series in Table 1 we see that when *R* is $\mathrm{C_2H_5}^-$ the bases are strongest and the acid weakest. This anomaly is also seen in much more marked form in the curariform activity column. If we assume that the $\mathrm{C_2H_5}^-$ group is not so electron-attracting as the rest, we can conclude that when the positive charge on the nitrogen atom in simple onium salts falls below a certain level, the compound loses its pharmacological activity very rapidly.

In the case of the symmetrical onium ions derived from nitrogen, sulphur, phosphorus and arsenic, we can obtain a qualitative idea of the influence of the central atom on the partial ionic character of the *X*—$\mathrm{CH_3}$ bond from the dipole moments of the corresponding *X*—H bonds, because change in *X* from nitrogen to sulphur to phosphorus to arsenic should influence both $\mathrm{CH_3}^-$ and H^- bonds in the same sense. But since the central charge on the onium atom depends on the amount of partial ionic character in the *X*—$\mathrm{CH_3}$ bond, the central charge should vary with the dipole moment in the correct direction. That it does (Table 2) is clear except in the case of arsenic, where there is a sudden loss in curariform activity. This sudden failure is like that which occurs in $[(\mathrm{C_2H_5})_4\mathrm{N}]^+$. In N—H and S—H the relative electro-negativity of the atoms in the bonds is such as to move the electrons towards the hydrogen atoms, nitrogen having more effect than sulphur, and hence to increase the positive charge on the central atom. In P—H the relative electro-negativity is zero, and in As—H it acts to decrease the charge on the central atom.

It seems clear, therefore, that in any onium ion of the type $[R_n—X]^+$ the charge distribution in the ion and hence that left on *X* will depend on the relative electro-negativity of *R* and *X*; and it appears that curariform activity requires that the central positive charge should not fall below a certain level.

It has been known to chemists for a long time that conjugated systems have a charge-distributing effect. We would therefore expect, other things being equal, to find less curariform activity from onium atoms attached to unsaturated systems, as opposed to the corresponding saturated compound. In this connexion it is noteworthy that at a concentration of 2 millimols per litre (Ing and Wright[2]) both dimethyltetrahydroquinolinium iodide and methyl ethyltetrahydroquinolinium iodide are more active than the corresponding unsaturated compounds methyl quinolinium iodide and ethyl quinolinium iodide.

The above theory as it stands does not explain why, when nitrogen forms part of a ring system, replacement of methyl by ethyl in the quaternary salt leads to an increase in curariform action if the ring is aromatic and to a decrease if the ring be saturated. It is possible, however, that the quasi triple bond $H_3\equiv C$— in methyl may hyperconjugate[8] if the ring be aromatic; this would cause an electron shift towards the ring and hence a decrease in the charge on the N atom which could not occur to such an extent if $C_2H_5^-$ were present instead of CH_3^-.

This theory does not explain why tetraethyl arsonium is more active than tetramethyl arsonium; but as Malone[9] has pointed out, the relationship between relative electro-negativity and bond dipole moment between arsenic and several other atoms is anomalous; and in the absence of further physicochemical information on the bond in the trimethyl and triethyl arsonium iodides, it is difficult to see how these considerations can connect the physical and pharmacological anomalies in these two compounds.

SCIENTIFIC EXPEDITION TO THE ANTARCTIC WHALING GROUNDS, 1946–47

By DR. R. A. M. CASE

A BRITISH scientific expedition is on its way to the Antarctic whaling grounds on board the new whale-factory ship *Balaena*, which has been equipped with a laboratory for biochemical and physiological work with specially designed apparatus for use at sea. The expedition has been organised by the Department of Scientific and Industrial Research on the initiative of Dr. Franklin Kidd, superintendent of the Low Temperature Research Station, Cambridge. It has as its main aim a study of the fuller utilization of the large potential supplies of whale meat protein for human food in view of the present world shortage of high-grade protein. Its secondary aim is the general one of advancing knowledge of the physiology and biochemistry of the whale. The expedition has been made possible by the collaboration of Messrs. United Whalers Ltd., who generously provided a laboratory and facilities for the investigations on board their new ship.

A preliminary investigation in 1939–40 by the Department under the leadership of Lieut.-Commander Marr of "Discovery" Investigations confirmed in the first place what whaling personnel have always stated, namely, that a large proportion of meat from the carcase is scarcely distinguishable from beef, and in the second place showed that there are wide variations in the quality of the meat from different carcases and from different parts of the same carcase. The meat shows a great diversity of colour, ranging from a pale veal tint through many shades of red to a curious deep red black, and this may possibly be correlated with the age of the whale[1].

The lean meat from the back muscles alone, the longissimus dorsi and psoas, on the basis of the total British and Norwegian pre-war catches, was estimated to amount to more than half a million tons, which is equivalent to about half the total amount of meat imported into Great Britain before the War.

The expedition will carry out palatability tests on a large number of whales and make observations on various factors which may have an influence on quality, such as: mode of death; whether accompanied by exhaustion; with or without bleeding; the time between slaughter and cutting up; and the subsequent freezing and storage history. Biochemical analyses will be carried out on board the whaling vessel on selected representative samples, and control samples frozen at various temperatures will be brought back for re-assessment and more complete analyses at the Low Temperature Research Station.

The above data, it is hoped, will be correlated with the biological data on the whole catch of the factory ship, collected by an inspector of the Ministry of Agriculture and Fisheries and by a biologist working for the "Discovery" Committee.

The diversity of colour will be studied, attention being paid to various fractions of the muscle pigment such as myoglobin, hæmoglobin and a third yellow protein fluorescing in ultra-violet light which has not yet been fully investigated, but which I have recently found in considerable quantities in frozen whale muscle by extraction with $M/15$ phosphate buffer at a pH of 6·5.

The opportunity will be taken to study the physiology and especially the under-water physiology of the whale and of collecting specimens of interest in other branches of science. The physiological work has the support of the Royal Naval Physiological Laboratory and the Royal Naval Personnel Research Committee. The interest of the former has led to the loan to the expedition of special equipment, such as, for example, recording thermographs of the harpoon type, for obtaining carcase temperatures, which will be of great value in collecting data required in fulfilment of the main objective. An attempt to obtain samples of blood and tissues from the whale carcase after it surfaces from its final dive will be made by a scientific man working in a self-contained oxygen swim-suit ('frog man suit'). In this way it is hoped to obtain some information about the gaseous equilibrium of a recently surfaced beast. A proper understanding of the diving mechanisms of whales might be used to throw more light on some problems of human divers. Members of the team underwent special training at Fort Blockhouse to enable them to carry out this project, and the Royal Navy has placed diving-gear at their disposal.

The under-water physiology of the whale is by no means unconnected with the qualities of whale meat as a food, because the character or composition of the muscles of the whale are adapted in several striking respects to the requirements of its submarine existence. There are indications from work carried out on material from the previous expedition that, as an indirect consequence of this adaptation, the proteins of whale meat are of exceptional value for growth by comparison with the meat proteins of land animals.

NEWS and VIEWS

Mathematics at Sheffield: Prof. A. G. Walker

Dr. Arthur Geoffrey Walker has been appointed to the chair of mathematics in the University of Sheffield, in succession to the late Prof. P. J. Daniell. Dr. Walker has been a member of the Department of Pure Mathematics at Liverpool for the past ten years. He is thirty-seven years old and was educated at Watford Grammar School and at Balliol College, Oxford. On taking his degree in 1931, he went to Edinburgh and commenced research under Prof. (now Sir) Edmund Whittaker. This was a time of exceptional activity at Edinburgh. Prof. Whittaker was mainly interested in relativity and differential geometry, and his staff, which in the years 1927–32 included E. T. Copson, J. M. Whittaker, J. G. Semple, H. S. Ruse, W. H. McCrea and A. Oppenheim, all of whom have gone on to professorial chairs, for the most part followed his lead. To Walker, who had gained distinction in differential geometry in the Final Honours School at Oxford, the subject of Prof. Whittaker's lectures was particularly congenial, and he wrote several papers, the first of a long series on differential geometry, relativity and cosmology. In 1933 he returned to Oxford to take up a Harmsworth Research Scholarship at Merton College, to which he had been elected in the previous year. He worked with Prof. E. A. Milne on kinematical relativity, then at the beginning of its stimulating and controversial career. This subject has continued to engage Dr. Walker's attention ever since. He is a supporter of Milne's general point of view, but has developed a more general theory, which seems capable of accounting both for cosmological effects and for phenomena due to intense local gravitational fields such as that of the sun. Certain functional equations present themselves in this work, and he has investigated them from the point of view of pure mathematics in collaboration with his Liverpool colleagues F. W. Bradley, now professor of mathematics at the University of Alexandria, and Miss Joyce Batty.

Fuel Technology at Sheffield: Prof. R. J. Sarjant, O.B.E.

The chair of fuel technology in the University of Sheffield has been vacant since the death of Prof. R. V. Wheeler in 1938, and the appointment of Dr. R. J. Sarjant to it assumes added importance in view of the national coal situation and the industrial area served by the University. Dr. Sarjant, who is chairman of the Yorkshire Section of the Institute of Fuel, has wide academic knowledge and industrial experience; trained under the late Prof. W. A. Bone at the Imperial College of Science and Technology, London, where he worked upon the constitution of coal, he was appointed in 1918 as fuel officer to the Research Department of Messrs. Hadfields, Ltd., there undertaking tasks pioneering in character. He published with Sir Robert Hadfield a number of papers on the uses of solid, liquid and gaseous fuels, gas producer practice, alloy steels for furnaces and chemical engineering, and gave the first course of lectures on furnace heating at the University of Sheffield in 1924. His later investigations dealt with: special aspects of the design of open-hearth, re-heating and heat-treatment furnaces; refractories and moulding sands; and various metallurgical, physical and radiological fields. In 1937 he was appointed a local director of Messrs. Hadfields, Ltd., and head of its Research Department; and during the War he rendered valuable service on a number of committees, particularly the Fuel Efficiency Committee of the Ministry of Fuel and Power, being chairman of its Education Sub-Committee which produced a notable war-time publication, "The Efficient Use of Fuel". He was the author of "Furnace Heating" (1925), and the section on fuel economy in industrial furnaces in "Coal: Its Constitution and Uses" (1936) by Bone and Himus. An account of his most recent research in collaboration with Prof. D. R. Hartree on the variable heat flow in solids has now appeared in the *Philosophical Transactions of the Royal Society*. Prof. Sarjant's appointment at the University of Sheffield will be widely welcomed.

Bicentenary of Johann Elert Bode

January 19 is the bicentenary of the birth of Johann Elert Bode, who at one time was the foremost astronomer in Germany. The son of a schoolmaster at Hamburg, from boyhood Bode was given to astronomical calculations and observations, and at the age of twenty-one published an elementary treatise which became very popular. He next published an essay on the transit of Venus of 1769. In 1772 Frederick II of Prussia called him to Berlin and made him astronomer to the Academy of Sciences, and the remainder of his life was spent in the Prussian capital. He commenced in 1774 the periodical *Astronomische Jahrbücher*, and in 1778 re-stated the law of planetary distance known by his name, which, however, had been stated previously by Titius and Wolf. It was through Bode that the name Uranus was given to the planet discovered by his fellow-countryman Herschel. His "Uranographia", published in 1801, gave observations of 17,240 stars. He made no important discoveries of astronomical objects, but by his writings and activities did much to diffuse a knowledge of astronomy in a country where for a time scientific studies had languished through the disasters of war. Bode died in Berlin on November 23, 1826, aged seventy-nine.

Cave Art at Lascaux

The discovery during the War of prehistoric paintings in the Lascaux Caves near Montignac in south-western France is of the highest interest. A large pine tree had blown down, and some French boys wandering with their dog in the vicinity found under its roots the entrance to a hitherto unknown cave. On the walls were innumerable paintings, many of them of large size, which were soon recognized as being palæolithic. Lascaux, though some distance from the well-known cave sites near Les Eyzies, is after all not so far away from them, and local folk knew by hearsay all about such places as Font de Gaume, Combarelles, etc. But the new paintings (there are also some engravings), while similar in style to some of the paintings at these other sites, are for the most part different. Indeed, the importance of the new discovery is that it vastly increases our knowledge of the earlier styles, of which elsewhere we have so far only known a little. The Lascaux pictures are mainly of Aurignacian age, antedating the wonderful polychromes found at Altamira in northern Spain and Font de Gaume in the Dordogne, and throw a new light on the evolution of this Phase I of the cave art which is now likely to become a great deal clearer. Many of the figures are very large and include drawings of bulls, horses, stags, bison and rhinoceros.

In one or two instances the animals are painted with their tongues out—reminding one of certain paintings of the eastern Spanish rock-shelter art, as also does the way in which some of the Lascaux animal horns are depicted. These two circumstances back up the contention that a part at any rate of the eastern Spanish art is palæolithic in date. Altamira is the site where the finest Magdalenian paintings have been preserved. Lascaux can claim the same title in respect to the earlier Aurignacian art.

The All-Russian Mineralogical Society

The Russian Mineralogical Society is celebrating its hundred and thirtieth anniversary during January 19–25, 1947, in Leningrad. This anniversary is being specially marked, because it was not possible to celebrate appropriately either the centenary or the hundred and twenty-fifth anniversary, since these occurred in 1917 and 1942 respectively. The Society is the oldest mineralogical society in the world—the Mineralogical Society of Great Britain and Ireland was founded in 1876 and the Société Minéralogique de France in 1878. Before the founding of the Geological Committee in 1881 in Russia, the Mineralogical Society was almost the only institution conducting regular geological and mineralogical exploration in that country. It thus became a centre for the collection of information concerning discoveries in little-known Russian regions. Among its most active members have been such brilliant scientific men as N. I. Koksharov, E. E. Chernyshev, E. E. Fedorov and A. Karpinsky. The present chairman of the Council is Academician S. S. Smirnov.

The Society has substantially influenced the development of the science of mineralogy through its publications, which began in 1830; they were issued at irregular intervals under various titles until 1866, when publication commenced of the periodical *Notes of the All-Russian Mineralogical Society* (*Zapiski Vserossiiskogo Mineralogicheskogo Obshchestva*). This was the first specialized mineralogical journal in the world; the *Mineralogical Magazine* commenced publication in 1877, *Bulletin de la Société Minéralogique de France* in 1878 and the *American Mineralogist* in 1916. Later Russian publications were the Bulletins and the Memoirs of the Geological Committee published departmentally (1883) and the Transactions of the Geological and Mineralogical Museum of the Academy of Sciences (1906). The discoveries of Russian mineralogists embodied in the *Notes* form an essential contribution to the world science of mineralogy. They include such classic memoirs as those by N. I. Koksharov and V. P. Yeremeyev reporting the measurements of minerals, the announcement by A. Gadoin of the discovery of 32 classes of symmetry, E. Federov's work on the discovery of the 230 space groups and many other important papers. The chief tasks of the Society are the exploration of the mineral wealth and soils of the U.S.S.R.; the spreading of mineralogical, geological and palæontological information within the U.S.S.R.; the establishment of closer contact among Russian men of science working in these fields and facilitating their relations with scientific institutions abroad.

A Monument to Darwin in Uruguay

In *Nature* of July 24, 1937, p. 138, it was recorded that Prof. Karl Walther, of Montevideo, had erected a stone on the Cerro de los Claveles to commemorate Darwin's visit to the locality in 1833. The project matured during the years of war, and Walther's original suggestion has now resulted in the erection of a monolith to the memory of Darwin on the summit of the Cerro. The Cerro was Darwin's 'farthest north' in Uruguay, to which he travelled on horseback from Montevideo. Nowadays it is easier to approach it by rail from Montevideo to Mercedes, the capital of the Department of Soriano, and thence by road to the Cerro 50 km. or more to the north-east on the high southern bank of the Río Negro at its confluence with the Arroyo Perico Flaco. The nearest village, formerly Saca Chispas, about 5 km. to the south of the Cerro, has been renamed Darwin in honour of the great master. It is a source of much gratification to note how, after more than a hundred years, Darwin's name and fame are still being honoured and acclaimed in Uruguay.

Zoological Society of London: Anatomical Research Fellowship

The Council of the Zoological Society of London has decided to re-establish a research fellowship in order to encourage investigations on the comparative anatomy of the animals brought to its prosectorium. The appointment offers unrivalled opportunities for work in this subject, in view of the wealth of material available, amounting during the course of an average year to approximately a thousand mammals, birds, reptiles and amphibians. Some of these animals belong to species likely to become extinct in the near future, and it is most important that some record of their anatomy should be preserved for the benefit of posterity. Also, contrary to the impression sometimes found among professed zoologists that comparative anatomy is an exhausted subject, little is known of the internal structure of any but the commonest animals. The prosectorium of a large zoological gardens offers the only opportunity of helping to fill these gaps in our knowledge. Such investigations are all the more urgent, since the extensive comparative anatomy collection of the Museum of the Royal College of Surgeons, built up mainly by Sir William Flower and his successors, was destroyed during the air raids—probably the worst single scientific loss of the War. It is hoped that the appointment will attract a student to a branch of zoology which, although rather out of fashion in recent times, remains the framework on which its many activities ultimately depend. Further information concerning the fellowship can be obtained from the Secretary, Zoological Society of London, Regent's Park, London, N.W.8.

War Industries and Town Planning

Two articles, by A. Shenfield and Prof. P. Sargant Florence, reprinted from the *Review of Economic Studies* (1944–45), have a bearing on the siting and development of new towns. The first article, "Labour for the War Industries: the Experience of Coventry", points out that the really important effect of the War upon Coventry is to be seen, not in the physical injuries which the city suffered, but in the conversion of its industries to war purposes and in their expansion to that end. Analysing the character and growth of the population of the city, Mr. Shenfield and Prof. Sargant Florence direct attention to the very high proportion of the workers of Coventry who at the beginning of the War were without roots in the city. This proportion was greatly increased by the enforced war-time expansion of its industries, and the existence of a highly abnormal proportion of such newcomers in the population is regarded as aggravating the problems of war-time production; first, because the outward as well as the inward mobility of the immigrant tends to be higher than that of other workers; and secondly, because with a population largely recruited by the attraction of high earnings and composed of those ready to snatch advantage from slack management, Coventry was likely to show higher costs than some other centres would have done.

In the second paper, "The Economics and Diseconomics of Industrial Concentration: the War-time Experience of Coventry", analysis of such factors as the cost of labour turnover, absenteeism, higher earnings, transport and housing leads to the conclusion that the localization since 1939 of war industries in Coventry on the scale required by the Government's plans, and the immigration they involved, was scarcely justified. The fundamental weakness of the Government's original plans was that it did not envisage the economic conditions of total war. The story of Coventry is the story of a war plan framed not merely in, but also to fit, the conditions of peace; and it is by no means certain that it leaves the city fit to meet the conditions of peace to-day. Before the War, Coventry possessed industries which were prosperous and expanding and which, in spite of the seasonal variations of the making of motor-cars, were fairly diversified. Presumably aircraft production will be cut down, and Coventry will depend mainly on the motor-car industry. Unless all the labour imported since 1939 emigrates, Coventry will require a larger motor-car industry than in 1939, since its other pre-war industries may not have been restored. Moreover, at the end of the War, Coventry was specializing more narrowly than before on trades liable to cyclical as well as seasonal fluctuation. Prof. Sargant Florence and Mr. Shenfield conclude that plans should be prepared to guard against abnormally high unemployment. Diversification with industries not liable to cyclical fluctuation and likely to meet post-war demands for durable goods is required, using as a basis the expansion and fostering of offshoots from the electrical, engineering, metal-working and textile industries, so that Coventry approximates in character to its more balanced neighbours, Birmingham and Leicester.

Chemotherapy

EVERYONE who is interested in chemotherapy should not fail to consult the *British Medical Bulletin*, No. 4, Vol. 4, 1946, the sub-title of which is "Background to Chemotherapy". Introduced by a sketch of the history of chemotherapy by Dr. E. M. Lourie, this issue of the bulletin contains an article on the steps leading to the therapeutic application of microbial antagonism by Sir Howard Florey, one on the analysis of antibacterial action by Dr. H. MacIlwain, and a valuable article on the nutrition of bacteria by Sir Paul Fildes. Dr. F. R. Selbie contributes an article on microbial resistance to chemotherapeutic drugs, Prof. L. P. Garrod deals with the principles and practice of local chemotherapy, and Prof. J. H. Gaddum writes on the principles of administration in chemotherapy. Dr. C. H. Andrewes and Dr. Harold King have written a valuable article on the chemotherapy of the rickettsial and virus diseases.

It is good to see that space is also given to the important chemotherapeutical work done in France, which is summarized in an article on the contribution of the Institut Pasteur, Paris, to recent advances in microbial and functional chemotherapy by four members of the staff of this famous institution, Jacques Tréfouël, Mme. Jacques Tréfouël, Daniel Bovet and Frédéric Nitti. An interesting article by Prof. F. G. Young, entitled "Claude Bernard and Scientific Adventure", pays a just tribute to the work of this great man. The book reviews and the guide to current medical literature continue to be a valuable feature of the bulletin. In this issue there is also a very interesting article on the making of a catalogue of medical films by Dr. Brian Stanford, who is in charge of the reference catalogue of all the films of medical interest in Great Britain, which is being maintained by the co-operation of the Scientific Film Association and the Royal Society of Medicine. Some notes on health education films and some of those produced at the Pasteur Institute are also given.

British Scientific Instrument Research Association

ONE of the first steps taken in the major scheme of expansion which the British Scientific Instrument Research Association is at present engaged in putting into effect was the creation of an Information Department to serve both members and staff. This Department, in April 1946, began the publication of a printed monthly bulletin, consisting of about twenty pages an issue, and containing Association notes, and abstracts of current, including patent, literature relating to scientific instruments. The bulletin, at first, was circulated only to members of the Association, to whom it is supplied free of charge, but, in order that it may be of the greatest possible use to makers and users of scientific instruments, the Council of the Association has now decided to make the bulletin available to non-members at an annual subscription of £2.

The October issue of the bulletin (vol. 1, No. 10) records that the work of transferring the Association's research laboratories from Russell Square, London, to new and much larger premises at Chislehurst, Kent, is making good progress, and it is expected that a substantial section of the chemical laboratories will have been removed by the end of November. The response to the request sent out to members for copies of their catalogues and other publications has been very good, and it is hoped to maintain an up-to-date collection of these in the Association's Library. The offices of the Association are at 26 Russell Square, London, W.C.1. The chairman is Dr. W. H. Eccles; the director of research and secretary, Mr. A. J. Philpot; and the information officer, to whom all communications relating to the bulletin and requests for loan of documents should be addressed, is Mr. C. W. Hanson.

Instrument Practice

WITH the outbreak of hostilities in 1939 a number of important Continental journals disappeared from the literature of instrument technology. Many of these are again becoming available in Great Britain; but there is no doubt that there is room for more published information in this large and varied field of scientific thought. The issue of the first number of a new English publication on instrumentation is, therefore, a matter of great interest. The name of this monthly journal is *Instrument Practice*, and its title page states that it hopes to cover the whole field of instrument technology and instrumentation. Its editorial policy is stated as serving and unifying the interests of instrument makers, users and technologists. The journal is primarily concerned with commercial rather than laboratory instruments, and it also aims at the publicizing of British instruments abroad. It will, therefore, be acknowledged that the new journal has set itself an impressive and ambitious task. A considerable section of the first issue is given to an account of a recent conference in the United States, with commentaries on the papers so brief as to be of little value in many cases. Another section is devoted to reprints of papers read before the Society of Instrument Technology. It is here that the new journal may serve a most useful purpose, as the papers of the Society have not yet been regularly published in any one journal. Permanent features cover new patents, news of the industry, trade and technical publications, particulars of new companies and a diary of forthcoming events.

Claims for War-time Awards for Inventions

The rules of procedure of the Royal Commission on Awards to Inventors were published in September 1946 (*Nature*, September 28, p. 443). About fifty claims arising from the use of inventions by the British and Allied Governments during the War have so far been referred to the Commission. They relate to a wide field of invention and include claims in respect of 'Mulberry', the flail tank, which was first used in North Africa for destroying enemy mines, plastic armour for use on ships, amphibious tanks, the Bailey bridge, the sticky bomb, and many others. Many of these cases raise complicated scientific and legal issues, and the preparation of a case for hearing takes a considerable time. It has, therefore, been necessary to postpone the first public hearing of the Commission; but it is hoped that a case will be ready in the middle of February or the beginning of March. A committee consisting of the chairman, Lord Justice Cohen, the deputy chairman, Mr. Kenneth Swan, and the secretary has been set up to deal with preliminary matters which may arise in a claim before it is ready for hearing before the full Commission.

Blood Group Reference Laboratory

Since the Galton Laboratory Serum Unit (Medical Research Council), formerly at Cambridge, closed in May last, Dr. R. R. Race, the former director, has moved to the Lister Institute, London, where he is in charge of the new Blood Group Research Unit of the Medical Research Council. Dr. A. E. Mourant, who formerly assisted Dr. Race, has become director of the new Blood Group Reference Laboratory of the Ministry of Health. This Laboratory, which is part of the Ministry of Health Blood Transfusion Service, is also at the Lister Institute, and will provide grouping serum and investigate clinical blood-group problems. The juxtaposition of these two laboratories will be of great mutual benefit and ensure the close association of the theoretical and practical sides of this subject. Hospitals and medical men requiring grouping serum should, in the first instance, apply to their local regional transfusion centre, through which grouping serum will be issued.

Astrology in the Hellenistic Age

The study of astrology fascinated mankind for some two thousand years. The fundamental idea was the association of a god with each planet and the transfer of the god's character and mythology to the planet. As a result the planet itself was believed to exercise a direct influence on mankind. A crude form of astrology grew up in Mesopotamia in prehistoric times. But Martin P. Nilsson (*Medd. Lunds Astron. Observ.*, ii, No. 111; 1943) suggests that the great system of astrology properly so called was a product of the Hellenistic age. Though based on the false premise already mentioned, the study of the heavens was scientific, and was the result of the labours of a number of scientific observers in the Hellenistic world.

Announcements

The Gold Medal for 1947 of the Royal Astronomical Society has been awarded to Prof. M. G. J. Minnaert, of Utrecht, for his outstanding contribution to solar physics in general and solar spectrophotometry in particular.

The annual general meeting of the Royal Meteorological Society will be held on January 22 at 5 p.m., when Mr. G. Manley will deliver his presidential address on "The Geographer's Contribution to Meteorology". The Symons Medal will be presented to Prof. David Brunt, in recognition of his distinguished services to meteorological science.

Prof. P. C. Sarbadhikary, professor of botany, University of Colombo (Ceylon), has been appointed Sir Rash Behari Ghosh professor of botany in the University of Calcutta in succession to Prof. S. P. Agharkar, who retired in May.

Mr. Ronald Ede has been appointed agricultural attaché to the British Legation in Copenhagen. Mr. Ede, who is forty-one years of age, has been secretary of the University School of Agriculture at Cambridge since 1929. He was secretary of the Luxmoore Committee on Post-war Agricultural Education which reported in 1943.

Mr. W. J. Drummond, deputy chairman of the North-Western Divisional Coal Board, has been appointed honorary secretary of the British National Committee of the World Power Conference, in succession to the late Mr. C. Rodgers.

Colonel L. W. Harrison has retired from the staff of the Ministry of Health, to which he has been adviser on venereal diseases since 1919. Colonel Harrison has been associated with the control of venereal diseases in England and Wales for nearly half a century. In recognition of his work the American Social Hygiene Association awarded him the William Freeman Snow Medal for 1946. He is the author of a number of books and papers on venereal disease.

The following have been elected officers for 1947 of the New York Academy of Sciences: *President*, Dr. Harden F. Taylor; *Vice-Presidents*, Dr. Robert B. Sosman, Dr. S. Stansfeld Sargent, Dr. Ross F. Nigrelli, Walter Dyk, Bernhard Haurwitz; *Recording Secretary*, Dr. George B. Pegram; *Corresponding Secretary*, Prof. Athelstan F. Spilhaus; *Treasurer*, Marvin D. Thorn; *Librarian*, Prof. Victor K. La Mer; *Editor*, Dr. Roy Waldo Miner; *Members of Council* (1947–49), William Brown Bell, Harry C. Charipper, Dr. Caryl P. Haskins; *Finance Committee*, Addison Webb (chairman), William Ottis Sweet, Dr. Charles N. Frey.

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Multiple Disintegration Processes Produced by Cosmic Rays

Some months ago, in collaboration with D. L. Livesey and L. V. Chilton[1], we described experiments on the prototype of the new photographic emulsions for the detection of fast protons and other heavy particles, which are now being produced by Ilford, Ltd., in various types and which are referred to as 'Nuclear Research Emulsions'. Our experience with these plates strongly suggested that they would be very suitable for detecting the multiple disintegration phenomena produced by the fast neutrons, γ-rays and other radiations in the cosmic rays[2,3,4,5]. We therefore exposed plates for six weeks at the Pic du Midi, Hautes Pyrenées, at a height of 3,800 metres, and in this communication we wish to direct attention to the important conclusions which can be drawn from an examination of the experimental material thus obtained.

In addition to the numerous long isolated tracks, which show a grain spacing characteristic of fast protons of energy up to 30 MeV., we observe, in emulsions of type $C2$, 40 μ thick, an average of two multiple disintegration 'stars' per sq. cm. of the plate. Up to the present, we have found more than three hundred events of this type. To avoid confusion due to any radioactive contamination of the emulsion, we accept for detailed study only those 'stars' in which there are three or more components, at least one of which has a range greater than 10 cm. of standard air. From the total area of our exposed plates, we conclude that we shall find about three thousand stars in a complete examination. We believe that this material is sufficiently extensive to enable us to establish regularities in the modes of disintegration of the light and heavy elements under bombardment with primary radiations of great energy.

We cannot, within the scope of a single communication, discuss the many interesting and novel events we have observed; but, as an example of the quality of the experimental material, we show, in Figs. 1 and 2, mosaics of photomicrographs of two comparatively simple disintegrations. We chose to photograph these particular 'stars' because they were among the first which we observed and they were of such a type that the work of constructing the mosaics was not unduly arduous. At the points where the track of each of the particles, radiating from the disintegrating nucleus, reaches the edge of the photograph, we show the total range of the corresponding particle in the emulsion, and indicate whether it ends in the emulsion (e), passes out of the surface (s), or into the glass (g). In making prints of the photographs for reproduction, the joins of the mosaic have been obliterated. At no stage in the photography, however, has any 'retouching' been done.

Fig. 1 shows a multiple disintegration in which the most prominent track, A, has a grain spacing characteristic of an α-particle. It ends in the emulsion and, from its observed range of 505 μ, we can conclude that its initial energy, at the moment of its ejection from the parent nucleus, was 36 MeV.[6]. The thinner tracks B, C, D, E, G and H have a grain spacing similar to that of protons of familiar energies ($\sim$ 20 MeV.), and they all pass out of the emulsion, while F, which passes into the glass, is probably an α-particle. In addition, the tracks of at least two short, very heavily ionizing particles can be distinguished in the original photographs.

Fig. 2 shows a multiple disintegration in which the two long tracks (Z) and (Y) are produced by protons. Z has a range of 290 μ (energy, 6·8 MeV.) and ends in the emulsion, while Y passes out of the surface after traversing a distance of 400 μ. The other tracks all leave the emulsion, so that we cannot make a certain identification of their nature; but, if their energies are each less than 30 MeV., (X) and (W) are protons and (V) is an α-particle.

The most striking feature of this second photograph is the 'hammer' track (T), in which the end of a heavily ionizing particle from the source is crossed by a second track in the form of a 'T'. It is possible that the cross-track is due to an α-particle of which the trajectory passes, by chance, within one micron of the end of the track of the particle from the 'star', and we observe tracks of approximately the same range and grain spacing throughout the plate. From the number of such tracks per unit volume of the emulsion we can, however, calculate the probability of the observed juxtaposition if it is to be explained as a chance event. We obtain a value less than 1 in 10^5, and we must therefore look for an alternative explanation.

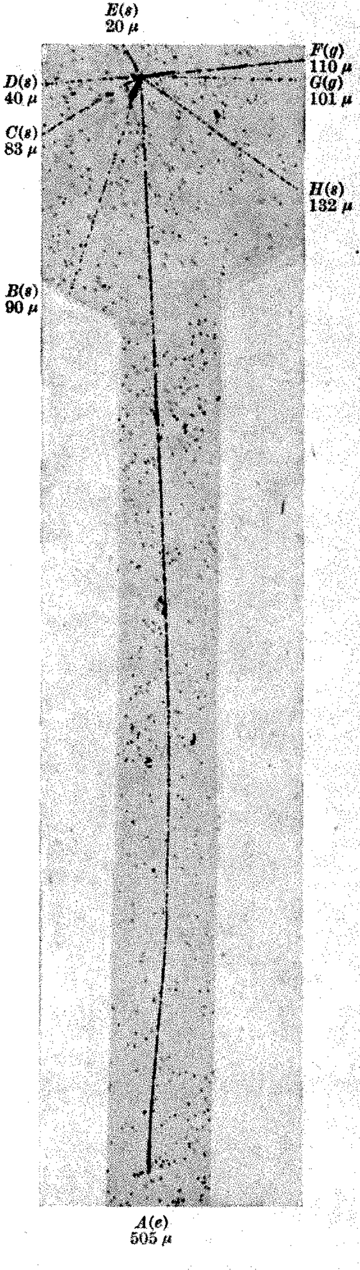

Fig. 1. Mosaic of twelve photomicrographs showing the multiple disintegration of a nucleus of silver or bromine. The different tracks are not all in the same plane and, with objectives of high aperture, several photographs must be taken to obtain a complete representation of the subject

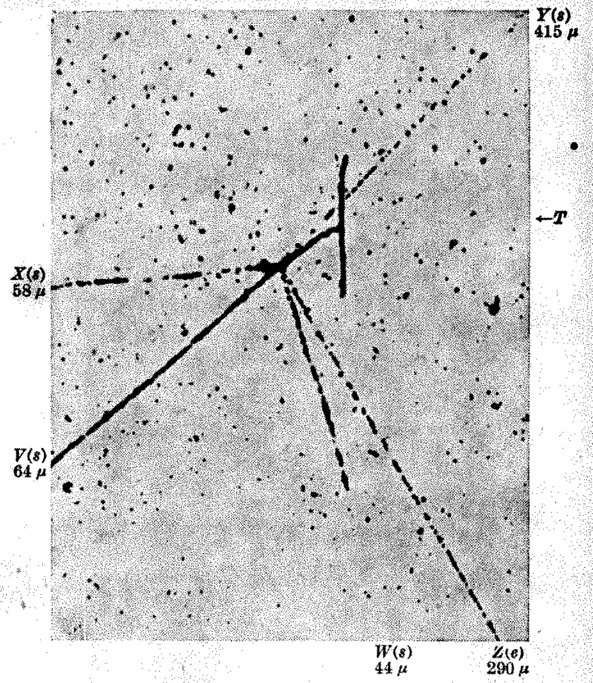

Fig. 2. MOSAIC OF SIX PHOTOMICROGRAPHS. THE COMPLETE HAMMER TRACK WAS OBTAINED IN A SINGLE PHOTOGRAPH

A microscopic examination of track *T* at high magnification indicates that the particle from the exploding nucleus is more heavily ionizing than an α-particle. The track shows the characteristic distorted appearance—a wavy kris-like structure—which occurs when there are so many developing particles in it that their expanding filamentous form during development causes the column of silver grains to buckle. This effect is not found at the end of the long α-particle track shown in Fig. 1, and this is in accord with our general experience with α-particle tracks in the *C*2 emulsion. We may therefore assume that the track is produced by a heavy nuclear splinter. The cross-track of the *T* is then to be attributed to the disintegration of the heavy particle, after it has been brought to rest, into two fragments which recoil in opposite directions. Since the two arms of the cross-track are of nearly equal length, 13·1 and 14·4 μ respectively, we must assume, on this view, that the two particles are of equal mass. If, as the simplest example of such a disintegration process, we assume the nuclear fragment to be an excited Be^{8} nucleus which decomposes into two α-particles, the observed ranges of the tracks indicate that the energy in the excited state is 7·5 MeV. Serious difficulties arise, however, if we assume the fragment emitted from the explosion to be such an excited nucleus.

The speed of the recoiling nuclear fragment must be of the order of 2×10^{9} cm. per sec. The time it takes to reach the end of its trajectory, 16 μ long, is therefore about 10^{-12} sec. Since the two component particles into which we regard it as decomposing are emitted in opposite directions, the velocity of the original Be^{8} nucleus must have been small or zero at the moment of its decay. We must conclude that the life-time of the excited state is greater than 10^{-12} sec. Such a relatively long life corresponds to a width in the excited level of only a small fraction of an electron-volt. This is in contrast with the excited state of Be^{8} at 2·9 MeV., which is known to have a width of several hundred KeV. and a correspondingly short life. We must therefore assume the existence of a metastable level in Be^{8}.

These difficulties can be overcome if we assume the original fragment to be a Li^{8} nucleus. It has been shown that this nucleus suffers a β-decay, with a period of 0·8 sec., in which two α-particles appear, together with the electron. The α-particles have a continuous distribution in energy extending from low values up to 7·75 MeV. Our observations are therefore consistent with the assumption that the fragment from the exploding nucleus is Li^{8}.

Whether or not this particular observation is to be attributed to chance, our observations of several other equally striking events make it clear that multiple disintegration phenomena of this type cannot be accounted for in terms of conventional ideas in nuclear physics, and that we are entering a realm of great theoretical and experimental interest. It is clear that for such experiments the new photographic emulsions give us an instrument of considerable power. Among the other advantages of the method, which are gradually being recognized, we may point out that for this particular type of experiment it allows us to measure time intervals about a thousand times shorter than would be possible in similar experiments using the expansion chamber. The investigation is continuing.

We are indebted to Prof. J. Baillaud, director of the Observatory of the Pic du Midi, for permission to use the facilities of the Observatory and for much kindness and hospitality. To him, to our friend Prof. Max Cosyns, without whose assistance we should not have succeeded in making the exposures, and to Mr. C. M. G. Lattes, who assisted with the preparation of the material for the experiments, we wish to express our grateful thanks.

(*Note added in proof.*) We have observed a second multiple disintegration star which shows a 'hammer' track with equal branches at the 'T'. In other cases we found that the nuclear fragment decays into two and sometimes three fragments before coming to rest.

A Theory of the Control of Twinning in Quartz

IN a previous communication in *Nature*[1] some experiments in connexion with the controlled alteration in the twin boundaries of electrically twinned quartz have been described. The following theory satisfactorily accounts for the production of substantially single-crystalline specimens by the application of a torque at temperatures somewhat lower than the α-β transition point (573° C.).

If a plate of twinned material is cut parallel to an arbitrary direction relative to the crystallographic axes and then twisted about an axis parallel to its length, the elastic energy per unit volume stored in each of the two individuals constituting the twin is different. The crystal of the first orientation in the twin may be more easy to twist than that of the second orientation, and will, in consequence, have more elastic energy per unit volume. According to the present theory, that orientation tends to predominate after the thermal and mechanical treatment which permits the crystal to twist as far as possible under a given torque.

This may be expressed quantitatively in the following manner. The expression for E, the elastic energy per unit volume of the crystal, will be of the form

$$E = \Sigma \tfrac{1}{2} t_{ik} r_{lm},$$

where t_{ik} and r_{lm} represent the stress and strain components respectively, and the summation is to be made over all the values for which i, k, l and m are independently made equal to 1, 2 and 3. This complete expression is too complicated to evaluate in most practical cases, but for torque applied to a long thin bar it is possible to simplify it. The predominant stress component for this type of experiment is a shear, tending to make a square drawn on the surface of the plate, with one edge parallel to the length of the plate, turn into a rhombus. The expression for E then becomes,

$$E = t'_{23} r'_{23},$$

where the X_3' axis is chosen parallel to the length of the bar and the X_2' axis parallel to the breadth.

Now since $s'_{23} \ll s'_{44}$, $r'_{23} = s'_{44} t'_{23}$, if all stress components other than t'_{23} may be neglected.

$$\text{Thus } E = s'_{44}(t'_{23})^2.$$

The orientation of the crystal in one part of the twin is derived from that in the other part by a rotation through 180° about the trigonal axis. The modulus s'_{44}, which applies to one part of the twin, differs in magnitude from the modulus s''_{44}, which applies to the other part of the twin in the same crystal plate. The change of energy per unit volume in changing from one orientation to the other is therefore ΔE, where

$$\Delta E = (s''_{44} - s'_{44})(t'_{23})^2.$$

From the standard expression for s'_{44} the value of $s''_{44} - s'_{44}$ may be evaluated in terms of the angles ξ and θ, where ξ is the angle between the projection of the normal to the major surface of the plate on to the (00*1) plane, and the diad axis and θ is the angle between the same normal and the trigonal axis. This value is given by the equation,

$$s''_{44} - s'_{44} = -4 s_{14} \sin 2\theta . \sin 3\xi.$$

The geometrical model which can be constructed from this equation, by making each radius vector defined by ξ and θ of length equal to $(s''_{44} - s'_{44})$, has the form and symmetry of the figure derived experimentally and published in the previous communication[1]. Further, the experimentally observed direction of the electric axis in a crystal untwinned by the application of a torque agrees with that required by the theory. There appears to be no direct determination of the variation of s_{14} with temperature over the whole range 20°–573° C., but, if this variation is similar to that of the other elastic moduli which have been measured, it is not likely to alter the applicability of the theory here proposed until a temperature close to 573° C. is reached. A satisfactory theory is therefore given of the behaviour under torque of twinned plates of various orientations having their lengths perpendicular to the trigonal axis.

Following on the lines of the above theory, Mr. L. A. Thomas, of the Research Laboratories of the General Electric Co., Ltd., Wembley, has calculated the expression for $s''_{44} - s'_{44}$ for a plate of completely general orientation, thus including the case of plates having their lengths inclined to the diad axis. When applied to R-cut and r-cut plates having their lengths inclined at an angle of 45° to the diad axis, the agreement between the theory and experiment still holds. The theory shows that the sign of ΔE is reversed relative to that in plates of otherwise the same orientation but having their lengths parallel to the diad axis. This corresponds to the experimental fact that in two R-cut plates, one having its length parallel to the diad axis and the other having its length at 45° to this axis, complementary orientations are stable under the torque-and-heat treatment. This agreement between the simple theory and experiment is obtained in spite of the fact that, on twisting plates of such general orientation, bending occurs as well as twisting. It would not have been surprising if the simple theory outlined above had proved inadequate for plates of general orientation.

This work, of which a fuller account will be published elsewhere, has been done in co-operation with the Research Laboratories of the General Electric Company, Ltd., Wembley, and I am grateful to the Director for permission to publish. I also wish to acknowledge my indebtedness to Mr. R. S. Rivlin for valuable discussions on this subject.

Crystal Structure of Copper Butyrate Monohydrate

VERY few soaps or other similar substances have been examined by means of the X-ray single-crystal technique because of the difficulty of obtaining crystals which are large enough, and particularly crystals which are thick enough. Consequently, there are few data on the unit cell dimensions. Copper butyrate, however, when crystallized by allowing an acetone solution to evaporate at room temperature, gives unusually large and comparatively thick crystals in the form of six-sided plates frequently twinned on the large face. They are of a deep green colour, and on exposure to the air for a day or so the faces become dull, the crystals ultimately disintegrating.

Dehydration experiments carried out in an atmosphere with a partial water-vapour pressure of 13 mm. mercury showed that one molecule of water was lost between 42° and 47° C. Analytical data also confirmed the presence of water of crystallization.

According to Groth[1], the monohydrate is described as triclinic pinakoidal ($a : b : c = 1{\cdot}6921 : 1 : 0{\cdot}9993$, $\alpha = 88° 55'$, $\beta = 123° 51'$, $\gamma = 88° 25'$). The present crystals, however, are monoclinic, the large face being $\{001\}$. Rotation, oscillation and moving-film photographs were taken about the three principal axes and about the diagonal of the bc face of the unit cell using copper $K\alpha$ radiation. The unit cell dimensions are as follows:

$a = 25{\cdot}12$ kX.; $b = 14{\cdot}65$ kX.; (c) $26{\cdot}79$ kX.; $\beta = 109{\cdot}7°$; d (001) = $25{\cdot}23$ kX. Density (obs.) = $1{\cdot}44$ gm./cm.^{3}; density (calc.) = $1{\cdot}45$ gm./cm.^{3} (assuming 32 molecules of $(CH_3.CH_2.CH_2.COO-)_2Cu.H_2O$ per unit cell).

The observed halvings were $\{hkl\}$ when $(k + l)$ is odd and $\{h0l\}$ all halved.

The space group is, therefore, $C_s^4 - Aa$ or $C_{2h}^6 - A2/a$. In the former space group, four asymmetric units are necessary, so that each unit would consist of eight molecules, whereas only four molecules per asymmetric unit are necessary in the latter space group. It is rather unusual for such a large number of molecules to be required.

I am indebted to Mr. Lang for preparing this compound, and to Dr. Vand and Mr. Lomer for carrying out the dehydration experiments. I wish to thank the director of the Chester Beatty Research Institute of the Royal Cancer Hospital (Free) for the loan of some apparatus, and the directors of Lever Brothers and Unilever, Ltd., for permission to publish these results.

Response of Photoconductive Lead Sulphide Cells

IN a recent communication, the possibility of using photoconductive lead sulphide cells for the measurement of rapidly varying surface temperatures has been emphasized[1]. For this purpose it is, of course, desirable that the response time of the measuring instrument be sufficiently small, and it is therefore of interest to see whether on theoretical grounds it is possible to decrease the response time of the cells. In this connexion it is important to remember that the conduction electrons can be captured both by the ionized impurities (n per c.c.), the number of which increases with increasing temperature, and by interstitial ions. At ordinary temperatures the equilibrium number of the latter (Frenkel defects) is very small; however, under suitable conditions of manufacture, a large number (M per c.c.) corresponding to a high-temperature equilibrium can be 'frozen-in'. The number of conduction electrons released by radiation (I per c.c. per sec.) and heat agitation (A per c.c. per sec.) is then determined by the equation

$$\frac{dn}{dt} = I + A - Bn(n + M),$$

the capture coefficients of the ionized impurities and interstitial ions being assumed equal for the sake of simplicity. The time t_α taken to obtain the fraction α of the full asymptotic response is, therefore, given by

$$2B(n_0 + \tfrac{1}{2}M)\, t_\alpha = \frac{1}{\delta} \log \frac{\delta + 1 + (\delta - 1)\alpha}{(\delta + 1)(1 - \alpha)},$$

where

$$\delta = \sqrt{1 + \frac{I}{B(n_0 + \frac{1}{2}M)^2}} = \sqrt{1 + \frac{(n_\infty - n_0)(n_\infty + n_0 + M)}{(n_0 + \frac{1}{2}M)^2}};$$

$$n_0 = n\,(t = 0), \qquad n_\infty = n\,(t = \infty).$$

Hence, if $M \gg n$,

$$t_\alpha = \frac{1}{BM} \log \frac{1}{1 - \alpha},$$

whatever I may be.

On the other hand, if $M \ll n$,

$$t_\alpha = \frac{1}{2Bn_0} \log \frac{1}{1 - \alpha} \text{ for small } \delta - 1,$$

$$t_\alpha = \frac{1}{2Bn_0\delta} \log \frac{1}{1 - \alpha} = \frac{1}{2\sqrt{IB}} \log \frac{1}{1 - \alpha} \text{ for}$$

large $\delta - 1$.

As B varies probably only slowly with temperature, the first formula shows that in the case $M \gg n$ the response time is almost independent of temperature but varies inversely as M. As distinct from this case, the response time decreases exponentially with increasing temperature of the cell if $M \ll n$, owing to the exponential increase of n_0 for semi-conductors. The case of large $\delta - 1$ requires too high intensities of radiation to be important in practice.

It is to be expected that the case of a large number of 'frozen-in' capturing centres will be realized in practice if there is a large and rapid drop in the diffusion coefficient of the Frenkel defects during the manufacture of the cell[2]; for example, if the lead sulphide film is obtained by evaporation at a high temperature and sublimation on a cool support. The higher the temperature at which the film is formed, and the cooler the support, the larger M will be, that is, the smaller the response time t_α. The other case, $M \ll n$, can be expected to apply to cells made at ordinary temperatures, for example, by chemical precipitation.

It must be pointed out that the decrease in response time is accompanied by a corresponding decrease in response (signal), the asymptotic number of photoelectrons being given by

$$n_\infty - n_0 = \frac{I}{2B(n_0 + \frac{1}{2}M)} = \frac{It_\alpha}{-\log(1 - \alpha)}.$$

Conversely, the formula shows that, at a loss of speed of response, the sensitivity of the cells can be increased by the methods indicated.

Details and comparison with experiments will be given elsewhere. I have to thank the Director-General of Scientific Research (Defence), Ministry of Supply, for permission to publish the present communication.

Temperature Dependence of the Intensities of Raman Lines

I HAVE undertaken the critical and exhaustive study of Placzek's polarizability theory of Raman scattering. My investigations have been carried out both with solids and liquids, and the following observations made: (1) The intensity of the Stokes lines decreases with the rise of temperature, while according to the theory there should be an increase. (2) The intensity of the anti-Stokes lines, in general, increases with the increase of temperature, but not to the extent that would be expected from Placzek's theory. (3) The intensities of the Stokes and the anti-Stokes lines tend to meet each other at some finite value, while from the theory we should expect the intensities of the Stokes and the anti-Stokes lines to become large at high temperatures and to tend to meet each other at infinite intensity. (4) The ratio of the intensities of the Stokes and anti-Stokes lines, at all temperatures, is in agreement with the result expected from Placzek's theory.

The polarizability of a molecule may be expanded as a series

$$L(q) = L_0 + \sum_j \left(\frac{\partial L}{\partial q_j}\right)_0 q_j + \tfrac{1}{2}\sum_{jk} \left(\frac{\partial^2 L}{\partial q_j\, \partial q_k}\right)_0 q_j q_k + \ldots,$$

where the suffix 0 refers to the equilibrium configuration, q_j, q_k, etc., are the various normal coordinates of the molecule, and a particular set of values of q_j, q_k, etc., define a configuration q of the molecule. The conclusions from Placzek's theory are arrived at by taking the factor $\left(\frac{\partial L}{\partial q_j}\right)_0$ as constant at various temperatures. Taylor's expansion is valid only in the close vicinity of the equilibrium configuration. But as the temperature is increased, the amplitudes become larger, and we can no longer assume that Taylor's expansion, which is taken in the neighbourhood of the equilibrium configuration, is valid. Therefore, $\left(\frac{\partial L}{\partial q_j}\right)_0$ cannot be regarded as constant. It will decrease rapidly with the increase of temperature. The observed results can be explained on this basis.

A detailed explanation will be published elsewhere.

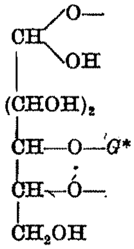
Structure of Starch and Cellulose

ALTHOUGH the characteristic features of the chemistry of starch and cellulose are satisfactorily represented by the commonly accepted structures involving chains of glucopyranosido residues, which are unbranched in cellulose and amylose, but branched in amylopectin, certain difficulties remain to be explained. These include, for example, the exact nature of the relationship between the amylose and the amylopectin components of the starches, and the reasons for the different behaviour of cellulose on methylation in the presence and in the absence of oxygen respectively.

In an attempt to overcome very real difficulties of this kind, Pacsu and Hiller[1] have recently advocated a novel structure for these polysaccharides based on the assumed occurrence of a small proportion of non-cyclic hemiacetal linkages. This is a modification of the Tollens acetal structure for cellulose, and the essential feature of it as applied to starch is shown in (I), which depicts a maltose residue in a hemiacetal form serving as a link between long chains of 1 : 4 linked glucopyranosido residues. The glucose residue marked with an asterisk is an end-group, and Pacsu and Hiller apparently postulate a sufficient number of these cross-linkages to account for the number of end-groups as determined by the methylation method. It is not possible, therefore, to decide on the results of methylation experiments alone whether or not such a formula is valid for a starch.

Other methods of approach to the problem of end-group determination have recently been developed, and by application of one of these we have obtained evidence from which it appears that the type of linkage suggested by Pacsu and Hiller does not occur in starches. Inspection of (I) reveals that the presence of hemiacetal linkages increases the number of contiguous hydroxyl groups at which oxidative attack by the periodate ion is possible, with the result that from the structure shown in (I) three molecules of formic acid would be formed for every terminal glucose residue (G^*). Actually, on the basis of the much more complicated detailed formula depicted by these authors, considerably more than three molecules of formic acid per end-group would be liberated, with the simultaneous formation of a large number of fragments of smaller molecular weight.



(I)

It has been found, however, by use of methods elaborated recently for the quantitative liberation and estimation of formic acid in periodate oxidations of polymeric glycosides[2], that starches yield only one molecule of formic acid per end-group. This result is in agreement with the expected value if amylopectin possesses the 'laminated' structure[3], but is incompatible with Pacsu and Hiller's formula.

In other respects also the newly proposed structure appears to be incapable of reconciliation with experimental observations. For example, investigations on the kinetics of the 'disaggregation' of starch have shown that the bonds broken in the reaction have the stability of glycoside links towards acid, and require no novel type of bonding to explain their properties[4]. Furthermore, it is difficult to see how the results of enzymic hydrolysis and dextrin formation could be explained by structures involving hemiacetal linkages of the type shown in (I).

Effects of Organic Arsenic Compounds on Tissue Enzymes and Proteins and on Tissue Metabolism

IN connexion with recent interesting reports, both in Great Britain and in the United States, on the relationship between organic arsenicals and enzymes containing thiol groups, we would like to take the opportunity of directing attention to some early observations of our own, incorporated in a report to the Medical Research Council in November 1940.

The following extract from this report gives our conclusions based on investigations, carried out in the Cardiff City Mental Hospital during 1938, 1939 and early 1940, on the effects of organic trivalent and pentavalent arsenic compounds on proteins and enzymes.

"(1) Reversible equilibria exist between pentavalent arsenic compounds (such as tryparsamide) or trivalent arsenic compounds (such as arsphenamine and derivatives of phenylarsenoxide) and purified tissue proteins. The affinity of organic arsenoxides to the proteins is far greater than that of pentavalent arsenic compounds. Affinity constants have been measured and new methods for analysis of $\mathrm{As}^{\mathrm{III}}$ and As^{V} in presence of proteins elaborated. Compounds of the type R.As.O combine reversibly with —SH groups of the protein and with other as yet unknown groupings.

"(2) Certain compounds of the type R.As.O (e.g., meta-amino-*p*-hydroxyphenylarsenoxide, also known on the market as 'mapharside') combine reversibly with —SH enzymes. They can be regarded as specific inhibitors of this class of enzymes, which includes urease, succinic dehydrogenase and choline esterase. It is proved for the first time by this means that choline dehydrogenase is an —SH enzyme. Enzymes known not to possess —SH groups as part of their active centres, e.g., invertase, catalase, lactic dehydrogenase, cytochrome oxidase are unaffected by R.As.O. The toxicity of R.As.O to enzymes is neutralised by the addition of —SH compounds, e.g., cysteine, in large excess. These condense with R.As.O to form easily dissociated compounds, and excess —SH is required to keep most of the —AsO in the form of the inert  $-\mathrm{As}\begin{matrix}\diagup\mathrm{S}- \\ \diagdown\mathrm{S}-\end{matrix}$ derivative.

"Compounds of the type R.As.O and R.As.Cl_2 also inhibit vigorously the respiration of intact cells in presence of glucose and sodium pyruvate. Such cells vary from intact brain tissue to bacterial suspensions. The oxidation of pyruvate and possibly other ketonic acids is greatly inhibited, and ketonic acids accumulate. The addition of —SH compounds in excess neutralizes R.As.O inhibition of the metabolism of intact cells.

"Compounds of the type R.As.O and R.As.Cl_2 are also highly bactericidal but the addition of —SH neutralises the lethal action.

"(3) Pentavalent arsenic compounds, e.g., tryparsamide and atoxyl, are reduced by —SH compounds (e.g., cysteine, glutathione) under biological conditions to the highly toxic trivalent —AsO derivatives. This may be demonstrated by the effects of the products of reduction on —SH enzymes (e.g., urease) and on intact cells. The reduction of tryparsamide in the body is doubtless accomplished by the —SH bodies (e.g., glutathione) present."

This work was undertaken as part of a programme to elucidate the mechanism of action of arsenicals in the treatment of syphilis of the central nervous system, and part of it was carried out with the assistance of Mr. W. J. Clarke.

The publication of these results was not allowed during the War for security reasons. Owing to war work we became separated, and only recently have we had the opportunity of reconsidering our early work for the purpose of publication.

The experimental results upon which the above conclusions have been reached will, it is hoped, be published shortly. We are much indebted to the secretary of the Medical Research Council for permission to publish the extract of the report in question.

Splitting of Phosphocreatine

IT is generally assumed that when phosphocreatine is hydrolysed either enzymatically or spontaneously, the end products are creatine and phosphoric acid. This, however, is not always found to be the case. When phosphocreatine is hydrolysed at 38° in saturated picric acid, about 10 per cent of the substance is converted into creatinine (Fig. 1). Under these conditions, creatine is not transformed into creatinine. Obviously phosphocreatine has a certain spontaneous tendency to ring formation. If heated to 100° either in picric acid or hydrochloric acid, there is a rapid formation of creatinine, followed by a linear increase due to the reaction creatine – creatinine (Fig. 2). If the two curves are subtracted, a curve of much the same appearance as Fig. 1 results. Whether picric or hydrochloric acid is used for hydrolysis is of no importance.

The phenomenon described may possibly be developed into a specific method for the estimation of phosphocreatine in blood and other tissues. Generally this substance is estimated as the difference ('direct determinable' P — 'true' inorganic P), thus neglecting other labile phosphorus compounds which may be present.

These experiments may perhaps throw some light on the creatinine formation in living organisms. It is well established that the daily excretion of creatinine

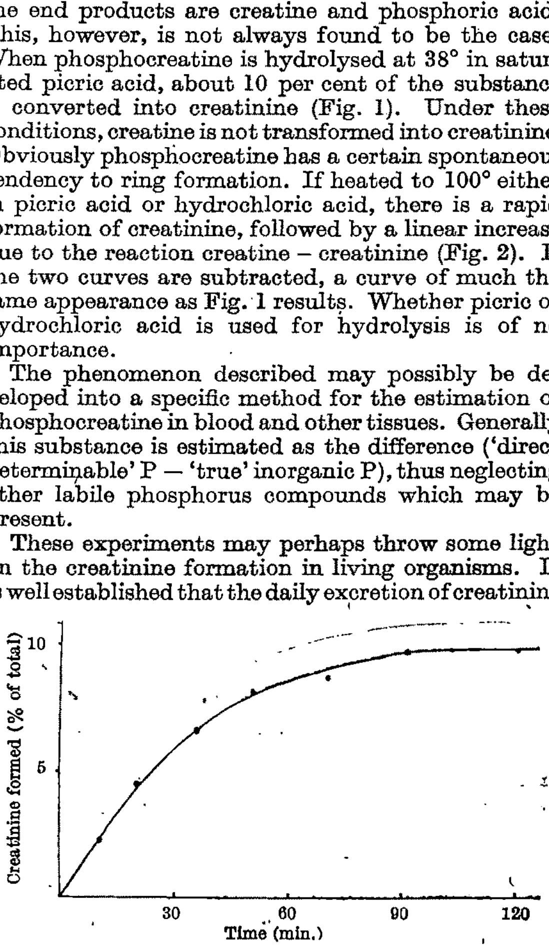

Fig. 1. FORMATION OF CREATININE FROM PHOSPHOCREATINE IN 8/9 SATURATED PICRIC ACID AT 38°. CONC., 0·35 MM./L.

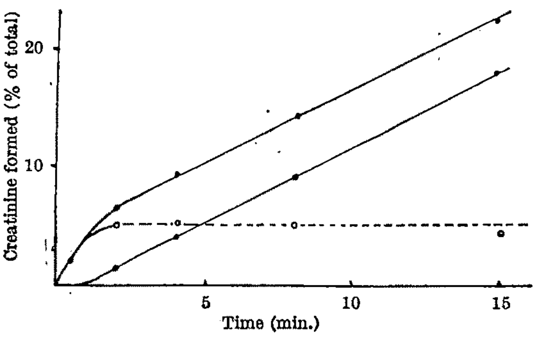

Fig. 2. FORMATION OF CREATININE FROM PHOSPHOCREATINE (UPPER CURVE) AND CREATINE (LOWER CURVE) AT 100° IN 8/9 SATURATED PICRIC ACID. – – – – – –, THE DIFFERENCE BETWEEN THE TWO CURVES. CONCENTRATIONS, 0·35 MM./L.

is rather closely proportional to the total amount of muscle tissue and independent of muscular activity. This may be explained if it is assumed that there is a spontaneous breakdown of phosphocreatine resulting in the formation of some creatinine. The phosphocreatine breakdown through specific activity yielding the energy-rich phosphate group to some acceptor can readily be imagined to give rise to no creatinine formation, thus explaining why the creatinine output is independent of muscular activity.

Another problem which may perhaps be attacked on the basis of the present observation is the active renal secretion of creatinine.

According to the hypothesis that a necessary condition of renal tubular secretion is that the substance is an acid[1], creatinine should not be secreted; and it is in fact the only substance not found to obey this rule, at least in mammals.

Rehberg[2] has suggested that phosphocreatine, known to occur in plasma after the injection of creatinine[3], may be converted into creatinine in the tubular cells and thus be responsible for part of the urinary creatinine. This suggestion seems to find support in the observation that phosphocreatine may form creatinine spontaneously. The tubular cells are supposed to exhibit a strong non-specific phosphatase activity, thus making possible a partial conversion of phosphocreatine into creatinine. That phosphocreatine should be absorbed from the blood stream by the tubular cells is well in accord with the hypothesis mentioned[1].

Preparation of Cell-free Tryptophanase

IN our earliest studies on the tryptophanase complex[1] active non-viable suspensions of *E. coli* were used. These had been sterilized by shaking with chloroform, 1 volume to 2 volumes of suspension. The mixture was shaken vigorously to 200 r.p.m. for 4 hours.

An active dry enzyme preparation was also prepared by precipitation of the cells with 66 per cent alcohol (at 0°) and subsequent washing with ice-cold absolute alcohol. Since at that time we were mainly concerned with the mechanism of the reaction, further work was not attempted; though occasional studies on the supernatants from viable cells suggested that the enzyme complex could be obtained as a cell-free preparation. More recently we have been concerned to know more of the nature of the enzyme complex, and the following represents the preparation of such a cell-free preparation and which, moreover, can be divided into a dialysable and non-dialysable portion.

Cells grown for 22 hours at 37° on a tryptic digest of cæsin solidified with agar were harvested, washed and filtered through glass wool. Thick creamy suspensions thus obtained were cooled in ice and poured into five volumes of ice-cold acetone with constant stirring. The flocculated cells were allowed to settle and then filtered off with gentle suction on a Buchner funnel, washed successively with acetone, acetone and ether, and finally ether, and dried in a desiccator.

Tests were made with buffer solutions of *p*H 5, 7 and 9 to extract the enzyme from the powder. After overnight extraction, the suspensions were centrifuged and supernatants adjusted to *p*H 7·4. Activity of extraction was nil at *p*H 5, faint at 7 and more marked at 9.

The present technique employed is overnight extraction with borate buffer *p*H 8·6 using 20 mgm. acetone-dried powder per ml. buffer. Whereas the optimum *p*H for the reaction by the intact organism is 7·6, the cell-free enzyme has an optimal *p*H range of 8–8·5. The activity obtained from such cell-free extracts has been, at the maximum, approximately 25 per cent of that obtained from intact organisms, presumably due to destruction of some portion(s) of the tryptophanase complex by acetone drying.

Dialysis of the cell-free extract has been performed, and both dialysate and protein portion have been shown to be inactive by themselves. When added to one another activity was regained.

Work is now in hand on the elucidation of the various factors of the enzyme complex, and a full report will be published at a later date.

Yeast and Rickets

IN his address to the Seventh Congress of Biological Chemistry in Liège on October 3–6, 1946, Dr. H. D. Kay summarized some experiments on feeding pigs with yeast, carried out during the War at the National Institute for Research in Dairying in Reading[1]. It was found that when the total food ration contained 8 per cent dried yeast, some of the animals developed stiffness and lameness, and were finally unable to stand. If the diet contained 20 per cent yeast, this condition developed rather rapidly in all pigs. X-ray examination of the bones indicated that the pigs were, in fact, suffering from rickets. The rachitic symptoms could be prevented by a sufficient supply of vitamin D, and could be almost completely prevented by increasing the calcium carbonate content of the diet from 1·5 to 4 per cent. When the yeast phosphorus was replaced by the corresponding amount of sodium phosphate phosphorus, no symptoms were produced.

During a recent visit to England, I discussed this problem with the Reading workers, who were now of the opinion that the rachitogenic effect of yeast might be connected with the high phytic acid content in the diet. The results of our experiments, which show that dried yeast is a strong inhibitor of the enzyme phytase, support this hypothesis.

The experiments were made on a crude enzyme solution extracted from rye bran. 25 ml. of the solution correspond to the phytase activity of about 15 gm. barley. The yeast used was dried brewers' top-yeast. The system contained 25 ml. enzyme solution and 72·0 mgm. phytate phosphorus, as pure sodium phytate; concentration of acetate buffer, 0·2 *M*.; total volume, 100 ml.; *p*H, 5·20 ± 0·05; temp. 30° ± 0·1° C.; time of reaction 2 hr., at the end of which 10 ml. was taken out to control the *p*H and 10 ml. 5 N hydrochloric acid added to end the enzymatic reaction. Phytate phosphorus was determined in the centrifugate. When yeast was added, it was first shaken for 1 hr. with 50 ml. 0·2 M. acetate buffer and the pH readjusted before adding enzyme and substrate. The yeast extract was made by shaking 20 gm. yeast with 150 ml. 0·2 N hydrochloric acid for 2 hr. The centrifugate was neutralized with sodium hydroxide and diluted so that 10 ml. is approximately equivalent to 1 gm. yeast. 10 ml. of the extract contained 5·5 mgm. inorganic phosphorus.

INFLUENCE OF DRIED YEAST ON PHYTASE ACTIVITY

No.	Addition	Phytate P split (mgm.)	Inhibition (per cent)
1	None	41	0
2	10 gm. fresh bakers' yeast	44	10
3	30 mgm. P as pot. phosphate	37	10
4	1 gm. dried yeast	31	24
5	3 ,, ,, ,,	22	46
6	5 ,, ,, ,,	10	76
7	10 ml. yeast extract	33	20
8	30 ,, ,, ,,	24	41
9	50 ,, ,, ,,	12	71
10	No enzyme	0	—
11	No enzyme ; 3 gm. dried yeast	0	—

If the phytase activity of the fodder and of the bacteria in the intestinal canal is as highly inhibited by yeast as the above experiments seem to indicate, the results of the feeding experiments obtained in Reading may become more intelligible.

Isolation of Phloridzin from Apple Seeds

IN a recent communication[1], the preparation of apple seed extracts capable of stimulating the development of unfertilized tomato ovaries was described. Treatment of the seeds with water at 100° C. for 15 minutes gave, on cooling, a crystalline substance which preliminary tests indicated was possibly glycosidic in nature. While not possessing the fructigenic activity shown by the aqueous filtrate, this compound disappeared at the stage when the extracts were no longer active, and consequently further investigation was indicated.

Hydrolysis with N/10 sulphuric acid gave glucose, characterized by the formation of the osazone and the β-penta-acetate, and a phenolic substance, m.p. 259–260° C., which gave elementary analytical results corresponding to the formula $C_{15}H_{14}O_5$. A comparison of the phenol, its tetra-acetate and trimethyl ether[2] with authentic specimens kindly supplied by Prof. A. Robertson confirmed its identity as phloretin[3] and the glucoside as phloridzin[4]. This latter is known to occur in the bark (especially the root-bark) and leaves of apple trees, but has not been reported in the seeds. In this connexion the yields are extremely interesting, being as much as 8 per cent (of seed fresh weight) four weeks after petal-fall, and decreasing to less than 1 per cent after eight weeks; ten weeks after petal-fall, phloridzin could no longer be isolated.

Further work involving an examination of the relationship (if any) between phloridzin and the hormone, and possible isolation of the latter, is proposed.

My thanks are due to Dr. L. C. Luckwill for supplying most of the glucoside and for carrying out the physiological tests.

Medium Suitable for the Cultivation of Meredith's Actinomycete

IN our study of the antibiotic properties of certain Actinomycetes[1], it has been one of our endeavours to devise a cheap medium for the growth of these organisms which would contain a minimum of organic and inorganic substances likely to interfere with the extraction of the antibiotic. Of the many varieties of liquid and solid media tested, we have finally adopted the following:

Autolysed yeast extract	0·25 per cent
Glucose	0·5 per cent
Distilled water	to 100 ml.

The reaction adjusted to a pH of 6·0 to 7·0.

Increasing the yeast extract content of the media beyond 0·25 per cent leads to a reduction in antibiotic production.

As for the yeast extract to be chosen, it would appear that any reasonably carefully prepared commercial brand is suitable. The three actually tried, 'Marmite', 'Gye' and 'Yeastrel', all gave the same degree of growth and antibiotic production.

Our medium has been tried also for the growth of *Actinomyces griseus*. It was found eminently suitable for this organism, yielding growth and production of antibiotic equal to that obtained by the media usually employed in the cultivation of this organism.

It may be of interest to record that the growth-liquor of our antibiotic-producing Actinomycete is highly active against a culture of *Cerospora nicotianœ* Ell. and Ev., obtained from the Baarn Type Culture Collection, and claimed to be responsible for the spotting of the tobacco leaf.

Connective Tissue Cementing Substance

IN 1876, W. Flemming[1] described a cementing substance associated with the fibrils of loose connective tissue. This finding is of considerable importance in relation to modern conceptions of the chemical structure of collagen and other fibrous proteins.

There is reason to suppose that the long-chain molecules of which collagen fibres are composed are mainly held together by lateral bondings of an electrovalent character. It has been pointed out by the late Dr. Jordan Lloyd[2] that, since such bondings are readily

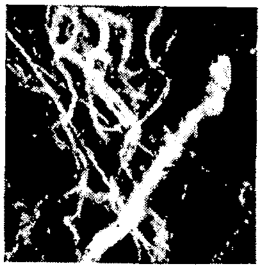

Fig. 1

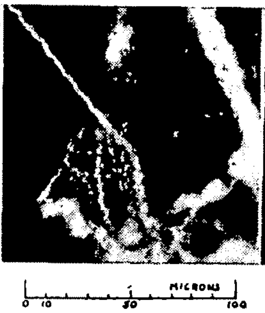

Fig. 2

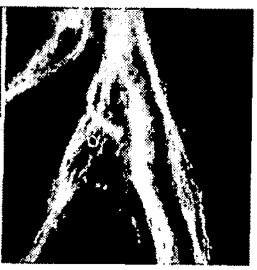

Fig. 3

Fig. 1. DARK GROUND PREPARATION SHOWING THE COMPACT BUNDLES OF COLLAGEN FIBRILS IN DISTILLED WATER AT pH 7·0. AN ELASTIC FIBRE MAY ALSO BE SEEN RUNNING DOWNWARDS AND DIAGONALLY FROM THE LEFT UPPER CORNER OF THE PHOTOGRAPH

Fig. 2. COLLAGEN BUNDLES AT pH 3·8. THEY ARE NARROW AND MARKEDLY CRIMPED

Fig. 3. COLLAGEN BUNDLES IN $M/2$ CONCENTRATION OF SODIUM CHLORIDE. THE BUNDLES ARE WIDE AND STRAIGHT AND THEIR CONSTITUENT FIBRILS EASY TO IDENTIFY. IN SUCH CONCENTRATIONS OF NEUTRAL SALTS THE INDIVIDUAL FIBRILS FREQUENTLY SHOW BROWNIAN MOVEMENT

susceptible to ionic penetration, it is somewhat surprising that when collagen bundles are removed from the animal body and teased out in water they show no tendency to dissolve but remain as coherent structures for a considerable time. Dr. Jordan Lloyd suggested that the larger collagen bundles are held together by sheaths composed of another fibrous protein, the reticular tissue. Specialized sheaths of this kind may certainly be shown to surround relatively large collagenous structures such as the tendons in the tail of the rat; but it is difficult to visualize such an arrangement in the much smaller bundles of loose connective tissue which in small animals vary from 2 to 10 μ in diameter. My observations of the loose connective tissue of the rat furnish strong evidence that these smaller bundles owe their cohesion to the presence of an amorphous cementing substance within them, rather than to any sort of fibrillary wrapping.

After killing the animal, pieces of fascial connective tissue were placed directly into the fluid the effect of which was to be investigated. After half an hour at room temperature, they were mounted under a coverslip in the same fluid and examined with the dark-ground microscope. In distilled water, pH 7·0, the bundles of collagen fibrils appeared compact. Their constituent fibrils were not generally easy to identify. With increase in hydrogen ion concentration the bundles became more condensed, their optical opacity was greatly increased, there was great reduction in thickness, and they became coiled up and crimped. This effect was easily perceptible at pH 5·0. It was maximal between pH 4·2 and 3·8. With further increase in hydrogen ion concentration, acid swelling of the collagen began, and at pH values between 3·8 and 3·0 the appearances indicated the antagonistic action of two processes, namely, the contraction of the cementing substance and the swelling of the collagen. The irregular beaded swellings of collagen bundles in acids of strengths around 0·001 N would seem to be a resultant of these two antagonistic processes.

An effect contrary to that due to hydrogen ions was produced by neutral salts. Concentrations of, and greater than, $M/8$ caused relaxation of the substance cementing the fibrils together. The bundles became wide and straight, and their constituent fibrils could readily be identified. In some bundles the individual fibrils were seen to show Brownian movement.

The contrasted changes produced in the cementing substance by hydrogen ions on one hand and neutral salts on the other were found to be reversible up to the point at which acid-swelling of collagen occurred. Bundles swollen in acid became shrunken again after treatment with salt, but they did not recover their former fibrillary structure. They remained opaque and granular.

Fleming considered the cementing substance to be of mucinous nature. This was not confirmed. On the contrary, pieces of connective tissue treated with testicular extract and also pieces treated with purified streptococcal hyaluronidase did not lose the properties described above. Treatment with a phosphate buffer of pH 8·0 at 0° C. for several days failed to remove the cementing substance. There is strong evidence, however, that this substance is acted upon by trypsin. After immersion in a solution of trypsin for 24 hours at 20° C., connective tissue loses its coherence and elasticity. It may be teased apart like a piece of damp blotting paper. In pieces afterwards treated with fluids of appropriate hydrogen ion concentration and examined with the dark-ground microscope, the crimping of the bundles is markedly reduced or entirely absent.

The presence of cementing substance within the bundles has been particularly emphasized. Its existence outside the bundles is harder to demonstrate, but may be reasonably deduced from the fact that at hydrogen ion concentrations around pH 4·0 the connective tissue as a whole becomes opaque and that opaque granules appear outside the fibrils.

It is to be concluded that the collagenous bundles of loose connective tissue owe their cohesion largely to a cementing substance in which their constituent fibrils are embedded. This substance is a protein, since it is acted upon by trypsin. Its viscosity would appear to be progressively increased in concentrations of hydrogen ions ranging from neutrality to pH 3·8, and reduced in the presence of neutral salts in concentrations of, and above, $M/8$.

Epidermal Thickness Following Oestrone Injections in the Mouse

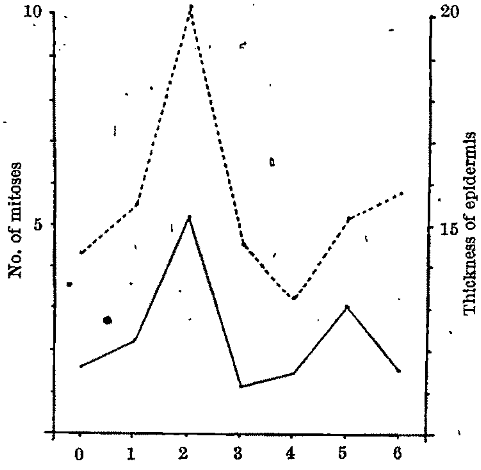
THE cyclic variation in the mitotic activity of the epidermis of the adult female mouse, which is dependent on the cyclic activity of the ovary, is accompanied by coincident cyclic variation in epidermal thickness[1]. Thus, in the antero-dorsal region of the body, the highest rate of mitotic activity occurs during the pro-œstrous period, with the result that the epidermis is at its thickest in pro-œstrus and early œstrus. It has also been shown that the mitotic activity of the epidermis can be artificially stimulated by œstrone injections[2], and it would therefore seem probable that the same treatment would result in epidermal thickening. However, Hooker and Pfeiffer[3] have reported that injections of œstradiol benzoate result in a decrease of epidermal thickness, an effect apparently due to inhibited mitotic activity. An additional analysis of the effects of œstrone injections on the rate of cell division and thickness of the epidermis has therefore been made in an attempt to throw light on the apparent contradiction.

The injections were started on the first day of diœstrus, the time when both the mitotic activity and the thickness of the epidermis are at a minimum. At each injection 0·025 mgm. of œstrone in 0·25 c.c. of water was introduced into each mouse, and the injections were repeated at 12-hourly intervals for three days. Groups of five mice each were killed 12 hours after receiving from one to six injections, and each animal was also given 0·1 mgm. of colchicine $9\frac{1}{2}$ hours before killing. The mitoses, mostly in the metaphase, were counted in 1 mm. lengths of anterodorsal epidermis cut at a thickness of 7 µ. Twenty counts were made for each individual, and thus for each group there were 100 counts, from which averages and standard deviations were calculated. In the same way the results regarding epidermal thickness summarize 100 measurements per group, the distance measured being from the base of the stratum germinativum to the free surface of the stratum corneum.

The results are recorded in the accompanying table and illustrated in the graph. From them it is evident that the induced mitotic activity was accompanied by an increase in epidermal thickness, the two maxima being reached simultaneously after two injections. Rapid cornification, combined with sloughing, apparently accounted for the fact that the thickness did not remain considerable after the rate of mitosis fell.

While these experiments lasted only three days, those of Hooker and Pfeiffer continued for a long period, the injections being given twice weekly. A comparison of the results indicates that although the mitotic activity and thickness of the epidermis are normally increased by œstrogenic substances, a prolonged excess of such substances leads to the opposite effect. The same is true of the sebaceous glands. Their mitotic activity and growth are normally stimulated by œstrogens[2]; but if the stimulation is unduly great and unnaturally prolonged, the opposite effect is produced[3]. Further, although the growth of hair presents special problems, it is interesting to note that here again the mitotic activity of the hair bulb is reduced by the continued administration of œstrogenic substances.

	Numbers of mitoses per mm. of epidermis	Thickness of epidermis (in µ)
Diœstrus: 1st day	1·65 ± 1·13	14·4 ± 4·2
Œstrone injections:		
1	2·26 ± 2·12	15·5 ± 2·99
2	5·12 ± 3·63	20·2 ± 4·37
3	1·14 ± 1·45	14·5 ± 1·94
4	1·41 ± 1·43	13·2 ± 2·59
5	3·02 ± 2·76	15·3 ± 2·51
6	1·64 ± 1·60	15·8 ± 4·13



RELATION BETWEEN MITOTIC ACTIVITY (CONTINUOUS LINE) AND THICKNESS (BROKEN LINE) OF MOUSE EPIDERMIS FOLLOWING ŒSTRONE INJECTIONS

Soil Sterilization on a Field-Scale

THE steam sterilization of soils is well known; for example, as carried out under glass for tomato growing—a practice which is now accepted as routine. As well as achieving a drastic diminution in the numbers of harmful bacteria, to the advantage of the surviving nitrifying bacteria, there is a marked increase in available nitrogen.

In the spring of this year, 'Gammexane' was mixed with fertilizer and sown with oats through a combine seed drill; this was on old lea with negligible wireworm and leatherjacket counts. The treated area revealed stronger, broader-leaved plants, and of a depth of green which made the control look undernourished. This difference was apparent until the oats were fully a foot long.

The same compound was applied on 'brairded' swedes, but this time for the purpose of mitigating the ravages of the turnip flea beetle; on this crop the 'Gammexane' was sown broadcast. The effect was very similar to that on the oats, namely, greater depth of colour and more vigorous plants. It is of interest to note that the weeds between the drills were also more vigorous than in the rest of the field.

From these observations, one may be justified in assuming that the chlorine liberated from the 'Gammexane' has effected a partial sterilization of the soil, and in consequence an increase in available nitrogen.

This opens up a field for wider investigation and research, and it is possible that in compounds of this nature we have, not only an insecticide of the first order, but also a sterilizing agent, easily handled and with unlimited possibilities within the industry.

COMMONWEALTH OF AUSTRALIA COUNCIL FOR SCIENTIFIC AND INDUSTRIAL RESEARCH

ANNUAL REPORT

THE nineteenth annual report of the Council for Scientific and Industrial Research, Commonwealth of Australia, covers the year ended June 30, 1945, and indicates the greater attention which was given to problems of post-war reconstruction, as, for example, in the use of the Soils Division's surveys of areas intended for closer settlement (Canberra: Commonwealth Gov. Printer). The report also refers for the first time to the Division of Radiophysics, which with its central laboratory at the University of Sydney was formed early in the War, and until the termination of hostilities was engaged solely on work for the Australian and American Fighting Services. In addition to representatives of the Australian Fighting Services, the Radiophysics Advisory Board included representatives of the Postmaster-General's Department and, later, of the Ministry of Munitions, while effective liaison was also established with Great Britain and the United States through the British Central Scientific Office at Washington. In addition to assisting the Services very considerably in technical training courses and facilities, the Division has been engaged in fundamental research associated with the design of radar equipment and in the investigation, development, design and manufacture to the prototype stage of radar and associated equipment required by the Armed Forces. A light-weight radar set was designed and constructed for the Royal Australian Air Force for air warning purposes, and in addition to investigations into the cause and incidence of super-refraction at relatively low heights in the atmosphere and ionospheric observations, the Laboratory has now initiated some work on possible applications in the field of navigational aids for civil aviation.

In addition to the account of the formation and work of this new Division, the report refers also to the conversion of three sections of the National Standards Laboratory to the status of Divisions of Metrology, of Electrotechnology and of Physics, respectively, while the former Division of Animal Health and Nutrition has been separated into two divisions, known as the Division of Animal Health and Production and the Division of Biochemistry and General Nutrition.

An important development during the year was the decision to undertake a comprehensive programme of research into building materials, including concrete and other materials for structures such as bridges, dams, etc. The Council has also accepted responsibility for work on flax processing, and is to be entrusted with an extensive programme of research and publicity for the wool industry; while as from April 16, 1945, the Council has taken over the Scientific Liaison Bureau.

Under the Division of Plant Industry, a laboratory for the study of pasture production under irrigation is being established in the area between the Murray and the Murrumbidgee Rivers, while other pasture investigations were concerned with pasture management, soil fertility, the establishment of pasture under cover crop, the control of Capeweed and other weeds. The Division also conducted trials of plants and seeds introduced from abroad, forage and pasture plant trials, as well as investigations on Guayule rubber, take-all disease of wheat, native plants as sources of medicinal drugs and insecticidal substances, the opium alkaloids, tobacco, the potato virus and varietal resistance to leaf roll, spotted wilt and fusarium wilt of tomato, the retting of flax, etc. Investigations on the physiological diseases of apples and pears were on a much reduced scale; but in the entomological field the outstanding feature was the attention given to the new insecticides D.D.T. and 666. A large-scale programme of investigation on the use of D.D.T. for the control of agricultural and horticultural pests was carried out in co-operation with all the State Departments of Agriculture, and particularly promising results were obtained in the control of cattle tick, buffalo fly and certain household pests. Methods for the control of mosquitoes and house flies reached an advanced stage of development, and investigation of the pests of stored wheat was practically concluded with the development of effective measures for the control of infestations in the main types of temporary stores. Much success in particular attended the campaign, based on the Council's advice, against wheat weevil carried out by the Australian Wheat Board; while the work on the biological control of weeds and insect pests continued to show great promise; for example, that of St. John's wort by three species of *Hypericum* insects. Work on D.D.T. emulsions led to the development of a solvent naphtha emulsion which was used in field trials in 1944–45, mainly at 0·2 per cent D.D.T., and work on the control of cattle ticks included trials with D.D.T. sprays.

Animal health investigations covered pleuropneumonia of cattle, mastitis in dairy cattle, contagious abortion of cattle, and the bacterial oxidation of arsenic cattle-dipping fluids. Studies with phenothiazine continued, as well as investigations of the blowfly strike problem and biochemical studies on mineral metabolism of sheep. There was no break in the sequence of the long-term research projects concerned with the nutrition of the Merino sheep, and the results should now provide a rational basis for breeding policy. Drought feeding and metabolic studies, the supply of vitamin A to flocks during prolonged periods of drought, the study of the plant proteins which are the raw materials from which the sheep produces wool fleece, studies of minor element deficiencies, and especially copper deficiency, are other directions in which the Council is assisting this major Australian industry.

The Division of Soils continued with a wide programme of surveys and investigations, and the obstacle to rapid progress presented by the lack of experienced staff is now being removed by the training of new personnel. Field-work was turning increasingly to the relation of soils and land use. The Soil Chemistry Section, organised jointly with the Chemistry Department of the Waite Institute under single direction, devoted attention to the study of methods for the examination of soils, including the use of the Lundegårdh flame spectrum technique for the determination of exchangeable cations. The study of soil structure and water relations of soils formed the main activity of the Soil Physics and Mechanics Section, while in the Bacteriology Section the investigation of the nitrogen-fixing organisms of leguminous plants was the main line of research.

At the Commonwealth Research Station, Merbein, initial investigations on vegetable production were completed, particularly variety trials of tomatoes, beans and carrots, while at the Irrigation Research Station, Griffith, work on the best methods of irrigation of both orchard and vegetable crops continued. Much of the work of the Division of Forest Products was again associated with the war effort; but the need for a more concentrated examination of timber utilization in Australia is recognized, and a series of lectures was prepared for a reconstruction training course for Service personnel proposing to enter the building trade. Wood structure, timber physics and mechanics, timber preservation and seasoning continued to receive attention, as well as the improvement of wood, particularly by gluing or impregnation with dimethylolurea.

The Food Preservation Division is to resume its investigations on the preparation and storage of chilled beef with particular attention to the loss of bloom, and work is also to be started on the rapid freezing of fruit and vegetables. Fundamental aspects of the metabolism of ripening and senescence of fruits were examined at the University of Sydney. Apparatus was designed for measuring the vapour pressure of dried foods, and heat transfer and evaporation from a wet surface under still air conditions; investigations on *Clostridium botulinium* and on the resistance of this and other bacterial spores to heat were continued. The relation between mould growth and the activity of water in fruit cake, the development of ascorbic acid in processed foods on prolonged storage and fundamental studies on the oxidation of ascorbic acid in fruit and vegetable tissue suspensions were initiated. The Division of Fisheries was able to expand its work somewhat.

The Division of Metrology continued to assist production directorates of the Ministry of Munitions and industrial organisations concerned with defence, in matters relating to inspection, design and examination of gauges, measuring equipment and precision tool-room equipment. The Division of Electrotechnology concentrated largely on confidential defence investigations, but is now considering the resumption of normal work. Its future programme is likely to be influenced by the recent formation of an Electrical Research Board. The programme of research on tropic proofing and the scope of climatic and durability tests on telecommunication materials and communications have been considerably extended. The Physics Division is also planning to extend its long-range and fundamental research; among work carried out during 1944–45 were studies of the optimum visual conditions for radar operators, the photometry of a new type of searchlight, the control and measurement of humidity in connexion with tropic proofing of service equipment, the design of an instrument for the accurate and rapid measurement of hæmoglobin for 'blood bank' work, and fundamental work on the physics of wool fibres. Aeronautical investigations have included studies of the effects of turbulence on the size, state and stability of the boundary layer formed on the surface of solid bodies moving through air, the strength and stability of plywood construction, a mathematical study of the vibration characteristics of an engine-propeller – cooling-fan combination, powder metallurgy, welding of steel tubing and fatigue failures.

In the Division of Industrial Chemistry, a Section of Chemical Physics has been established at Melbourne. The Minerals Utilization Section has perfected a method for the production of the special grade of rare-earth oxides required for polishing optical lenses and prisms. The Cement Section is investigating the deterioration of concrete through expansive reaction between aggregates and cement, and in the Biochemistry Section the development of depilatory paints less harmful to wool than the lime-sulphide paint now used, the wool-loosening action of ammonia, proteolytic enzymes and the production of 2 : 3-butylene glycol by fermentation have received attention. The separation of minerals by flotation, physico-chemical characteristics of acridine drugs and surface areas of solids have been studied by the Physical Chemistry Section. The Organic Chemistry Section was also concerned with the production of butadiene from 2 : 3-butylene glycol obtained by fermentation, and continued work on the exudation of mannitol from *Myoporum platycarpum*, synthetic resin adhesives and aniline-formaldehyde resins. In the Chemical Engineering Section pilot-plant trials were conducted of the Fremey-Lipson process rendering woollen goods resistant to felt, and of an improved process for the manufacture of rare-earth hydroxides from monazite. The general basic attack on problems associated with friction, lubrication, bearings and wear continued, including the mechanism of boundary lubrication, effect of abrasives on wear, the development of a soluble extreme-pressure cutting and drawing lubricant, the lubrication between a journal and a bearing and the behaviour of pure metals.

THE GEOMETRY OF NUMBERS

THE meeting of the London Mathematical Society on December 19, 1946, took the form of a symposium on the geometry of numbers, arranged by Prof. H. Davenport. Prof. E. C. Titchmarsh, president of the Society, was in the chair.

In his introductory remarks, Prof. Davenport outlined the nature of the subject. It consists in interpreting geometrically questions in the theory of numbers, making use of points with integral co-ordinates, either in the plane, or, more generally, in an n-dimensional space. The system of all points with integral co-ordinates is called the *standard lattice*. The general homogeneous linear transformation, or affine transformation, of the standard lattice gives a *general lattice*. Thus the points of a general lattice in n-dimensional space are the points $(x_1, \dots, x_n)$, where $x_1, \dots, x_n$ are linear forms:

$$\begin{array}{l} x_1 = a_{11} u_1 + \dots + a_{1n} u_n \\ \dots\dots\dots\dots\dots\dots\dots\dots \\ x_n = a_{n1} u_1 + \dots + a_{nn} u_n \end{array}$$

in n variables $u_1, \dots, u_n$, which take all integral values. The determinant of the coefficients a_{ij} is called the determinant of the lattice, and measures the density with which the lattice points are distributed in space (the density being inversely proportional to the determinant).

Many questions in the theory of numbers can be expressed in the form: Does a particular region contain a lattice point, or under what conditions is this the case? This geometrical approach led Minkowski to many important theorems. It is also valuable in suggesting new and interesting questions, even when it does not provide any means for answering them. Two of the three topics discussed later are, in fact, treated by other methods.

Mr. C. A. Rogers spoke on his recent work[1] on a theorem of Hlawka. This theorem is a partial converse of the fundamental theorem of Minkowski, which asserts that any convex body in n-dimensional space, which is symmetrical about the origin of co-ordinates O, and has volume greater than 2^n, contains a point other than O of every lattice of determinant 1. Hlawka's theorem, in its most fundamental form, states that if any body (whether convex or not) has volume less than 1, then there exists a lattice of determinant 1 such that no lattice point, except possibly[1] O, lies in the body. Mr. Rogers gave a simple proof of this theorem, restricting himself to the two-dimensional case for simplicity. We are given a bounded region in the plane, of area A less than 1. Let p be a large prime, and consider the lattice of points (x, y) with

$$x = u/\sqrt{p}, \quad y = (su + pv)/\sqrt{p},$$

where s is fixed, and u, v take all integral values. This lattice has determinant 1. We give s the values $0, 1, \ldots, p - 1$, and suppose that each of the lattices has a point other than O in the region. It can be proved that these p points are all different. On the other hand, the total number of points of all the lattices in the region is easily found to be asymptotically pA for large p. Since $A < 1$, this is impossible, and so one at least of the lattices satisfies the requirement of having no point, except possibly O, in the region.

Dr. H. Heilbronn spoke about some recent joint work with Prof. Davenport on a problem to which they had been led by considerations in the geometry of numbers. The problem was to find two lattice points in a given plane lattice, say (X_1, Y_1) and (X_2, Y_2), which generate the lattice, and for which $X_1 Y_2$ is numerically small. Two such points would be, in a certain sense, each near one of the two coordinate axes. Expressed analytically, the problem becomes that of investigating the minimum of a bilinear form:

$$B = (\alpha x + \beta y)(\gamma z + \delta t),$$

when x, y, z, t take all integral values which satisfy the condition $xt - yz = \pm 1$. The results are as follows[2]. If $\Delta = |\alpha\delta - \beta\gamma|$, one can always satisfy $|B| \leqslant 2\Delta/(5+3\sqrt{5})$. If certain special forms are excluded (namely, those equivalent to $(x + \theta y)(z + \theta' t)$, where θ and θ' are $\frac{1}{2}(-1 \pm \sqrt{5})$), this can be improved to $|B| \leqslant \Delta/(4+2\sqrt{2})$. If more special forms are excluded, this can be further improved to $|B| \leqslant \Delta/(3 + 3\sqrt{2})$. But this inequality cannot be further improved by similar exclusions. There is a striking contrast with Markoff's results on the minimum of an indefinite quadratic form $(\alpha x + \beta y)(\gamma x + \delta y)$. There Markoff established the existence of an infinite sequence of possible minima. In the present problem, the first two possible minima of the bilinear form correspond to those of a quadratic form, but the third does not.

Prof. Davenport gave the third talk, which was on another joint paper[3] with Dr. Heilbronn. Let $Q(u_1, \ldots, u_r)$ be an indefinite quadratic form in r variables. It has been conjectured for many years that if $r \geqslant 5$, such a form takes arbitrarily small values for an infinity of integral values of the variables. If the form has rational coefficients, this is true, since it then represents zero infinitely often. The general conjecture has an interpretation in the geometry of numbers. It is that the region of r dimensional space defined by

$$|x_1^2 - x_2^2 \pm x_3^2 \pm \ldots \pm x_r^2| < 1,$$

where $r \geqslant 5$, contains a point other than O of *every* lattice. In the language of Mahler, this region is of 'infinite type'.

A special case of the conjecture was proved by Chowla in 1934, namely, when $Q = \lambda_1 u_1^2 + \ldots + \lambda_r u_r^2$ and when $r \geqslant 9$. In the present work the result is proved for this particular form when $r \geqslant 5$. The proof uses a modification of the powerful methods created by Hardy and Littlewood for the treatment of problems in additive number-theory.

Prof. L. J. Mordell expressed appreciation of the talks, and said that the work of Mr. Rogers was particularly interesting in view of the complication of Hlawka's original proof, and of the deep ideas associated with the theorem by Siegel, in his recent proof in the *Annals of Mathematics*. Mr. Rogers had shown the value of a new and elementary approach to an apparently difficult theorem.

COMPLETE DOCUMENTATION*

By Dr. S. C. BRADFORD

THIS Conference is important historically, because it marks the beginning of a second stage in the progress of documentation. In the past, our main endeavour has been directed to bring about the collaboration of documentary agencies in the single task of making accessible the scattered records of thought and achievement, especially in science and technology, until to-day more decimally classified references are produced than different papers abstracted. But, as the result of statistical investigations, made in the main by the British National Section, we have come to see that this alone will not suffice to produce a tolerably complete index to the records of human endeavour. Half the records are overlooked by the existing abstracting and indexing agencies. We need a means of covering all this literature. The means has been discovered. Its promotion has commenced, and this begins a second stage in our activities.

Statistical analyses have been made of the whole intake of the Science Library, London, not merely of three per cent samples. The results are for that reason the more reliable, although there is still room for more research, for which financial aid would be desirable.

The investigations were divided into four parts: (i) It was established that about ¾ million useful scientific and technical papers are recorded every year in an aggregate of some 15,000 useful scientific periodicals, while 300 abstracting and indexing periodicals publish also ¾ million abstracts, or references. But these abstracts, or references, relate to only ¼ million different papers. So that more than half the useful discoveries and inventions are recorded, only to be buried on the library shelves.

(ii) This general analysis was confirmed by the examination of the literature of certain definite subjects. The details of the examination of electrical engineering literature show that only 11,500 different papers on this subject, out of an annual output of 24,000, are covered by a yearly total of 45,000

* Synopsis of a paper read at the sixteenth International Conference of the International Federation for Documentation at Paris, November 4–9, 1946.

abstracts, or references. These tests indicated also the basic reasons for this imperfection, which are: (a) individual abstracting agencies concentrate upon the periodicals devoted to their special subjects, together with a few of those the fields of which are closely allied to these subjects, and thus they miss the articles on their special subjects which occur in other periodicals the scopes of which are less closely related to them; and (b) abstracting agencies often ignore books, pamphlets, separate reports and patent specifications.

(iii) The actual scattering of articles on a given subject throughout the mass of periodical literature was investigated. This scattering is the necessary consequence of the fact that every branch of science is related in some degree to every other branch of science, so that a periodical on any branch of science may contain, from time to time, a paper which is of interest from the point of view of any other science. The actual law of scattering has been deduced, both from theoretical consideration, and from investigation of the actual articles indexed on a given subject. This law shows that it is practically impossible for an abstracting agency, acting alone, to pick up more than about half the articles published on its special subject.

(iv) The actual occurrence of these scattered articles, in the estimated quantity, was proved by a bulk experiment with the collaboration of the abstractors of a large abstracting bureau.

These experiments show conclusively that, somehow, every useful article in every useful periodical must be dealt with as it appears. There are two different ways of accomplishing this task. Either we could create a new organisation to index, or to abstract, each useful article in each useful periodical, independently of the subject of the article; or the useful periodicals could be divided into groups, according to the subjects treated by existing abstracting agencies, and these agencies should undertake to pass on the articles not within their scopes to the agencies who should be interested in their subjects.

The former method would be utterly uneconomic, because it would duplicate, without any adequate reason, the work of the existing skilled and experienced abstracting bureaux. The latter method needs much less additional expense. No interference is involved with the internal machinery of any abstracting agency. Each can continue to deal with and abstract as many periodicals as it desires and to publish its abstracts in any format, provided only that it passes on the articles not within its own scope.

The application of this principle has been commenced in Great Britain. A committee of important abstracting agencies has been formed, which has accepted the principle, and an agreement has been made by two of the most important agencies, British Abstracts and Science Abstracts, to work together so far as possible in this way. Bibliography is unforgettably indebted to Dr. J. A. Wilcken, secretary of the British Committee, for his outstanding services in this work.

The comprehensive indexing of books and other separate publications is essentially a matter for librarians and can best be achieved by improving the accessions lists of the national libraries of each country. In this way we can certainly achieve complete documentation.

[This plan was adopted unanimously by the Council of the International Federation for Documentation, and a small international committee was appointed to promote it.]

SCIENCE MASTERS' ASSOCIATION

ANNUAL MEETING

THE forty-fourth annual meeting of the Science Masters' Association was held at the Imperial College of Science and Technology, London, during January 1–3; and once again, in spite of the fact that the previous meeting was held only last Easter, the attendance was large, and an excellent programme of lectures and visits to works marked another successful gathering. There was also the usual exhibition of books and apparatus by the leading publishers and manufacturers of scientific apparatus, and the customary exhibit of apparatus devised and constructed by members themselves, and also one of graphic material of use in teaching. The Association has now returned to its old practice of holding its annual meeting during the Christmas holiday.

Giving the presidential address, Lord Horder spoke on the "Place of Science in Teaching", approaching this in the free and interesting spirit of one who saw things in their wider setting, and presenting some sound advice to his audience. His address, which sparkled at times with some keen wit and was illustrated by apposite anecdote, took three aspects of the subject: the pupil, the matter taught, and the teacher. The most important aspect is the pupil, who is still, it must be emphasized, a child, still half-savage, with recurring moods of self-exhibitionism and fantasy which can last well into undergraduate life and which must neither be unduly encouraged nor neglected. The task of the teacher is to help the child on the road to the full development of personality; he cannot create such personality.

The matter taught must be free from domination by the examination spectre which stultifies curiosity and impairs receptive power, and must avoid undue emphasis on application at the expense of first principles. Through the study of science the youthful mind can acquire habits of clear thinking and direct expression which lead it to become a joy to itself and a source of benefit to others.

The attitude of the teacher is of fundamental importance to the efficiency of his teaching. This attitude must be animated by two ideals: first, that science must be free and self-contained, owing subservience to neither Church, State nor the pressure of economic adjustment; secondly, the discoveries of science must be used for the benefit of humanity. The present troubles of the world are due to too little science, not too much. To drive science underground by the cessation of research would be to repeat all the evils of the Dark Ages. What is important is that we retain sufficient control to drive the machine and not allow it to drive us. Upon these ideals it is important that science teachers should stand firm. The chief aim of science is truth, and truth grows as does a living plant, which suffers as much from forcing as it does from neglect.

The Association was again fortunate in having lectures from men of science of eminence in their own fields. Mr. E. J. Bowen spoke on "Elementary Wave-Mechanics", presenting a treatment which opened the way to deriving ideas of great value in chemistry teaching; Sir Edward Salisbury discussed "The Changing Flora of Britain", describing the nature of large-scale changes since the Glacial period; Sir George Thomson spoke on "Atomic Energy in Peace and War", ending with a stimulating consideration of present problems; Prof. J. Z. Young took the subject of "Use, Effort and the Powers of Life", and dealt with the problem of treating in biology the self-preserving powers of organisms; and Dr. G. A. Jones discussed "High Speed Cinematography", accompanying his lecture with demonstrations of modern devices used to synchronize flash and exposure.

At the business meeting of the Association it was announced that the Association had been invited to hold its next annual meeting at the University of Sheffield. Prof. Irvine Masson, vice-chancellor of the University of Sheffield, has consented to serve as president for this year. Prof. E. N. da C. Andrade, last year's president, was elected an honorary member according to custom, and this tribute was also paid to the work for the Association of Mr. F. Fairbrother, the retiring membership secretary. Mr. H. F. Broad (Leighton Buzzard) was elected membership secretary in succession to Mr. Fairbrother; and in succession to Mr. A. E. E. McKenzie (chairman) and Mr. E. Lucas, who retired from the Committee, the meeting elected Mr. J. Lambert (King Edward School, Birmingham) and Mr. H. Jennings (Liverpool College). Mr. E. H. Coulson was re-elected treasurer.

A. E. Bell

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, January 20

Manchester Literary and Philosophical Society (in the Reynolds Hall, College of Technology, Manchester), at 5.30 p.m.—Prof. J. M. Meek: "Lightning and Spark Discharges".*

Royal Anthropological Institute (joint meeting with the Royal Geographical Society, at Kensington Gore, London, S.W.7), at 5.30 p.m.—"The Ashanti Social Survey, 1945–46".

King's College, Strand, London, W.C.2, at 6 p.m.—Prof. S. J. Davies: "Gas Turbines and their Prospects" (Lecture on behalf of the Institute of Marine Engineers).*

Tuesday, January 21

Society of Chemical Industry, Agriculture Group (in the Physical Chemistry Lecture Theatre, Royal College of Science, South Kensington, London, S.W.7), at 2.30 p.m.—Dr. F. H. Malpress: "The Use of Hormones in Animal Husbandry".

Society of Dyers and Colourists, Leeds Junior Branch (in the Colour Chemistry and Dyeing Department, The University, Leeds), at 4 p.m.—Dr. F. H. S. Curd: "The Chemotherapy of Malaria".

Royal Institution (at 21 Albemarle Street, London, W.1), at 5.15 p.m.—Dr. C. D. Darlington, F.R.S.: "The Physiology of Chromosomes". (Subsequent lectures on January 28 and February 4.)

Eugenics Society (at the Royal Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Symposium on "Relation of Intelligence to Fertility" (Speakers: Sir Alexander Carr Saunders, Sir Cyril Burt and Dr. J. H. Fraser Roberts).

Institution of Electrical Engineers, Radio Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "Radio versus Line for Communication Systems" (to be opened by Mr. A. H. Mumford).

Sheffield Metallurgical Association (at 198 West Street, Sheffield), at 6.30 p.m.—Annual General Meeting.

Society of Dyers and Colourists, Huddersfield Section (at Field's Café, Huddersfield), at 7.30 p.m.—Dr. T. Richardson and Mr. E. R. Wiltshire: "The Package Dyeing of Cotton by the Pigment Method".

Institute of Physics, Scottish Branch (at the University, Edinburgh).—Prof. P. I. Dee, F.R.S.: "Photography of Atomic Tracks".

Wednesday, January 22

Institution of Post Office Electrical Engineers (at Faraday Building, 9th Floor, South Block, Knightrider Street, London, E.C.4), at 5 p.m.—Mr. A. Hudson, Mr. E. A. Smith and Mr. F. S. Hyatt: "Auto. Exchange Maintenance".

Physical Society, Low-Temperature Group (at the Science Museum, Exhibition Road, London, S.W.7), at 5 p.m.—Dr. M. Ruhemann: "The Separation of Oil Gases".

Royal Meteorological Society (at 49 Cromwell Road, London, S.W.7), at 5 p.m.—Annual General Meeting; Mr. G. Manley: "The Geographer's Contribution to Meteorology".

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 5 p.m.—Sir Claude Gibb: "Gas Turbines".

Institution of Electrical Engineers (joint meeting of the Transmission and Measurements Sections, at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "Switchgear Alarms and Indications" (to be opened by Mr. T. S. Andrew and Mr. T. R. Reyner).

Society of Dyers and Colourists, Midlands Section (at the Victoria Hotel, Nottingham), at 7 p.m.—Mr. C. S. Turner: "Shortcomings of the Dyeing Industry as seen by the Launderer, Dry-cleaner and Garment Dyer".

Thursday, January 23

Chemical Society, Liverpool Section (in the Chemistry Lecture Theatre, The University, Liverpool), at 5 p.m.—Prof. H. A. Krebs: "Metabolic Cycles".

Linnean Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Major Gavin Maxwell; "The Basking Shark (*Cetorhinus maximus*) of the Hebrides"; Dr. Hans Grüneberg: "The Significance of Coat Colour in Mammals".

Royal Institution (at 21 Albemarle Street, London, W.1), at 5.15 p.m.—Prof. H. W. Melville, F.R.S.: "The Chemistry of High Polymers". (Subsequent lectures on January 30 and February 6.)

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1), at 5.15 p.m.—Discussion on "Statistics and the Statistician in Industry" (to be opened by Mr. H. T. Weeks).

Institution of Electrical Engineers, Installations Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. V. J. Francis and Mr. W. R. Stevens: "The High-Pressure Mercury-Vapour Discharge and its Applications".

Chemical Society, South Wales Section (joint meeting with the University College of Swansea Chemical Society, in the Chemistry Lecture Theatre, University College, Swansea), at 6 p.m.—Mr. E. J. Bowen, F.R.S.: "The Absorption of Light".

Royal Institute of Chemistry, Manchester Section (at the Engineers' Club, Albert Square, Manchester), at 7 p.m.—Prof. T. P. Hilditch, F.R.S.: "Fat Shortages and Fat Substitutes".

Chemical Society, Society of Chemical Industry and Royal Institute of Chemistry, Edinburgh and East of Scotland Sections (at the North British Station Hotel, Edinburgh), at 7.30 p.m.—Mr. F. A. Scholefield: "Edmund Knecht" (Society of Chemical Industry Jubilee Memorial Lecture).

Friday, January 24

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Geophysical Discussion on "Atmospheric Oscillations" (to be opened by Prof. S. Chapman, F.R.S.).

Institution of Electrical Engineers, Measurements Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. H. Cobden Turner and Mr. G. M. Tomlin: "The Application of Electrical Technique to the Service of some other Industries".

Institution of Mechanical Engineers (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Dr. F. T. Barwell and Mr. J. C. W. Humphrey: "Materials New to Engineering".

Society of Dyers and Colourists, Scottish Section (at St. Enoch Hotel, Glasgow), at 7 p.m.—Mr. G. G. Simpson: "The Selection of Dyes for Covering Faded Garments".

Chemical Society, Aberdeen Section (in the Chemistry Department, Marischal College, Aberdeen), at 7.30 p.m.—Dr. D. P. Cuthbertson: "Recent Advances in our Knowledge of the Metabolism of Proteins and Amino Acids".

Saturday, January 25

Biochemical Society (at the British Postgraduate Medical School, Ducane Road, London, W.12), at 11 a.m.—Scientific Papers and Demonstrations.

British Sound Recording Association (at the Royal Society of Arts, John Adam Street, Adelphi, London, W.C.2), at 4.15 p.m.—Conference on "Sound Recording".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Graduate Field Research Workers to investigate problems connected with the growth of forest trees in relation to soil and site factors—The Director, Imperial Forestry Institute, The University, Oxford (January 25).

Lecturer in the Department of Mechanical Engineering—The Principal, Birmingham Central Technical College, Suffolk Street, Birmingham (January 25).

Lecturer in Chemistry, and a Lecturer to teach Electrical and/or Civil and Mechanical Engineering, in the Plymouth and Devonport Technical College—The Director of Education, Cobourg Street, Plymouth (January 25).

Assistant Teacher to be responsible for Agricultural Science, Animal and Soil Husbandry—The Chief Education Officer, County Offices, Aylesbury, Bucks. (January 29).

Lecturer in Mechanical and Electrical Engineering in the Mining Department of the Denbighshire Technical College, Wrexham—The Director of Education, Education Offices, Ruthin (January 31).

Assistant Masters in H.M. Dockyard Schools—The Director, Education Department, Admiralty, London, S.W.1 (January 31).

Technician for research laboratory workshop—The Secretary, Barnato Joel Laboratories, Middlesex Hospital, London, W.1 (February 1).

Chemists (men and women, temporary) at various research and development establishments of the Ministry of Supply—The Secretary, Ministry of Supply (Est.5.B.2), Room 828, Adelphi, London, W.C.2, quoting 'Chem/Gen' (February 1).

Lecturer in Social Anthropology—The Registrar, The University, Oxford (February 7).

Assistant Lecturer (Grade III) in the Department of Biochemistry—The Registrar, The University, Liverpool (February 7).

Economist (with a good degree and experience of economic research), and a **Sociologist** (with a good degree and experience of sociological or anthropological research), in connexion with a survey of factors bearing on the problem of nutrition in the Gambia—The Secretary, Colonial Social Science Research Council, Palace Chambers, Bridge Street, London, S.W.1 (February 10).

Geologist-Geophysicist, or a **Geologist** experienced in electrical methods of geophysical work, for the Uganda Geological Survey—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1 (February 12).

Lecturer in Psychology at the University of Tasmania—The Agent-General for Tasmania, Golden Cross House, Charing Cross, London, W.C.2 (February 15).

Lucas Chair in the Principles of Engineering Production—The Secretary, The University, Edmund Street, Birmingham 3 (February 15).

Senior Chemist to take charge of corrosion research on metal coatings with or without organic finishes, an **Electro-Chemist** for original research on the deposition of alloy coatings, an **Analytical Chemist** with experience in analysis of metals and alloys, and a **Librarian** (male or female) to take charge of scientific library and information service—The Director, Tin Research Institute, Fraser Road, Greenford, Middx. (February 28).

Assistant Directors in the Imperial Agricultural Bureaux of Soil Science, of Dairy Science, of Horticulture and Plantation Crops, and of Pastures and Forage Crops (including Field-Crops)—The Secretary, Imperial Agricultural Bureaux, 2 Queen Anne's Gate Buildings, London, S.W.1 (March 1).

University Librarian and Keeper of the Brotherton Collection—The Registrar, The University, Leeds (March 10).

Professor of Dairying—The Registrar, The University, Reading (March 17).

Topographical Engineer by the Government of Iraq for the Directorate General of Surveys—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.17249.

Junior Technician in a physical research laboratory—The Administrative Officer, National Institute for Medical Research, Hampstead, London, N.W.3.

Assistant Master to teach General Science and Mathematics up to Matriculation standard—The Principal, Dartford County Technical College, Essex Road, Dartford, Kent.

Head of the Physics Department—The Governing Body, Northern Polytechnic, Holloway, London, N.7.

Laboratory Assistant (man) at Coopers Hill Emergency Training College, Englefield Green, Surrey—The Education Officer (Estab./2), County Hall, Westminster Bridge, London, S.E.1.

Textile Technologist in India—The Secretary, Indian Jute Mills Association Research Institute, Imperial Institute, South Kensington, London, S.W.7.

Director of Research—The Secretary, British Leather Manufacturers' Research Association, 8 St. Thomas Street, London, S.E.1.

Research Assistant with experience of ultra-violet absorption spectroscopy—The Secretary, Royal Cancer Hospital (Free), Fulham Road, London, S.W.3.

Deputy Head of the Library and Information Bureau, and a **Physicist** (young) for work on the application of physics and mathematics to problems of a mechanical nature—The Director, British Cotton Industry Research Association, Shirley Institute, Didsbury, Manchester.

UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANISATION

IN the debate in the House of Lords on December 3, in which the Government accepted Lord Vansittart's motion for the encouragement of the development of close political and economic relations between the countries of Western Europe, Lord Lindsay spoke eloquently of the importance of relaxing in every way possible the regulations which make travel and the intercourse of minds difficult. He rightly stressed the value of the contribution to the unification of Europe which could come from abundant intercourse between the young ; and on the cultural side, he also urged that energetic measures should be taken to deal with the scarcity of books, for books could be a real step towards establishing a common culture in Europe. Though the debate was pervaded with a sense of the ultimate necessity of such steps as Field-Marshal Smuts and Mr. Churchill have urged in recent speeches, no one suggested that a United States of Europe is as yet practical politics. Rather it was realized that there must be established once more that free intercourse of minds out of which creative ideas and action emerge in politics as well as in science and in art.

Something of the same impression came from the debate in the House of Commons on November 22 on the United Nations Educational, Scientific and Cultural Organisation. Quoting from the preamble to the constitution of the Organisation, "Since wars begin in the minds of men, it is in the minds of men that the defences of peace must be reconstructed", Mr. Eric Fletcher urged the importance of more public attention being given to the work of the Organisation which, if backed by an informed public opinion, could, he believed, make a vital contribution to international understanding. He suggested that attacks on illiteracy, on the revision of text-books, and on the general book shortage should be among the first tasks to which the new Organisation could set its hand. The scientific field offers many opportunities for co-operation, and Mr. Fletcher mentioned in particular a publication entitled "The Tasks and Functions of the Secretariat's Division of Natural Science". There is grave danger, he believes, that the United Nations Educational, Scientific and Cultural Organisation may attempt too much. In this he was vigorously supported by Mr. Kenneth Lindsay, who thinks that that has already occurred and that the Preparatory Commission ignored too much the growing points already in existence. Particularly in the scientific field, there are already many international bodies, some of which did not entirely cease to function even during the War. Dr. J. Needham, it is true, has pointed out the numerous gaps that persist, but it may well be that the Educational, Scientific and Cultural Organisation will serve the United Nations best if it is used here as a clearing house with a secretariat and a first-class personnel, and only establishes new bodies with great caution.

Mr. Lindsay pressed for more attention to the pioneer work of the Allied Ministers of Education, and pointed to the work of the Association of University Professors and Lecturers of Allied Countries in Great Britain as providing a nucleus on which an international body could be built up; such a body would certainly facilitate the fundamental educational work, from the university-level downwards. Other speakers in the debate urged that the Educational, Scientific and Cultural Organisation should keep to practical tasks really within its compass, and especially the restoration of educational systems, the exchange of students, the supply of adequate numbers of text-books and of other educational equipment; although it was also recognized that, if the Organisation is to succeed, there are other matters in which the active interest and support not merely of the Ministers of Education but also of other Government departments would be required.

Miss Ellen Wilkinson, Minister of Education, replying to the debate, promised that a summary or report of the first general conference of the United Nations Educational, Scientific and Cultural Organisation would be issued, either as a White Paper or a Ministry pamphlet. She accepted the principle of concentration on certain practical tasks, where it is a question of money and people and things to be done immediately, but she stoutly championed the idea of wide vision and unrestricted intercourse, rather than narrow conceptions of the ultimate functions of the Organisation. Speaking as chairman of the Preparatory Commission, Miss Wilkinson emphasized the importance of the delegations to the Conference being Government delegates with authority and also having wide influence and support in their own countries.

Miss Wilkinson then spoke specifically of the steps being taken to deal with the appalling destruction of all kinds of educational and scientific apparatus. In view of the world shortage of paper, the possibilities of microfilm in remedying the shortage of books are being explored. The needs of the Continent for scientific apparatus and laboratory equipment were surveyed by the Anglo-American Scientific Equipment Mission at the instance of the Educational, Scientific and Cultural Organisation early this year; it is estimated that material to the value of at least £9 million will be required, chiefly for the smaller and less expensive equipment, to restore the laboratories of the Continent to their pre-war level.

The way in which the Organisation could take over in the scientific and educational world, in the widest sense, the work being done by the United Nations Relief and Rehabilitation Administration has been discussed. Translations and a central pool of scientific information are other matters to which immediate attention is being given, but Miss Wilkinson urged that such immediate and practical tasks are not necessarily the most important. Much more important is that very difficult task of acting as a clearing house of minds; and in urging this, and showing that unless we can instil into the minds of youth standards of value, the sense of a difference between right and wrong, and the conviction that intellectual needs are not mere luxuries, the Minister of Education was in harmony with the whole trend of the debate in the House of Lords.

The Minister's speech is somewhat reassuring, for many have been not unreasonably disturbed at the mass of items with which the agenda for the recent conference of the Educational, Scientific and Cultural Organisation was packed. The value of many of the programmes suggested is undoubted; but their expediency at the present time can be seriously questioned. Not all of those specifically mentioned by the Minister can be regarded as so urgently important as measures to deal with the shortage of books, keenly felt even in British universities and even more on the Continent. Repair and replacement of the buildings, equipment, and libraries of great centres of learning destroyed during the War; the filling of the many gaps in sets of learned periodicals held by research and learned institutions of all kinds throughout the world, on which the research worker depends; and the freeing of scientific publications and of the exchange of students and research workers are the really urgent problems. On the speedy solution of them depends that cross-fertilization of mind, and that wider outlook and fuller understanding across frontiers, out of which must come slowly the thought and purpose which will shape the new political institutions and organs of co-operation needed by the world.

Miss Wilkinson recognized that such practical tasks cost money; it has been estimated that educational relief on the proper scale in Western Europe alone would cost £50,000,000. None the less, no wide discussion of general themes or ideas will avert a feeling of frustration and profound disappointment if the first conference of the Organisation does not result in a real attack, supplied liberally with funds, on educational relief in Europe. The Educational, Scientific and Cultural Organisation is primarily a piece of machinery, and it will best secure the support of public opinion and avoid the relative futility of the Committee on Intellectual Co-operation if it promotes such practical measures as have been mentioned. The whole trend of the House of Commons debate was behind such a view of the primary activities of the Organisation, and reflected the concern which the listing of seventy projects as of special urgency in the progress report of the Preparatory Commission, as well as the representation on a number of the committees, had engendered. The sense of the debate was quite opposed to the programme of philosophical collaboration outlined in the preparatory report, and on which Dr. Julian Huxley had spoken as a long-range aim. That can only be achieved after the barriers to the exchange of thought and knowledge are removed, and when the contact of mind with mind, and experience in working together in pursuit of common aims, lead to a fresh synthesis and formulation of the values of civilization.

No one could suggest that in the debate there was any desire to prolong or intensify ideological differences: in spite of the insistence on the values of Western civilization, there was just as evident a desire to see Soviet Russia fully associated with the Educational, Scientific and Cultural Organisation, as found expression at the conference last July on the

Organisation and the Universities arranged by the British Association, a report of which has now appeared in *The Advancement of Science* (4, No. 13; 1946). Sir Alfred Zimmern, in his opening address to the conference, rightly affirmed that the Organisation is bound to respect intellectual freedom and the unrestricted pursuit of truth, and that in its dealings with universities and other learned bodies it should avoid anything savouring of an attempt at control. The safeguarding of these values is indeed a major aim of the Organisation, and one in which it can count on the support of universities in every part of the world. But although Sir Alfred went on to discuss the form which co-operation between the universities and the Organisation would assume in practice, as well as that between the Organisation and other international associations such as the Council of Scientific Unions, few of the other speakers at the conference appear to have kept the discussion at a severely practical level.

The fact that the conference was also considering the report of the British Association's Committee on Post-War University Education may be partly responsible for this. Discussion was thereby drawn into a debate between two schools of thought: those who hold, like Mr. Bruce Truscot, that the purpose of universities is both the advancement and dissemination of knowledge, and those who, like Senor Ortega y Gasset, reject the research function and maintain that universities exist for the maintenance and propagation of broad cultural values and for the creation of an educated *élite*. We need, indeed, as Prof. Dobrée said, a far larger number of men and women, of university training, able to grasp ideas and aware of the conditions upon which our highly complex life is lived. Fuller and closer contacts between the universities in Great Britain and in other countries may well assist the development of new and more effective means of raising the general educational level and making international co-operation easier. But at the moment that task is surely second to that of getting the educational systems of Europe going again and repairing the havoc of war. Generous tribute was indeed paid by Prof. Jean Timmermans and others to the work of the Minister of Education and of the Association of University Professors and Lecturers of Allied Countries in Great Britain, the forerunner of the International Association; but little was said about the urgency of immediate educational reconstruction in Europe.

To compare the published report of the conference for the establishment of the United Nations Educational, Scientific and Cultural Organisation held in London in November 1945 with the programme which was presented to the Preparatory Commission in July (cf. *Nature*, August 31, p. 298) is to realize that there is some solid foundation for the belief that the priorities have been changed. It is true that there is no less emphasis laid on the importance of promoting increased co-operation and contact between philosophers, men of science, humanists, historians and others, and of the free and unrestricted exchange of ideas and knowledge, to the value of which both the Prime Minister and Miss Wilkinson testified at that conference, and which found expression in particular in the resolution concerning plans for a working arrangement between the Organisation and the International Council of Scientific Unions. The task of restoring and extending the means through which men of science of all lands may exchange information and work together for the advancement of knowledge and for its application to human needs is still recognized as urgent; but one misses in the later programme the sense of urgency, apparent, for example, in the instrument establishing the Preparatory Commission, which charged the Commission to appoint a special technical sub-committee to examine the problems relating to the educational, scientific and cultural needs of the countries devastated by the War, with a pointed reference to immediate action.

The original conference was fully aware of the urgency of such immediate practical problems, and was not anxious to establish fresh bodies. On the contrary, many speeches indicated the desire to build on, and to develop, existing institutions wherever possible. If, therefore, enthusiasm for the immense contribution which the United Nations Educational, Scientific and Cultural Organisation can make ultimately by promoting intelligent co-operation throughout the world, at all levels, seems to have led the Preparatory Commission rather astray from some of the more limited, immediately practicable objectives, there is reason for hope that the Paris Conference has redressed the balance. It may be found, when the promised report appears, that ideals and long-term policy have been harmonized with an immediate practical programme directed to assist the reconstruction of European educational systems. Outside the Organisation itself, indeed, support is already forthcoming for practical measures—the recent appropriation to the Organisation from the American Chemical Society for promoting the exchange of chemists and chemical engineers between different countries is one example—and it will be noted that the reconstruction of education in Europe was indeed placed first by the Preparatory Commission on its list of programmes. It is from the demonstration of its ability to minister to these imperative practical needs that the Organisation will draw the public support and understanding necessary for the formulation and/execution of wider and more far-reaching plans for bringing the nations together in cultural and intellectual co-operation, and focusing the full force of human intelligence on the task of forging a peaceful co-operative community.

These immediate tasks are in fact but the stepping-stones from which the Organisation should move forward to develop and increase the means of communication between its members, to foster the unrestricted pursuit of truth and the free exchange of thought out of which may ultimately develop something of a world community, and the creative thought which will shape the appropriate instruments of world order to serve the needs of modern society. Neither education nor research can, however, be unifying forces in the world, until these first steps have been taken, and on them our attention should for the moment be focused.

BACTERIOLOGY AND IMMUNITY

Topley and Wilson's Principles of Bacteriology and Immunity

Third edition, revised by Prof. G. S. Wilson and Prof. A. A. Miles. Vol. 1. Pp. xi + 970 + xliv. Vol. 2. Pp. viii + 971–2,054 + xliv. (London: Edward Arnold and Co., 1946.) 2 vols., 60*s*. net.

THIS edition, the third in seventeen years, following four printings of the first and seven of the second edition, indicates a large and steady demand for the work. The late Prof. Topley had withdrawn from authorship, and the latest revision has been undertaken by Profs. Wilson and Miles. The plan of the work, which is divided into four parts in two volumes of about a thousand pages each, has remained as before.

Part 1, by way of introduction, treats of "General Bacteriology", including the history of the science, bacterial morphology and metabolism in their broad aspects, with subsequent chapters on matters of practical interest to the hygienist and physician concerning disinfection and what may be summed up as chemotherapy. Then the phenomena of antigens and antibodies are considered, and this part closes with sections on bacterial variation, classification and the bacteriophage. Part 2, headed "Systematic Bacteriology", commences with a short description of methods of obtaining pure cultures of bacteria and identifying them. Following this, a series of chapters deal with the various groups of bacteria in a sequence which would probably not be used in teaching the subject, since it begins with Actinomyces, then goes on to *Erysipelothrix* and *Listerella*, next to the tubercle bacillus group, diphtheroids, anaerobic or micro-aerophilic Gram-negative bacilli of the Fusiformis group, etc., while *Streptococcus* and *Staphylococcus* come later. This part, which finishes with the general properties of the animal viruses, comprises a most extensive collection of the characters of a very large series of bacteria and will prove of much use to workers in the fields of veterinary and economic bacteriology as well as to medical bacteriologists. Part 3, which occupies three hundred pages, is concerned with "Infection and Resistance". These important subjects are considered very fully and with a wealth of detail. Part 4, the final division of the work, is entitled "The Application of Bacteriology to Medicine and Hygiene". Here the chapter headings correspond to a considerable extent with those in Part 2, and much information is given for clinicians and administrators about the diseases caused by the pathogenic members of the groups discussed earlier. But, of course, complete correspondence is impossible, since, for example, suppuration is due to a wide variety of organisms. Toward one third of the way through the list one finds in sequence chapters on "Cholera", "Meningitis", "Gonorrhœa", "Scarlet Fever and other Diseases due to Hæmolytic Streptococci", "Pyogenic and Wound Infections", "The Bacteriology of Rheumatic Infections and of Endocarditis". This indicates that meanwhile only piecemeal treatment of bacteriology is possible. Such is likely to remain the case until 'general' bacteriology is studied for its own sake and the chief interest ceases to be the production by a given organism of a specific disease or some particular chemical reaction. However, it may be argued whether the most suitable arrangement is secured by separating by more than eight hundred pages consideration of the microscopic and cultural characters of the tubercle bacillus and the diphtheria bacillus from the sections on tuberculosis and diphtheria; after all, the production of these diseases is the most noteworthy characteristic of the two organisms. Accordingly, it will be clear that the work is essentially one for reference. To the practising bacteriologist the book is invaluable; it gives very full lists of publications, and the attention paid to recent literature effects a great saving in the reader's time by indicating what he ought to consult in the original. It may, of course, be considered captious to criticize the book for what it does not contain, but, like a number of other text-books on bacteriology in English, it omits very largely details of procedures. While it is self-evident that skill in bacteriological methods cannot be acquired except by practical work in the laboratory, nevertheless a considerable amount of description and specification in print is required for reference. Also, advances in knowledge can come only through the channel of experimental methods. Therefore, it is to be regretted that no companion volume is available dealing more extensively with the authors' laboratory practice. A further loss of another kind is entailed by limiting consideration to the ordinary bacteria, spirochætes, rickettsiæ and viruses, while omitting pathogenic Protozoa and Fungi. The pathogenic Protozoa, which are so like many of these other organisms in their effects on the living body of the host, and which are studied by essentially similar techniques, could with great advantage have been included. Discussion on the causes of bacillary dysentery and exclusion of amœbic dysentery is a case in point. Also, any exposition of chemotherapy must suffer from a presentation which, with the limitations imposed, cannot help devoting chief attention to the sulphonamides and penicillin. In connexion with chemotherapy one wonders what is the authority for the statement (p. 155) that Ehrlich's great pioneer work "started in 1905 with a systematic search for a cure for syphilis". The reviewer remembers well remarks made by Ehrlich (about 1906) emphasizing how the experimental pharmacologists up to that time had chiefly concentrated on toxicology, while his own aim was "kranke Tiere heilen".

The book as a whole is emphatically not for the use of the higher forms in schools. So far as undergraduate and postgraduate students preparing for examinations are concerned, one feels that a few selected chapters should be prescribed as a training on how to assess the literature critically. However, we owe a debt equally to the authors and the publishers of "Topley and Wilson's Principles" for making this mass of up-to-date information available at a very modest price. The authors must also be congratulated on the organisation which has enabled them to marshall the almost overwhelming mass of printed matter which has had to be dealt with in its preparation. A conservative estimate places the contents at about 1,200,000 words, while the Medical Research Council's "System of Bacteriology" in nine volumes contains about two million words. It is unfortunate that exigencies imposed on the production of a book such as the "Principles" make it necessary to deal with an actively growing subject like bacteriology in this way. A series of monographs would, we think, serve much better the interests of users. These separate volumes could then be brought up to date independently as advances required.

C. H. BROWNING

THE AIRY INTEGRAL

British Association for the Advancement of Science Mathematical Tables. Part-Volume B: The Airy Integral, giving Tables of Solutions of the Differential Equation $y'' = xy$. Prepared by J. C. P. Miller. Pp. B.56. (Cambridge: At the University Press, 1946.) 10*s*. net.

THE tabulation in this volume is mainly concerned with the function $Ai(x)$ and its derivative, and before discussing the actual details of the tables, it is instructive to recall the history of the function.

A little over one hundred years ago, in calculations relating to the light-intensity in the neighbourhood of a caustic, Airy was confronted with the integral

$$W = \int_0^\infty \cos \tfrac{1}{2}\pi\,(w^3 - mw)\,dw,$$

and succeeded in producing a 5-decimal table for values of m ranging between ± 4, later extended to ± 5·6.

It can be deduced that W satisfies the differential equation

$$\frac{d^2W}{dm^2} = -\frac{1}{12}\pi^2 m\,W,$$

and hence that the problem of computing it is effectively that of computing the solutions of the second order differential equation

$$\frac{d^2y}{dx^2} = xy.$$

The form of this last equation suggests that its solutions are closely allied to Bessel functions of a certain order, and denoting them by $Ai(x)$ and $Bi(x)$, it may be shown, for example, that when x is real and positive,

$$Ai\,(-x) = \tfrac{1}{3}\,x^{\frac{1}{2}}\,\{J_{-\frac{1}{3}}\,(\xi) + J_{\frac{1}{3}}\,(\xi)\}$$
$$Bi\,(-x) = (\tfrac{1}{3}\,x)^{\frac{1}{2}}\,\{J_{-\frac{1}{3}}\,(\xi) - J_{\frac{1}{3}}\,(\xi)\}$$

where $\xi = \frac{2}{3}x^{3/2}$, with similar results for positive arguments in terms of modified functions.

Recently the demand for tables of the Airy integral has revived; a revival closely connected with the simplicity of the differential equation above, and in virtue of which the British Association, through its tables committee, has prepared this volume (issued as Part-Volume *B*, in conjunction with a volume dealing with the tabulation of Legendre polynomials).

It is provided with a substantial introduction discussing the history of the function, the formulæ and equations involved, and the methods of computing and checking. This occupies some fifteen pages and is followed by tables of $Ai(x)$ and $Ai'(x)$, for the range $x = -20$ to $x = 2$, at intervals of 0·01, the entries being to eight decimal places, with second differences.

Subsidiary tables of the logarithms, zeros and turning values of the functions are also included, and similar results for the *Bi* functions for the range − 10·0 (0·1) + 2·5 are provided. Finally there are eight pages of tables of auxiliary functions, with definitions and formulæ.

The whole book is beautifully produced and does its authors great credit. It is interesting, in conclusion, to note that Airy's original computations, in spite of the exceedingly laborious work which they involved, were almost entirely devoid of error.

J. H. PEARCE

MAP PROJECTIONS

Map Projections

By George P. Kellaway. Pp. viii + 128. (London: Methuen and Co., Ltd., 1946.) 10*s*. 6*d*. net.

WE welcome a book whose "aim is to provide students of geography with a logical treatment of the commoner map projections". A careful study leaves no doubt of its value as a contribution to the teaching of the subject: the plan is well conceived and skilfully executed.

The earth sphere, latitude and longitude are compressed into four pages, which lead to discussion of the fundamental problem of representation of the earth on flat maps. There is a double classification based on: (1) nature—perspective, geometrical and conventional; (2) construction—on plane, cylinder or cone.

Part 1 begins with polar maps: the order gnomonic, stereographic, orthographic is surprising; there is something to be said for beginning with the sphere as ordinarily seen. Cylindricals follow, and here the discussion of Cassini's is particularly welcome though the construction is not detailed, probably because it is too difficult for those for whom the book is intended. Conicals, ending with Bonne's, complete the geometrical types. Conventionals open with Sanson-Flamsteed. Aitoff receives due notice as an improvement on Mollweide.

The plan of treatment in each case is: (1) mathematical basis; (2) statistical examination of properties at regular latitude intervals; (3) summary of general properties; (4) limitations; (5) construction. The statistical treatment leads to the study of limitations. This is very thoroughly done. Perhaps, after full treatment in one case and a beginning in others, something might, with advantage, have been left for the student to do; on the other hand, much labour has provided some very acceptable reference material.

Part 2 deals with equatorial zenithals and obliques. The outstanding impression is that the author is deeply concerned, and quite rightly, that the student should realize the importance, in dealing with approximations, of considering the degree of accuracy attained. One would like to think of non-mathematical geographers at school or university being at home with the mathematical work, in these days of numerical trigonometry to School Certificate. To follow the manipulative work would be a severe tax; at worst, the student can take it as read, pay due attention to the statistical data and construct according to instructions. No student can really be said to have studied map projections without constructive work.

The book ends with an admirable discussion of the use of various projections and a collection of representative questions set by university examining boards. Could we not give them a lead in setting questions concerned with travel, and would it not be worth while for examiners to ask a candidate to construct rather than write about projections, at least sometimes?

In conclusion, the reviewer has read the book with real pleasure: he feels no hesitation in recommending its careful study by those seeking a stimulating textbook on the subject or a worthy addition to the geographical library. He congratulates author, publisher and printers on an excellent production.

A. HINCKLEY

The United Nations

A Handbook on the New World Organisation. By Louis Dolivet. Pp. 144. (London : Phœnix House, Ltd., 1946.) 6*s*. net.

IT is probably true to say that the prestige of the United Nations Organisation has fallen as much in twelve months as that of the League of Nations fell in as many years. Disillusionment and bewilderment are as widespread as the realization that, for all such disappointment, the diagnosis of the founders of the Organisation remains correct. It is still true that Western civilization cannot indefinitely sustain the strain imposed upon it by the conflicting interests of the Great Powers.

If, however, this situation is to be retrieved and the United Nations Organisation is to succeed in its objectives, it must have the firm support of individual men and women throughout the world. That support must be based on clear understanding of the ramifications of the Organisation, the diversity of its problems and the mechanics of its operations. Mr. Dolivet's handbook is an objective contribution to that end. It is not a commentary; but a conscientious and workman-like attempt to give a factual picture of the actual structure and purposes of the Organisation. The book is readable, and although in some respects incomplete, being free from any attempt to record achievements or current controversies, it should assist the ordinary citizen to arrive at some independent judgment for himself. The appendixes include the Charter of the United Nations, the Statute of the International Court of Justice, and the names of representatives on the Security Council, the Military Staff Committee, the Atomic Energy Commission, and the delegates to the Economic and Social Council and to the First Assembly. If to future editions there could be added similar factual presentations of the relations with, and functions of, the Educational, Scientific and Cultural Organisation, the Food and Agricultural Organisation, and the like, which are in this edition rather summarily discussed, and of the trusteeship developments, it could well become a reference book that the ordinary citizen would be glad to have at hand.

R. B.

Les Liquides Dispersifs et leurs Applications

Par Dr. G. Ahier. Pp. 88. (Paris : Jouve et Cie., 1940.)

OWING to war conditions, this interesting monograph has only recently become available in Great Britain. It forms a useful summary of a great deal of work on the applications of liquids of high dispersivity, especially to the construction of Christiansen filters (*C.R. Acad. Sci., Paris*, 202, 1775 (1936) ; 205, 37 (1937) ; 206, 203 (1938)).

Christiansen filters consist essentially of a powdered solid immersed in a liquid of similar refractive index but different dispersivity. For one wave-length, the refractive indices are equal ; the mixture is then homogeneous and transparent to this wave-length, while all other wave-lengths are scattered. The literature records the use of a number of such filters. Dr. Ahier's book discusses the theory of these filters, and derives formulæ which may assist in their construction. He also describes fully a series of liquids and solids with which he assembled filters which selected narrow bands of wave-lengths, from the visible region down to 1850 A. Careful manipulation renders it possible to isolate bands, which, in some cases, were only 3 A. wide. The merits and defects of Christiansen filters are compared with those coloured filters and monochromators. In genera Christiansen filters are cheaper, more easily mad and more satisfactory from the point of view of bot selectivity and optical density.

Dr. Ahier's book should be useful to workers r quiring light filters, partly as a practical handboo and partly as a review of the subject, including t infra-red region.

G. J. MINKOFF

Chemical Thermodynamics

By Dr. J. A. V. Butler. Fourth edition. Pp. xvi+57 (London : Macmillan and Co., Ltd., 1946.) 12*s*. 6

IN this book, the author has brought together one volume the two parts of his introduction thermodynamics, which were formerly publish separately. The first part gives a straightforward a elementary account of the first and second laws, a their application, with the emphasis towards electr chemistry. The second part, which is considerab more advanced, deals with the more importa thermodynamic functions and the third law, a their applications. This part has been revis and brought up to date, and a good deal of ne material added. The revision could, with advantag have been extended to Part 1 ; even the younge student may, in this atomic age, raise his eyebro at the statement on p. 4 that "According to som modern physical theories, matter and energy a interconvertible. If this were substantiated, th Conservation of Energy would be replaced by wider principle of the Conservation of Mass-Energy." There might also, with advantage, hav been a closer synthesis of the text of the two parts.

The book contains a good deal more than its tit implies, and discussions of detailed mechanisms a frequently included. This adds considerably to th value of the book, since it gets down to fundamental In particular, the author writes interestingly and we on the subjects in which he has made original co tributions, such as the kinetic theory of the electro processes, or the mechanism of over-potential. The is a large number of well-selected examples, many which are worked out ; and a short but very cle account of the application of statistical methods the determination of thermodynamic functions, the late Dr. W. J. C. Orr, has been added as a appendix. The book should continue to prove useful and stimulating introduction to the subject.

F. P. BOWDEN

General Mathematics

By Clement V. Durell. Vol. 1. Pp. xv+312+xlv Vol. 2. Pp. xxxi+324+xl. (London : G. Bell an Sons, Ltd., 1946.) 5*s*. without Answers ; 5*s*. 6*d*. wit Answers, each Vol.

AS Mr. Durell rightly says in his preface, "el mentary mathematics should be treated as single subject". The course embodies many mode ideas of teaching designed to meet the expanding an changing needs of post-war secondary schools. deals with arithmetic, algebra, geometry and tri onometry, and covers all the requirements laid dow in the current syllabuses of the various Scho Certificate examining authorities.

Each book contains many exercises which a classified into two main groups : a first course, an a parallel course. The first is intended for all pupil while the second provides extra practice. Usef test papers and revision exercises are supplie together with answers to all exercises.

THE 'CYTOGENETICS' OF BLACK AND WHITE GUINEA PIG SKIN

By R. E. BILLINGHAM and P. B. MEDAWAR
Department of Zoology and Comparative Anatomy, University of Oxford

IT is an obvious empirical fact that the differentiated cells of the adult organism, if they are capable of dividing at all, 'breed true' and preserve for ever in cellular inheritance their specificity of histological type. Even under the regime of tissue culture, in which a cell lineage may well comprise a hundred generations, there is no reduction of embryological rank, and no degradation of histological specificity that is not a mere matter of 'nurture' and reversible at will. What is the mechanism of conservative inheritance in the cell lineages generated by mere asexual fission ? An attempt will be made to answer this question by special reference to two cytogenetically distinct but closely related types of cell: those of the 'white' and 'black' epidermal epithelia of guinea pigs' skin. It will be suggested that the inherited difference between them is due to the possession by the black epidermis of a cytoplasmic self-reproducing system concerned with melanogenesis that has some of the properties of what are usually called 'viruses'. Analysis of the type we have undertaken is, indeed, only made possible by the circumstance that black skin is capable of 'infecting' white, and endowing it with its own cellular phenotype ; a process which is in some respects analogous to a cross between sexual organisms, and which has the same methodological significance for the study of cellular heredity as the phenomenon of segregation has for Mendelian genetics.

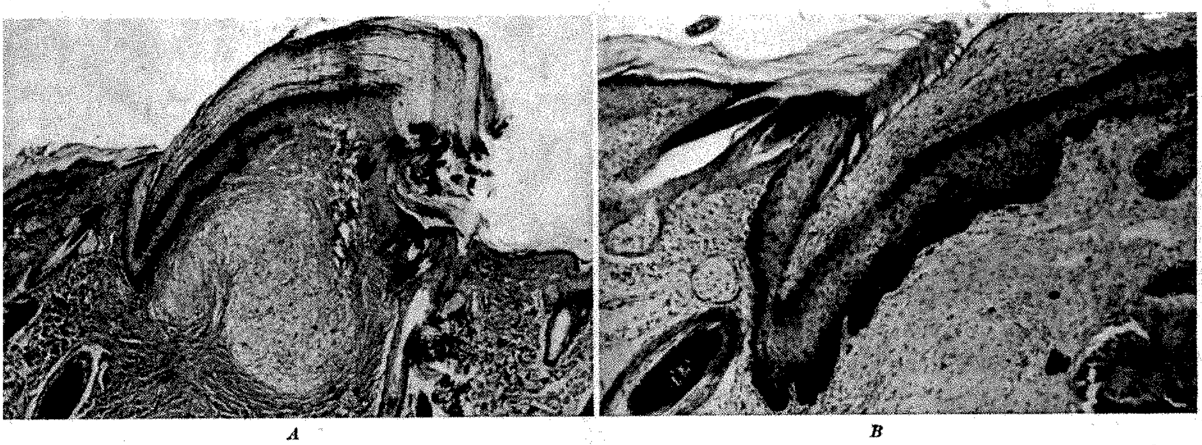
The skin that bears black hairs in a spotted black-and-white guinea pig is itself black in colour. This is because the basal layer cells of its epidermis contain melanin granules. (In rabbits and mice, by contrast, any apparent pigmentation of the skin itself is due to melanin granules housed in the hair follicles alone.) It has been known for fifty years[1,2] that if black guinea pig skin is grafted to a white area on the same animal, a process that may non-committally be called 'infection' takes place: the white skin that surrounds the black graft blackens centrifugally, though the hairs that grow on infected white skin almost invariably stay white. Conversely, white skin grafted to a black area in due course blackens.

Loeb's explanation[3] of the phenomenon is as follows. "The pigmented epidermis is the stronger one" ; and because of the physiological disturbance entailed by grafting, it "asserts its authority over the white epithelium", and in the "struggle" that ensues, it wins. Bleached of its metaphorical colourings, the theory amounts to this : for reasons not yet clear, black skin grows into and displaces white[4].

There is no convincing histological evidence that any such process of invasive replacement takes place, save perhaps in the irrelevant special case in which a white graft from one guinea pig (a homograft) is transplanted to a black area on another. We have now conclusive evidence that no replacement occurs. For if the white epithelium of the lunula of a white claw[5] is transplanted to a black area on the skin of the chest, it promptly blackens and produces a jet black claw in the normal skin area (Figs. *A*, *B*). White sole-of-foot or vaginal epithelium transplanted to black areas of dorsal skin likewise promptly blacken, while retaining all their other easily recognizable graft-specific characters, such as the high growth-rate and dense stratum corneum of the sole-of-foot graft, from which a thick pad of compact cuticle may be removed weekly. Moreover, if a white sole-of-foot graft is caused to blacken by grafting to a black area of dorsal skin, it may then be removed and returned to its original surroundings ; whereupon the white sole is blackened at second hand by something evidently derived in the first instance from dorsal skin. Results such as these must be held to refute the hypothesis of cellular replacement. If, for example, black dorsal skin epithelium had in fact replaced white claw-forming epithelium, it could scarcely be expected to form a black claw. *Mutatis mutandis*, the same applies to sole-of-foot and vaginal grafts.

Other hypotheses may now be considered.

(1) The blackening of white skin around a black graft is due to the simple diffusion from cell to cell of enzymes or co-enzymes concerned with melanogenesis. In principle, this does not differ from the outward diffusion of a black dye from the graft, supposing that its epithelium were black merely because it had been stained by a black vital dye.



(*A*) VERTICAL SECTION THROUGH A BLACKENED CLAW THAT HAS DEVELOPED FROM A SMALL GRAFT OF WHITE LUNULAR EPITHELIUM 33 DAYS AFTER TRANSPLANTATION TO THE BLACK SKIN OF THE CHEST. THE BASAL LAYERS OF THE CLAW EPITHELIUM AND THE CLAW SUBSTANCE ITSELF ARE LOADED WITH MELANIN GRANULES. HÆMATOXYLIN AND VAN GIESON. (*B*) A VIEW IN HIGHER POWER OF THE CLAW-SKIN JUNCTION : FROM A NEIGHBOURING SECTION STAINED WITH EHRLICH'S HÆMATOXYLIN AND ORANGE-G. THE UNIFORM INFECTIVE PIGMENTATION OF THE CLAW EPITHELIUM IS OBVIOUS. NOTE THE ABRUPT TRANSITION BETWEEN SKIN AND CLAW EPITHELIUM, AS INDICATED BY THE CHANGE IN THE STRUCTURE OF THE STRATUM CORNEUM

This hypothesis is untenable because the 'blackness' of artificially blackened white skin becomes a heritable characteristic of its cells. The induced blackness of even so mitotically active an epithelium as that of the sole does not diminish during the dozens of cellular generations through which it must pass in a period of three or four months. In certain circumstances, indeed, it may increase. Moreover, as Fessler first showed[6], if part of the blackened annulus surrounding a black-in-white graft is removed and transferred to a white area, it duly infects the surrounding white skin; and part of this newly formed blackened annulus may in turn blacken its surroundings if grafted to a white area elsewhere. In short: whatever maintains the formation of melanin granules in artificially blackened white skin multiplies with the cells that house it.

(2) A second explanation, therefore, is that the process of contagious infective blackening is produced by the diffusion from black cells into white of a self-reproducing entity that is part of the normal equipment of cytogenetically black cells. This entity spreads like a virus from cell to cell, possibly across the cytoplasmic bridges that are said to unite epidermal cells of the prickle layer; and, being self-reproducing, brings about a change in the white epidermal cells that is thereafter permanently conserved in cellular heredity. It is irrelevant to this interpretation whether the postulated entity is an enzyme, co-enzyme, enzyme vehicle, or colloidal micelle of the 'microsome' type[7]. The point is that it must be supposed to reproduce itself. There are two reasons for supposing that any such entity must be housed in the cytoplasm: (*a*) it must evidently come out of the nucleus, if stationed there, to infect a neighbouring cell; and (*b*) one is not yet entitled to suppose that black and white epidermal cells of the same individual have different complements of nuclear genes. Yet there is no doubt that nuclear genes *do* initiate pigmentation and govern the pattern of its distribution; and we are led to suggest, by analogy with the known behaviour of the 'cytogenes' of yeasts[8,9], that the cytoplasmic factor is gene-initiated but not gene-maintained. Indeed, it is difficult to conceive how the different cell-races of the individual body come to acquire their specificity of histological type, and to maintain it indefinitely in cellular heredity, without postulating the existence of such self-reproducing bodies in the cytoplasm. They may initially have been called into being by some specific act of co-operation between nuclear genes and an external 'morphogenetic' stimulus; but thereafter they maintain themselves autonomously in the cytoplasm. It was to examine a hypothesis of this type that the experiments described here were done; and it was the speculations of Darlington[10] and Haddow[11] that set us thinking on these lines.

There are already several candidates for admission to the status of self-reproducing cytoplasmic 'genes' or proprietary viruses, namely, 'cytogenes', 'plasmagenes'[10], and factors of the type described by Sonneborn[12]; and the idea that such factors play a determinative part in somatic cellular differentiation and heredity is far from new[7,9,11,13]. The inherited difference between black and white epidermal cells is a test case for the following reasons: (i) the two cell types are cytogenetically very similar; (ii) they are nevertheless cytogenetically distinct, and in a superficially obvious way; (iii) black and white epidermal cells can establish just that intimate cytoplasmic contact that may in most cases be necessary for infection to take place. It may prove possible to strengthen our hypothesis by showing that the infective agent that turns white cells black can be introduced into white cells in cell-free extract. Tests of this type are in their early stages, and they have not yet been successful. It seems unlikely that cells of other types should lend themselves so easily to experiments on infective transformation. One could scarcely hope to turn a liver cell, say, into a cell of thyroid epithelium; but it might not prove impossible to endow an undifferentiated fibroblast with osteogenic power.

(3) It is only by analogy with the behaviour of 'viruses'[10] and the cytoplasmic factors of yeasts[8,9] that we have been led to suggest that the infective agent we are dealing with is *itself* self-reproducing. By analogy with what the embryologist has called 'homoiogenetic induction'[14] we might equally well liken it to an 'evocator', that is, to a substance that merely *initiates* the formation of such self-reproducing bodies in the cytoplasm and, consequently, a change of cellular phenotype that is thereafter self-sustained. Now viruses multiply only in association with living cells; and some viruses, like our own candidate, can only multiply in cells of a very restricted type. (As will be shown later, the epidermal epithelium of the tongue is not overtly infectable.) To show that the infective agent we are dealing with is 'really' self-reproducing, we cannot but introduce it into cells of the type that it is known to infect, and show that it multiplies there; in other words, perform the very test that fails to disqualify the alternative view that it is 'really' a morphogenetic hormone. We could, of course, distinguish between virus and evocator by an arbitrary act of definition—as by saying that viruses are always associated with nucleo-proteins and evocators with sterolic compounds; but to attempt to do so before we are much clearer about the form which such a definition had best be made to take might be a real misfortune, born of a deep-seated but perhaps mistaken belief in the propriety of 'always defining one's terms'. All we can say is that the properties of our infective agent relate it more closely to the things which people who study 'viruses' call by that name. For example, black skin *homo*grafts (see above) do not elicit a blackening reaction when grafted to white skin[15]; even, we find, when grafted in such low dosage[16] that they should have time, before their eventual destruction, to infect the neighbouring epidermal cells of the host. The infective agent is therefore iso-antigenic, or is closely associated with something that is. This is perfectly consistent with a virus-type theory of infection, for reasons that involve too many details of the theory of transplantation immunity to be discussed here; but less obviously consistent with a simple 'evocator' theory, since most evocators are not even species-specific in their action.

Pending the publication of a full report, we may take this opportunity of mentioning some of our other experimental findings. (*a*) White tongue epithelium does not blacken in a black skin environment. Even months after grafting, the margin of contact between black skin epithelium and white tongue epithelium (with its characteristic cuticle, and without granular layer) may be distinguished to a cellular boundary. Tongue epithelium may be cytogenetically too far removed from that of skin for such a process of infection to take place; and it may be relevant that we have not so far seen a naturally occurring pigmentation in the tongue of the guinea pig, although feet, claws, and vagina are pigmented in some individuals. (*b*) The process of infection occurs mainly in the basal layers of the superficial (as opposed to follicular) epidermis, so that the hairs borne by artificially blackened white skin tend to remain white, even after manipulative treatment (such as grafting itself) which causes the hairs to be thrown off and replaced by new. We believe that this is because the primordia of new hairs are usually formed from the bases or shafts of the old follicles, to which the infective agent does not gain access (possibly because the rate of upward flow or migration of follicle epithelium is greater than the rate of spread of infection downwards). But black hairs *do* sometimes form in artificially blackened white epithelium; as often, it may be, as the primordia of new hairs are budded off from the blackened superficial epithelium rather than from the epithelium of effete follicles. (*c*) Contrary to the belief of Fessler[6], skin grafts, competently transplanted, invariably grow hairs. (*d*) The rate of blackening of a white-in-black graft seems to vary directly with the intrinsic (that is, 'graft-specific') rate of cell division in the epidermal graft. It is particularly high in sole-of-foot and claw-forming epithelia, and white grafts of such epithelia blacken in a matter of weeks. The rate of centripetal blackening of a white dorsal skin graft in a black skin area is, however, anomalously slow: we do not yet know why. (*e*) The pigmented character of artificially blackened epithelia of all types is a property of *all* the cells of their basal layers (cf. Fig. *B*). Whatever may be the role of melanophores in amphibian skin grafts, we have no evidence that they play any primary part in the phenomena we have described.

Summary. Black guinea pig epidermis has the power to 'infect' neighbouring white epidermis, and so to blacken it. This is shown not to be due to a cellular invasion and a replacement of white cells by black. It is due to an agent which, having entered white cells, brings about a permanent heritable change that causes them and their descendants to remain thereafter black. The infective agent may be a self-reproducing body housed normally in the cytoplasm; or, less probably, it may be a morphogenetic hormone that merely initiates the formation of such self-reproducing bodies in the white cells which it infects. The experiments described have a direct bearing on the problems of somatic cellular differentiation and heredity.

FUNDAMENTAL PROBLEMS IN MODERN PHYSICS

THE Physical Society intends to hold a series of ordinary meetings at places outside London, and the first of these took place in the Physics Department of the University of Birmingham on December 20. This meeting, which took the form of a one-day conference under the general title "Fundamental Problems in Modern Physics", was attended by about two hundred fellows of the Society and visitors from universities, government establishments and industrial firms. The morning session was devoted to three papers; in the first, Prof. R. E. Peierls, of the University of Birmingham, discussed some of the outstanding difficulties of fundamental theoretical physics, and indicated the type of experimental evidence which would be most valuable in resolving them. He was followed by Mr. J. S. Gooden, also of the University of Birmingham, who read a paper on the design of a proton synchrotron, with special reference to the factors influencing the amplitude of phase oscillations of the particles and consequently affecting the intensity of the emergent beam. The third paper, by Mr. D. W. Fry, of the Telecommunications Research Establishment, dealt with some practical aspects of synchrotron design, in the light of experience gained with the three electron synchrotrons already under construction in Great Britain. A paper by Prof. J. Sayers, of the University of Birmingham, on recombination phenomena in highly ionized gases, opened the afternoon session; Prof. Sayers was unfortunately not able to be present at the meeting, but his paper was read by Prof. P. B. Moon. The conference closed with a paper by Dr. F. Hoyle, of Cambridge, on the synthesis of heavy elements from hydrogen in stars, and their distribution throughout space.

Prof. Peierls suggested three main lines of experimental investigation from which information useful to the theoretical physicist may be forthcoming. In the first of these, the energies of the nuclear particles involved are not excessive, and the greatest need is for improvement of measuring apparatus and for a systematic collection of results. In the case of β-disintegration, for example, it is now known that some of the apparent discrepancies between experiment and the original Fermi theory were due to experimental difficulties which have since been overcome; but there still remains some freedom of choice in formulating the theory, which can be narrowed down only by detailed knowledge of quantities such as the spin and symmetry of the initial and final nucleus and the distribution in energy of the emitted particles.

With regard to the short-range forces between particles in complex nuclei, Prof. Peierls pointed out that although Bohr's 'liquid drop' model represents the qualitative properties of such nuclei reasonably well, the assumptions made are independent of the nature of the forces involved, and hence the deductions drawn from them can give no information on this point.

Even if the laws of force were known, it would be impossible to calculate exactly the values of the energy-levels of complex nuclei, on account of the large number of particles involved. We must therefore discuss these nuclei in a statistical way, and so it becomes important to have a large amount of experimental data systematically collected. The importance of each individual item might seem small, but that of the whole would be considerable if an effort were made to obtain as much information as possible about each energy-level, and great care were taken to proceed systematically in those cases where it is necessary to obtain information from transitions between two levels.

The difficulties with which the theoretical physicist has to contend in describing nuclear processes while still ignorant of the law of force between the particles are augmented by doubts as to the limits of applicability of the fundamental mechanical laws. For example, an unstable condition is predicted on extrapolating to short distances the law expressing the non-central force between the components of the deuteron. Experimental data on neutron–proton collisions, when the bombarding particle has a de Broglie wave-length of the same order of magnitude as the distance at which the simple law breaks down, would therefore be of value in suggesting suitable modifications for use at these distances. Particles with kinetic energy in the region of 12 MeV., or greater if possible, would be required, and accurate data from the scattering experiments are essential. Turning to experiments in which very high energies are required, Prof. Peierls pointed out that existing theory breaks down completely when applied to particles the distances of approach of which are of the order of 10^{-13} cm., and to states existing for the order of 10^{-23} sec. To provide a signpost for theory in this region, the study of collisions between elementary particles at energies of the order of 100 MeV. is necessary. Another possible outcome of experiments on particles with energies in the 100 MeV. region is the production of mesons in controllable experimental conditions, whereupon it might be possible to investigate their electric charge, to ascertain whether they have a range of masses, and to obtain further data on their spin, in circumstances more amenable to interpretation than those existing at present, when the only source of mesons is cosmic radiation.

In the two papers which followed, Mr. Gooden and Mr. Fry took up Prof. Peierls' challenge to practical physics by showing how high-energy particles might be obtained. Referring to the proton synchrotron under construction at the University of Birmingham, Mr. Gooden showed that in the case where the particle velocity, and consequently the frequency of the accelerating radio-frequency field, increases with increasing particle energy, some particles will possess a phase oscillation the amplitude of which is to a first approximation constant, and might, under certain conditions, steadily increase. If the amplitude is allowed to increase, these particles enter the region of unstable phase, and are lost from the circulating beam. Particles can, however, be accelerated provided that a careful control is exercised in the choice of those physical variables which affect the amplitude of the oscillation. Mr. Gooden showed that there are no less than eight significant forces affecting this oscillation, four of which cannot be varied. Three of these are associated with the radial displacement of a particle from the central, or stable, orbit, since such displacements determine the energy gain per revolution required to maintain the particle in its instantaneous orbit, the amount of magnetic flux enclosed by the orbit, and the response of the particle to changes in the frequency of the accelerating electric field. The fourth invariable force arises from the fact that, as the total kinetic energy of the particle increases, the radial displacement resulting from the given change in the energy-gain per revolution becomes smaller. The combined effect of these four forces is to produce a very small damping of the phase oscillation in the case of acceleration of protons to energies of about 1,000 MeV. The four variable forces were then discussed; these were shown to depend on the rate of change of the frequency and amplitude of the accelerating field, the form of time variation adopted for the magnetic field, and the shape of the faces of the accelerating chamber. Finally, Mr. Gooden considered the factors affecting the number of radio-frequency cycles, and the time interval per cycle, during which particles could be accepted for acceleration.

Mr. Fry restricted his attention to electron synchrotrons, and therefore discussed only those types of machine in which the initial acceleration (to velocities of about 0·98c) is obtained by betatron action, the radio-frequency accelerating pulse being phased to start just as the betatron core begins to become saturated. When the particle velocity is nearly equal to that of light, the orbital frequency will remain constant if the radius of the orbit is kept constant by suitable increase of the magnetic field with time; the frequency of the alternating voltage between the accelerating electrodes can then be constant during each pulse. After mentioning the essential components of a synchrotron system and the relative times at which the voltages must be applied to the injection gun, accelerating electrodes and ejection coils, Mr. Fry went on to describe the magnet systems used in the 30 MeV. machine designed by the Telecommunication Research Establishment and the 300 MeV. synchrotron which is being made by Metropolitan-Vickers with help from the Establishment for the University of Glasgow. To reduce the magnet weight, it is convenient to use a symmetrical iron circuit of high-quality laminations in which a high flux density can be achieved. Considerations of the maximum energy which has to be stored in the field show that it is desirable to keep the volume of the annulus in which the particles circulate as small as possible; this, in turn, necessitates very careful design and construction to prevent particles from being lost on account of irregularities or out-of-phase fields produced in air gaps by leakage from the magnet stampings. In the case of the 300 MeV. machine, the stored energy is supplied by a condenser bank; but the high cost of this equipment makes it necessary to consider alternative sources, such as a motor generator or a resonant magnet circuit working on a reduced duty cycle, to supply higher energy synchrotrons. Mr. Fry concluded his paper with a discussion of the type of resonator which it is proposed to use in the radio-frequency system, in order to minimize eddy current field, the technical problems associated with making the vacuum envelope for the 300 MeV. machine, and the arrangements for obtaining a high injection voltage (about 100 kV.) prior to betatron acceleration.

Prof. Sayers's paper began with a summary of the measurements by Kenty on the decay of ionization in argon after the sudden interruption of a low-voltage arc. Later measurements by Mohler in cæsium and mercury vapour were similar to Kenty's, in that mechanical commutators were used to interrupt the arc and apply voltages after various intervals to Langmuir probes, by which the electron densities were measured. Sayers used a cathode-ray oscilloscope to measure the current of a Langmuir probe, maintained at an adjustable potential, as a function of time after the interruption of a low-voltage arc in argon. From a series of such measurements the time-variation of the electron (or ion) concentration and the electron temperature could be determined at various places in the tube. The loss of particles by diffusion to the walls was illustrated by graphs showing the concentration as a function of position within the tube at different times; at first the concentration was practically uniform over the greater part of the tube, but this region of uniformity became more and more closely confined around the axis of the tube as time went on. Within this region, loss by diffusion may be neglected, so that the value of α, the coefficient of recombination, may be deduced from the equation $\frac{dN}{dt} = -\alpha N^2$, where N is the number per cubic centimetre of ions of either sign. Sayers found that α varies with electron temperature, but is independent of the pressure over the range 0·1–1·0 mm., as would be expected if the recombination is a two-body process. At an electron temperature of 1,000° K., α for argon is about $6 \cdot 6 \times 10^{-10}$ cm.^{3} sec.$^{-1}$.

In comparing these experiments with theory, Prof. Sayers pointed out that the probability of recombination to the ground state of the neutral atom is likely to be only a small fraction of the total recombination probability and, since the excited states will be roughly hydrogen-like for all atoms, it is not unreasonable to compare calculated values of α for oxygen with the experimental values obtained for argon, mercury and cæsium. The variation of α with electron temperature is as predicted by theory, but the absolute magnitude of α is about five hundred times larger than theory predicts. Observations on recombination in the F region of the ionosphere agree with the laboratory experiments, but considerations of the balance of electron population in interstellar space agree with the theoretical value. In contrast to these unresolved discrepancies concerning the capture of electrons into the whole series of states of the atom, measurements by optical methods of the radiative capture of electrons into individual atomic states seem to agree well with theory.

The discussion which followed centred largely around the question of whether, in the laboratory experiments, it is proper to consider the electrons as being in temperature equilibrium at each instant during the few milliseconds occupied by the decay of the ionization.

In the last paper of the afternoon session, Dr. Hoyle discussed one of the most fascinating problems of astrophysics—the process of synthesizing heavy elements from hydrogen and helium, and obtaining the observed distribution of these elements throughout space. There are two main problems to be considered: first, it is necessary to establish the conditions in which this synthesis can take place, and secondly to determine where, in the universe, these conditions are actually to be encountered. Having considered the very great difficulties involved in any theory which envisages conditions other than those of thermal equilibrium between the different elements, Dr. Hoyle proceeded to discuss the results obtained by applying statistical mechanics to the evolution of the heavy elements. He pointed out that from this point of view nuclear reactions can be treated by applying the well-known properties of statistical assemblies of dissociating gases, together with an equation determining the neutron-to-proton ratio as a function of density. This latter equation shows that both the concentration of free neutrons and the ratio of neutrons to protons increase with increasing density, and that to obtain a proportion of heavy elements in accordance with observation, densities of the order of 10^7 gm. per cm.^{3} are required. It can be shown also that to establish equilibrium between the various elements in a time sensibly less than the age of the universe, the region considered must have a temperature of the order of 10^9 degrees. The central temperatures of normal stars are too low by a factor of about 100, but in the case of those which have collapsed to a small fraction of their initial radius owing to the exhaustion of their hydrogen supply, temperatures of the required magnitude may be encountered. At some stage during the collapse, depending on the angular momentum, which differs widely from one star to another, the rotating spheroid becomes unstable, and material is thrown off into space from its equator. Now the nuclear reactions which would have to take place in order to re-establish equilibrium at the lower temperatures and densities require the emission of energy, so cooling is rapidly accelerated. Dr. Hoyle suggested that a small fraction of the heavy elements formed in a collapsed star remain 'frozen'. Thus, since the amount of material thrown off may amount to 99 per cent of the total mass of the star, such elements may be present both in the material thrown off and in the residual core. Dr. Hoyle connected the super-nova catastrophe with physical conditions inferred from the hypothesis that the Crab nebula represents the remains of a past super-nova.

Among difficulties raised in the course of the discussion was that of accounting for the presence of heavy elements in all known stars, which contain also hydrogen and helium.

THE GIACOBINID METEOR SHOWER, 1946

SEVERAL papers describing British observations of the Giacobinid meteor shower, 1946, were presented at a meeting of the Royal Astronomical Society on December 13, 1946. Special interest was attached to this subject because of the incidence of a shower of such exceptional intensity at a time when the considerable advances made by radar techniques were able to make an important contribution to the observations. Such methods not only enabled estimates of hourly rates to be made without interference due to poor visibility, but also demonstrated how information on certain meteor characteristics can be provided more conveniently and more precisely than is possible by visual meteor watches.

An introductory paper on the visual watch was given by J. P. M. Prentice, director of the Meteor Section of the British Astronomical Association. Although observations were considerably hindered by bad weather, it was possible to obtain a complete curve showing the variation in hourly rate by combining the results of several observers. The shower was of approximately six hours duration, rising steeply to a sharp maximum around 0345 hr., followed by a steep decline. The variation in rates was so rapid that the mean hourly rates, determined by averaging over short periods, are considerably affected by the length of period chosen. The visual observations were averaged over 7–8 minutes, and the maximum hourly rate corrected to a radiant in the zenith was 2250. An allowance for the strong moonlight which prevailed was made by comparing the magnitude distribution with the corresponding distribution during the great shower of 1933, for which the observations of F. de Roy are available. Even when this factor is taken into account, the 1933 shower appeared to be at least twice as rich at all stages in the development as that of 1946. It had been anticipated that the shower would be richer in 1946 since the comet was so much nearer the earth at its node than in 1933, the distances being 135,000 miles in 1946 as compared with 500,000 miles in 1933.

Dr. A. C. B. Lovell then described the radar observations which he made with C. J. Banwell and J. A. Clegg at the University of Manchester. The aerial system, which was adjustable in both azimuth and elevation, provided a narrow radio beam at a wave-length of 4·2 m. An almost continuous watch was maintained for 71 hours between October 8 and 11. The radio echoes were generally recorded by visual observation of the cathode ray tube; but, in addition, a ciné-film was taken at 8 frames per second during the peak period.

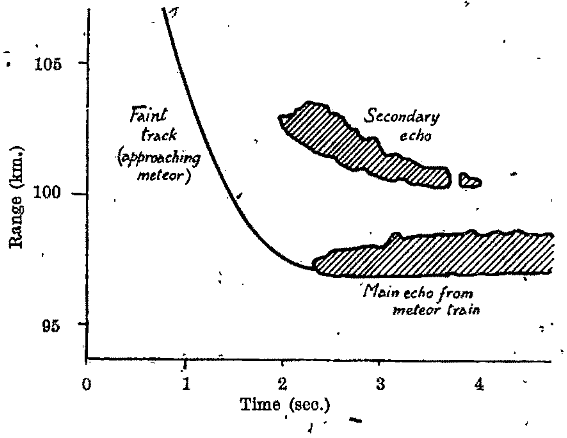
Throughout most of the watch the radio beam was directed at 90° from the Giacobinid radiant. To confirm that echoes are generally only obtained when the beam is perpendicular to the ionized trails produced by the passage of the meteors, the beam was directed towards the radiant for part of the shower, when it was found that the number of echoes fell to 4 per cent of the previous value.

Observations of the hourly rate of occurrence of echoes were made with the directional aerial system, supplemented by a dipole aerial system giving an almost all-round looking beam. Until 2100 hr. U.T. on October 9, the rate was very low, usually 2 per hour and never greater than 6 per hour. A very slight increase was recorded after 2100 hr. U.T.; but it was not until after 0000 hr. on October 10 that the shower suddenly developed. The maximum which occurred between 0340 to 0343 hr. U.T. was extremely sharp, and a peak rate of 168 echoes per minute, averaged over a period of 24 sec., was attained. Within ± 5 min. of this peak the rate was down to 50 per minute, and within ± 30 min. it was 1 per minute. By 0600 hr. the shower had passed completely.

An examination of the life histories of echoes recorded on the ciné-film showed, in a number of cases, very rapid fluctuations in amplitude with a fairly regular decay superimposed. An analysis of the distributions of heights, durations and amplitudes gave evidence of change during the progress of the shower, thus indicating either variation in the characteristics of the stream or in the conditions of the upper atmosphere. The ciné-film record obtained at the maximum of the shower provided a sufficiently accurate distribution of echo amplitude for an estimate to be made of the size distribution of the meteors by means of the theories of meteor ionization developed at the University of Manchester by Herlofson. It was shown that the number of electrons produced per cm. path by the meteor could be determined from the received echo strength, for a radio beam directed at right angles to the meteor train, from the relation

$$\text{received echo power} = 8{\cdot}88 \times 10^{-28}\frac{\alpha^2\lambda^3}{R^3}P_0G^2 \text{ watts},$$

where α is the number of electrons per cm. path, R the range of the echo in cm., λ the wave-length in cm., P_0 the peak transmitter power in watts, and G the power gain of the aerial system (the same for transmitter and receiver) as compared with a half-wave dipole. Calculations by Herlofson showed that α is proportional to the size of the meteor and inversely proportional to the velocity. It was hence deduced from echo-strength measurements during the maximum of the Giacobinid shower that the number of meteors of a given size was inversely proportional to the size.



A visual watch was carried out simultaneously with the radar observation between 0014 and 0107 hr. U.T. and 0134 and 0228 hr. U.T., when the sky was clear; 26 per cent of the radio echoes observed during these periods were coincident with visual meteors. If the analysis is restricted to radio echoes of more than 0·5 sec. duration, then 50 per cent of these were coincident with visual meteors. This simultaneous watch afforded an opportunity of testing Herlofson's theory, according to which a meteor which produces 10^{10} electrons/cm. path will be at the limit of naked eye visibility. This value was found to be in general agreement with that deduced from calculations of the ionization necessary to give the observed radio echoes.

J. S. Hey gave an account of observations made in collaboration with S. J. Parsons and G. S. Stewart, at the Operational Research Group, Ministry of Supply. A continuous watch was maintained during October 7–11, with radar equipment of about 5 metres wave-length, using both visual and photographic recording of the cathode ray tube display. One of the most important results, which emerged as a consequence of improved photographic methods giving better resolution than hitherto, was the recording of the fine structure of the echoes and the determination of meteor velocity. The echoed signals were made to appear as bright spots on a linear-range trace on the cathode ray tube. This was photographed on a film moving at right angles to the trace at uniform speed. The resulting record thus gave a plot of echo-range against time. Satisfactory resolution was obtained by displaying a limited range-band of 80–115 km. over the full width of the cathode ray tube and by using a 35-mm. film moving at 2·4 mm. per sec.

In earlier work by Hey and Stewart (*Nature*, **158**, 481; 1946), it was shown that the main echoes are obtained at right angles to the meteor trails. Some of the recordings in the present series showed clearly that prior to the formation of the main echo there is a faint fast-moving echo which can be associated with the ionization in the immediate vicinity of the approaching meteor. Not until the ionized column approximately reaches the point of intersection of the normal from the observing station to the ionized column can the stronger and more enduring broadside echo be obtained. Secondary reflexions which appeared in the recordings can be attributed to the effects of drifts and diffusion which, as is known from visual meteor data, may cause irregularities in the train a few seconds after its formation. An example of a Giacobinid meteor echo, producing sufficient ionization around it for the track of the approaching meteor to be detected, is illustrated in the accompanying diagram, which is taken from a photographic recording.

These faint tracks resulting from the reflexion from the ionization in close proximity to the approaching meteor enabled the geocentric velocities to be determined without requiring a knowledge of the radiant position. The range–time characteristics, with few exceptions, were found to be representative of a body moving with uniform velocity in a straight line. The range R at any instant T is then given by

$$R^2 = R_0^2 + V^2 (T - T_0)^2,$$

where R_0 and T_0 represent the range and time when the range is a minimum and V is the geocentric velocity. From the analysis of twenty-two tracks, the weighted mean of the computed velocities was found to be 22·9 km./sec., with root-mean-square deviation of 1·3 km./sec., the weighting factor being made proportional to the duration of the track. This mean value is in close agreement with the theoretical velocity of 23·7 km./sec. given by Dr. J. G. Porter, director of the Computing Section of the British Astronomical Association.

Sir Edward Appleton and R. Naismith, who in 1932 noticed the general occurrence of the transient ionospheric radio (or radar) echoes which are now known to arise from the ionization trails of meteors, took part in the discussion. The results which they obtained on the occasion of the Giacobinid Shower of October 10 were described in these columns a few weeks ago (*Nature*, 158, 936; 1946). Moreover, as a result of their systematic study of the diurnal and seasonal variations of both meteor ionization trails and sporadic ionization in the E layer of the ionosphere, they have been led to the important conclusion that the fine dust of sporadic meteors contributes substantially to the irregularities of ionization which have long been known to exist in the E layer. An account of these phenomena, and the descriptions of the investigations of the other radar workers mentioned above and of 60 Group R.A.F., are being given at a meeting of the Physical Society on January 31.

J. S. HEY

NEWS and VIEWS

Gold Medal of the Royal Astronomical Society: Prof. M. G. J. Minnaert

PROF. MARCEL GILLES JOZEF MINNAERT, director of the Sonnenburg Observatory, Utrecht, has been awarded the Gold Medal of the Royal Astronomical Society for his outstanding contributions to solar physics and in particular to solar spectrophotometry. A pupil of Julius, he was later at Utrecht a colleague of Ornstein and Moll, and an early worker in the field of spectrophotometry, both developing the technique and applying it to a wide range of solar problems. He has taken part in a number of eclipse expeditions: to Sumatra in 1926 and 1929, and to Canada in 1932, all spoilt by clouds; his one successful expedition was to Lapland for the eclipse of 1927, where he obtained the first absolute values of the intensities of the chromospheric lines. He produced during the early days of the War a "Photometric Atlas of the Solar Spectrum", a most valuable contribution to solar spectroscopy. His later years in the War were spent in a concentration camp, from which he has emerged with his scientific enthusiasms undamped. He is chairman of the Commission on Spectrophotometry of the International Astronomical Union, a position for which he is well qualified by both experimental and theoretical studies. The distribution of energy in the sun's continuous spectrum and in that of the corona, the law of darkening of the sun's limb, and the polarization of the corona are among other subjects to which he has made valuable contributions. He has also worked on the direct photometry of Venus, the moon and red stars. His work is throughout characterized by a thoroughness, accuracy and care which have secured him a leading position in his own field. He was elected an associate of the Royal Astronomical Society in 1945.

Cadman Medal of the Institute of Petroleum: Mr. R. P. Russell

THE Council of the Institute of Petroleum has awarded the Cadman Memorial Medal to Mr. Robert Price Russell, president of the Standard Oil Development Co., the central technical and research organisation of the Standard Oil Company (N.J.). Great services were rendered by Mr. Russell and his associates during the War in the production of high-octane aviation fuels, synthetic rubbers and toluene for explosives, and in the development of flame throwers, incendiaries and smoke generators. More than half the American output of aviation petrol for war-planes was manufactured by the catalytic cracking process, in which Mr. Russell played a notable part. Nine tenths of the American output of petroleum-based butadiene, the starting material in the manufacture of synthetic rubber, came from the process which Mr. Russell directed into large-scale production. In recognition of his war-time work, Mr. Russell was awarded the Medal for Merit, the highest civilian award in the United States. In 1946 he received the gold medal of the American Institute of Chemists for "noteworthy and outstanding service to the science of chemistry". Mr. Russell is well known personally in Great Britain, for he came here in 1944 as chairman of the Petroleum, Chemical and Rubber Division of the U.S. Strategic Bombing Survey. A team of scientific workers under his supervision entered Germany on the heels of the front-line troops to survey the enemy's vast oil-chemical industry.

Born in Massachusetts in 1898, Mr. Russell saw military service in the First World War; on resuming his studies, he obtained a master's degree in chemical engineering at the Massachusetts Institute of Technology in 1923. After holding some academic appointments, he joined the Standard Oil Co. (N.J.), in 1927, when he became research director of the newly established Esso Laboratories at Baton Rouge, La. Here he initiated research on the hydrogenation process and the manufacture of synthetic products from petroleum. Mr. Russell is now directing research on new and improved uses for crude oil, the production of liquid fuels from coal and natural gas, and the development of improved synthetic rubbers and plastics.

Institution of Electrical Engineers: Honorary Member

THE Council of the Institution of Electrical Engineers has elected Sir John Macfarlane Kennedy, past president, to be an honorary member of the Institution, in recognition of his distinguished work in the sphere of electricity supply and of the services rendered by him to the Institution. Sir John was at Trinity College, Cambridge, and also went to Zurich Polytechnic. He served his pupillage with Richard Moreland and Sons, London, Willans and Robinson, Rugby, and Siemens-Halske, Berlin. During 1902–34 he was a partner in the firm of Kennedy and Donkin, and was engaged in electricity supply, distribution and traction works. In 1922 he submitted to the Electricity Commissioners proposals for the reorganisation of electricity supply in Great Britain, and eventually prepared a report for the Ministry of Transport on the reorganisation of electricity supply. In 1934 he took office with the Electricity Commission, of which he is now deputy-chairman.

Faraday Medal

THE Faraday Medal of the Institution has been awarded to Sir Standen Leonard Pearce, for his outstanding contributions to the advancement of engineering practice and notable achievements in electrical engineering. Sir Leonard Pearce was educated at Bishops Stortford College and Finsbury Technical College, London. He served his pupillage with J. G. Statter and Co. at West Drayton, and Thomas Richardson and Sons of Hartlepool. After occupying various posts, he was appointed in 1903 to be chief engineer to Manchester Corporation Electricity Undertaking; in 1926 he became engineer-in-chief of the London Power Co.

Prof. F. J. W. Roughton, F.R.S.

DR. F. J. W. ROUGHTON, who succeeds Prof. E. K. Rideal in the John Humphrey Plummer professorship of colloid science in the University of Cambridge, is a physiologist admirably qualified to deal with the border-line between biological and physical science. Since his election to a fellowship at Trinity College, Cambridge, in 1923, his researches have been concerned with the carriage of gases by the blood and with the physical chemistry of the blood pigments. His best-known work is that begun with Meldrum on the enzyme carbonic anhydrase, which plays an important part in the transport of carbon dioxide from the tissues to the lungs. Physical chemists will remember also the ingenious methods which he used with Hartridge to study the rapid rate of combination of oxygen with hæmoglobin. Largely as the result of his work, the complex interchanges between the corpuscles and the plasma in the lung capillaries are far more clearly understood. His wide knowledge of physico-chemical techniques and of their application to biological problems has made him an authority in a field which is rapidly becoming one of the growing points in natural science; and physiologists will wish him every success in an appointment which will give full scope to his talent for reducing biological equations to measurable terms.

Human Nutrition at the London School of Hygiene and Tropical Medicine: Prof. B. S. Platt, C.M.G.

THE increasing importance attached to the scientific study of nutrition is reflected in the appointment of Dr. B. S. Platt as professor of human nutrition at the London School of Hygiene and Tropical Medicine. Dr. Platt will continue to hold, in conjunction with the chair, his present post as director of the Medical Research Council's Research Unit of Human Nutrition, at the National Hospital, Queen Square, London. His appointment is thus also another welcome sign of the growing readiness of universities to elect to professorial rank those whose duties are primarily in research; under the old system a professor was too often so fully occupied with teaching as to have little time left for research. Dr. Platt graduated in the School of Chemistry at Leeds in 1923. He engaged in research there under the late Prof. J. B. Cohen, was elected to a Beit Memorial Fellowship in 1926, and became medically qualified in 1930. During 1932–38 he was attached to the Division of Clinical Research of the Henry Lester Institute of Medical Research at Shanghai, as associate in medicine, and in 1932 was the author of the B.M.A. "Bishop Harman Prize Essay" on "The Importance of Vitamin B_1 for Maternal Health in Pregnancy and Lactation". In 1938 he was appointed to the scientific staff of the Medical Research Council, and since 1944 has been director of the Council's Human Nutrition Research Unit.

Dr. Platt has served as a nutritional expert on a considerable number of government committees, including the Scientific Food Policy Committee, the Committee for the Care of Shipwrecked Personnel, the Rations Sub-committee of the Military Personnel Research Committee, and the United Kingdom Delegation to the Food and Agriculture Organisation Conferences; and in his work he has travelled widely, including visits to West and East African territories, Newfoundland and the West Indies. In 1944, he gave the De Lamar Lecture in hygiene at the Johns Hopkins University. He has published a considerable number of papers, dealing mostly with biochemical studies on water-soluble vitamins, his best known work perhaps being that with Miss Lu on the blood pyruvate in vitamin B_1 deficiency in man.

Prof. Frank Horton, F.R.S.

THE recent retirement of Prof. Frank Horton from the University chair of physics which he has held at the Royal Holloway College (University of London) since 1914 brings to an end an active teaching career lasting more than forty years. That career really falls into two parts, Cambridge and London, though it should be mentioned that he received his earlier training at Birmingham, of which University he holds the degree of M.Sc. At Cambridge, as a lecturer at the Cavendish Laboratory in the days of J. J. Thomson, he formed one of that brilliant team of young physicists comparable in their way with those other teams in other spheres during the same epoch, namely, 'Cromer's young men' in Egypt and the Sudan, and 'Milner's young men' in South Africa. An early election to a fellowship of the Royal Society placed a hallmark on the value of his contributions to the field of science in which he specialized.

Prof. Horton went to London in 1914. There, in addition to his teaching and research work, he soon entered into the inner circles of university administration, culminating in 1939 with his election as vice-chancellor. He continued to hold this high and arduous office throughout the War. To quote the words used by the principal of the University in his latest report: "No period of its history was more fraught with danger for the University than these six years, danger not only of physical destruction but of spiritual disintegration. Under the emergency measures which were taken to carry on the work of the University, the Vice-Chancellor was entrusted with wide powers. They were used with the utmost discretion and judgment. Professor Horton enjoyed none of the pomp and pageantry which fall to the lot of the Vice-Chancellor in normal times, but he must surely feel that the widespread and sincere tributes paid to his exceptional services afford some measure of compensation." The Senate, realizing that his term of office as a faculty representative was drawing to a close, paid tribute to the debt which it owed to his services by electing him as one of its co-opted members.

National Institute of Sciences of India: Elections

THE following have been elected ordinary fellows of the National Institute of Sciences of India: Mr. S. Basu, deputy director general (forecasting), Poona, distinguished for his work in weather forecasting; Dr. U. P. Basu, chief chemist, Bengal Immunity Co., Ltd., Calcutta, distinguished for his work in chemotherapy; Mr. J. Coates, senior geologist, Burmah Oil Co., Ltd., Digboi, distinguished for his work in geology; Dr. G. Krishnamurti, assistant director, Department of Chemotherapy, Haffkine Institute, Bombay, distinguished for his work on Indian medicinal plants; Dr. B. S. Kadam, Central Tobacco Research Station, Guntur, distinguished for his work in genetics and plant breeding; Prof. D. D. Kosambi, professor of mathematics, Tata Institute of Fundamental Research, Bombay, distinguished for his work in path geometry and statistics; Mr. V. Khanolkar, director of laboratories, Tata Memorial Hospital, Bombay, distinguished for his work in human pathology; Dr. D. R. Malhotra, B.B. and C.I. Railway, Ajmer, distinguished for his work in metallurgical chemistry; Dr. B. Mundkur, mycologist, Imperial Agricultural Research Institute, New Delhi, distinguished for his work in systematic mycology; Dr. B. Narayana, professor of physiology, Prince of Wales Medical College, Patna, distinguished for his work in physiology; Dr. B. P. Pal, economic botanist, Imperial Agricultural Research Institute, New Delhi, distinguished for his work in genetics and plant breeding; Dr. V. G. Panse, statistician, Institute of Plant Industry, Indore, distinguished for his work on the application of statistical methods of plant breeding; Dr. P. B. Sarkar, senior research chemist, Indian Central Jute Committee, Calcutta, distinguished for his work on the chemistry of jute; Dr. B. N. Srivastava, Physics Department, University of Allahabad, distinguished for his work in thermodynamics; Dr. L. C. Verman, director of physical laboratories, Council for Scientific and Industrial Research, Delhi, distinguished for his work in applied physics.

Geological Society Awards

THE Council of the Geological Society announces the following awards:

Wollaston Medal to Dr. Joseph Burr Tyrrell, for his services to geological science in the Dominion of Canada, more particularly his pioneer work on the Barren Lands west of Hudson Bay and on the goldfields of Klondyke and Kirkland Lake.

Murchison Medal to Mr. Percy Evans, in recognition of his researches on the oilfields of Burma and Assam, and his work on the geological interpretation of gravitational surveys.

Lyell Medal to Dr. Stanley Smith, for his researches on Palæozoic corals, particularly their structure and relationships, and for his investigations into Lower Palæozoic and Carboniferous stratigraphy.

Bigsby Medal to Dr. George Hoole Mitchell, for his geological investigations in the Lake District and his work on the coalfields of Yorkshire and the Midlands.

Wollaston Fund to Dr. Austin William Woodland, for his work on the Cambrian rocks of Merionethshire and on the water supply of the Midlands and East Anglia.

Murchison Fund to Dr. Duncan Leitch, in recognition of his studies of the Carboniferous stratigraphy of Scotland and his investigations of the lamellibranch faunas of the Scottish coalfields.

A moiety of the Lyell Fund to Dr. Leslie Rowsell Moore, for his investigations of Upper Carboniferous faunas and floras of the Bristol, Somerset and South Wales coalfields; another moiety of the Lyell Fund to Mr. Claude William Wright, for his work on the faunas of the Cretaceous rocks of southern England and the Yorkshire and Lincolnshire wolds.

Physical Society's Proposed Acoustics Group

A MEETING of those interested in the formation of an Acoustics Group of the Physical Society will be held in the Jarvis Hall of the Royal Institute of British Architects, 66 Portland Place, London, W.1, at 3 p.m. on February 19. Mr. H. L. Kirke, head of the B.B.C. Research Department, will be in the chair, and Dr. Alex Wood will give an address on "The Contribution of Acoustical Science to Allied Studies". It is hoped to arrange an informal exhibition of recent acoustical apparatus. The agenda for the meeting will include a general discussion of the proposal to form such a group, the election of a chairman and officers, and the adoption of a set of rules. Those interested should send their names, indicating whether they will be able to attend the meeting, to the acting secretaries, Mr. A. T. Pickles and Mr. W. A. Allen, at the office of the Society, 1 Lowther Gardens, Prince Consort Road, London, S.W.7.

Recenti Progressi in Medicina

THE appearance of the first issue (dated October 1946) of *Recenti Progressi in Medicina*, a monthly review of international medical and surgical literature, published in Rome under the directorship of Giuseppe Lazzaro, supported by some twenty-eight collaborators, is an interesting development of post-war medical activity in Italy. This first issue, which owes much to the advice and experience of Prof. Giuseppe Bastianelli, to whom the editor pays a warm tribute, is mainly devoted to a review of recent progress in our knowledge of the various types of inflammation of the lungs. It deals not only with the types of pneumonia caused by bacteria, but also with influenzal pneumonia, coccidiomycosis, *Q*-fever and psittacosis. An especially long and detailed section, illustrated by X-ray photographs, deals with primary atypical pneumonia. Another article is devoted to the condition known to some as infiltration of Hegglen or pneumonia associated with a positive Wassermann reaction. Treatment of the pneumonias with penicillin and sulphonamides is the subject of another article, and there are abstracts from literature dealing with other aspects of the study of inflammation of the lungs. A short section records two immunological laboratory procedures. A bibliographical section consists entirely of the contents of the *British Medical Journal* during the months January to April 1946.

The next issue of this journal will be devoted to recent progress in the treatment of disease with penicillin, and will contain articles by Sir Alexander Fleming and Sir Howard Florey, the translation of these two articles having been aided by the British Council. The editors offer a special word of thanks to the British Council and to the president of the Medical Section of American Relief in Italy for the help given to them in the publication of the journal. British and American sources predominate in the first issue. Future numbers will be awaited with interest. The journal should do much, not only to bring Italian medical men the latest information on a wide variety of subjects, but also to promote co-operation between them and medical men in other countries.

Trees Used for Animal Fodder in India

INDIAN FOREST LEAFLET No. 82 (Sylviculture) (Forest Research Institute, Dehra Dun. Pp. iv+17. 8 an.) discusses those trees the foliage of which is used for animal fodder in India. It is the third edition of a small publication written by M. V. Laurie, then sylviculturist at the Forest Research Institute, Dehra Dun, first issued in 1939. It was quickly sold out, as also was the second edition, the present being a revised third edition. India has been one of the countries the population of which has been much addicted to tree lopping, usually to provide forage for animals. With the appearance of the Animal Husbandry Wing of the Agricultural Research Council in India, a start was made in collecting information on the subject of fodder grasses and general fodder supplies. It was left to the Forest Research Institute at Dehra Dun to institute inquiries into the trees used for this purpose—and used very often to the detriment of the forests so maltreated. The list does not make any claim to scientific accuracy, but merely represents the consolidated opinions of forest officers throughout India of the relative popularity of different trees for lopping for fodder.

British Council Scholarships, 1946–47

FOR the current academic year, 248 graduates and others of like status from overseas have been awarded British Council scholarships, which enable them to take a wide range of post-graduate courses of study in British universities and similar institutions. The scholarships are normally for one year, but extensions are granted in suitable cases. In addition, the Council has helped to place many students who have come to Britain under the auspices of overseas authorities or privately. The Council has this year established a Students' Welfare Department to deal with the reception and non-academic welfare of scholarship holders, and to help them to gain a general knowledge of British life and institutions. To this end vacation courses, which enable those residing in London to visit the provinces and vice-versa, as well as term-time talks, discussions, shows of documentary films and other events are arranged. These facilities are available also to students sponsored by the Colonial Office, the Indian and Sudan Governments, and to other overseas students. Scholarship holders this year have come from some fifty Empire and foreign countries. The awards are for various subjects, including agriculture and agricultural sciences (6), engineering and mining (15), sciences and technology (50).

Spectrochimica Acta

AN international medium for the publication of research results in applied spectroscopy was launched in 1939, and published by Julius Springer in Berlin until 1944. This is being revived under the joint editorship of several spectroscopists, as before. The editorial board will consist of: Dr. A. Gatterer (Vatican Observatory), Mr. E. van Someren (London), Prof. R. Breckpot (Louvain), Dr. W. Gerlach (Munich), Dr. H. Kaiser (Jena) and Dr. L. W. Strock (Saratoga Springs). The first number of the third volume should appear early in 1947, and authors of papers on emission or absorption spectroscopy are invited to submit manuscripts, in English, French, German or Italian, to the nearest member of the editorial board. Publication should be fairly prompt, by current standards. As in most scientific publications, authors are urged to be concise; but the paper supplies are sufficient to allow each author 75 reprints. The printing will be undertaken by the printers in the Vatican City, who are accustomed to dealing with a variety of languages. Authors in Great Britain should communicate with Mr. E. van Someren, 20 Churchfields, Broxbourne, Herts.

Announcements

THE Medical Research Council has appointed Dr. S. T. Cowan (formerly of the University of Manchester) to succeed Dr. R. St. John Brooks as director of the National Collection of Type Cultures of Micro-organisms. The Collection continues to be housed at the Elstree establishment of the Lister Institute of Preventive Medicine, but will be moved to the Central Public Health Laboratory at Colindale as soon as accommodation there is available.

MR. J. B. BENNETT has been appointed to succeed the late Mr. W. Barnicot as secretary of Rothamsted Experimental Station.

IN accordance with its usual practice, Trinity College, Cambridge, announces the offer of a research studentship open to graduates of other universities who propose to go to Cambridge in October next as candidates for the degree of Ph.D. The value of the studentship may be as much as £300 a year. Candidates must not have reached the age of twenty-six before May 1 (length of war service can be added). The College also offers, as usual, exhibitions of the value of £40 to students of Dominion and Colonial universities who wish to go to Cambridge next October as candidates for the degree of B.A., M.Litt., M.Sc., or Ph.D. A candidate for a studentship or exhibition should apply through the principal authority of his university, and his application must reach the Senior Tutor, Trinity College, Cambridge (from whom further particulars may be obtained), by May 1.

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Ethical Aspects of the Development of Atomic Energy

When I read the editorial article in *Nature* of December 21 on "Ethical Aspects of the Development of Atomic Energy" I had not seen "Programme for Survival" by Prof. Lewis Mumford, reviewed in that article. I have now obtained and read it—with surprise; for you say "Unconditional co-operation, Prof. Mumford holds, is the price of mankind's survival; and he sets that as the objective, urgent and imperative, but not to be attained unilaterally or forthwith as Mr. Lionel Curtis is inclined to suggest". Yet on p. 4, Prof. Mumford writes, "We must think swiftly, plan swiftly, act swiftly". I am all the more puzzled because the article in *Nature* had noted that "Prof. Mumford is as insistent as scientific men themselves that we have only a limited time in which to learn the art of control and to prevent the suicidal misuse of scientific knowledge".

Reference is made to the report of scientific men transmitted on June 11, 1945, to the Secretary of War at Washington, and they are reported as urging that "the political problems arising from the mastering of nuclear power should be recognized in all their gravity, and that appropriate steps should be taken for their study and for the preparation of the necessary decisions. The existence of nuclear weapons is regarded as the most compelling argument calling for an efficient international organisation for peace."

The date of this report is significant. Before the atomic bombs had been dropped on Japan its inventors had realized the need to establish an international organisation powerful enough to control their terrible weapon and were warning their political chief in advance. They, at any rate, did not regard advice to postpone the creation of such an authority as a counsel of wisdom.

It is rightly said that Prof. Mumford wants the world "to wait a decade if need be before the harnessing of atomic energy to peaceful purposes proceeds apace".

But soldiers, industrialists and rulers are not going to wait because we wish them to wait. The *Nature* article continues: "The future of humanity depends, as Prof. Mumford asserts, on the three great Powers, not less than others, placing themselves strictly under the judgment and the surveillance of the rest of the world. . . . 'The authority of the United Nations must be unqualified and universal; every last laboratory and factory must be open to investigation by authorized international agents, responsible to the central world authority. The power to spread, limit or even outlaw scientific investigation must reside in such a body no less than the power to outlaw completely all national armies. Privacy, secrecy, sovereignty must be unconditionally surrendered to a common body whose prescribed powers must override all local administrative organs at every point that is necessary to ensure freedom from fear and freedom from unlawful aggression.'"

To all this no one could agree more fervently than I. But things like this are not to be done by mere wishing or by words, however eloquent. They can only be done, to quote the *Nature* article, by bringing "the fact-finding method of science into the political sphere as a step towards the elucidation of policy 'and measures'", or in the words of the report of the scientific men quoted above: "the political problems arising from the mastering of nuclear power should be recognized in all their gravity, and appropriate steps should be taken for their study and for the preparation of the necessary decisions".

I quote this last passage because this exactly was done by the Leave Groups of men and women of all ranks from the Forces of all the United Nations who met every week in Balliol College, Oxford, for the last three years of the War. Some three thousand passed through these groups all inspired by the purpose of working out some plan for an international democracy strong enough to save their children from a third World War, from such horrors as they were facing in the Second World War and their fathers had faced in the First. It was my privilege to lead their discussions. The results hammered out week by week are fully stated in "World War; its Cause and Cure", and more shortly in "War or Peace?". I think Prof. Mumford would take heart if he studied these records and realized how far effect had already been given to methods advocated in the American report you quote, and also in your own article. These results are now known as the Leave Groups policy, a policy in the real sense of the word. But a policy, however carefully framed, is not by itself enough. I think Prof. Mumford sees this when he says "It is a question of dynamic will-power", though I prefer the simpler words "of leadership", such leadership as Mr. Winston Churchill gave us in 1940 and throughout the War. Field-Marshal Smuts saw this in his great speech at The Hague—when he called on Britain to lead the democracies, impotent as they now are, to strength and the safety that strength alone can give. My own comment on this was that a nation can lead other nations only in so far as it is itself led by one of its own recognized leaders.

Since the *Nature* article appeared on December 21, Mr. Winston Churchill has published his two momentous articles in the *Daily Telegraph* of December 30 and 31 entitled "The Way to Stop a New War". His thought seems to have led him to the same conclusions as those reached in the Leave Groups after three years of discussion. Let me quote his significant words. "One spasm of resolve! One single gesture! The prison doors clang open. Out walk, or totter, the captives into the sunshine of a joyous world. I do not at all conceal from the reader that an act of the Sublime is required. It is a very simple act, not even a forward bound. Just stand erect, but all together. . . . If we cannot get all countries, we must get all we can; and there may be many. . . . It may well be that everybody cannot join the club at once. The beginning must be made. The nucleus must be formed in relation to the structure as a whole, so that others can join easily as soon as they feel inclined or feel able. The ideal is so commanding that it can afford a gradual realisation.

"Of all the deterrents against war now acting upon the minds of men, nothing is comparable to this frightful agency of indiscriminate destruction. While this supreme weapon rests in the hands of the United States alone, it is probable, though we cannot say it is certain, that a breathing space will be accorded to the world. We cannot tell how long this breathing space will last. Let us make sure that it is not cast away. If, in this interval we can revive the life and unity of Europe and Christendom, and with this new reinforcement build high and commanding a world structure of peace which no one dare challenge, the most awful crisis of history will have passed away and the high road of the future will again become open. . . . If during the next five years we can build a world structure of irresistible force and inviolable authority, there are no limits to the blessings which all men may enjoy and share."

Mr. Churchill makes it clear that in our own country this must be the work of both parties, for he tells us that "Mr. Attlee has declared 'Europe must federate or perish' and he does not readily change his opinions".

So since the *Nature* article was published the leadership to action which we needed and for which we have waited so long has been given.

Nuclear Disintegration by Meson Capture

RECENTLY, multiple nuclear disintegration 'stars', produced by cosmic radiation, have been investigated by the photographic emulsion technique. Plates coated with 50 µ Ilford B.1 emulsions[1] were exposed in aircraft for several hours at 30,000 ft. One of these disintegrations was of particular interest, for whereas all stars previously observed had been initiated by radiation not producing ionizing tracks in the emulsion, the one in question appears to be due to nuclear capture of a charged particle, presumably a slow meson.

The star consists of four tracks *A*, *B*, *C* and *D* (Fig. 1). *A*, *B* and *D* lie almost in the plane of the emulsion, whereas *C* dips steeply (at about 40°) and ends in the glass. *D* is due to a proton of energy 3·7 MeV., and *C* also corresponds to a proton, of more than 3 MeV., and most likely about 5 MeV. Track *B* was most probably produced by a triton of 5·6 MeV. A short track, about 1 µ long, between *A* and *B* is apparently due to the residual recoil nucleus.

Track *A* appears to enter the emulsion surface about 150 µ from the star centre. On account of the relatively large distances between consecutive grains at this range, the track cannot be distinguished at all easily against the spontaneous background of grains, and only the last 100 µ of track (below arrow) can be traced with certainty. Assuming it to be singly charged, the mass of the particle producing track *A* has been roughly evaluated by the following methods.

(1) Both ionization and scattering increase towards the origin of the star, hence the particle was definitely travelling *towards* the disintegration point.

An electron is discounted because the observed ionization is far too high (an electron track of this range would, in fact, not be detected at all), and the scattering too small. On the other hand, a proton is discounted since the observed scattering is too great (Fig. 2). We must, therefore, conclude that the particle had a mass intermediate between that of electron and proton.

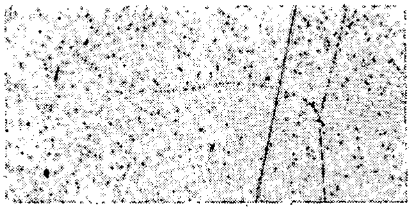

Fig. 1 *a*. PHOTOMICROGRAPH OF CENTRE OF STAR, SHOWING TRACK OF MESON PRODUCING DISINTEGRATION. (LEITZ 2 MM. OIL-IMMERSION OBJECTIVE. × 500)

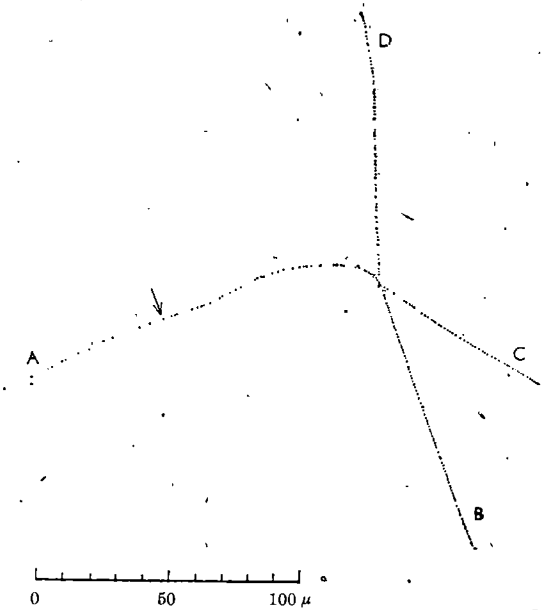

Fig. 1 *b*. TRACE OF COMPLETE STAR ON SCREEN OF PROJECTION MICROSCOPE, SHOWING PROJECTION OF THE TRACKS IN THE PLANE OF THE EMULSION. TRACK *A* CANNOT BE TRACED WITH CERTAINTY BEYOND THE ARROW

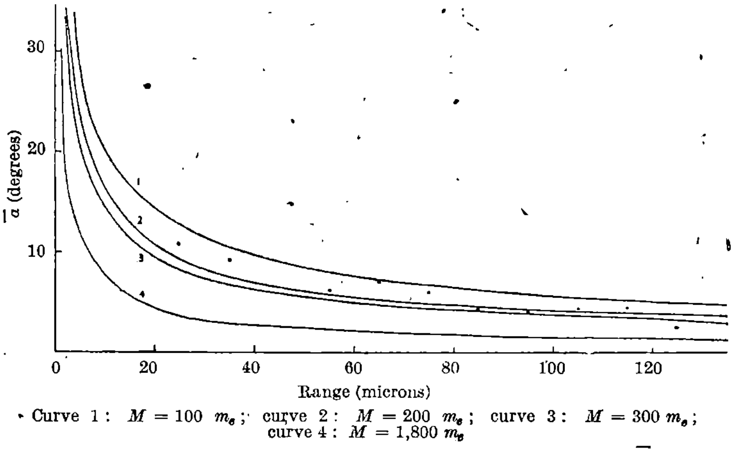
The grain density along track *A* does, in fact, agree well with that to be expected of a meson of the observed range of about one tenth of the proton mass. The range-energy curve for mesons in the emulsion has been obtained from that for protons (kindly lent by Dr. C. F. Powell), using the ratio of the masses of the two particles.



Curve 1 : $M = 100\ m_e$; curve 2 : $M = 200\ m_e$; curve 3 : $M = 300\ m_e$; curve 4 : $M = 1{,}800\ m_e$

Fig. 2. MULTIPLE SCATTERING OF MESONS AND PROTON IN THE EMULSION. $\bar{\alpha}$ DENOTES THE MEAN ANGLE OF SCATTERING FOR A 10 µ LAYER OF THE EMULSION. CURVES CALCULATED FOR PARTICLES OF MASS 100 m_e, 200 m_e, 300 m_e AND 1,800 m_e (PROTON), m_e BEING THE ELECTRON MASS. EXPERIMENTAL POINTS, FROM MEASUREMENTS ON TRACK *A*, INDICATED BY DOTS

(2) The elastic scattering of mesons and protons can be calculated from the known emulsion constitution, using Williams's formula[2] for the mean square angle of multiple scattering, and is shown plotted against range in Fig. 2. Bearing in mind the fact that the single scattering will introduce large fluctuations, the experimental points appear to be consistent with a meson mass between 100 m_e and 300 m_e, m_e being the electron mass. Only the horizontal projection of the scattering along the track can actually be measured; on the average, multiplying this by a factor $\sqrt{2}$ will give the true value. The scattering of fast electrons cannot be found from any simple formula, but it is certainly much greater than the observed values.

(3) A value of the meson mass can also be arrived at from the energy required in the nuclear disintegration. In this process, the emitted particles must have sufficient energy to surmount the potential barrier, so that the disintegrating nucleus in this case cannot be that of silver or bromine, and must, therefore, be either carbon, oxygen or nitrogen (in the gelatin).

An approximate calculation of the momentum of the recoil nucleus indicates that at least one neutron must be postulated to conserve momentum; the kinetic energy of this neutron must be around 4 MeV. If we assume that a negative meson is captured by a nucleus nearly at the end of its range and is annihilated, so that the rest energy of the meson becomes nuclear excitation energy, we could have disintegration schemes such as

$$Y^- + \mathrm{O}^{16}_{8} \to \mathrm{N}^{16*}_{7} \to \mathrm{H}^{3}_{1} + 2\mathrm{H}^{1}_{1} + n^{1}_{0} + \mathrm{Be}^{10*}_{4}$$
$$(\text{or } 2n^{1}_{0} + \mathrm{Be}^{8}_{4})$$
$$Y^- + \mathrm{N}^{14}_{7} \to \mathrm{C}^{14*}_{6} \to \mathrm{H}^{3}_{1} + 2\mathrm{H}^{1}_{1} + n^{1}_{0} + \mathrm{Li}^{8*}_{3}$$
$$Y^- + \mathrm{C}^{12}_{6} \to \mathrm{B}^{12*}_{5} \to \mathrm{H}^{3}_{1} + 2\mathrm{H}^{1}_{1} + n^{1}_{0} + \mathrm{He}^{6*}_{2}$$

As the recoil nucleus would be expected to have a fairly high excitation energy (5–10 MeV.) above the ground-state, it must be relatively stable against further disintegration into charged particles. With this limitation, there are still a large number of possible reactions (considering all isotopes of carbon, oxygen and nitrogen), but it appears that in general the mass excess of the recoil nucleus $\sim$ 15 MeV., whereas that of the initial one $\sim$ 5 MeV. or less. The negative Q value of the reaction, allowing for excitation energy, is then found to be $\sim$ 60 MeV., and the total kinetic energy of the ejected particles $\sim$ 20 MeV. The total excitation energy of the original nucleus would then be $\sim$ 80 MeV., probably with an error of ± 20 MeV. (to allow for the various numbers of neutrons emitted, etc.).

On the above hypothesis, the meson should, therefore, have a rest energy of 60–100 MeV., that is, a mass of between 120 m_e and 200 m_e.

Near the end of the meson track, a small number of grains are observed slightly off the main track. If these are due to fast secondary electrons, their ranges appear to be considerably greater than would be expected from the energy of the primary.

I am indebted to the A.O.C., Royal Air Force, Benson, Oxon., for kindly exposing the plates.

Angular Distribution of Protons Ejected in the Disintegration of Nitrogen by α-Particles

USING a powerful polonium source and an especially well-defined geometry, we have recently obtained 850 expansion-chamber photographs showing 90 proton tracks produced on the disintegration of nitrogen by α-particle bombardment. Our arrangement, therefore, gave on the average one disintegration for every ten photographs, thus greatly reducing both the expense of the photographic materials used and the labour of the examination of the photographs.

The number of disintegrations decreases rapidly as the energy of the α-particles is reduced, but the photographs show that disintegrations occur quite definitely for energies less than 1·7 MeV., and probably at energies less than 1 MeV.

The angular distribution shows a marked change with energy. For α-particles of energy less than 3 MeV., the distribution is almost uniform in numbers between 30° and 120°, while at 3·5 MeV. there is a marked preponderance at about 90° with proportionately smaller numbers of protons ejected symmetrically at angles greater and less than this value. It is interesting to recall that the well-known disintegrations recorded by Blackett and Lees[1] for 3–4 MeV. α-particles in nitrogen both show the ejection of the proton in the neighbourhood of 90°.

A full report of the experiment, together with selected photographs, will be published elsewhere.

A Revised Estimate of the Age of the Earth

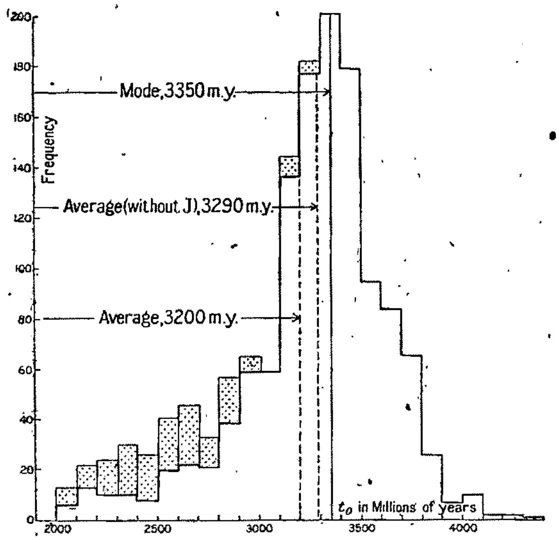
SINCE the publication of my preliminary account of a new method of estimating the age of the earth[1], based on Nier's isotopic analyses of samples of lead from galena and other lead minerals of known geological age, I have revised the calculations, using Glaisher's Exponential Tables[2], and greatly increased the number of solutions. 1,419 solutions for t_0 (the time since the isotopic constitution of the earth's primeval lead began to be modified by additions of lead isotopes generated from uranium I, actinium U and thorium) and for x and y (the respective isotopic abundances of Pb^{206} and Pb^{207} in primeval lead) have been obtained from the following combinations of data (Table 1). The numbers are those of the lead samples as listed in the original article[1], and the italicized figures in brackets are the approximate ages in millions of years (t_m) of the parental lead minerals.

TABLE 1

Number of lead sample	Combined with Nos.	and also with Nos.
25 (Great Bear Lake, *1330*)	1, 2, 3, 5, 6 (*25*[illegible])	19 and 21
23 (Broken Hill, N.S.W., *1200*)	7 (*60*)	19 and 21
22 (Broken Hill, N.S.W., *1200*)	9 and 11	19 and 21
21 (Quebec, *800*)	(Joplin, *100*)	19
19 (Ivigtut, *600*)	13–18 (*220*)	—

together with combinations of each of the above five sets with the others.

The data for six samples have not been used: either because the ages of the parent minerals are unknown or because the constitutions of the leads are so abnormal as to give highly discordant and mutually divergent results.



HISTOGRAM REPRESENTING THE FREQUENCY DISTRIBUTION OF 1,419 SOLUTIONS FOR t_0 WITHIN RANGES OF 100 M.Y. THE FREQUENCIES OF 162 SOLUTIONS (J) INVOLVING THE JOPLIN LEADS, NOS. 9 AND 11, ARE INDICATED BY DOTTING. THE HISTOGRAM FOR 1,257 SOLUTIONS (WITHOUT J) IS INDICATED BY BOLD LINES

As shown by the accompanying histogram, the solutions for t_0 now range from 2,000 to more than 4,000 m.y., but have a marked concentration around 3,350 m.y. A few additional results fall below 2,000 m.y., but as these are inconsistent with the ages of the oldest known rocks, and give impossibly high values for x and y, they have been neglected. The relatively narrow range of the solutions for t_0 originally published[1] (2,700–3,150 m.y.) was due, partly to the limited number of solutions then completed, partly to an early work-sheet error in copying Nier's figure for the isotopic abundance of Pb^{206} in the Joplin lead No. 11. This mistake did not affect the estimate of t_0 which was finally adopted, but it made it appear that the solutions involving the Joplin data were in far better agreement with those not involving the Joplin data than they actually are.

It is now clear, as originally suspected, that the Joplin samples of lead are all of abnormal isotopic constitution. The solutions involving Joplin data are indicated separately in the histogram, in order to bring out the facts (*a*) that they all lie on the left-hand side of the frequency maximum or mode; (*b*) that the histogram becomes much less skew without them; and (*c*) that the mode itself is independent of the Joplin solutions.

The new average and modal solutions, together with the original one, are listed in Table 2.

TABLE 2

	Original solution (Holmes, 1946[1])	Average of 1419 solutions (including J*)	Average of 1257 solutions (excluding J*)	Modal solution (see Fig.)
Age of earth (in m.y.)				
t_0.	3000	3200	3290	3350
Primeval lead ($Pb^{204} = 1$)				
x (Pb^{206})	12·50	11·20	11·04	10·945
y (Pb^{207})	14·28	13·70	13·61	13·51
Sum of squares of 'age anomalies' (see Table 3)	686,500	138,125	66,725	58,900
Sum of squares (including J* anomalies)	933,000	281,775	270,375	265,475

* 'J' refers to solutions involving the Joplin leads Nos. 9 and 11.

TABLE 3

Test of modal solution: $x = 10·945$; $y = 13·51$; $t_0 = 3350$ m.y.

No. of lead sample	Excess Pb^{206} $(a-x)$	Excess Pb^{207} $(b-y)$	$r = \frac{b-y}{a-x}$	t'_0 (m.y.)	'Age anomalies' +	−
1	7·905	2·15	0·2720	3350	0	0
2	7·725	1·94	0·2511	3220		130
3	7·455	2·02	0·2710	3340		10
5	7·125	1·89	0·2653	3310		40
6	7·765	2·19	0·2820	3405	55	
7	8·355	2·22	0·2657	3300		50
13	7·155	2·06	0·2879	3380	30	
14	7·255	1·95	0·2688	3270		80
15	6·415	1·95	0·3040	3470	120	
16	7·515	2·15	0·2861	3370	20	
17	7·005	2·06	0·2941	3415	65	
18	7·485	2·10	0·2806	3340		10
19	3·705	1·14	0·3077	3360	10	
21	5·325	1·65	0·3099	3310		40
22	5·125	1·89	0·3688	3425	75	
23	4·985	1·78	0·3571	3360	10	
25	4·985	1·79	0·3591	3315		35
					+385	−395

Sum of squares of 'age anomalies' = 58,900

The relative merits of the above solutions can be tested by a 'least square' method, as illustrated in Table 3, which refers to the modal solution. Knowing a and b (the relative atomic abundances of Pb^{206} and Pb^{207} in each sample of lead) and adopting the modal values for x and y (Table 2), we have:

$$r = \frac{\text{No. of atoms of } Pb^{207} \text{ generated from } t_0 \text{ to } t_m}{\text{No. of atoms of } Pb^{206} \text{ generated from } t_0 \text{ to } t_m} = \frac{b-y}{a-x}.$$

The values of r for various assigned values of t_0 can be computed for each appropriate value of t_m from the formula

$$r = \frac{1}{139} \cdot \frac{e^{t_0 \lambda \mathrm{AcU}} - e^{t_m \lambda \mathrm{AcU}}}{e^{t_0 \lambda \mathrm{UI}} - e^{t_m \lambda \mathrm{UI}}},$$

and for each value of t_m a curve can be drawn showing the variation of r with t_0. From the resulting family of curves the value for t_0 (distinguished as t'_0 in Table 3) corresponding to each value of r in Table 3 can be easily read off.

Ideally, t'_0 should be 3,350 m.y. in each case. The differences between 3,350 m.y. and t'_0, which may be called 'age anomalies', are given in the last two columns. As between the four solutions summarized in Table 1 the 'best' solution should be the one for which the sum of the squares of the 'age anomalies' is a minimum. The results, given in the last line of Table 2, show that the modal solution is slightly better than the average solution without Joplin results; that both are better than the average solution with Joplin results; and that all three are far superior to the preliminary solution originally announced. Moreover, beyond $t_0 = 3{,}350$ m.y., the sums of the squares again begin to increase; for example, a group of solutions averaging $t_0 = 3{,}475$ m.y. gives 61,775 and 297,350 for the respective sums (cf. Table 2). It is, therefore, concluded that, on the evidence at present available, the most probable age of the earth is about 3,350 million years.

Shift of Aromatic Band in Substituted Benzene

THE aromatic band[1] found in benzene at 671 cm.$^{-1}$ shifts as a consequence of mono-substitution (in benzene) to 740–760 cm.$^{-1}$. In the case of di-substituted benzenes, there is a steady movement to higher frequencies in passing from the ortho- to the para-position; whereas in the case of para-substituted phenols we find that increase in molecular weight of the para-substituent from methyl to octyl does not shift the absorption band, which is found in all these compounds at 825–830 cm.$^{-1}$. Less extensive data on the ortho-phenols show no drift in the aromatic band at 750–755 cm.$^{-1}$ as a result of change in the molecular weight of the substituent from methyl to isopropyl. *m*-Cresol and *m*-ethyl phenol absorb strongly at 780–785 cm.$^{-1}$. It would appear that increasing molecular weight by aliphatic substituents does not shift the aromatic band in the mono-substituted phenols.

In the case of di-substituted phenols the following data were obtained:

1 : 2 : 5	$OH : CH_3 : CH_3$	800 cm.$^{-1}$.
1 : 2 : 5	$OH : C_2H_5 : CH_3$	815 ,,
1 : 3 : 5	$OH : CH_3 : CH_3$	830 ,,
1 : 3 : 5	$OH : CH_3 : C_2H_5$	850 ,,

While the shift of the aromatic band, as a result of a change from methyl to ethyl in one of the two substituents of phenol, is rather more, especially in the case of the 1 : 3 : 5 derivatives, than in the case of the mono-substituted phenols, it should be noted that Whiffen and Thompson's data show a shift of 15 cm.$^{-1}$ in moving from methyl to ethyl in the case of mono-substituted benzenes, and a shift of 36 cm.$^{-1}$ in the case of *p*-xylene and *p*-ethyl toluene. Finally, in the case of 1-hydroxy 2 : 3 : 5 methyl benzene, the aromatic band is found at 840 cm.$^{-1}$. Comparison of this tetra-substituted benzene with the related tri-substituted benzenes is given below:

1 : 2 : 3	$OH : CH_3 : CH_3$	770 cm.$^{-1}$.
1 : 2 : 5	$OH : CH_3 : CH_3$	800 ,,
1 : 3 : 5	$OH : CH_3 : CH_3$	830 ,,
1 : 2 : 3 : 5	$OH : CH_3 : CH_3 : CH_3$	840 ,,

It is evident that adjacency of substituents and degree of substitution affect the shifting of the band, to a greater extent in general than increase in molecular weight of the substituent.

I am indebted to Mr. J. S. M. McKee, who carried out the experimental work.

Rate of Growth of Current in Arc Discharges

IF a condenser, charged to a few hundred volts, is connected directly across a small two-electrode tube containing rarefied gas, and a discharge initiated by applying a high-tension triggering pulse near the cathode, the condenser will be discharged in a few microseconds. The discharge is a form of arc, since a 'cathode spot' is necessary to supply the very high currents (a thousand amperes or more) needed to do this, and the applied potential is lower than that associated with glow or spark discharges.

These arcs have been used by many investigators[1] in order to obtain photographs of rapidly moving objects; but a study of the factors within the tube which determine the rate of growth of current seems to have been neglected.

As a result of such a study I have reached the following conclusions about the early stages (that is, the first microsecond) of the discharge. The current density of emission from the cathode spot is greater than 10^6 amp. per sq. cm., and this emitting area generally races over the surface of the cathode at such a velocity that it moves on to new territory in about 10^{-7} sec. Even at such an emission current density, the cathode does not become unduly heated because of the velocity of the spot; thermionic emission is thus very unlikely.

This current density is sufficiently high for field emission to be the most probable cause of the electron current from the cathode. On this assumption one might expect the current in the tube to rise as rapidly as positive ions can be created and carried to the cathode from the 'positive column' close to it. Nearly all the applied potential appears to be taken up by this column. The rate of growth of current is, in fact, found to be greater for a residual gas the ionization coefficient (that is, the number of ion pairs created per cm. per electron) of which is high, and is also increased to a lesser extent by using lighter gases.

For example, in a tube with electrode spacing about 15 mm., connected across a condenser of capacity 2 microfarads charged initially to 300 volts, the current rises from about 1 amp. to 10 amp. in about 12 × 10^{-8} sec. with the tube filled with air at 2 mm. mercury pressure. It rises by this amount in 6 × 10^{-8} sec. if filled with argon at 2 mm. pressure, and takes about 4 × 10^{-8} sec. if filled with helium at 2 mm. pressure.

It is hoped to publish a fuller account of this work in due course elsewhere.

I am indebted to Sir George Thomson for valuable discussion and advice; and to Dr. M. Blackman for discussions on cathode heating.

Heat of Atomization of Carbon

IN a private letter from Princeton dated April 26, 1939, Prof. A. G. Shenstone reported the following observation: "In all cases where I have photographed arcs in N_2 using carbon electrodes I have observed three lines which act like C I lines although I have found no trace of them in the literature. They are in the correct position and have proper intervals to be $sp^3\ {}^5S - sp^2s\ {}^5P$. They are quite sharp and I think my measures are probably good to ± 0·01 A.:

λ		ν		
1431·595	20	69852·1		$sp^3\ {}^5S_2 - sp^2 3s\ {}^5P_3$
			25·3

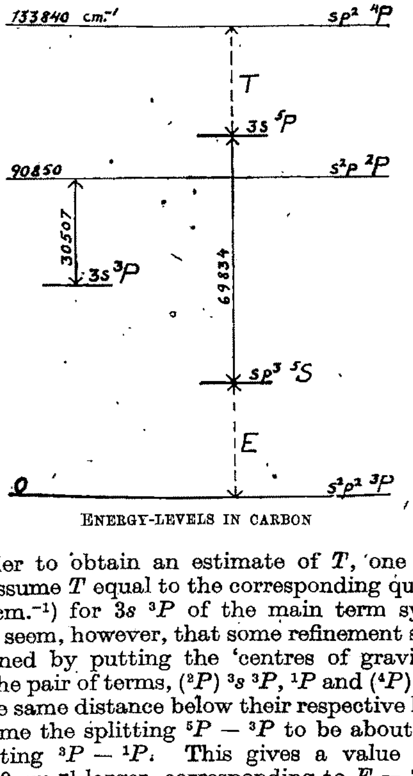
correct. The discovery and identification of these carbon lines has reduced—as illustrated by the diagram—the problem of finding the excitation energy (E) of the important ${}^5S$-level to the simpler problem of deriving a value (T) of $3s\ {}^5P$ with respect to its parent term, the low ${}^4P$ of C II. The position of ${}^4P$ is fixed through inter-system combinations[1]. From the diagram, in which the figures correspond to the centre of gravity of each multiplet term, one finds $E = 64006 - T$ cm.$^{-1}$.



ENERGY-LEVELS IN CARBON

In order to obtain an estimate of T, one might simply assume T equal to the corresponding quantity (30,507 cm.$^{-1}$) for $3s\ {}^3P$ of the main term system. It would seem, however, that some refinement should be obtained by putting the 'centres of gravity' of each of the pair of terms, $({}^2P)\ 3s\ {}^3P, {}^1P$ and $({}^4P)\ 3s\ {}^5P, {}^3P$, at the same distance below their respective limits, and assume the splitting ${}^5P - {}^3P$ to be about twice the splitting ${}^3P - {}^1P$. This gives a value for T about 800 cm.$^{-1}$ larger, corresponding to $E = 32{,}700$ cm.$^{-1}$, or $E = 93\cdot4$ kcal./mole (using the conversion factor 1 cm.$^{-1}$ = 2·8575 cal./mole). With regard to known structures of similar spectra, the estimate of T should be reliable enough to justify the statement $E = 94 \pm 2$ kcal. In any event, the value around 70 kcal., which has been advocated on the basis of certain thermochemical considerations in the recent discussion[2] on the bond energies of carbon, would be unacceptable.

IT is known that spectroscopic data are in agreement only with a series of discrete values for the dissociation energy of carbon monoxide (D_{CO}) and therefore also for the heat of sublimation of carbon (L_{C}).

The values of 11·11, 9·14 and 6·92 eV. for D_{CO} and 169·8, 124·4 and 73·2 kcal. for L_{C} have been considered by different authors. However, for each of these values several contradictory spectroscopic arguments can be presented[1].

Among methods used in attacking this problem, we wish to mention the determination of the vapour pressure of carbon. In 1936, Goldfinger and Jeunehomme[2] were able to show by thermodynamic calculations that the vapour-pressure curves for the three possible values of L_{C} lie far apart, and that, therefore, even rough measurements should suppress the ambiguity. A critical study of the known data, based on the idea that the measured pressure could lie below, but not above the equilibrium value, led to $L_{\text{C}} = 124$ kcal. as the most probable value[3]. This value was also admitted by Goldfinger, Lasareff and Rosen[4], as well as by Herzberg[1], and recently by Mulliken and Rieke[5]. The direct measurement of the triple point of carbon by Basset[6] is in excellent agreement with this value. Nevertheless, several workers do not agree with the interpretation of the experimental results.

Because of the persistent confusion in this important question, it seems necessary to use another method, which is based on the valency state of carbon in its tetrahedric compounds. It is well known that the state of the carbon atom in CH_4 cannot be represented either by ${}^3P$ or by ${}^5S$. Van Vleck has shown[7], by a thorough analysis, that the valency state of carbon in methane does not correspond to one of the sp^3 structures of the free atom but is a linear combination of them. He calculates a promotional energy of 7·1 eV. above the normal ${}^3P$ level; this state is, therefore, very different from the ${}^5S$ level, which according to Edlén lies at 4·2 eV. The identification of the actual state of the combined carbon atom with the ${}^5S$ level of the free atom or the neglect of the energy of re-organisation explains the confusion in a number of thermochemical discussions. The interesting points of view brought recently into the discussion[8] show certain apparent contradictions, which disappear by the use of the following method. Let us consider the well-known cycle:

$$\begin{array}{llcl}
CH_4 & = C_{\text{gas}} + 4H & - & W \\
4H & = 2H_2 & + & 2 \times 102\cdot4 \\
C_{\text{gas}} + O & = CO & + & D_{\text{CO}} \\
2H_2 + O_2 & = 2H_2O_{\text{liq.}} & + & 2 \times 68\cdot3 \\
C_{\text{sol}} + O_2 & = CO_2 & + & 94\cdot5 \\
2H_2O_{\text{liq.}} + CO_2 & = CH_4 + 2O_2 & - & 212\cdot8 \\
CO & = C_{\text{sol}} + 1/2\ O_2 & - & 27\cdot6 \\
1/2\ O_2 & = O & - & 1/2 \times 117\cdot5
\end{array}$$

which gives

$$W = D_{\text{CO}} + 136\cdot8 \text{ kcal.} \quad . \quad . \quad (1)$$

Penney has proposed[9], on the basis of Van Vleck's paper, a formula for the formation energy of methane from normal atoms:

$$W = 4\,E_{\text{CH}} - V(v) - 6\,M(H_2), \qquad (2)$$

where $V(v)$ is the activation or promotional energy of the carbon atom in CH_4, and $6\,M(H_2)$ the pairs of steric repulsions between the four hydrogen atoms.

Similarly, the formation energy of the methyl radical is given by:

$$W' = 3\,E_{CH} - [V(v) - w] - 3\,M(H_2), \quad (3)$$

where w is the difference of the promotional energies between CH_4 and CH_3.

The energy D of removal of the first hydrogen atom in methane according to

$$CH_4 = CH_3 + H - D\,. \quad . \quad . \quad (4)$$

is now well known from several experimental studies[10] and is equal to 100·8 kcal. According to (2), (3) and (4), D is not equal to E_{CH}, but is given by

$$D = W - W' = E_{CH} - w - 3\,M\,(H_2). \quad (5)$$

By taking E_{CH} from (2) and W from (1) and introducing them into (5) we obtain

$$D_{CO} = 4\,D - 136{\cdot}8 - [V(v) - 4w - 6\,M(H_2)].$$

According to Van Vleck[7] and Penney[9], the values for $V(v)$, $6\,M(H_2)$ and w are respectively 163, 51 and 15·6 kcal., and we obtain thus:

$$D_{CO} = 217 \text{ kcal., or } 9{\cdot}4 \text{ eV.; and } L_C = 132 \text{ kcal.}$$

Considering the uncertainty of about 10 per cent, generally admitted for the determination of $V(v)$, $M(H_2)$ and w, the agreement with the spectroscopic value of 9·11 eV. is very satisfactory, and must be considered as an important argument for $L_C = 124{\cdot}4$ kcal.

We wish to emphasize that the above values of D_{CO} and L_C are independent of spectroscopic data on the CO molecule. They would not be changed by a different interpretation of these data, resulting, for example, from the existence of maxima in the potential energy curves of this molecule.

The concept of promotional energy applies as well to other carbon compounds, especially to aldehydes, ketones and acids, as may be easily understood from the work of Goldfinger, Lasareff and Letort[11]. The method sketched above yields for these compounds promotional energies of about 150 kcal., as compared with Van Vleck's theoretical figure of 163 in methane. We hope to go into details of this question by experimental studies on several free radicals, especially CH_2 and CH_3CO.

It is to be noted that Kynch and Penney[12] have given arguments for $L_C = 170$ kcal. by comparing calculated and observed energies of excited states of molecules with conjugated double bonds. It seems, however, that their conclusions are not definitive, since they neglected to consider the removal of degeneracy of the excited states of butadiene and hexatriene. Further calculations might change their results noticeably, as has already been remarked by Mulliken and Rieke[5].

We may conclude that among all the discussed values, the value $L_C = 124{\cdot}4$ kcal. can alone be accepted, being in agreement with (a) spectroscopic data on the CO molecule; (b) vapour-pressure data on carbon; (c) removal energy of hydrogen from hydrocarbons and promotional energy of C in organic compounds.

On the other hand, by using the relation between the twisting frequency of the ethylene molecule and L_C, one of us has shown[13] that the value 170 kcal. is very improbable.

Finally, it is also very difficult to explain with this latter value the results of Faltings, Groth and Harteck[14] on the photochemical decomposition of CO, as well as the results of the studies on ionization of CO by electron impact[15].

Note added in proof. Voge[16] has obtained a value of the energy of the valency state of carbon which is appreciably lower than Van Vleck's estimate. In connexion with our considerations Voge's value (4·5 eV.) would lead to $D_{CO} \cong 12$ eV., a figure considerably higher than even the highest possible spectroscopic value. On the other hand, the relative removal energies of the four hydrogen atoms from methane seem incompatible with Voge's result.

In view of the fact that the evidence obtained by Prof. Shenstone in 1939 has not yet been published, and that others have not had an opportunity of considering the conditions under which his spectra were obtained, or of examining the spectra as a whole, we feel that the statement made by Prof. Edlén at the end of his letter cannot be accepted as final. In any event, it would appear to us that his argument by analogy requires further confirmation.

The communication of Messrs. Duchesne, Goldfinger and Rosen provides valuable confirmation for the value $L_1 = 125$ kcal. which on other grounds we have advocated[1] as the most probable value for the reaction

$$C_{\text{solid}} \longrightarrow C_{\text{gas}}\,(^3P).$$

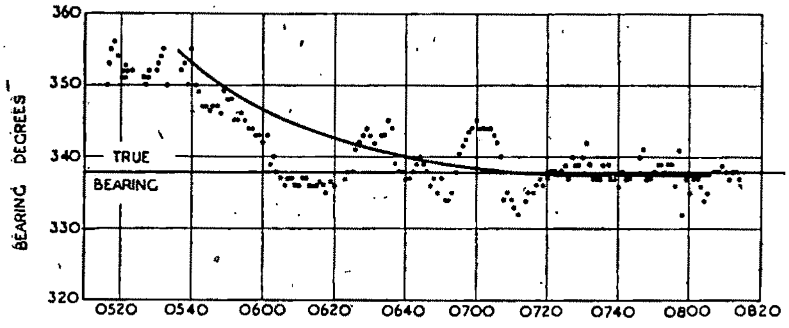
Lateral Deviation of Radio Waves at Sunrise

THE observation of systematic lateral deviations of radio waves requires that such deviations shall be large enough not to be obscured by the random deviations always occurring. The sunrise period is particularly favourable for such observations, since the relatively rapid changes in ionization at this time produce appreciable horizontal ionization gradients. The direction of these is such as to move the reflexion point of the ray towards the east, and qualitative confirmation of this effect has previously been noted.

Some further observations have been made at the Radio Research Station, Slough, on the British Broadcasting Corporation 6·05 Mc./s. transmitter *GSA* in Cumberland, a distance of about 400 km. from Slough. The experiments were carried out during April and May 1946, the sunrise line being then approximately along the transmission path. The instrument used was a rotating spaced-loop direction finder[1], and the period of observation was two to three hours around sunrise, covering the normal time at which the maximum usable frequency condition was attained.



BEARING OF *GSA* AT SLOUGH, APRIL 12, 1946
······, observed bearing; ——, calculated bearing

The bearings immediately following the maximum usable frequency condition were usually some ten or twenty degrees to the east of the true direction, which was afterwards gradually approached. This process occupied a time varying on different days from a few minutes up to nearly an hour. Thereafter the bearings showed fluctuations of a few degrees about the true value but no systematic deviations.

A quantitative estimate may be made of bearing deviations to be expected from the changes with time of equivalent height of reflexion, obtained from vertical incidence ionospheric data. Calculations on this basis agree with the directional observations in giving the largest deviations when the frequency is close to the maximum usable frequency, since the equivalent height is then falling most rapidly with advancing time.

Detailed quantitative correlation is not in general possible owing to complications involved by the presence of the extraordinary ray. On one occasion, however, when the observed bearing changes took place comparatively slowly, a simple calculation of equivalent height based on the ordinary-ray transmission alone was found to give good agreement with the experimental results. The observed and computed bearings are shown in the accompanying graph.

The ionospheric data used were obtained from vertical incidence measurements made at the Radio Research Station, Slough, and this note is publish by permission of the Department of Scientific a Industrial Research.

Fluid Flow at a Small Hole due to Vibrati

PROF. GILBERT WEST has recently described[1] ingenious experiment in which a stream of smo laden air is made to issue from a hole in a cylindri resonator when an appropriate tuning fork is broug near. This is said to demonstrate the pressure sound, but I am much in doubt as to whether does so.

The passage of a sound wave cannot cause a bulk streaming of the air, so that the suggestion I take it, that the sound wave exerts a pressure each smoke particle, as it undoubtedly does on extended surface. I have point out, however, that an ordina smoke particle takes up practica the full vibratory amplitude of t air at ordinary frequencies; example, at 600 c./sec. smo particles of diameter $1\,\mu$ acqu 0·9999 of the full amplitude the sound vibration[2]. In the circumstances no pressure is erted on them.

Prof. West's experiment is, in opinion, a demonstration of an teresting effect known to me many years and first described, believe, by H. Sell[3]. A cylindri box is closed on one side by flat surface carrying a small metal jet: opposite t is a diaphragm which can be set in vibration. Wh the diaphragm is excited there issues from the je stream of air which can blow a light vane asi The explanation is quite simple. When the diaphrag moves so as to expel the air, the air issues in a we defined stream; when it moves back so as to su in the air, the air enters from all sides. The expelled is equal in volume to that sucked in, b the path of the entering air differs from that of t expelled air, just as the lines of flow of a liquid at t entry of a capillary tube differ from the lines of fl at exit.

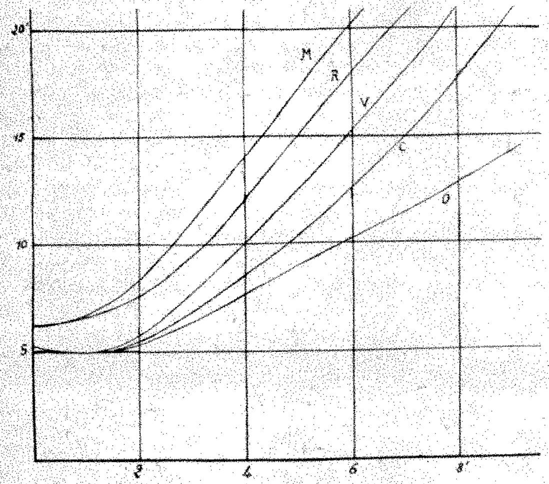
Measurement of Visual Acuity with Blurred Tests

WHEN testing visual acuity with Snellen's curre type, we use black letters printed upon a whi ground, and the transition from black to white is abrupt as can be. If the patient's eyes are emmetrop or hyperopic without presbyopia, or myopic and co rected, the retinal image of the test remains shar and visual acuity is limited only by the structure of the retina and the aberrations of the eye. On the contrary, when the patient's eyes are myopic and not corrected, the retinal images are blurred and visual acuity is poor. This relation of visual acuity to ametropia has been studied by W. Swaine[1], whose measurements one of us has shown to be in fair agreement with theory[2]. But further experiments were necessary.

When an ametropic eye is looking at a sharp test object, it is difficult to measure the blurring of its retinal imagery; but, for the same purpose, we may use an emmetropic eye looking at a blurred test object. Such test objects can be made very easily by the projection of a transparent slide (with opaque letters) upon a diffusing screen which is systematically put out of focus. By this means, we found that various letters resisted this blurring to various degrees, as can be seen from the graph, which shows the characteristic curves of five letters; the scale of abscissæ gives the apparent diameter, in minutes of arc, of the diffusion circle corresponding to an object point; the scale of ordinates gives, in minutes of arc also, the minimum angle subtended by the heights of the letters when the latter are just recognized; in fact, these heights are those of sharp letters as they would appear on the screen if the aperture of the projection lens were very small. The apparent heights are actually larger, because of the diffusion band, and this fact explains the paradoxical amelioration of acuity which we sometimes observed when images began to be blurred.



Complete results will be published elsewhere, and we hope they will allow a rational classification of Snellen's letters, based upon their resistance to blurring. We hope also to make experiments with an asymmetric blurring, similar to the effect of astigmatism upon vision.

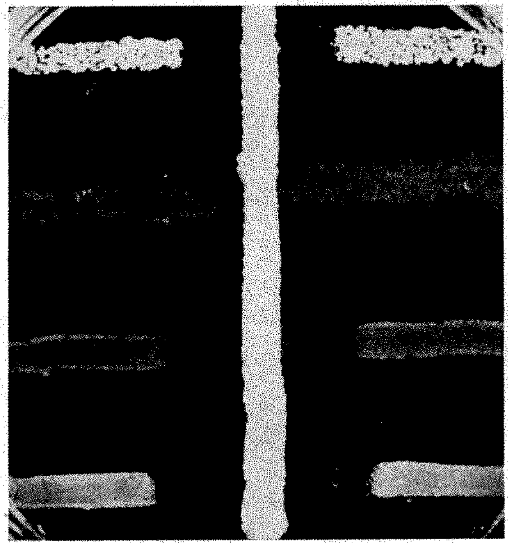
Antibacterial Activity of the Staphylococcus

The observation that the Staphylococcus can inhibit the growth of other bacteria has been recorded in some fifty papers over a period of sixty years, beginning with Babès[1], who showed that a Staphylococcus inhibited the growth of *B. anthracis* and of another staphylococcus. The majority of reports have been concerned with the action of Staphylococci against the diphtheria bacillus. In 1909, Schiøtz[2] recorded the observations that a patient with a staphylococcal sore throat, nursed in a diphtheria ward because of a mistaken diagnosis, did not develop diphtheria, and that carriers became free of the diphtheria bacillus during a non-specific throat infection. There followed a number of attempts, mostly in the United States, to use Staphylococci in a spray to treat diphtheria carriers.

More recently, inhibitory Staphylococci have been examined by a number of workers, of whom Dujardin-Beaumetz[3] was among the first to produce convincing evidence that the inhibition was due to the production of an antibacterial substance.

Experimental. As a preliminary to further work, two hundred and five strains of Staphylococcus have been surveyed for their inhibitory power on a solid medium. The strains were obtained through the kindness of Dr. R. L. Vollum, of the Emergency Public Health Laboratory Service. All but six came from human sources. The majority were picked at random off routine diagnostic plates, mostly from nose or throat swabs, some had been isolated from septic wounds at the Birmingham Accident Hospital, and three had been specially selected, being derived from cultures from patients with diphtheria in which difficulty in isolating the diphtheria bacillus had been attributed to the action of an accompanying Staphylococcus.

Agar plates containing 5 per cent serum were inoculated by streaking a loopful of broth culture of the Staphylococcus across the diameter. After the plates had been incubated over-night, selected test organisms were streaked at right-angles on both sides of the primary streak, the size of the inoculum being regulated to give a growth which was just confluent



Inhibition by active Staphylococcus on agar plate. Organisms cross-streaked are, from top to bottom, *Staph. aureus*, *Bact. coli*, *C. diphtheriæ* var. *gravis*, *C. xerosis* but not heavy. The test organisms used were *Staph. aureus* 'H', N.C.T.C. No. 6571, and laboratory stock strains of *Corynebacterium xerosis*, *C. diphtheriæ* and *Bact. coli*. After re-incubation, inhibition if present was recorded as the distance in millimetres between the edge of the primary streak and the beginning of growth in the secondary streak. Inhibition was invariably symmetrical on the two halves of the plate. The accompanying reproduction shows a representative plate, streaked with an active strain. All the active and eighty-five of the inactive strains chosen at random were tested for coagulose production, and all the active strains for pigment production and fermentation of lactose and mannitol.

TABLE 1. SOURCE AND ANTIBACTERIAL ACTIVITY OF STRAINS OF STAPHYLOCOCCUS

Selection	Source	No. of strains		
		Active	Inactive	Total
Random	nose or throat	20	116	136
	wound	3	51	54
	miscellaneous	0	12	12
	Total	23	179	202
For suspected inhibitory power	throat diphtheria	3	0	3
	Total	26	179	205

Results. Table 1 summarizes the origin and activity of the strains examined. Of the organisms tested, *C. xerosis* was inhibited by all the twenty-six active strains, *Staph. aureus* and *C. diphtheriæ* by most of them, and *Bact. coli* by none. The strains differed in the amount of inhibition which they produced. When arranged in order of activity the gradation from strong to weak inhibition of *C. xerosis*, the most sensitive test organism, was paralleled with *Staph. aureus* and *C. diphtheriæ*. Whether or not each of these organisms was inhibited appeared to be a quantitative rather than a qualitative matter. In additional tests it was shown that the *gravis*, *intermedius* and *mitis* varieties of *C. diphtheriæ* were inhibited about equally, that *C. hofmannii* was inhibited equally with *C. xerosis*, and that *Ps. pyocyanea* and *Salm. enteritidis* (Gaertner) were, like *Bact. coli*, not inhibited at all.

Within the limits of the numbers investigated none of the metabolic characters examined was related to the amount of inhibition produced. The six active *albus* strains, for example, were scattered evenly through the series. It was further shown, in respect of one metabolic character, namely, coagulase production, that the proportion of strains possessing it was the same among the active Staphylococci and among eighty-five of the inactive strains chosen at random. The figures are given in Table 2.

TABLE 2. PRODUCTION OF COAGULASE BY STAPHYLOCOCCI ACTIVE AND INACTIVE AGAINST BACTERIA

Antibacterial activity	No. of strains		Per cent positive
	total examined	coagulase positive	
Present	26	19	73
Absent	85	56	66

Some strains of Pneumococcus and Streptococcus form hydrogen peroxide in sufficient quantity to produce wide zones of inhibition on a streak plate, but this has never been reported for the Staphylococcus. That it did not account for any of the inhibitory activity of these strains was established first by the differential nature of the inhibition, since peroxide inhibits all the test bacteria about equally, and secondly by reproducing the activity of all strains on a medium containing catalase.

Rhythmical Impedance Changes in Salmon Eggs

THE protoplasmic membranes of fertilized and unfertilized trout eggs undergo periodic structural changes after being in tap-water for about seven hours. These changes are associated with variations in electrical impedance[1]. The frequency of the impedance change is approximately 1/1·5 min., and the effect can be abolished reversibly by phenyl urethane[2]. Through the kindness of Prof. J. H. Orton, of the University of Liverpool, and Mr. G. M. King, of the Dee Fishery Board, fertilized and unfertilized salmon eggs have been examined in the same way as trout eggs, in an alternating current-bridge of high sensitivity, with a visual detector. Salmon eggs undergo periodic impedance changes (Fig. 1), which are remarkably similar to those previously observed in trout eggs. Their frequency at 16·5° C. is approximately 1/3 min.

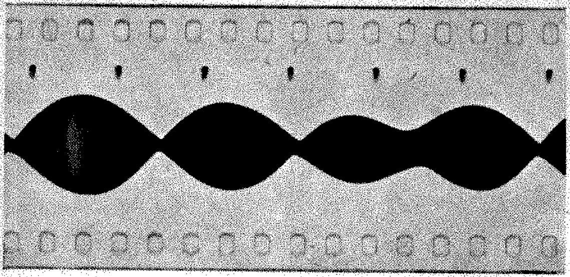

Fig. 1. PERIODIC IMPEDANCE CHANGE IN FERTILIZED SALMON EGG, TWO DAYS AFTER FERTILIZATION. TIME-MARKER, MINUTES

As in the trout egg, the impedance cycle can be resolved into two components: a 'fundamental' change, and another with one half the frequency, which has the effect of making every fourth bridge balance less sharp than the previous three. In some eggs, particularly those which are more than two days old, this effect is very marked.

The trout egg impedance cycle has been analysed in terms of the vitelline membrane resistance and capacitance, and it is found, somewhat surprisingly, to be mainly capacitative[3], though small changes in resistance may be difficult to observe if the membrane resistance is very high. The same applies in the salmon egg. A salmon egg circle diagram (time-admittance locus, similar to the 'time-impedance locus' described by Cole and Curtis[4]) is shown in Fig. 2.

It will be seen that the $1/R_p$, ωC_p co-ordinates at different times but at the same frequency lie on an arc of a circle, indicating that the impedance change seems to be mainly due to a change in membrane capacitance. There is only a very slight suggestion

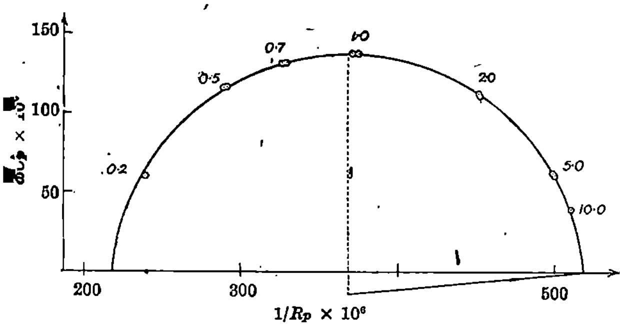

Fig. 2. TIME ADMITTANCE LOCUS OF SAME EGG AS IN FIG. 1, SHOWING THE CO-ORDINATES $1/R_p$, ωC_p, OSCILLATING ALONG AN ARC OF A CIRCLE. FREQUENCIES IN KILOCYCLES

that membrane resistance is involved. The membrane phase angle is 84°, and the membrane impedance is of the form $|z| = K\omega^{-2\varphi/\pi}$. There is no change of phase-angle during the impedance cycle.

The meaning of these impedance cycles will only become clearer when eggs, or other cells which exhibit this phenomenon, are put through their physiological or biochemical paces. So far, these eggs are the only living material in which such changes have been observed; they may be peculiar to this type of egg, which is morphologically somewhat specialized. On the other hand, these eggs are specially suitable for very sensitive measurements of bio-electrical properties, as they present the experimenter with a thin spherical shell of protoplasm the area of which is nearly 1 sq. cm. Other material might not be so favourable for the observation of these rhythmical changes in protoplasmic structure.

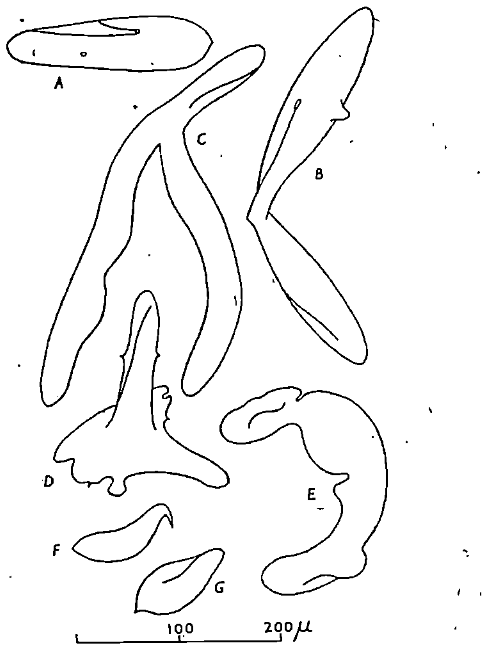
Unco-ordinated Growth in *Paramecium* Induced by 'Gammexane'

THE γ-isomer of hexachlorocyclohexane ('Gammexane') is toxic to *Paramecium caudatum* when introduced into the cultures at a rate of 10 parts per million down to 1 per million. The action of the poison is slow and cumulative, the organisms continuing to feed until near death. Nuclear division is inhibited, and so they become hypertrophied, increasing in length and breadth up to 50 per cent beyond normal. There is a threshold concentration of the drug somewhere between 1 and 0·5 parts per million where some normal division occurs, but a proportion of the hypertrophied cells divide as to the nuclei but not as to the body of the cell itself. Consequently, Siamese-twin forms are produced which feed and live a long time without making further progress, except that a small lateral outgrowth sometimes suggests that they might produce buds. Complete budding has not been observed in the 'Gammexane'-treated medium.

When the twin forms, or highly hypertrophied *Paramecium* from the lower 'Gammexane' concentrations, are placed in normal medium, macronuclei and micronuclei divide repeatedly while the cell throws out lobes in all directions. As many as fourteen micronuclei have been counted in one individual while the macronucleus was throwing off pieces of varying size. Buds become detached with varying nuclear combinations, and while it is likely that all these buds are not viable, some of them succeed in starting fresh colonies of apparently normal individuals. These budding forms have several times the bulk of a normal *Paramecium*, are ciliated all over in the normal way, and have a pharynx or sometimes two pharyngeal openings. They feed, and the cilia are active; small ones swim, but the large ones contort themselves and roll over constantly but are too heavy to move from the floor. The accompanying illustration shows the normal form of *Paramecium* and some of the smaller abnormal forms drawn from life. It should be noted that while the pressure of the drug is on them, only simple Siamese twins are formed; but when this pressure is relieved the fully unco-ordinated growth occurs. In a manuscript on this topic by the late J. C. Mottram, who has recorded these abnormal growths in *Paramecium* after contact with several of the cyclic hydrocarbons[1], emphasis is also laid on the two factors, one sensitizing and the other developing.



NORMAL *Paramecium* AND FORMS DISTORTED BY 'GAMMEXANE'. (*a*) NORMAL; (*b*) THE SIAMESE TWINS; (*c*), (*d*), (*e*) SMALL BUDDING FORMS; (*f*), (*g*) FREED BUDS. ALL ARE FULLY CILIATED. DRAWN FROM LIFE

This development arises out of my connexion with the informal committee on sewage filter-flies of the Water Pollution Research Board (Department of Scientific and Industrial Research). My thanks are due to the officers of the Board for the supply of materials. A full account of the method of obtaining these abnormalities and of the behaviour so far observed will shortly be ready for publication.

Polyploidy in *Polypodium vulgare*

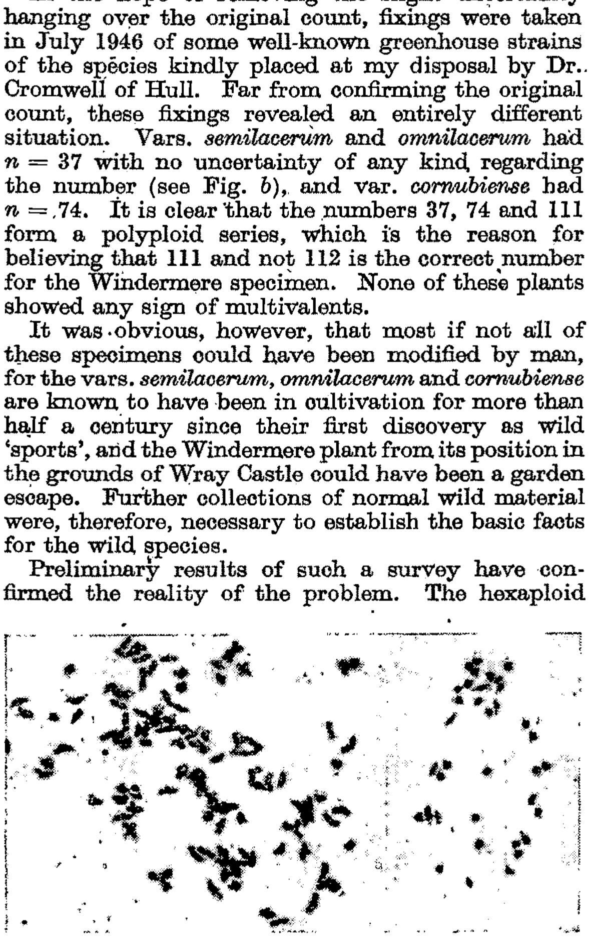
THE common polypody (*Polypodium vulgare* L.) is such an apparently well-defined and isolated species, being the only one of its kind hitherto recognized in Europe, that it was a matter of considerable surprise to detect in it cytological complexities recalling those of the Male fern[1] without, fortunately, quite equalling the full intricacies of that 'species'. *Polypodium* is, however, complicated enough to need a very large collection of living samples from all over its geographical range before it will be adequately understood, and it is in the hope of soliciting the cooperation of correspondents both in Great Britain and farther afield that this note has been offered for publication.

Polypodium sporangia mature late in the season (August or September in northern England). The first chromosome count made with any pretension to accuracy was obtained in September 1944 from a normal-looking and apparently wild plant in the grounds of the Biological Station at Wray Castle (Windermere). One cell is shown in Fig. *a*, and the chromosome number, known to be accurate to within three chromosomes, was at first recorded as $n =$ 'approx. 112'; there is now (see below) strong reason for believing that the correct number for this plant is $n = 111$.

In the hope of removing the slight uncertainty hanging over the original count, fixings were taken in July 1946 of some well-known greenhouse strains of the species kindly placed at my disposal by Dr. Cromwell of Hull. Far from confirming the original count, these fixings revealed an entirely different situation. Vars. *semilacerum* and *omnilacerum* had $n = 37$ with no uncertainty of any kind regarding the number (see Fig. *b*), and var. *cornubiense* had $n = 74$. It is clear that the numbers 37, 74 and 111 form a polyploid series, which is the reason for believing that 111 and not 112 is the correct number for the Windermere specimen. None of these plants showed any sign of multivalents.

It was obvious, however, that most if not all of these specimens could have been modified by man, for the vars. *semilacerum*, *omnilacerum* and *cornubiense* are known to have been in cultivation for more than half a century since their first discovery as wild 'sports', and the Windermere plant from its position in the grounds of Wray Castle could have been a garden escape. Further collections of normal wild material were, therefore, necessary to establish the basic facts for the wild species.

Preliminary results of such a survey have confirmed the reality of the problem. The hexaploid (as the Windermere plant may be called) has not so far been found again, but specimens from a wood near Kendal (Westmorland) and from a very remote spot on Rannoch Moor (Perthshire) were tetraploid (that is, $n = 74$). Diploids ($n = 37$) were found at Dartmouth (Devon), the Cheddar Gorge (Somerset), and in a plant brought back from the neighbourhood of Montpellier (Pont du Gard) in southern France in 1946. The Montpellier plant belongs to *P. vulgare* var. *serratum*, which is the only representative of *Polypodium* in that part of Europe, and it is probable that the British diploids will also be referable to var. *serratum*, though their characters are less clearly defined than in the French material.



MEIOTIC METAPHASES IN ACETOCARMINE OF A HEXAPLOID AND A DIPLOID *Polypodium*. × 500. (*a*) MORPHOLOGICALLY NORMAL SPECIMEN FROM WINDERMERE; (*b*) THE HORTICULTURAL VARIETY 'SEMILACERUM'

While it seems highly probable that 'var. *serratum*' will need to be recognized as a second European species of *Polypodium*, it is clearly desirable, before this is done, for information on a much larger scale to be assembled. All forms of *Polypodium* are easily recognizable as such even by amateurs, and they are remarkably tolerant of rough handling. If firmly wrapped to prevent desiccation, they will probably survive a postal period of several weeks.

I would be very grateful for any living specimens that can be sent to me from Great Britain, Europe or America, provided that the place of origin is clearly indicated. To facilitate transmission from abroad, non-British parcels may be addressed to the Keeper of the Herbarium, Royal Botanic Gardens, Kew, Surrey.

Effect of Temperature of Storage on the Rate of Loss of Fertility of Stock Cultures of *Melanospora destruens*

MYCOLOGICAL literature contains many references to loss of fertility by fungi in culture. During an investigation of the physiology of perithecial production in *Melanospora destruens* Shear, the strain became progressively less fertile. Fertile saltants developed in cultures grown at the relatively high temperature of 37° C. These were isolated and their growth-rates were compared with those of sterile saltants at various temperatures.

At relatively low temperatures, namely, laboratory temperature (18° C.) and 20° C., growth of the sterile strains began several hours before that of the fertile ones. At 25° C. the difference was reduced, while at 30° C. and above, the growth-rates of the sterile and fertile strains were approximately equal.

Thus it is clear that if stock cultures of this fungus are kept at laboratory temperature, the chances of picking up any sterile saltants present when subculturing would be greatly increased, since these are likely to become established before the fertile ones commence growth, and so would probably prevent the development of the latter. If, however, the stock cultures were incubated at 30° C. for at least two days after subculturing, the chances of survival of the fertile strains would be greatly increased. This problem is being investigated, and it is hoped to publish a fuller account later.

MECHANISM OF HIGH ACID PRODUCTION BY YEAST AND ITS BEARING ON HYDROCHLORIC ACID FORMATION IN THE STOMACH

By Prof. EDWARD J. CONWAY

AND

Dr. THOMAS BRADY

Department of Biochemistry, University College, Dublin

As previously described[1], when baker's yeast ferments unbuffered glucose solutions, a high degree of acidity can be reached if potassium chloride in the suspending fluid is brought to about 0·1 *M*. With simple variations of the conditions, *p*H values as low as 1·49 have now been occasionally observed, and often a *p*H of 1·6.

The high acidity arises from an exchange of hydrogen and potassium ions[1]. In the search for the source of the hydrogen ions, we were at first influenced by the view that one acid would be largely if not entirely involved, and probably an acid with *p*K value as low as 2–3. From the inhibiting action of fluoride and iodoacetic acid, such an acid could be expected at or below the level of pyruvic acid. A parallelism was found between the rate of pyruvic acid production and the acidity, and very probably this acid (as well as phosphopyruvic acid) plays a part in potassium and hydrogen exchanges, but it accounts only for a small fraction, as appears from the quantitative relations. The truth seems to be that various acids formed in the breakdown of the sugar can take part, but the evidence shows that the major part of the exchange is due to succinic and carbonic acids, the latter free or protein-linked. It may be noted that when yeast carboxylase acts on pyruvic acid, carbonic acid (H_2CO_3) is directly formed and not carbon dioxide[2], and a fuller investigation of the question has now provided evidence that it can largely participate in the hydrogen ion exchange, though it is not clear so far if it does so directly or as some protein-linked compound.

Evidence for the participation of succinic acid. When yeast ferments glucose under the conditions described above, succinic acid appears in the fluid outside the cells, rapidly and in surprising quantity. At the same time the concentration of succinic acid in the cells is only a small fraction of that outside. If potassium chloride be present in the suspending fluid (to about 0·1 *M*) considerably less succinic acid appears in the free fluid, but an amount corresponding largely with this reduction is retained inside the yeast cells, the potassium chloride having at the same time little or no effect on the average rate of production of carbon dioxide.

The accompanying table gives the mean data for three experiments:

Nature of suspension (1 pt. of moist yeast to 0·6 pt. suspending fluid, mgm. per cent)	Succinic acid in the suspension (mgm. per cent)	Succinic acid in fluid after centrifuging (mgm. per cent)	Succinic acid in yeast cells (calculated value) (mgm. per cent)	*p*H of suspension
Without KCl	85	155	12	3·03
With KCl	78	111	44	1·97

The interspaces between the cells had a mean value of 22 c.c. per 100 gm. yeast as shown by studies of the inulin space.

The succinic acid retained in the cells in the presence of potassium chloride accounted for approximately 45 per cent of the hydrogen and potassium ion interchange, assuming one of the ionizing groups (*p*K of 4·2) to contribute the hydrogen ions. Further supporting evidence for the contribution of succinic acid in the hydrogen and potassium ion exchanges could also be furnished.

If another *organic* acid were associated with the exchange, it could be expected to appear like succinic in the suspending fluid; but analysis shows that upwards of 80–90 per cent of the organic acid in the suspending fluid is, in fact, succinic.

Evidence for the participation of carbonic acid in the potassium and hydrogen ion exchanges. When, in such experiments, whether conducted *in vacuo* or at atmospheric pressure, or again when through fermenting mixtures carbon dioxide is freely bubbled at atmospheric pressure, in the presence of potassium chloride there is found in nearly all cases an excess of acid-labile carbon dioxide (other than free carbon dioxide). This, on the average, is sufficient to account for a high proportion of the potassium and hydrogen ion exchange (about 40–50 per cent, but occasionally higher). The excess of acid-labile carbon dioxide increases up to 30–50 min. and then falls as the fermentation decreases.

Bearing of these experiments on hydrochloric acid production by the gastric mucosa. The apparent participation of carbonic acid (or of some immediate associate) in the high acid production by yeast is of special interest for hydrochloric acid formation by the gastric mucosa. The view has been previously advanced by Davenport and Fisher[3] that carbon dioxide is associated with this production, the change to carbonic acid being catalysed by carbonic anhydrase; but the view that this enzyme plays a direct part in the hydrochloric acid formation appears no longer tenable[4]. The literature up to recent years has been summarized by Hollander[5] and by Babkin[6].

Here it is considered that the entrance of carbonic acid is quite the opposite of that proposed by Davenport, for free carbonic acid and not carbon dioxide is formed by carboxylase on pyruvic acid (and in such decarboxylation it may be presumed to be always so formed). At the same time, it is probable that it is not the H_2CO_3–HCO_3' system that is the fully operative mechanism, but that protein-linked carbonic acid is associated, helping to damp down the rate of passage to carbon dioxide gas.

In recent studies on the respiratory exchange and hydrochloric acid production with the gastric mucosa of the frog[7], Davies and co-workers appear to have obtained results of much value. From their account it would seem that they have obtained occasionally Q_{HCl} values much higher than Q_{O_2} figures. At the same time, it may be noted that when Q_{HCl} exceeded twice Q_{O_2}, with the mucosal sack immersed in bicarbonate saline, the tissue appeared damaged, and in phosphate saline the damage seemed obvious with Q_{HCl} just above the Q_{O_2}.

The findings of Davies—so far indicated—in no way disprove the essentials of the theory proposed from their Department as to the manner of the hydrochloric acid formation. In this theory potassium chloride is first excreted as a neutral chloride, and then potassium ions are exchanged for hydrogen ions across a membrane, the latter ions being furnished in the metabolic processes of the cell. It is clear that the simplest source of such hydrogen ions could be the carbonic acid formed metabolically, but this may be supplemented by organic acid formation, and especially when the tissue is not in good condition, in which case Q_{HCl} may exceed Q_{O_2}. At the same time, it is possible that a cyclical formation of an acid such as phosphopyruvic could occur at the site of the hydrogen ion exchange, and then be reversed to a substance of weaker acidity within the cell. The actual concentration of the operating acid need only be small, but charging the membrane with a relatively high concentration of hydrogen ions. Such a cyclical process could give Q_{HCl} values far higher than Q_{O_2} values, the ratio being limited only by the available energy and the efficiency of its utilization—a limiting condition of any process involved in the formation of hydrochloric acid.

Concerning the action of carbonic anhydrase (which was shown by Davenport to be present in relatively large amounts in the gastric mucosa, and in the stomachs of cats, rats and dogs to be present almost exclusively in the parietal cells), any view which considers the anhydrase to hasten the change of carbon dioxide to carbonic acid at the site of its formation is very probably incorrect. This is so because of the analogy of the yeast carboxylase action[3], and the structure of the carboxylic acids; and all decarboxylations may be considered as involving a primary formation of carbonic acid. But when, as the result of the processes above considered, HCO_3' ion accumulates, the excretion of this ion into the blood may be accelerated by conversion to carbon dioxide (hastened by carbonic anhydrase) and by a chlorine ion and HCO_3' exchange.

HIGH POLYMERS

STRASBOURG CONFERENCE

AN international conference on high polymers was held at the University of Strasbourg during the week of November 25. This is the first of a number of conferences on special subjects to be held in France, arranged by the Centre National de Recherche Scientifique, under the sponsorship of the Rockefeller Foundation. Each conference is designed for the intensive discussion of current research by a relatively small group of French and foreign men of science.

The papers presented at this conference were restricted to the subject of the molecular properties of large molecules, for it was felt that a discussion extending over the entire field was impractical. The programme was as follows: W. T. Astbury (Great Britain), X-ray research on the structure of chain-like molecules; M. L. Huggins (United States), statistical thermodynamics of polymer solutions; G. Gee (Great Britain), statistical thermodynamics of polymer solutions; Mme. A. Dobry (France), incompatibility and demixing of macromolecules; H. Benoit (France), statistics of polymer molecules; C. Sadron (France), the particle equivalent of a polymer molecule; M. Gibert (France), measurement of translational diffusion; M. Calvet (France), measurement of translational diffusion; A. Banderet (France), ultracentrifugal studies of cellulose glucolic acids; P. Kinell (Sweden), sedimentation in the ultracentrifuge; R. Signer (Switzerland), streaming birefringence in polydisperse media; P. Doty (United States), scattering of light from polymer solutions; M. Magat (France), viscosity studies on *GRS* solutions; G. Gee (Great Britain), statistical thermodynamics of gels; M. L. Huggins (United States), theory of rubber elasticity; P. Doty (United States), swelling of polymer networks; J. J. Hermans (Holland), deformation of cellulose gels; G. Champetier (France), solvation and swelling of cellulose derivatives; P. H. Hermans (Holland), crystalline and amorphous states in cellulose fibres; J. Chedin (France), ageing of nitrocellulose solutions; M. Mathieu (France), mechanisms of dispersion; P. Grabar (France), action of ultrasonics on macromolecules.

It is hoped to print these contributions in the January 1947 issue of the *Journal de Chimie Physique*.

The final session of the conférence was devoted to a discussion of the problems of publication and the possible formation of an international union of workers on the science of macromolecules. It was felt that the most desirable publication policy would involve an international journal of the following type. Each article would be printed in English and in either French, Russian or German according to the author's choice. Such a journal should include articles of general importance, articles based upon completed research, and reviews. Papers reporting the progress of research and of less general interest should appear in national journals and be abstracted in the international journal. The consummation of such a scheme as this is probably not possible without an international organisation. The informal offer to adapt the *Journal of Polymer Science* in the direction of these recommendations was welcomed.

Members of the conference were generally agreed on the desirability of a permanent international organisation capable of surveying the diverse scientific fields involved in the study of macromolecules. The administration of such an organisation, which would not be concerned with the technical uses of macromolecules, could perhaps be carried out by representatives of the member organisations; its duties should include: (1) active co-operation with the United Nations Educational, Scientific and Cultural Organisation; (2) planning and procuring financial aid for international conferences; (3) co-ordination of publication and subsidizing of an international journal; (4) facilitation of international exchange of research workers and substances; perhaps a store of highly purified macromolecules the physical properties of which had been carefully measured could be established.

All these discussions are preliminary and are reported for the purpose of initiating more universal consideration of these proposals. In order that the general feelings of workers in the field of macromolecules can become known, it is requested that those interested communicate with either Dr. M. L. Huggins, Kodak Research Laboratories, Rochester, N.Y., or Prof. Charles Sadron, Institut de Physique, 3 rue de l'Université, Strasbourg.

ELECTRODEPOSITORS' TECHNICAL SOCIETY

PROGRESS AND DEVELOPMENT

THE Electrodepositors' Technical Society was founded on December 9, 1925, so it has now come of age.

The inaugural meeting took place at the Northampton Polytechnic, Clerkenwell, which remained the Society's headquarters until very recently, when larger offices had to be secured to cope with the increasing membership. The Society, which first received the title "The Electroplaters and Depositors' Technical Society", was formed under the ægis of the Faraday Society, the secretary of which, Mr. F. Spiers, did much of the initial work in association with Mr. S. Field, at that time head of the Chemistry Department of the Northampton Polytechnic, Mr. W. James and Mr. W. E. Harris. The three latter individuals became the first president, honorary treasurer and honorary secretary respectively of the newly formed Society. Dr. S. Wernick, who took over the honorary secretaryship shortly afterwards, in 1927, and remained continuously in this office until 1945, has taken a prominent part in shaping the Society's policy. He is now its president.

The main object of the Society, namely, the publication and dissemination of information relating to electrodeposition and allied processes, has been faithfully carried out, as testified by the twenty volumes of *Transactions* which the Society has thus far published. Some hundreds of meetings have been held regularly, both at the London headquarters, and in Birmingham at the James Watt Memorial Institute, the headquarters of the Society's Midlands Centre. The recent War seems only to have given a further impetus to the Society's activities, and meetings continued to be held during the height of the bombing attacks on the capital and in the Midlands. The membership has steadily increased during this period, there being more than eight hundred active members enrolled at present.

The published papers are of a high standard and record the considerable development which has taken place in electrodeposition theory and practice. Much of the published work represents original research carried out during the past two decades in Government and industrial laboratories and research institutes. The work of the 'Woolwich' School, led by Mr. D. J. MacNaughtan (succeeded by Mr. A. W. Hothersall), occupies a prominent place in the Society's publications; much of the latter work was carried out in association with the British Non-Ferrous Metals Research Association. The publications prove convincingly that pioneer work in Great Britain on electrodeposition does not lag behind that of any other country in the world, despite the fact that, particularly in the United States, research facilities are superior, research being more generously endowed by an industry which is approximately some ten times the size of that of Great Britain. This record of continuous publication has been achieved by a relatively small society with slender financial resources, and is surely a striking testimony to the vigorous effort and ability displayed throughout by those honorary officials who have worked zealously in the Society's cause. Until recently the Society employed no paid clerical staff, practically the whole of its income being devoted to the issue of publications. In order to cope with the increased financial burden envisaged by future publications, the Council has lately opened a Publications and Development Fund, and donations to this Fund will be solicited from industrial undertakings which have directly or indirectly benefited from the Society's activities to date. It is hoped to raise a fund of £10,000 for this purpose.

Apart from its publishing activities, the Society has done much in disseminating information on electrodeposition and allied processes by organising exhibitions and conferences on numerous occasions; thus, in 1931, it organised the section on electrodeposition, electroplating, electro-forming, etc., at the Faraday Centenary Exhibition, which was held at the Albert Hall in London. In 1935, an Electrodeposition Exhibition was organised at the Science Museum, South Kensington; this proved to be one of the most comprehensive exhibitions dealing with all phases of pure and applied electrodeposition ever brought together in Great Britain.

The Society was also responsible for organising the First International Electrodeposition Conference, held in London in 1937; it was attended by leading authorities in this field of technology from many foreign countries, who contributed papers on different aspects of electrodeposition. Just before the outbreak of war in 1939, the American Electroplaters' Society followed this lead by holding the Second International Electrodeposition Conference in New York. The third has already been planned by the Electrodepositors' Technical Society, and will be held, it is hoped, in London in May of this year.

The Society has done much useful work in the field of standardization. Its permanent Standards Committee, under the chairmanship of Mr. E. A. Ollard, has worked unceasingly in the interests of laying down specifications to be used by the industry, covering not only the purity of chemicals and materials employed, but also the quality of the electrodeposits produced. One of the first tasks of this Committee was to revise the glossary of scientific and technical terms relating to electro-chemistry, etc., and thus produce the first comprehensive vocabulary, which has been of very material value to technicians ever since. With regard to standardization, one of the most recent specifications issued by the British Standards Institution, with which body the Society has worked very closely, covers the popular finishes, nickel and chromium plating. This is a signal achievement in view of the considerable controversy which arose on the possibilities of producing a specification which would be acceptable alike to technicians and industrialists.

At the official celebration of the Society's twenty-first anniversary, a large number of members and visitors met at the Northampton Polytechnic. Representatives of sister societies were present, and messages from the Chemical Society, Royal Institute of Chemistry, Institution of Electrical Engineers, Faraday Society, American Electroplaters' Society, Electrochemical Society, and a number of Continental bodies were read. Examples of some of the latest types of electrodeposits and some of the newly developed instruments for the control of electrodeposition were exhibited. Among the past presidents present were Mr. S. Field, Prof. R. S. Hutton, Mr. E. A. Ollard, Mr. A. W. Hothersall, Dr. H. J. T. Ellingham and Dr. J. R. I. Hepburn.

During the meeting, the president, Dr. S. Wernick, announced the Council's decision to institute a medal, to be known as the E.T.S. Medal, which would be awarded annually or at longer intervals to individuals who had performed outstanding service in the field of electrodeposition. It is hoped that the scope of the Medal will be international. It had been unanimously decided by the Council that the first recipient of the Medal should be the first president of the Society, Mr. Samuel Field. A scroll was formally handed by the president to Mr. Field as a token of the award, as it had not been possible to cast the Medal in time for the celebration; it is hoped that it will be possible to present the Medal itself on the occasion of the Third International Electrodeposition Conference.

PRESENT STATE OF SOME GERMAN MUSEUMS

By FRANCIS J. GRIFFIN

In *Nature* of May 11, 1946, p. 631, I gave some information on the condition of a number of German museums and their contents. I have recently heard from Prof. Martin Hering, of the Zoological Museum, Berlin, giving me more up-to-date information, which can be summarized here.

On January 1, 1946, Prof. Hering writes, the Russians returned the Zoological Museum to the University of Berlin, and it has now resumed work under its old title of Zoological Museum of the University. At the same time the hymenopterist, Prof. Werner Ulrich, was appointed director of the Museum, a post he holds simultaneously with that of director of the Zoological Institute of the Agricultural Faculty (formerly Agricultural High School) and that of director of the Institute of Agriculture. This appointment has met with general satisfaction.

The entomological collections of the Museum have survived the War undamaged in the cellars, with the exception of the Lepidoptera. This section is the most heavily damaged part of the Museum, but the roof has been repaired and the windows made weather-proof, partly with glass and partly with cardboard, so that damp can be kept out; the final drying out, however, must wait until next summer, since the walls are still too wet. For this reason, the Lepidoptera and Coleoptera will not be brought up from the cellars until next spring, and until then it will not be possible to see whether the conditions in the cellars have caused any damage. The collections have been there since 1943. Sampling suggests that no damage has been caused.

Dr. Deckert has returned from a prisoner-of-war camp and will resume his work shortly.

The library of the German Entomological Society is now in safety and no longer threatened by dampness; the damage is not so great as had been feared. All the Society's entomological periodicals were removed to the cellars, where they have suffered little, apart from a certain amount of mould on the bindings which is easily removed. Unfortunately, the Society has still not obtained permission to resume its activities. At the instance of the British Military Authority, a request was made in April to the Berlin Town Authority (*Magistrat*) for permission to start up again, but no answer had been received when writing. Prof. Hering adds that this is the more regrettable since the Society was not involved in Nazi politics and refused to eject its Jewish members.

There is good news of Prof. Hering's famous "Minen-Herbarium". After having been plundered, it was largely brought together again by the schoolteacher of the town to which it was sent, and is now restored to its rightful owner. Most of the lost specimens have been replaced, and Prof. Hering is now able to work again at his chief subject. Unfortunately, a few unique specimens are lacking. Of the 18,000 insects bred from the leaf-mines which were removed to the air-raid shelter in the Wilhelmsplatz, all have safely survived, including all the types.

Dr. Kaestner has written that the greater part of the surviving entomological material from the Stettin Museum has now been removed to Lublin. Dr. E. Urbahn, the lepidopterist, is not dead, as was thought, but is living at Zehdenick, near Berlin. His collection, which was housed in the Stettin Museum, was, however, destroyed before the removal of the latter.

The dipterist, W. Hennig, formerly at the German Entomological Institute at Dahlem, is at present working at the Zoological Institute of the University of Berlin.

The German Entomological Institute was, as I have already reported, evacuated to Blucherhof, Post Vollratsruhe, Mecklenburg, where it, and the library, is undamaged. Dr. Sachtleben is still director, and the Institute is now united with the Biologisches Zentralanstalt (formerly Reichsanstalt).

R. Friedlander and Sohn, booksellers and publishers, have resumed business under their own name, and their present address is Dorotheenstrasse 75, Berlin.

Max Gaede, collaborator in the Seitz book, died last spring, and K. M. Heller, coleopterist and Rhynchophora specialist, is also dead. Dr. Sick, a collaborator in Seitz's book, and latterly editor of the Geometridæ, is unable, for reasons of health, to continue work.

The publishing house of Gustav Feller, of Neubrandenburg, has been completely burned out, and the whole stock of the "Catalogus Lepidopterorum" and all the other catalogues of this publisher, as well as Hering's "Blattminen Mittel- und Nordeuropas", is lost.

Prof. E. T. Titschack, formerly of the Hamburg Museum, was a Nazi and now lives near Bitterfeld.

Of the large work, "The Zoology of Peru", everything not already distributed is destroyed.

H. G. Amsel, microlepidopterist, of the Bremen Museum, was a Nazi and has been turned out of the Museum.

Klaus Günther, orthopterist, of Dresden, is alive, as is Prof. F. Peus, dipterist, who is now entomologist at the Museum in Munster, in Westphalia.

The following are also alive: Prof. Ferdinand Pax, formerly of Breslau and now in the Harz; Prof. Max Draudt, successor to Seitz in the editorship of the "Grossschmetterlinge der Erde"; and Prof. K. Escherich, formerly of Munich, now near Tegernsee.

Dr. Riehm, president of the Biological Central Station for Agriculture and Forestry (formerly "Reichsanstalt") in Dahlem, has been removed as a Nazi, and his successor is Dr. Schlumberger; while the present lecturer at the Agricultural Faculty of the University of Berlin is Dr. Fritz Zimmermann, formerly lecturer in entomology at Tetschen in Czechoslovakia and a microlepidopterist.

FORTHCOMING EVENTS

*(Meeting marked with an asterisk * is open to the public)*

Monday, January 27

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 5 p.m.—Dr. A. Dickson Wright: "The Advances of Modern Surgery" (Cantor Lectures, 1).

Institution of Electrical Engineers (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "National Certificates and their relation to the Needs of Industry" (to be opened by Mr. S. E. Goodall).

Society of Chemical Industry, Manchester Section (joint meeting with the Manchester Section of the Institution of the Rubber Industry, at the Engineers' Club, Albert Square, Manchester), at 6.30 p.m.—Mr. F. A. Jones: "The Chemistry and Technology of Organo-Silicon Compounds".

Tuesday, January 28

Institute of Physics, Electronics Group (at the Royal Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Prof. H. S. W. Massey: "Semi-Conductors".

Institution of Electrical Engineers, London Students' Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 7 p.m.—Mr. P. H. J. Johnson: "The Principles of Manual and Automatic Telephone Exchanges".

Society of Instrument Technology (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 7 p.m.—Mr. W. C. Fahie: "Some Applications of Electronics in the Iron and Steel Industry".

Wednesday, January 29

Textile Institute (at the University, Leeds), at 10.30 a.m.—Conference on "Modern Methods of Single Fibre Testing".

Physical Society, Colour Group (at the E.L.M.A. Lighting Service Bureau, 2 Savoy Hill, London, W.C.2), at 3.30 p.m.—Mr. H. D. Murray: "The Use of Colour in Factories".

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 5 p.m.—Mr. Walter C. Puckey: "Economic Reconstruction, 2, Scientific Approach to Labour Problems".

Society of Chemical Industry, Nutrition Panel of the Food Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Prof. E. Capstick: "The Nation's Milk Supply and its Best Use".

Textile Institute, Midlands Section (at Coventry), at 7 p.m.—Mr. L. H. C. Tippett: "Quality Control in the Textile Industry".

Thursday, January 30

Imperial Institute, Mineral Resources Department (in the Cinema Hall, Imperial Institute (East Entrance), South Kensington, London, S.W.7), at 3 p.m.—Mr. J. H. Harris: "A Metallurgist in Tanganyika".*

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1), at 5.15 p.m.—Mr. D. J. Finney: "Principles of Biological Assay".

Chemical Society, Sheffield Section (joint meeting with the Sheffield University Chemical Society, in the Chemistry Lecture Theatre, The University, Sheffield), at 5.30 p.m.—Prof. J. B. Speakman: "Some Relationships between the Structure and Properties of Natural and Synthetic Fibres".

Institution of Electrical Engineers (at Savoy Place Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. L. H. A. Carr: "The Teaching of the Principles of Electrical Machine Design".

Royal Aeronautical Society (at the Institution of Civil Engineers, Great George Street, London, S.W.1), at 6 p.m.—Air Marshal the Hon. Sir Ralph Cochrane, K.B.E.: "War-time Developments in Air Transport".

Royal Photographic Society, Scientific and Technical Group (at 16 Princes Gate, London, S.W.7), at 7 p.m.—Mr. N. McQueen: "Animation in Scientific Films".

Society of Dyers and Colourists, Bradford Junior Branch (at the Technical College, Bradford), at 7.15 p.m.—Mr. E. Yeadon: "Cotton Dyeing".

Society for Visiting Scientists (at 5 Old Burlington Street, London, W.1), at 7.30 p.m.—Discussion on "The Outlook in the Social Sciences" (Speakers: Prof. Michael Poston, Prof. T. S. Simey and Prof. S. Zuckerman, F.R.S.).

Pharmaceutical Society, Manchester, Salford and District Branch (in the Lecture Theatre, St. Mary's Hospital, Manchester), at 7.45 p.m.—Mr. R. N. Bomback: "Modern Development in Photography".

Friday, January 31

Chemical Society, St. Andrews and Dundee Section (in the Chemistry Department, University College, Dundee), at 5 p.m.—Dr. W. G. Campbell: "Modern Trends in the Chemical Utilisation of Wood".

Physical Society (in the Lecture Theatre of the Science Museum, Exhibition Road, London, S.W.7), at 5 p.m.—Sir Edward Appleton, F.R.S., and Mr. R. Naismith: "The Radio Detection of Meteor Trails and Allied Phenomena"; Mr. J. S. Hey and Mr. G. S. Stewart: "Radar Observations of Meteors"; Dr. E. Eastwood and Mr. K. A. Mercer: "A Study of Transient Radar Echoes from the Ionosphere including Observations made during the Solar Eclipse of July 1945"; Dr. A. C. B. Lovell, Mr. C. J. Banwell and Mr. J. A. Clegg: "Radio Echoes from Meteors".

North-East Coast Institution of Engineers and Shipbuilders (at the Mining Institute, Newcastle-upon-Tyne), at 6 p.m.—Dr. Ad. Meyer: "Marine Gas Turbine".

Royal Statistical Society, London Group of the Industrial Applications Section (at the E.L.M.A. Lighting Service Bureau, 2 Savoy Hill, London, W.C.2), at 6 p.m.—Dr. B. P. Dudding: "Control Charts Applied to Sales Data".

Manchester Statistical Society, Industrial Group (at the Manchester Society of Architects, 16 St. Mary's Parsonage, Deansgate, Manchester), at 6.45 p.m.—Dr. J. M. Rodgers: "Significance in the Interpretation of Test Data".

Royal Institution (at 21 Albemarle Street, London, W.1), at 9 p.m.—Prof. E. K. Rideal, F.R.S.: "Thin Films on Water".

Saturday, February 1

Institute of Physics, South Wales Branch (at University College, Cardiff), at 3 p.m.—Dr. L. J. Comrie: "Some Applications of Calculating Machines".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Lecturer in Physiology, and a Lecturer in Physics—The Clerk to the Governing Body, Battersea Polytechnic, Battersea, London, S.W.11 (January 31).

Principal of the Royal Technical College, Salford—The Correspondent to the Governors, Education Office, Chapel Street, Salford, Lancs. (February 1).

Chair of Mathematics tenable at the Imperial College of Science and Technology—The Academic Registrar, University of London, Senate House, London, W.C.1 (February 4).

Lecturer in the Electrical Engineering Department, South-East London Technical Institute, Lewisham Way, London, S.E.4—The Education Officer (T.1), County Hall, Westminster Bridge, London, S.E.1 (February 8).

Teacher of Physics up to H.N.C. standard—The Principal, Technical College, Corporation Street, Preston (February 8).

Teacher of Zoology and Botany for Day and Evening Classes at Norwood Technical Institute, Knights Hill, London, S.E.27—The Education Officer (T.1), County Hall, Westminster Bridge, London, S.E.1 (February 8).

Senior Lecturers and Lecturers in Science (Biology and General Science) and Mathematics at the Royal Military Academy, Sandhurst—The Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 1780 (February 12).

Forest Entomologist (male) at the Forest Research Station, Alice Holt, Farnham, Surrey, under H.M. Forestry Commission—The Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 1657.A (February 14).

Physicists or Electrical Engineers for research and development work on telecommunications, radar and supersonics—The Ministry of Labour and National Service, Appointments Department, Technical and Scientific Register, Room 572, York House, Kingsway, London, W.C.2, quoting A.6/47.A (February 14).

Principal Scientific Officer for research in animal nutrition with special reference to the metabolism of ruminants—The Secretary, Hannah Dairy Research Institute, Kirkhill, Ayr (February 15).

Lecturer in Mathematics—The Registrar, College of Technology, Manchester 1 (February 17).

Regius Professor of Physiology at Glasgow University—The Private Secretary, Scottish Office, Fielden House, 10 Great College Street, London, S.W.1 (February 20).

Lecturer (part-time) in Psychology—The Secretary, King's College of Household and Social Science, Campden Hill Road, London, W.8 (February 20).

Lecturer (junior) in the Physics Department—The Warden and Secretary, London (Royal Free Hospital) School of Medicine for Women, 8 Hunter Street, London, W.C.2 (February 21).

Senior Lecturer in Genetics, a Lecturer in Horticulture, and a Senior Lecturer in Rural Sociology and Head of the Department of Economics and Rural Sociology, at the Canterbury Agricultural College, New Zealand—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.2 (February 25).

Senior Lectureships (2) in Psychology (one in Psychopathology and the other in Industrial Psychology), and Lectureships (2, temporary) in Psychology (in the field of Industrial and General Experimental Psychology), in the University of Melbourne—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.2 (February 25).

Psychologist (temporary) at the Civil Service Selection Board, Stoke d'Abernon—The Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 1779 (February 28).

Secretary and Administrative Officer—The Director of Research, Research Association of British Rubber Manufacturers, 105 Lansdowne Road, Croydon, Surrey (February 28).

Readership in Organic Chemistry tenable at Queen Mary College—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 5).

Anatomical Research Fellowship—The Secretary, Zoological Society of London, Regent's Park, London, N.W.8 (April 1).

Senior Assistant in the Department of Civil and Mechanical Engineering, a Senior Assistant in the Department of Chemistry, a Lecturer in Chemistry, and a Lecturer in Geography—The Principal, Technical College, Queen Street South, Huddersfield.

Research Worker to investigate the mechanism of learning in various animals (and in the first instance in Octopus)—The Secretary, University College, Gower Street, London, W.C.1.

Professor of Pure and Applied Mathematics in the Royal University of Malta—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1.

PROFESSOR OF PHYSIOLOGY—The Bursar, Royal Veterinary College, Royal College Street, London, N.W.1.

SECRETARY-EDITOR—The Hon. Secretary (Business), Physical Society, 1 Lowther Gardens, London, S.W.7.

JUNIOR DEMONSTRATOR OF PHYSICS—The Dean of the Medical College, St. Bartholomew's Hospital, West Smithfield, London, E.C.1.

MAN-POWER FOR HIGHER ADMINISTRATION

SIR GODFREY INCE, permanent secretary of the Ministry of Labour, emphasized in a statement in London on January 9 that Britain faces a shortage in man-power likely to extend over several years. A growing appreciation of this fact is to some extent behind the concern which has been recently expressed, not merely at the absolute size of the Civil Service, but also at the relative proportion of the nation's man-power employed in the national and local government services. A total of more than two millions employed in such services and a ratio of one Civil servant to slightly fewer than three persons employed in the whole of the manufacturing industries of the country consorts ill with the over-riding need for increased production in almost every field. While not all the changes involved in the nationalization proposals of the Government affect appreciably the proportion of persons employed in production to those employed in distributive, clerical or administrative work, there are undoubtedly genuine misgivings on the part of impartial observers, as a House of Lords debate on December 18 testified, about the pace at which that programme is being executed and the consequent strain imposed upon the Civil Service.

Nor is this all. While some eight and a half per cent of the working population are engaged in local or national government service, the administrative class, on whom the main burden falls, has only increased to about 4,000, or double the numbers on April 1, 1939. It was argued by Lord Schuster that it is impossible from the reservoir of strength which we now possess to recruit sufficient people to the Civil Service fit to bear the responsibilities and to discharge the burdens which at present confront us. That point of view was not accepted by Lord Ammon, but neither he nor any other Government spokesman appears to appreciate the real dangers of overstraining the senior administrative officers of the Service. Under such conditions, it is idle to expect the constant scrutiny of methods and procedure necessary to eliminate redundant work and obsolete practice or controls which is essential to secure the utmost economy and efficiency in the use of staff.

Reports from the Select Committee on National Expenditure repeatedly stressed this point during the War; but while it is probably impracticable to increase very rapidly the administrative class of the Civil Service, too little attention is commonly given in discussions of the man-power situation to the way in which a shortage of persons qualified to fill professional and administrative posts may seriously impede the nation's recovery and its economic and social progress. The Barlow Committee on Scientific Man-power recognized that some order of priorities must be laid down; but neither in that Report, nor in the observations on it which the Parliamentary and Scientific Committee has issued under the title "Universities and the Increase of Scientific Man-power", is sufficient attention paid to the bearing of efficient management on the wise use of man-power. Its importance is well brought out in a broadsheet, "Britain's Need for Brain-power", in which *Planning* points out how efforts to increase the efficiency of industry and to develop the health, education and other social services are creating a demand for men and women with professional and administrative training much greater than could be met even if the pre-war level of recruitment had been maintained, and there had been no seven years gap in recruitment to some professions, as well as a drastic reduction in the number of those passing through the universities.

In such circumstances, it is essential not only to increase the supply of trained man-power as rapidly as possible and to see that qualitatively the increased supply is related to demand, but also to avoid so far as possible a wasteful scramble for the limited resources immediately available. Industry has already recognized that it would be unwise to attempt to attract immediately too large a proportion of scientific workers for the various research posts in the post-war development schemes planned; and the Government might well give more evidence of a similar wise restraint, and adjust the tempo of its plans for expansion of the research associations, for example, and for social services and nationalization, to the size of the scientific or administrative staff which can reasonably be expected to be available. So far there has been little sign that any attempt has been made to plan the use of Great Britain's limited resources of trained man-power to the best advantage, apart from the broad assessment of priorities in the Barlow Report.

While the *Planning* broadsheet stresses the need for such planning, it represents chiefly a careful survey of the future requirements of the professions and the upper ranks of industry, commerce and the public service, and of the arrangements desirable for recruitment. It is not easy to forecast the extent of the future demand of the Civil Service for trained men and women, and the figures circulated by the Chancellor of the Exchequer in Hansard of December 17 give little guidance. As already noted, the administrative class of 4,000 could probably with advantage be expanded, but even at 6,000—which is three times the pre-war level—would only provide a career for a comparatively small proportion of a doubled output of graduates. Some arts graduates may well find their way into the executive class, now numbering about 44,000 as against 19,000 in 1939; but the bulk of the 46,000 university students at present reading subjects other than pure or applied science must look elsewhere than to the Civil Service for careers.

On the other hand, the professional, technical and scientific full-time staff in the Civil Service numbered approximately 41,000 on October 1, as against 32,000 on July 1, 1945, and only 11,000 in 1939. Disregarding any such staff in the unanalysed total of 73,000 part-time workers on October 1, it would seem that the Civil Service is likely to absorb in future a considerably greater proportion than corresponds with the fifty per cent increase in scientific students at present in the universities, or than the hundred per cent increase contemplated, according to the Barlow Report, in university expansion during the next five years. When all allowance has been made for the elimination of unnecessary controls and for the improvement of operating methods and economy of man-power, the higher ranks of the Civil Service on both the scientific and non-scientific sides may fairly be expected to take rather more than a *pro rata* proportion of the increased output of graduates that would result from doubling the numbers coming from the universities.

It is, of course, much more difficult to estimate exactly the extent of the increased demand for arts graduates than that for graduates in science and technology. More graduates will be needed for local government services, for social work, for law and accountancy, and probably also for journalism, broadcasting, the theatre and the cinema; but whether industry and commerce will in fact take the greater number of arts graduates that they could, and should, is less certain.

Emphasizing that the community needs more men and women with the broad vision and lively critical faculty which a liberal education is designed to foster, *Planning* suggests that the output of arts graduates might be increased gradually to double the pre-war numbers by 1955, whereas that of science graduates, as the Barlow Committee concludes, should be doubled as soon as possible. For technologists, however, *Planning* is inclined to query the advisability of doubling the number. In some professions, such as medicine, an increase of about 20 per cent should be sufficient, while in others, such as dentistry, more than doubling has been recommended by the Teviot Committee.

Reviewing the professions generally, the *Planning* broadsheet points out that those for which forecasts have been made fall into three groups. First, there are those such as teaching, nursing and dentistry, in which a substantial increase in total strength is required and an increased annual intake throughout the years 1946–55. Next there are those such as accountants, company secretaries and librarians, in which the pre-war annual intake will probably be sufficient, once the fall in recruitment during the War has been made good. The third group comprises those professions, such as opticians, pharmacists and, possibly, solicitors, in which the total number is now sufficient and in which a smaller annual recruitment than before the War will be adequate.

One attempt to provide such a forecast has been made by the Manchester Joint Research Council. A survey of the Greater Manchester area attempts to assess the increase to be expected in the number of scientifically trained men employed by industry in the coming years as compared with 1939; it represents, in fact, something of the type of report on trends of employment which the Hankey Committee on Higher Appointments recommended should be issued from time to time by the Appointments Department of the Ministry of Labour. The university appointments boards might have undertaken similar surveys, but apart from that of the Cambridge

University Appointments Board on "University Education and Business" (see *Nature*, 156, 671; 1945), nothing has appeared. The Manchester Joint Research Council's report does, however, provide some means of gauging the extent to which recent developments in management, such as the formation of a Central Institute of Management, are likely to stimulate the demand for better trained men. The report shows that the greatest percentage increases in the number of firms employing graduates compared with 1939 were in textile manufacture (62 as against an overall of 32), engineering (35), chemicals (21), and textile finishing (18). The demand for graduates in industry is estimated at 80 per cent above the pre-war figures, and firms employing 85 per cent of these graduates expressed a preference for men who have had experience of research before entering industry. The biggest increase estimated was 100 per cent in chemicals, with 62 and 60 per cent in engineering and textile manufacturing, respectively. In more than 60 per cent of the firms offering employment to graduates, the higher executive posts are open to any scientific worker who shows himself to be competent and adaptable. More than 80 per cent of such firms have openings in plant control—works manager grades—and 55 per cent have a research and development department. Generally, firms employing large numbers of graduates prefer men with experience of research methods, whereas the smaller firms lay greater stress on technical training for graduate staff. While there is a sharp increase in the anticipated employment of graduates, the increase in the number of firms proposing to employ them is less marked, and it would appear that firms already employing them are readier to increase the employment of graduates than those who have not yet done so. The increase in the employment of graduates in scientific and technical capacities might have been expected, but that on the managerial side could not have been assumed with the same confidence.

It is essential to have more surveys of this kind and also to devise some system of forecasting future requirements. Means must also be found of ensuring that effect is given to the findings of such forecasts, so that we may be able to secure the fullest development and employment of the nation's reserves of brain-power. Both university expansion and the programme of nationalization, so far as they affect the Civil Service and demand the services of trained managers and administrators, must conform to, and be in step with, such findings.

Such forecasts of future requirements must form the basis of any recruitment policy; but once again *Planning* points out that Britain has the additional responsibility of training highly qualified men and women for service abroad. This applies not merely to administrators and business men but also to scientific workers, engineers and agricultural experts, who in recent years have gone out in increasing numbers to less highly industrialized countries. Moreover, it is important that university and professional training should be available in Britain to men and women from the Dominions and Colonies, and from foreign countries also. Further, it is essential to avoid regarding the problem exclusively from the demand side. A university education should provide not so much a professional technique as an intellectual training which is valuable in any walk of life. Training is not necessarily wasted when a man leaves the profession for which he has been trained, and it is important that allowance be made for transfers from one profession to another, and from a specialist to an administrative post.

DIAGNOSIS OF A FAILURE

Religion and Science

A Diagnosis. By the Rev. Dr. Charles E. Raven. (L. T. Hobhouse Memorial Trust Lecture No. 16, delivered on 1 May, 1946, at Bedford College.) Pp. 16. (Oxford: At the University Press, 1946.) 2*s*. net.

A RIGHT understanding of the causes and history of the conflict between modern science and the Christian religion is of primary importance for sociology to-day. It seems self-evident that scientific development has outrun ethical progress, and the consequences of this may be disastrous, though the situation admits of no simple remedy. The trouble is that though science can get along well enough in isolation from metaphysics, this is not equally the case with ethics, which seems to require for stability some sort of religious or philosophical background. The traditional European ethic has hitherto been based upon the Christian religion, and the decay of faith in that religion has been accompanied by signs of decay in the associated ethic.

Decay of faith in a religion may be due to some radical and incurable flaw such as the intellectual untenability of its fundamental tenets. Or, on the other hand, it may be due to faulty presentation of these beliefs, or to some twist or perversion which they suffered in the past but which might now be remedied.

Canon Raven takes this latter view, namely, that the present divorce between modern science and the Christian religion—a divorce fraught with serious consequences—is due to a twist of long standing, whereby a religion which originally recognized the worth and significance of Nature and history, came to adopt an attitude of contempt towards both. In his view the factor responsible for this perversion was the nature of the world into which Christianity was born. Its disillusion, corruption and brutality warped the new religion's development. There developed a tendency to contrast the supernatural with the commonplace; the wholesomeness of the Christian ethic became tainted with asceticism; eternal life became identified with the hereafter rather than with the here and now. God became again King and Judge rather than Father; the divinity and humanity of Christ were regarded as mutually incompatible, leading to the theological bankruptcy of Chalcedon. As for the creative conception of the Holy Spirit, this aspect of the divine nature was, so to speak, put into commission and became little more than a synonym for the supernatural prerogatives possessed and bestowed by the clergy. Thus between the ethos of the Gospels and that of the Creeds, there came about a change not only of climate but also of basic principle.

"The Gospels accept and sanctify the world of nature and history; the Creeds tend to renounce it:

the New Testament presents Christ as the consummation of the one natural-supernatural order; theological orthodoxy reshapes him as a divine intruder sent to rescue the elect from a world inevitably doomed."

St. Augustine embodied the pessimism of the time in treatises which shaped the future, condemning Nature as totally corrupt, and expounding as his philosophy of history a rigid dualism of natural and supernatural. Reinforced by the defeat of Pelagius, and coinciding with the growth of monasticism, Augustinianism shaped the Catholicism of Europe. Even in the brilliant zenith of medieval thought in the thirteenth century, the interest in natural phenomena which found religious expression in St. Francis, influencing also the Emperor Frederick II and the great schoolman Albertus Magnus, was powerless to affect the general outlook. The Englishman Roger Bacon was practically a unique phenomenon among the faithful, and nowhere in current views of Nature is there to be found any trace of first-hand observation or factual accuracy. Even the pictures in the herbals are almost invariably copies, debased and formal, of Græco-Roman originals. Thus the medieval Church was totally unable to adjust itself to the new ideas of the Renaissance.

The situation was that the magnificent system of Catholic metaphysics developed by the Schoolmen had been combined with a physics which were hopelessly defective; and the conviction had begun to prevail that problems could no longer be solved by appeal to authority, but that there was need for first-hand observation supplemented by experiment and formulated as hypothesis. The scientific movement, of which the foundation of the Royal Society in 1662 was a crucial point, reasserted the importance for philosophy and for religion of a sound and serious study of Nature and history. In the great days of the seventeenth century, there was a brilliant but brief period in which a new and satisfying interpretation of religion—a Christian synthesis worthy to replace the scholasticism of the Middle Ages—was foreshadowed and almost attained. Sir Thomas Browne in his "Religio Medici" and the Cambridge Platonists, Benjamin Whichcote, John Smith and others, expounded and developed it.

Yet the promise of this movement was not fulfilled, and Canon Raven examines the causes of failure. The scientific interest of the seventeenth century was predominantly biological in character. It was the study of life and the work of zoologists, botanists, physiologists and medical men. Thus the abstractness of the scientific outlook, its estrangement from life and culture, and its concentration upon mathematics, were by no means in evidence. Only with the coming of Newton did the narrowing of the field take place, and the Cartesian doctrine that science is mechanistic begin to prevail. Doubtless biological studies had reached a point when their further development must await progress in physics and chemistry, and it was perhaps inevitable that the Cartesian compromise (which was really a surrender) should be accepted, namely, that science should be content with the sphere of the material and that which is capable of exact measurement, while religion and the qualitative aspects of existence should lie outside its sphere.

What actually took place was a complete reversal of the medieval achievement. Then an ambitious metaphysical system was associated with grossly defective theories of the physical world. But now increasingly complete knowledge and control of the physical is associated with a metaphysic inadequate to the interpretation of life. Man's religious and moral experience is dismissed as illusory. Our development, like that of the medieval epoch, is lopsided, though our equilibrium wavers in an opposite direction.

Such is Canon Raven's diagnosis of the failure of our time to bring religion and science into line. Whether the new synthesis will come in time to save civilization from disaster remains to be seen.

BREEDING BIRDS OF DENMARK

The Breeding Birds of Denmark

With Special Reference to Changes during the Last Century. By Poul Jespersen. (Published by the Danish Section of the International Committee for Bird Preservation.) Pp. 79. (Copenhagen: Einar Munksgaard, 1946.) 6 Cr.

THIS small book is a brief account of the changes which have taken place in the breeding birds of Denmark during the last century and a half.

The first part is a systematic list of all the birds which nest or are said to have nested in Denmark during the period under review. There are a few remarks on their increase and decrease with suggestions as to the causes. The second part is devoted to lists of species which have changed their status or are sporadic or occasional breeders. Finally, there are a few pages on the distribution of a number of birds the nesting of which is restricted to certain parts of the area.

Of the 217 species said to have bred in Denmark, thirty must be eliminated, since the evidence is not above suspicion. These include the willow-tit, grasshopper-warbler, dipper, fieldfare, golden eagle and jack snipe. Such species as the roller, hoopoe and the larger birds of prey ceased to nest during the nineteenth century, and the evidence points to the fact that this was due to man's direct interference. More recently seventeen other birds have seriously decreased, and among them five birds of prey, some of which, no doubt, as the result of man's persecution, though in the case of the marsh harrier draining of breeding sites is the main cause. This, too, has affected the bittern, wood sandpiper and black tern, while the planting of heaths has restricted the nesting sites of the black-game and golden plover. The green woodpecker is included in this list and in earlier times was generally distributed, but is now restricted to parts of Jutland, where, however, it appears to be spreading, so the decrease may be merely temporary.

The white stork, which the fairy tales of Hans Andersen has made everyone associate with Denmark, is still common in many parts of Jutland, though seriously diminished in numbers. At one time there were two thousand breeding pairs in Denmark, but by 1930 these had diminished to 250. No one cause can be assigned for this decrease; but fortunately the picture is not quite so black as this suggests, since in recent years the numbers have increased and there are said to be 500 occupied nests.

The planting of large tracts has led to the increase of some birds, especially tits. The cole-tit, formerly known only as a winter visitor, is now a common nesting species, having spread from Germany. The central European race of the crested tit, *Parus cristatus mitratus*, was first found breeding in Jutland in 1890 and has since extended its range. It is reported nesting from N.E. Zealand, but whether the same race or the typical one is not known. The colonization of Denmark, however, by two separated races is known in the case of the bullfinch. The small European race, *P.p. minor*, began to spread into Denmark from the south some twenty years ago and nests in Jutland and Funen. In 1916 the northern bullfinch, *P.p. pyrrhula*, bred in Bornholm and in 1934 in Zealand. The spread of these two forms will be watched with interest.

Mr. Poul Jespersen has done his work well, and he Danish Section of the International Committee for Bird Preservation is responsible for the publicaion. If other sections of the International Committee would publish similar accounts they would be of great interest.

SOCIAL BIOLOGY FOR SIXTH FORMS

An Introduction to Social Biology

By Alan Dale. Pp. vii+396. (London: William Heinemann (Medical Books), Ltd., 1946.) 15*s*. net.

THERE has been a marked tendency in recent years for educationists to review the contents of school curricula so as to bring them into closer relationship with everyday life. Biology, in particular, has been the target of much criticism on the ground that most school teaching was but a faint and distant reflexion of advanced university courses—or, as one critic put it, "the beverage of school children is Hentschel and Cook and water". Signs have not been lacking, however, that changes are on the way. Some School Certificate biology syllabuses have been 'humanized', the journal *Biology* has added "*and Human Affairs*" to its title; the columns of *Nature* have had articles discussing the significance of social biology and proposing the establishment of a National Institute of Social Biology; and now the social biology text-books are beginning to appear.

Mr. Dale's selection and treatment of material will meet with general approval. His main 'type' species is *Homo sapiens*; but he avoids the pitfall of narrowing biology into human anatomy and physiology. He gives much attention to the very important matters of sex and reproduction, but avoids the error of making 'social biology' a euphemism for 'sex instruction'. He discusses many aspects of human health and disease, but steers clear of morbid pathology. He relates the social life of humans to that of other animals, but avoids the temptation to make of man a magnified ant. In short, his material is of intrinsic interest and of social significance, and is built up into a systematic and scientific course of biology.

Many readers, however, will object on philosophical grounds to phrases such as "matter imbued with life", and to conceptions such as "a centralised pool of life, to which all life returns after the death of the host-matter" (p. 2). The final chapter on "The Nature of Life" does, however, present some alternative philosophical conceptions, although it makes no mention of the approach of dialectical materialism. Most readers, one hopes, will now be sufficiently aware of the harm that has been done by race theories to regret the use of the phrase "negroid and australoid races" (p. 42); while it is perhaps something of an exaggeration to assert that "the phenomenon of sex has basically nothing to do with reproduction" (p. 99). It is also somewhat surprising that a discussion of economic–demographic problems leads to the conclusion that "The ideal would be to have the bigger families born to parents of the upper classes and the smaller families in the lower classes", rather than that wealth should be redistributed.

Despite these and other criticisms, however, this is a book to be welcomed. It is well written, attractively produced and excellently illustrated—and it should go far to answer those critics who have claimed that courses in social biology would be merely 'soft options' for those who could not face the more academic courses.

CYRIL BIBBY

LIFE OF SPINOZA

Spinoza

Portrait of a Spiritual Hero. By Rudolf Kayser. Translated by Amy Allen and Maxim Newmark. Pp. xix+326. (New York: Philosophical Library, Inc., 1946.) 3·75 dollars.

THE author of this book allows himself the liberties of the novelist. He is omniscient and omnipresent. He knows Spinoza's private thoughts and how he looked on occasions when he was quite alone. No questions about authenticity of evidence trouble him. All this would have mattered little had he possessed the imaginative insight and power of expression which can justify such flouting of the rules. As it is, the book is neither reliable biography nor a living picture of a personality. It is not without value. Spinoza's stature is so great that it would need a very bad writer to shut him out of sight altogether. Mr. Kayser gives a great deal of useful information about the circumstances of Spinoza's life and about his contemporaries. The excursions into legend do not seriously affect the general tenor of the narrative, though they do throw doubt on the author's critical capacity.

Our main source of information about Spinoza is the short biography by Colerus, which occupies, in the English version and apart from polemical passages, barely twenty pages in the late Sir Frederick Pollock's book. As a good Lutheran, Colerus is shocked at Spinoza's heresies and says so explicitly and in no measured terms. But as an honest man who knew Spinoza personally he is equally shocked at the silly malicious gossip about him, and he writes in order to stop slanderous tongues from wagging. They went on wagging for about a century, but they stopped at last, and now his testimony remains as almost the only valid contemporary record. Colerus was not an artist in words and was something of a pedant, like many other Germans. But he had positive qualities not too common among people of any nation; he loved the truth, and knew a good man when he saw him. Thus we can see a great deal of the personality of Spinoza through his bald sentences. Spinoza is a supreme example of honesty and courage; the perfect model of the wise man of Stoic theory, who really lives up to his philosophy. He shows that it is possible, by accepting all events equally as inevitable, for a man to be so indifferent to the worst that circumstance or human malice can do, that in effect he becomes the master of circumstance and malice is disarmed against him. Spinoza is also the only philosopher known to history who earned an honest living by the work of his hands. A. D. RITCHIE

ADVANCED THEORY OF STATISTICS

The Advanced Theory of Statistics
By Maurice G. Kendall. Vol. 2. Pp. vii+521. (London: Charles Griffin and Co., Ltd., 1946.) 50*s.* net.

THE first volume of this work, reviewed by Prof. R. A. Fisher in *Nature* of October 16, 1943, covered the subjects of frequency distributions and their properties; theories of probability and sampling and the sampling distributions to which they lead; and the theory of correlation. Chapter 12 on the χ^2 distribution was described by the author as something of an intrusion. A new edition of volume 1 in 1945 had no alterations of substance. The present very welcome volume 2 falls into five sections, dealing with estimation, the theory of statistical tests including the analysis of variance, regression analysis, the design of statistical inquiries, and the analysis of time series.

Prof. A. D. Ritchie, in *Nature* of November 2, 1946, p. 639, has drawn a distinction between the man of science and the technologist which can, I think, be applied, with a difference, to mathematicians. Some, if they carry out calculations, do so as practice for the sake of understanding. Others, though they must understand first, do so for the sake of the practical application. I may perhaps speak for those who want to apply statistical methods in various fields—in my case experimental psychology and education—but want also to understand them, indeed become interested in them for their own sake. Such must welcome Mr. Kendall's book warmly, and perhaps especially this second volume, in which Chapters 23 and 24 on the analysis of variance, and 25 on the design of sampling inquiries, are of peculiar interest to them.

In agricultural experiments, properly designed, there seldom arises the problem of "unequal numbers in subclasses" (par. 24.6 *et seq.*). But in all sociological experiments, numbers in subclasses are liable to inequality. Absences from school affect one class more than another. An island population does not fall into occupational or racial classes of equal size. So the procedures to be adopted with 'non-orthogonal' data (pp. 220–9) are of importance. I am sorry there is only a page and a half (pp. 262–3) about 'confounding'. It is very useful, however, to have everything in one book, and the examples and exercises (easy and difficult) are an admirable training and clarification.

Mr. Kendall describes the work on canonical correlations of Hotelling and others, on pp. 348–58. Their perusal reminded me of a problem which I posed a few years ago, to which I have not received an answer. In work with intelligence tests the canonical correlation technique appears as the problem of finding sets of weights to apply to two batteries of tests so that the correlation coefficient of the two weighted scores is a maximum. I applied this in 1940 (*Brit. J. Psychol.*, **30**, 358) to the problem of finding what weights would maximize a battery's reliability, that is, its correlation with a duplicate battery. These weights will, however, be different from those which cause this battery to give the best prediction of some 'criterion', such as future success in a secondary school, and straining after reliability may spoil prediction, and vice versa. The problem was to find weights which would make reliability equal to prediction and both as large as possible under this condition. In simple cases a solution can be found. But what is the general solution ?

Students who are not primarily mathematicians very much need and welcome preliminary genera explanations of the logic and purpose of the procedures to be proved and used in the succeeding pages, and some of them find geometrical analogies helpful. Given such assistance, they are able to follow the algebraic work more easily, or at leas to appreciate its general trend, and to feel able to accept, not quite blindly, the formulæ arrived at.

Such assistance is not wanting in Mr. Kendall's volume—I may instance pp. 269–72 with the diagram, at the outset of the discussion of the genera theory of significance tests, and the diagrams of confidence belts on pages 68, 69 and 77. In the latter I suggest the addition in dotted lines of the whole sausage-shaped region of acceptance, of which the shaded area is a section.

The theory of probability has always been an arena for controversies and even quarrels. Mr Kendall has refused to take sides in present-day disputes, but has objectively described both points of view. About the different approaches to the treatment of confidence intervals and fiducial inference, differences which so easily escape from one's mind even when one has again and again grasped them fleetingly, he has written two admirably lucid chapters, and has had them read by Prof. Egon Pearson and Prof. R. A. Fisher respectively to ensure that he has at least not misrepresented them. To the outsider, now one and now the other view seems the better. In sociological work, it is important not merely to consider the possibility of a hypothesis being the true explanation, but also its relative standing when compared with alternatives. Neyman and Pearson make just this point, and in addition to defining regions within which we reject a hypothesis because the odds are so and so that the data did not arise from it (of which regions there may be many) they choose among them that region which minimizes the chance of accepting the hypothesis when it is false.

On the other hand, the Behren's test does not hold in the theory of confidence intervals, and the reply that "some questions may not have an answer" seems scarcely sufficient. Then Kendall protests that we can never test a fiducial distribution by drawing samples. But we can set up some apparatus corresponding to the value of θ and find experimentally the proportion of samples which give rise to t. Then we can change θ and repeat; and so on. Surely this is an experimental frequency distribution.

Many will look forward to the future publication which Mr. Kendall half promises, in which he hopes to show that all these disagreements are more apparent than real.

The book is beautifully printed and the proofreading has been excellent.

GODFREY THOMSON

BIOCHEMICAL RESEARCH AT OXFORD UPON MUSTARD GAS

By Prof. R. A. PETERS, F.R.S.

CONCURRENTLY with the research upon arsenical vesicants which led to *BAL*[1], a biochemical attempt was initiated at the outbreak of the War in 1939 by the writer and directed in the Biochemical Department, Oxford, for the Ministry of Supply, with the object of finding either a better compound to act as a 'chaser' to follow quickly and to remove unreacted mustard gas in the skin, or an antidote capable of reversing the combination of mustard gas with the skin constituent. This review deals with the salient features of the work of the Oxford sub-group (J. St. L. Philpot, A. G. Ogston, E. R. Holiday and L. A. Stocken); for other related work see the recent reviews of M. Dixon and D. M. Needham[2], and of A. Gillman and F. S. Phillips[3].

Whatever view be taken as to the physiological and pathological changes involved in vesication, the first step is a biochemical change, better called a 'biochemical lesion'. Some indication of our attitude to earlier hypotheses of the action of mustard gas is necessary to explain our mode of attack. Two outstanding points in regard to its action upon skin are: (*a*) the minute amounts which will cause erythema and vesication; and (*b*) the delay in appearance of erythema and other pathological signs.

Much earlier (1923–25) Peters and Walker[4,5] had rejected both the theory that mustard gas poisoned by liberation of intracellular acid, and also the 'sulphone' hypothesis based by Flury and Wieland—with little evidence—upon the idea that mustard gas was first converted into dichlorodiethylsulphone by oxidation in the skin. Peters and Walker proved that, when suitably applied, dichlorodiethylsulphone was as vesicant as mustard gas, and the Chemical Defence Experimental Station at Porton showed that it had a high toxicity. But the sulphone hypothesis was nevertheless untenable for at least two reasons: (*a*) because no dichlorodiethylsulphone could be recovered from skin treated with mustard gas; and (*b*) because mustard gas failed to abolish the fixed —SH reaction in skin tissue, which rapidly vanished upon treating with the mustard gas sulphone *in vitro*. Applying the work of Hopkins and Dixon[6] upon the fixed —SH group in muscle tissue, they also found that other skin vesicants, diphenylchlorarsine and allyl isothiocyanate, abolished the nitroprusside reaction given by the fixed —SH group in skin, muscle and tracheal tissue.

No support could then be obtained for a third hypothesis, namely, that mustard gas attacked an enzyme; later, Peters[7] revived the enzyme hypothesis by showing that dichlorodiethylsulphone (as well as arsenite) had a selective action upon the brain pyruvate oxidase system, resembling that produced by aneurin deficiency; in particular, the oxidation of lactate was inhibited selectively at the pyruvate stage by concentrations of dichlorodiethylsulphone (0·087m*M*.) which left (by inference) the cytochrome and lactate dehydrogenase systems intact. Since the action resembled iodoacetate, he was led to suggest that the vesicant action was due to attack upon the same enzyme. This work was carried out independently and about the same time as work in relation to tumour glycolysis by Berenblum, Kendall and Orr[8], who found a more marked action upon glycolysis than upon respiration *in vitro* with mustard gas, dichlorodiethylsulphone and cantharidin; they did not relate this to individual enzymes.

Our work in the War started with the idea that the pyruvate system was specifically poisoned; though an N-group could not then be absolutely excluded, and in spite of earlier contrary evidence, it was thought that, as with the arsenicals, the site of attack must be an —SH group, because mustard gas so readily attacked simple thiols. It was clear that knowledge of the biochemical components affected, and of the chemical reactions involved, was essential.

Rational progress was soon made upon the mechanism of chemical action of mustard gas (Holiday, Ogston, Philpot and Stocken[9]; earlier findings upon the kinetics of hydrolysis at physiological *p*H (Peters and Walker[4]) were interpreted upon Ingold's theories (see Watson, H. B.[10]) as indicative of an SN_1 reaction; it was realized that the compound was a remarkable alkylating reagent, active at room temperature; by a generalization known as the 'competitive theory', the groups most likely to be selected for attack by replacement reactions in a mixture could be predicted (Ogston[11]). The competition factor (*F*) of a reagent was defined as the ratio of the rate of its reaction to that of water, when the concentration of the reagent is 1 equivalent per litre; the reaction with water is:

$$S(C_2H_4Cl)_2 + 2H_2O = S(C_2H_4OH)_2 + 2\,HCl.$$

COMPETITION FACTORS

Thiophosphate	7×10^4	*BAL* $7{\cdot}8 \times 10^2$
Thiophosphonates (di)	$1{\cdot}0 \times 10^4$–10^5	amino $1{\cdot}8 \times 10^1$
Thiosulphate	$2{\cdot}7 \times 10^4$	carbonyl $1{\cdot}0 \times 10^1$
Diethyldithiocarbamate	$3{\cdot}4 \times 10^4$	phosphate $7{\cdot}5 \times 10^1$
Cysteine	$1{\cdot}2 \times 10^3$	

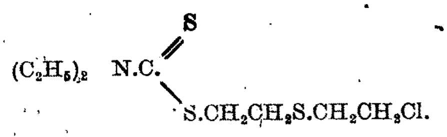
The table gives briefly some of the competition factors for different types of substance. (Similar work was started independently later by Linstead and colleagues in the United States.) Compounds likely to act as 'chasers' could now be developed upon a plan. It will be noticed how much more reactive were some complex thiols, for example, diethyl dithiocarbamate and the dithiophosphonates; the latter were new compounds specially developed for this research by Philpot and Stocken. Of all competitors, though of no value for skin treatment, they proved much the most promising; being comparatively non-toxic, they could be injected and were therefore suitable for dealing with mustard gas in the circulation; they could protect rats as well as the brain pyruvate system against mustard gas; later this work was intensively developed by Rydon, G. R. Cameron and others at Porton. In spite of their theoretical advantages, in practice, injection of these compounds proved to give no longer interval for treatment than existing anti-gas measures, owing largely to the rapidity of fixation of toxic amounts of mustard gas in the skin (Fell and Allsopp, 1940, G. R. Cameron, H. M. Carleton and K. Harrison, 1940; H. Cullumbine, 1942, U.S. workers) and to the speed with which mustard gas enters the circulation. In this, earlier quantitative work by Holiday and Ogston[12] in rats was confirmed and extended by the radioactive technique then being developed by Wormall and his team at Cambridge, and afterwards extensively used in the United States and in Canada. From a different angle Stocken[13] also proved the rapidity of mustard gas fixation in human skin by showing that his new, highly penetrant and reactive chlorinating compound (N.dichlorethane sulphonamide) was not effective against skin contamination after five minutes.

As an extension of this work, Ogston[14] made the advance for kinetic theory in preparing for the first time the half-product of hydrolysis of mustard gas, β-chloro-β′-hydroxydiethylsulphide, $ClCH_2CH_2S.CH_2CH_2OH$: (this was also done independently at Sutton Oak). By its use he found finally that the second —Cl in mustard gas hydrolyses rather more quickly than the first.

In attempts to understand mustard gas effects in the cell, the competition theory is fundamental, because it predicts what groupings might be expected to be attacked; it also shows why there must be a more general alkylation of a variety of groups with increasing concentration.

Quite early we proved that the pyruvate oxidase system was almost as sensitive to poisoning by dichlorodiethylsulphone and divinylsulphone as to arsenic (Peters and Wakelin); though there was some correlation between toxicity to this system and vesication, this did not hold for mustard gas, to which the system was less sensitive. Mustard gas was scarcely toxic to the cytochrome and succinoxidase, lactate oxidase or amino-acid oxidase systems. The pyruvate oxidase system was sufficiently poisoned by mustard gas to be used as a convenient test for protective trials with the thiol compounds (Holiday, Ogston, Peters, Philpot and Stocken[15,16]).

There was followed at this stage an interesting potentiating action of diethyldithiocarbamate upon the action of mustard gas upon the pyruvate oxidase system, by which it became practically as toxic as the sulphones and the arsenicals. Found to be a property of some dithio compounds, the action was traced mainly to the toxic action of the half-product of combination[17], namely:



$$(C_2H_5)_2\ N.C\begin{matrix}\nearrow S\\ \searrow S.CH_2CH_2S.CH_2CH_2Cl.\end{matrix}$$

One explanation of this potentiation was that it converted a feebler attack upon some other grouping in the enzyme system into an attack upon the —SH group (Philpot). A paradox had developed; all the highest competing substances contained —SH groups; the pyruvate oxidase was proved to contain —SH groups, yet our older view that mustard gas did not attack the fixed —SH group appreciably appeared to be correct. Drs. Dixon and Needham[2], and colleagues, for example, who were then developing the hexokinase theory of mustard gas and of vesicant action which appeared to cover the facts better, obtained suggestions that an —SH group was not the site of attack. This showed clearly the marked difference between the action of the arsenicals and of mustard gas.

At this period, too, a study of the alkylation of kerateine by mustard gas (Peters and Wakelin[18]) showed that though some of the thiol groups were attacked, about three-quarters of the mustard gas had combined with other groups (much more detailed studies on proteins were made by Wormall's team[19]). Independently again, A. Pirie[6] found that collagen, comparatively free from thiol groups, combined with mustard gas. All this was evidence that, in spite of the reactivity of compounds like the thiophosphonates, the —SH groups were not so easily selected by mustard gas in the tissue. Indeed, our protective experiments *in vitro* on the pyruvate oxidase system had suggested that cysteine with comparatively low competition value was as effective in protection as highly competitive substances. For fundamental biochemical theory, these facts throw into relief the importance of understanding the reactivity of —SH groups attached to large molecules. Much evidence has now accumulated at Cambridge and in the United States that this vesicant attacks —COOH groups in proteins.

The practical failure of substances able to detoxicate mustard gas rapidly focused attention upon the possibility of removing the combined fragment. In regard to any thioether linkage formed (—C—S—C—) an interesting silver reaction was developed; if silver nitrate is added at room temperature at faintly acid *p*H to form a silver complex with some thioethers, and the *p*H then changed to faint alkalinity, the thioether may be decomposed with regeneration of the constituents (Peters and Wakelin and with Ford-Moore[3]); for example, in the case of the compound of cysteine and phenyl-β-chlorethylsulphone, the *p*H at which the splitting starts is about *p*H 7·8 (near that of the cell), and it was possible to isolate both split fragments. Curiously enough, the similar sulphide does not show this scission reaction; but it will do so if the sulphide is oxidized to the sulphoxide form. From a different aspect, similar results were reached in the United States. In regard to the labilization of a mustard gas fragment which has alkylated —COOH groups, Ogston had shown earlier that there was slow hydrolysis of the acetate at physiological *p*H, and Pirie that much of the mustard gas combined with collagen could be split in alkaline solution. It was found (Peters and Wakelin[21]; also work of Kinsey and Grant, and Bergman *et al.*[22]) that oxidation (presumably to sulphoxide) of the bound sulphur in mustard gas kerateine made the mustard gas fragment much more unstable, suggesting that much was combined with COOH. This appears to be a suggestive observation and is reminiscent of earlier biochemical work on labilizing groups in relation to enzyme action. The important point is that regeneration of cell constituents attacked by mustard gas at —COOH and —SH groups is not now absolutely inconceivable.

That poisoning of an enzyme can initiate vesication seems proved for the arsenicals; the theory of Dixon and colleagues[2] that mustard gas action is due to the initial poisoning of hexokinase is based upon its rapid poisoning of this enzyme *in vitro*. The outstanding difficulty in regard to this theory is that, *in vitro*, hexokinase is not immediately poisoned, which, though consistent with the slow appearance of erythema, is difficult to reconcile with cumulative histological evidence that mustard gas also makes an immediate attack upon skin. In searching for other interpretations, we made use of our studies on thermal burns (Beloff and Peters[23]), where we had found recently the liberation of a proteinase at an early stage from burned rat skin, owing presumably to a change in permeability. Similar experiments with mustard gas showed that within a short time of contamination there was a disappearance of proteinase, not due to inactivation by mustard gas; as in the case of thermal burns, it seemed that this might be responsible for the epidermal separation (Beloff, Peters and Wakelin[24]). In this connexion it was most pertinent that H. Cullumbine and H. N. Ryden[25] found that our proteinase could liberate leucotaxine from some proteins and so cause vasodilatation. These experiments have led us to doubt the enzyme theory for mustard gas, in the sense that this was the first constituent attacked with the lowest toxic concentration of mustard gas, and to believe that the first attack was upon the surfaces of skin cells; though even an attack on 'surface' enzymes is not quite excluded, it is possible that changes in cell permeability with a contingent dilution of cell constituents would be dangerous. This 'cell surface' hypothesis, making the action of mustard gas somewhat analogous to that in thermal burns, was reached from a different angle by Cori *et al.*[26], and was also the view of R. K. Cannan[27].

If this be indeed the first site of attack, we are still in ignorance of the constituent concerned. During the first nine months of the War, Dr. Berenblum and Miss Schontal (Department of Pathology, Oxford) worked in parallel with our team and found that nucleoprotein in thymus extracts was powerfully and rapidly attacked by mustard gas. This would be in line with the cytotoxic action; for example, the formation of mutations (C. Auerbach and J. M. Robson[2]). At present there is a trend of biological opinion towards the idea that there is nucleoprotein in the cytoplasm; if some reactive nucleoprotein is situated in the interface, we should have a good working hypothesis for further studies. That points of fundamental scientific, in addition to practical, interest will repay further study seems reasonably certain, though they will have to be done by those who are not yet hypersensitive to its effects! A reagent capable of alkylating the nucleus at room temperature surely has great possibilities.

In conclusion, it is interesting to note that of the four biochemical lesions studied in the laboratory, two, namely those produced by aneurin deficiency and arsenicals, attack the pyruvate oxidase system. At present there is some support for the view that both heat and mustard gas appear to concentrate their initial attack upon the cell surface.

It should be recorded that a different approach was initiated by Dr. R. H. S. Thompson of this Department. In 1942[2] he found that the 'nitrogen mustards', ββ′-dichlorodiethyl-N-methylamine and trichlortriethylamine, are effective inhibitors of cholinesterase both *in vitro* and *in vivo*. Mustard gas also inhibited this enzyme but to a lesser extent. Certain of the systemic effects produced by these agents are muscarine-like in nature, so that a failure to hydrolyse liberated acetyl choline might well account, in part at least, for some of the pathological symptoms observed. But since it is clear that this is only one of several enzymic inhibitions produced by these compounds, it is not yet possible to formulate any definite relation of this inhibition of cholinesterase to the action *in vivo* of these vesicants. It may be recalled in this connexion that Cordier[5] has reported experiments upon alkaloid-like effects of mustard gas.

During the War, an independent study was made by Z. Bacq and his colleagues (see Z. M. Bacq[30]) of the effects of chemical warfare agents upon thiol compounds in relation to vesicant action.

We are indebted to the Director General of Scientific Research (Defence), Ministry of Supply, for permission to publish this work. As in the case of the work upon arsenicals, we are grateful to Mr. Davidson Pratt and his colleagues at the Ministry for their support, and to the staff of the Chemical Defence Experimental Station, Porton. We have also much appreciated discussions with Dr. Dixon and his team, as well as with others.

A reference thus, "Peters Report No. 1 (1940)", refers to a report submitted to, and given a restricted circulation by, the Chemical Defence Research Department of the Ministry of Supply in that year.

MEDICAL ASPECTS OF MUSTARD GAS POISONING

By Dr. H. CULLUMBINE
Chemical Defence Experimental Station, Porton

MUSTARD gas, or 2, 2′ dichlorodiethyl sulphide, was first prepared by Guthrie in 1859, and he commented on its vesicant properties. It is, in fact, a very versatile agent, defiling all tissues with which it comes into contact, and it is potent in the vapour as well as in the liquid phase.

Mode of Penetration of the Skin

Mustard gas penetrates the skin rapidly; but there is a latent period of some hours, under temperate climatic conditions, before any macroscopic change is produced, and there has been much speculation on what is happening to the mustard gas during that time. The problem has been studied histochemically (Cullumbine, 1944) and by the use of mustard gas containing radioactive sulphur (Moritz, Henriques *et al.*, 1942–43). It would appear that 80–90 per cent of the mustard gas penetrating the skin passes rapidly into the circulation. Of that remaining in the skin, most (about 12 per cent of that penetrating) is rapidly fixed, possibly by combination with protein, and only a very small amount remains 'free'. This 'free' mustard gas does not exist in the skin of man except in the epidermis, and even this has disappeared within thirty minutes of contamination. No 'free' vesicant is demonstrable in the dermis even within five minutes of contamination.

The extent of vesication is proportional to the amount of 'fixed' mustard gas, and since 'free' mustard gas has only a transient life in the skin, we should expect any therapy based upon a reaction with 'free' mustard to be valueless unless applied very soon after contamination. Examples of such therapies are the reactive principles of British anti-gas ointments, which, even under temperate climatic conditions, suffer the limitation of being effective decontaminants for only a few minutes after the application of the mustard gas to the skin.

These ointments depend for their efficiency on the liberation of chlorine on the skin; but it has been shown (Cullumbine and Liddell, 1944), by histochemical means, that available or 'free' chlorine does not exist as such in the inuncted skin. The active principles of the anti-gas ointments do penetrate the skin only to be immediately reduced by the many unsaturated compounds present in the skin. Therefore, ointments depending for their efficiency on the liberation of chlorine in the skin are useless as late decontaminants for mustard gas; the only hope of preventing skin damage is by therapy which will reverse the mustard gas fixation and the physiological processes accompanying it.

Competitors

The 'fixed' mustard gas is probably held in the skin in combination with skin protein, for many workers have shown that mustard gas can react with a wide range of proteins (Berenblum, 1940; Wormall, 1940; Pirie, 1941; Peters and Wakelin, 1941; Northrop, 1942; Hellerman *et al.*, 1943; Cozan, Kenny and Grant, 1943). In fact, by substitution reactions involving the highly reactive β-chlorine atom, mustard gas can react in an aqueous phase with compounds containing the groups —SH, carboxyl, amino, hydroxyl, etc. (including proteins, amino-acids, nucleic acid, etc.), and its toxic effect has been assumed to be due to its reactivity in this fashion with one or more of the cell constituents (Ogston, 1942). Therefore, any reagent with itself an affinity for the β-chlorine atoms of mustard gas might be expected to be successful in preventing mustard gas 'fixation' or in reversing such 'fixation'. A representative selection of such compounds ('competitors') has been tested (Cullumbine and Rydon, 1944) on contaminated human skin with this end in view; they all proved less effective, under the conditions of test, than existing anti-gas ointments. The rationale of the use of 'competitors' for the treatment of mustard gas-contaminated skin assumes, of course, that the 'fixation' of the vesicant is reversible; Cullumbine (1944) and Kinney and Grant (1944), using animals and yeast cells respectively, have been unable to find any evidence for this assumption.

Leukotaxine

'Fixation' of the vesicant occurs very rapidly, but yet some hours may elapse before obvious reddening and vesication appear. This long latent period is of macroscopic significance only, and there is evidence that changes occur in the underlying tissues shortly after the mustard gas is applied. Thus Cameron and Short (1944) using rabbits, and Cullumbine (1944) in man, have shown that an increased capillary permeability occurs in the skin within a few minutes of contamination; at the same time, they have produced histological evidence of damage in the dermis and underlying structures 20–30 minutes after the application of mustard gas. The increased permeability and the early accumulation of leucocytes are apparently due to the formation of a factor similar to Menkin's 'leucotaxine'. This factor can be isolated quite early from mustard gas-contaminated skin and also from the blister fluids of several vesicants (Cullumbine and Rydon, 1943). Its formation is not specific to the action of mustard gas on the skin, since other vesicants and injuries can produce an apparently identical factor. The substance has been partially purified, and it appears to be a polypeptide of comparatively low molecular weight. Moreover, its ready production by the digestion of certain proteins suggests that it may be produced by the interaction of mustard gas and protein in the skin; the skin proteinase of Beloff and Peters (1945) may play some part in this formation.

Enzyme Systems

However, mere injection of the capillary permeability factor does not produce a vesicle. Therefore, some additional factor must be involved in the mechanism of vesication. Histological study has shown that the separation of the blister roof occurs by disruption somewhere around and along the epidermal–dermal junction. This separation probably occurs through the inhibition of certain enzymes (phosphokinases) which are necessary to cell life.

A whole host of enzymes can be inhibited by mustard gas if the conditions are sufficiently drastic, and such a general inhibition may be the cause of the necrotic action of mustard gas when applied to the skin in massive doses. However, under milder conditions, the action of the vesicant would appear to be more specific. Peters (1940) observed that the brain pyruvate oxidase system was inhibited by mustard gas and certain other vesicants, and this phenomenon has been used to measure antidotal effects too small to be detected easily *in vivo*. Dixon (1941) has also studied thoroughly a large number of enzymes. He has shown that there is a close relationship between vesication and the inhibition of glycolysis, and he has concluded that mustard gas inhibits a group of enzymes, the phosphokinases. Thus in the glycolysis system it inhibits the reactions for which the enzymes hexokinase and deutero-hexokinase are responsible. In addition, Dixon found that substances which poison hexokinase are all vesicant, and that substances which do not poison hexokinase are all non-vesicant. Again, there is a close parallelism between vesicant activity and power to inhibit hexokinase. Moreover, hexokinase has been detected in various tissues, including skin, and the visible development of the skin lesion runs parallel in time with the inhibition of glycolysis. The importance of the inhibition of the phosphokinases, and especially of hexokinase, is thus evident. Dixon, indeed, has suggested that the inhibition of the pyruvate oxidase system, noticed by Peters, may actually involve the inhibition of a phosphokinase since the oxidation of pyruvic acid appears to involve phosphorylation.

Northrop (1942) has shown that the growth of yeast can be inhibited by mustard gas without affecting respiration, glycolysis, proteolysis or invertase activity. The different biological system used may account for this apparent divergence from the phosphokinase theory, though the results do suggest that even more sensitive systems than the hexokinase one may be involved.

The actual chemistry of the reaction between hexokinase and mustard gas is still unknown, and we are still ignorant of the cause of the time lag in vesication. Hexokinase is inhibited at once *in vitro* by mustard gas, but the inhibition of hexokinase in rat skin only occurs after a delay corresponding in time to the appearance of skin changes.

Sensitivity of 'Hot and Sweaty' Skins

It is a well-established fact that the skin is more sensitive to mustard gas in hot climates than in cold. Moreover, even in temperate climates, certain regions of the skin are more sensitive to mustard gas vapour than others; for example, the skin of the scrotum and of the armpits shows vesication much more easily than the skin of the rest of the body. An attempt has been made to discover the factors involved in determining the sensitivity of the skin to mustard gas vapour (Cullumbine, 1943). The experimental results suggest that the moisture on the surface of the skin plays the major part in increasing the sensitivity of 'hot and sweaty skins', although increased temperature, by increasing the solubility of the vesicant and accelerating its 'fixation' in the skin, may aid this.

Treatment of Mustard Gas Intoxication

Many methods of preventing vesication, once contamination was established, were tried with varying degree of success. One drastic but effective method was by the use of certain acids—trichloroacetic, monochloroacetic, and thioglycollic—which were effective for a considerable time after contamination and against many (if not all) vesicants (Cullumbine, 1943). These acids prevent the immediate loosening of the epidermal–dermal junction, thrombosis of the small skin vessels thus limiting the serous effusion also occurring. An intact firm epidermis instead of a vesicle is produced, though this skin may break down later.

Various local methods of treatment of the mustard gas skin lesion have been considered. The therapies have been tested by two means: (*a*) on small standard experimental burns on volunteers (Cullumbine and Sinclair, 1943); (*b*) on actual clinical cases of vesication. The findings indicate that mustard gas burns will heal in a similar manner, though possibly more slowly than thermal burns, and can be treated in the same way as thermal burns. Epidermal regeneration begins about the third day and, when complete, is often hypertrophic with ingrowths and 'nests' of epidermal cells evident in the dermis. If the blister is intact, mere collapse of the blister roof is advantageous, since pain, infection and healing-time would seem to be reduced.

It must not be forgotten, however, that general treatment is just as important in the case of mustard gas burns as with thermal burns. 'Shock', toxæmia and secondary infection must all be guarded against or treated. If the contamination has been severe, general symptoms and signs may be manifest before the skin requires treatment.

The most consistent organic lesions occurring in human cases of mustard gas intoxication are those in the intestinal tract and the bone marrow, indicating that a toxic factor must be transferred from the local site of contamination. Certainly the mustard gas, in some form or other, rapidly enters the blood from the skin (Ball, 1942; Henrique *et al.*, 1942). Lymph does not carry mustard gas at all, since the lymph draining from the contaminated hind-limb of a dog was non-toxic (Courtice, 1944). The skin itself or the œdema fluid, however, do not appear to contain a systemic toxic factor (Cullumbine, 1944). The circulating form of mustard gas is rapidly taken up from the blood by the tissues generally (Young, 1942; Ball, 1942). However, although there is no preferential absorption, some of the tissues, for example, the bone marrow and the intestinal tract, suffer specific damage, others do not (Dixon and Wormall, 1943). There is a suggestion that the toxic factors are formed locally in these specific tissues, since extracts of bone marrow from intoxicated animals will produce bone marrow changes upon injection into normal animals (Cullumbine, 1944). The damaged tissues show an early increase of capillary permeability, so that the local liberation of a capillary permeability factor may play some part in the systemic lesions. Such a factor can be demonstrated in the extracts of intoxicated bone marrow and, unlike normal serum, the serum from intoxicated animals does not inhibit the activity of this factor.

Dixon *at al.* (1943) have shown that the anaerobic glycolysis and the respiration of rabbit bone marrow are inhibited after an intravenous injection of a lethal dose of mustard gas; the action is delayed and exhibits a parallelism, in time, with the histological changes. Hence, Dixon has suggested that inhibition of hexokinase may play an important part in mustard gas systemic poisoning. It may have a part in the pathology of the bone marrow changes, but not in the intestinal changes, since Cori (1943) has shown that, after the intravenous administration of mustard gas, the hexokinase and the phospho-creatine phosphokinase of the intestine are not affected, but the inorganic pyrophosphatase and cholinesterase are inhibited.

In general, the more serious the prognosis from skin contamination the lower the white cell count. Attempts to reverse the bone marrow damage by means of non-specific stimulants have so far failed (Courtice, 1943; Cullumbine, 1943). Certain compounds with high competition factors have shown promise in reducing the mortality of contaminated animals; but the time intervals for effectiveness of these compounds are short. This suggests that, as in the skin, once 'fixation' has occurred in the tissues, the process would seem to be irreversible (Cameron and Rydon, 1944).

The mortality can also be reduced by the simple administration of sodium chloride solutions, by mouth, subcutaneously, or intraperitoneally (Cullumbine, 1944); the administration preferably commencing early and continuing throughout the possible period of mustard gas intoxication. The replacement of electrolyte lost locally and in the intestines and via the saliva, vomitus and diarrhœic stools is apparently an urgent need.

I am indebted to the Chief Scientific Officer, Ministry of Supply, for permission to publish this paper.

EDWARD LHWYD: GEOLOGIST, BOTANIST AND PHILOLOGIST (1660-1709)

By V. A. EYLES

ACCOUNTS of the lives, work and writings of some of the more prominent naturalists and men of science who flourished during the second half of the seventeenth century and the early years of the eighteenth, among whom may be mentioned Newton, Boyle, Hooke, Ray and Plot, have provided the subject-matter of a number of books published in recent years. A further addition to these studies has now been issued as a result of the labours of the late Dr. R. T. Gunther*. It forms volume 14 in the series "Early Science in Oxford", and has been published posthumously, thanks to the co-operation of Dr. John Johnson, of the Oxford University Press.

Edward Lhwyd, the subject of this volume, was a Welshman. Though his father's name was Lloyd, he preferred to be known as Lhwyd, nearly always signing himself thus. The spelling of his name seems always to have occasioned difficulty, for he has been referred to in one place or another as Llwyd, Lhuyd, Llhuwyd, Floyd, Floid, ffloid and, *latinè*, as Luidus or Luidius.

Lhwyd was very active in his time as a student of botany and of fossils, and he also devoted much attention to philology and archæology; but he has received little mention from historians of science. Yet he was well known to contemporary scholars, among whom he was held in esteem, and with a number of whom he corresponded for many years. The deficiency in our knowledge has now been remedied by Dr. Gunther.

The opening pages of Gunther's work are occupied by a reprint of a short life of Lhwyd compiled by Richard Ellis, and published some years ago by the Honourable Society of Cymmrodorion[1]. Following this biographical account, a selection, totalling 288, from the very considerable number of letters extant that were written by or to Lhwyd has been reproduced. These are arranged in strictly chronological order, but have been divided into groups, representing successive periods in Lhwyd's life, each of which is prefaced by a commentary by Dr. Gunther. Among the correspondents John Ray and Martin Lister figure very largely, but a number of other well-known names occur in the list, including those of John Aubrey, the antiquary; Dr. John Woodward, founder of the Woodwardian chair of geology in Cambridge; Dr. Richard Richardson, the botanist; and Tancred Robinson, botanist and friend of Ray.

Lhwyd, after attending Oswestry Grammar School, went up to Oxford in 1682, being entered at Jesus College, which then, as now, had strong Welsh associations. His means were slender, necessitating his taking up a paid appointment, and about 1684 he became assistant to Dr. Plot, the first keeper of the Ashmolean Museum, with the title "Register of the Chymicall courses of ye Laboratory". He would have preferred an appointment which would have enabled him to travel abroad, so that he could acquire a wider knowledge of the subjects that interested him, but circumstances were against him. For a time, therefore, his movements were confined to journeys into the countryside within easy reach of Oxford. During these trips he searched the fields and quarries thoroughly for botanical and geological specimens, even training children and labourers to assist in the work; and he was sometimes accompanied by visiting scholars.

During these early years in Oxford, Lhwyd pursued his studies in a variety of subjects with great application, and gained the friendship of a number of the more influential members of the University. As a result, when, in 1690, Plot resigned from the keepership of the Ashmolean Museum, Lhwyd was appointed to succeed him. This position, though still not a well-paid one, gave him more freedom, and his first excursion outside the Oxford district followed before very long. It resulted from a commission to supply fresh material about Wales for a new edition of Camden's "Britannia", then being prepared under the general editorship of his friend Edmund Gibson, later Bishop of London. Lhwyd agreed to "doe all Wales; & to take a journey speedily quite through it for ten pounds in hand; and twenty copies of y^e Book, when it shall be published". He visited Wales to execute this commission in 1693, and the results of his work appeared in 1695, in the new edition of the "Britannia". Lhwyd's acceptance of this work was not primarily for monetary reward; but in the hope of advancing his own reputation sufficiently to influence patrons who might finance more extensive travelling. In this he met with some success, as will be mentioned below.

Meantime, by 1695, Lhwyd's collection of fossils had grown so large that he decided to prepare a catalogue for publication. He petitioned the University to undertake this for him, but without success; and it was only with the assistance of Sir Hans Sloane, and other friends, including Sir Isaac Newton, who each agreed to subscribe for ten copies, that the catalogue ultimately appeared, in 1699, in a small edition of 120. It bore the title "Lithophylacii Britannici Ichnographia", and included brief descriptions of nearly eighteen hundred fossils, with a note of the locality in which each had been found. Many were illustrated by such carefully drawn figures that it is still possible to identify them accurately (some of Lhwyd's fossils are illustrated in Gunther's work). The book is noteworthy as the first systematic catalogue of British fossils. Of the small number printed, it is stated that thirty were sent abroad, and the work is now very rare. A reprint, with some additional matter, was published by the Clarendon Press in 1760.

Returning again to 1695, Lhwyd's contribution to Camden's "Britannia" was evidently favourably received. Gibson, in writing to a correspondent in Oxford, remarked: "When I tell you, that the whole business of Wales was committed to the care of Mr. Edward Llwhyd . . . no one ought to dispute the justness and accuracy of the Observations". Shortly after the publication of the book, some gentlemen of Glamorgan invited Lhwyd to undertake the preparation of a natural history of Wales. Nothing suited the impecunious Lhwyd better, provided he could raise sufficient funds to cover his travelling expenses. He therefore caused to be printed a pamphlet outlining an ambitious "Design of a British Dictionary, Historical and Geographical; with an Essay Entituled, Archaeologia Britannica: and a Natural

---

* "Early Science in Oxford." By R. T. Gunther. Vol. 14: Life and Letters of Edward Lhwyd. Pp. xv+576+14 plates. (Oxford: A. E. Gunther and Dr. Mavis Gunther, c/o University Press, 1945.) 42s.

History of Wales", in which he solicited annual money payments from parties who were interested in the project. His appeal, which was circulated in London and in Wales, attained its object. He therefore prepared a further circular, a questionnaire, in which he sought information from local residents about the geography, antiquities and natural history of the districts he proposed to visit. This also was widely distributed by the somewhat uncertain methods then available, not only in England and Wales, but eventually in Scotland and Ireland as well.

Having thus prepared the ground, early in 1697 Lhwyd set out on his travels. These were to last several years, though latterly the subscriptions promised by his patrons were not all forthcoming. First Wales was revisited, and then he crossed to Ireland, where he was welcomed by members of the Dublin Philosophical Society, and also visited the Giant's Causeway. From Ireland he went on to Scotland, where he met the distinguished Edinburgh naturalist and physician, Sir Robert Sibbald. In a letter written from Bathgate, near Linlithgow, in December 1699, he informed Martin Lister that he had "sped well enough in ye Highlands as to some materials for ye Archaelogia Britannica". Ireland was revisited, and then he returned to Wales. Towards the end of 1700 we find him in Cornwall and, early in 1701, he set out for Brittany. His journeys up to now had not been without minor mishaps, but in France he met with a somewhat more serious misadventure. He was arrested as a spy, and spent eighteen days in confinement in a fortress in Brest. Conditions on the Continent were such that he had to cut short his visit to France, and he returned to Oxford in March 1701.

The remainder of his life was spent in and around Oxford, interrupted only by a short visit to Cambridge to examine certain manuscripts. Apart from his duties as keeper of the Ashmolean, a post that he retained until his death in 1709, his time was spent in digesting and preparing for publication the vast stores of information accumulated during his travels, and sent to him by correspondents. Unfortunately, little of this reached the stage of publication. In 1707, however, volume 1 of "Archaeologia Britannica" was printed in Oxford. It bore the sub-title "Glossography", and was devoted to comparative Celtic philology. Among those competent to appreciate it, it seems to have been looked on as a work of great merit, and Ellis quotes the statement of one authority, that Lhwyd "was in many respects the greatest Celtic philologist the world has ever seen"[2]. Unfortunately, this somewhat abstruse work did not please the Welsh squires who had subscribed towards paying for a natural history of Wales.

Owing to Lhwyd's preoccupation with philological and archæological matters during his last years, his botanical and geological studies seem to have been suspended, though his letters show that he had not entirely lost interest in these subjects. In fact, there is little doubt that it was his intention to publish a natural history of Wales, had he survived, and this, no doubt, would have contained much of interest to botanists and geologists. Unfortunately, after his death, his manuscripts were dispersed, falling into private hands, and, later, by accident, many were burnt.

Thus, apart from the "Lithophylacii", Lhwyd published comparatively little that is of interest to naturalists. He contributed a number of papers to the *Philosophical Transactions of the Royal Society*, including some of botanical and geological interest. His contribution to Camden's "Britannia" included botanical notes; and his friend Ray made use of botanical material supplied to him by Lhwyd. He also supplied Martin Lister with shells that were figured by the latter in his publications on conchology. In passing, it may be mentioned that he contributed material used by Ray in his "Collection of English Words not Commonly Used".

Gunther stresses especially Lhwyd's geological work. Certainly in his earlier years the study of fossils occupied much of his time, and his "Lithophylacii" is a work of very considerable interest and merit. It is remarkable for the accuracy of its illustrations, and for the fact that the fossils figured are carefully localized. Lhwyd is also remembered, among palæontologists especially, as the first to figure a specimen of the extinct order of trilobites. Yet to claim, as Gunther does, that Lhwyd is to be regarded as the father of British palæontology is, perhaps, to allow enthusiasm to outstrip judgment. His views on the origin of fossils were not so sound as those of his contemporary, Robert Hooke, for example. A lengthy exposition of these views is contained in a letter to Ray which has been reproduced by Gunther (No. 200). In this he refers to the work of Steno; but he does not seem to have profited much from the enlightened views of the latter.

The fact that Lhwyd's genius and energies were dissipated in the study of so many branches of learning possibly accounts for his failure to attain lasting fame in any one branch of natural history, and his influence on the thought of his contemporaries may perhaps have been of more importance than his publications. At all events, he occupies a definite niche in the scientific life of the period, no account of which would be complete without something more than a passing mention of his activities. The gap in our knowledge has now been filled by Dr. Gunther, who has collected into one volume most, if not quite all, the information about Lhwyd's work and career that has survived. The sources from which he has drawn this information are scattered and in many cases not easily accessible, and in producing this most readable book there is no question but that he has performed a most useful service, which does full justice to the memory of a neglected naturalist. It should also prove a useful tool for serious students of the history of science. With this in mind, it is as well to point out that one or two sources of information appear to have been overlooked by Gunther. He makes no reference to an interesting though short memoir on Lhwyd published in 1777[3], nor to three letters to Lhwyd, of Scottish interest, that have been published among the early letters of Robert Wodrow[4]. It is clear, though it is not specifically stated, that not all the Lhwyd correspondence known to Dr. Gunther has been reproduced. It may also be mentioned that the Catalogue of Published Works of Edward Lhwyd (Appendix A) is incomplete, and inaccurate in one or two particulars. Attention has been directed to these faults to put the reader on his guard, but they detract little from the merits of this interesting book.

OBITUARIES

Mr. A. B. Jackson

Mr. Albert Bruce Jackson, who for many years has been an authority on the identification of hardy trees and shrubs, died on January 14 at his home, in the village of Kew Gardens, Surrey, after a short illness. He was nearly seventy-one years of age, having been born at Newbury on February 14, 1876.

On leaving school at the age of sixteen, Jackson began work as a journalist; but it did not appeal to him and he studied botany in his spare time, paying particular attention to the British flora. Some four or five years later his work on British botany attracted the attention of the director of the Royal Botanic Gardens, Kew, who offered him a post as temporary technical assistant in the Herbarium, where he would have an opportunity of furthering his botanical studies. Soon after, Mr. H. J. Elwes and Dr. A. Henry, when preparing their great work, "The Trees of Great Britain and Ireland", wanted an assistant who could look up botanical references and go about the country collecting information about rare and remarkable trees, and Jackson was given the post. It proved to be a very useful appointment, for not only did it enable him to lay the foundation for his future work upon trees and shrubs, but also, as Elwes and Henry had been given facilities for carrying out their work at Kew, Jackson was able to maintain his connexion.

On the recommendation of Mr. Elwes, Jackson undertook in 1910 to prepare a catalogue of the trees and shrubs in the gardens at Syon House, and that was the forerunner of what became a specialized part of his spare-time work. Later, he catalogued the trees and shrubs at Yattenden Court, Albury Park, Westonbirt, Borde Hill, and so late as last year, Dawyck.

In 1910, the director of the Royal Botanic Gardens recommended Jackson for an assistant's post in the Imperial Institute, which he retained until 1932; since when, part of his time has been occupied with specialized work in the Department of Botany in the British Museum. In addition to his other activities he found time to coach a number of people in the identification of trees and shrubs, including the Duchess of Northumberland at Albury Park, and the late Duchess of Bedford at Woburn. It was at the suggestion of the Duchess of Bedford that the collection of trees and shrubs at Woburn was placed under his charge, and he visited the estate periodically for many years. During later years he has advised on the care of the trees for the authorities at Stowe School.

Although I had known Jackson from the date of his entrance into Kew, it was not until 1920 that we came into close contact. I had for several years been collecting material for a book on the Coniferæ, and had got a good start, when a mutual friend told me that Jackson had a similar book in view. I therefore suggested collaboration, and after discussion we agreed that he should undertake the descriptions of hardy species and prepare keys to genera and species; I, on my part, undertaking the descriptions of all other species and supplying cultural and economic information. However, he was working hard at the Westonbirt Catalogue at the time, and in the end undertook the four genera, *Abies*, *Cupressus*, *Juniperus* and *Picea* with the whole of the keys. Through his friendship with Miss Lister he was able to arrange with her to make and supply, free of cost, the many life-size drawings of Conifers which are such a distinct feature of the book. He was very keen on making keys to genera and species, and had often been asked to produce a small book giving keys to the Coniferæ with a few details of identification of the kinds commonly grown in gardens. That book was published in 1946. Among his other activities, Jackson was a member of the Scientific Committee of the Royal Horticultural Society.

W. Dallimore

Mr. William Barnicot, M.B.E.

Mr. William Barnicot, who had been secretary of the Rothamsted Experimental Station since January 1, 1920, died suddenly on December 30. He was born on February 10, 1872, at Shepley, near Huddersfield, and was educated at Marlborough, where he took a prominent part in athletics. Before going to Rothamsted he managed the family business of woollen manufacture, and during the First World War he was commissioned in the R.N.V.R.

Mr. Barnicot's twenty-seven years service as secretary of Rothamsted covered a period of remarkable expansion in agricultural research. The experience of the War of 1914–18 led the Government to devote considerable sums to the development of agricultural science, and both in buildings and in staff Rothamsted shared fully in the increase. Throughout this period of expansion a great deal of work necessarily fell on Mr. Barnicot, which he did with his customary unflurried efficiency. His labours were recognized in 1934 by the award of the M.B.E. In the disturbed conditions of the Second World War, the celebration of the Rothamsted centenary in 1943, although necessarily on a restricted scale, involved much more arduous preparation, in which Mr. Barnicot took a prominent share.

After two brief but serious illnesses in 1941 and 1942, Mr. Barnicot might have retired, but at the special request of the Ministry of Agriculture he agreed to continue until 1947. His loss will be severely felt not only by his colleagues but also by a large number of agricultural scientists throughout the world who have worked at or visited Rothamsted, and with whom he formed many friendships.

We regret to announce the following deaths:

Sir John Flett, K.B.E., F.R.S., director of the Geological Survey of Great Britain and the Museum of Practical Geology during 1920–35, on January 26, aged seventy-seven years.

Prof. W. L. Jepson, emeritus professor of botany in the University of California, on November 7, aged seventy-nine.

Prof. H. P. Lewis, professor of geology in the University College of Wales, Aberystwyth.

Dr. C. T. Madigan, lecturer in geology in the University of Adelaide and well known for his journeys of exploration in Central Australia, on January 14, aged fifty-seven.

Prof. Karl Mannheim, professor of education in the University of London, on January 9.

Hr. J. W. Sandström, director until 1939 of the Stockholm Meteorological and Hydrographic Institute, aged seventy-two.

NEWS and VIEWS

Genetics at Edinburgh: Prof. C. H. Waddington

DR. CONRAD HAL WADDINGTON, formerly of the Department of Zoology, University of Cambridge, has been appointed to the chair of animal genetics in the University of Edinburgh as from January 1, 1947. This chair has been vacant since the end of 1944 when Prof. F. A. E. Crew, its former and first occupant, was transferred to the chair of public health and social medicine. Simultaneously with this announcement comes the intimation that a headquarters of the National Animal Breeding Research Organisation, a creation of the Agricultural Research Council, is being set up in Edinburgh, and that the Genetics Laboratory of this Organisation, which has been occupying temporary accommodation at Hendon, will be transferred to Edinburgh and accommodated in the Institute of Animal Genetics, where it will work alongside the University staff. Prof. Waddington will retain his position as chief geneticist in this Organisation.

Prof. Waddington is a man of many parts. He took his degree at Cambridge in geology; but soon he was displaying his peculiar aptitude as an experimental zoologist by adapting the standard tissue culture technique to the purposes of a very complete investigation of the formation of the embryo. He was successful in showing that the parts of the developing avian and mammalian embryos determine one another's growth just as they were known to do in amphibians. In joint work he studied the chemical nature of the evocator of neural differentiation and the substances which can replace it. For this work he received from the Royal Academy of Belgium the first award of the Albert Brachet Prize given annually for the best published work on embryology. He became a lecturer in zoology at Cambridge in 1932, holding this appointment until 1945 and taking the degree of Sc.D. in 1938. As an illustration of his versatility, it is to be recorded that after taking his degree he held the Arnold Gerstenberg studentship at Cambridge, which is for the encouragement of philosophy among natural scientists. Prof. Waddington later turned to the study of the normal metamorphosis of *Drosophila melanogaster* and the effects on development of many mutant genes, determining in this way and in considerable detail the part played by normal genes in controlling development. During the war years he served with the Coastal Command R.A.F. as scientific adviser to the Commander-in-Chief.

Prof. Waddington's task at Edinburgh will be twofold. On one hand he will be responsible for the conduct of the research basic to the scientific breeding of farm livestock, that is, for the essential 'objective fundamental' research. On the other, he will lead a University department with all its normal functions; that department will produce geneticists for service either in the National Animal Breeding Research Organisation or elsewhere, and in its research on genetics will be unfettered by any restrictions of application. These changes will mean that the opportunities for genetic research in Edinburgh, both fundamental and applied, will be greatly expanded, and this, taken in conjunction with developments projected under the new Research Organisation in other parts of Great Britain, should ensure the full application of the science of genetics to animal breeding.

Atomic Energy Act: Exemption Order

SECTION 11 of the Atomic Energy Act limits the disclosure of information in the field of atomic energy, and the wording of this 'secrecy clause' is such as to include many types of scientific apparatus, under the heading of "plant", and many types of scientific experiments as "production of atomic energy". In the Parliamentary debate, the Minister of Supply had announced his intention of using his powers of exemption under the Act to make an Order which would release from the prohibition the tools of the nuclear physicist and, so far as possible, their results. This Order has now been made (Statutory Rules and Orders, 1947, No. 100, H.M. Stationery Office, 1*d*.). Broadly speaking, it exempts from secrecy any apparatus for the investigation of nuclear reactions, except where the reaction is fission of an element of atomic number greater than 89 and results in a positive energy balance. It also exempts detecting apparatus (such as counters), accelerators (such as cyclotrons) and apparatus for generating charged or uncharged particles (including gamma-rays) by means of nuclear reactions, except by means of chain reactions from fission. The wording of the Order refers to the purpose for which the apparatus is to be operated, and presumably if any such apparatus is designed to be used for producing atomic power, or a weapon, disclosure of the details would remain prohibited except by permission of the Minister. This Exemption Order refers, of course, only to the prohibitions of the Atomic Energy Act, and does not affect the position as regards information obtained from official sources, which remains subject to the Official Secrets Act.

Atomic Energy—Destruction or Construction?

AN instructive series of exhibits has been brought together by the *Daily Express* at the Dorland Hall, Lower Regent Street, London, to demonstrate some of the facts and potentialities of the controlled release of nuclear energy. The exhibition will remain open during February (weekdays, 10.30 a.m.–7 p.m.; Sundays, 2–7 p.m.; admission, 1*s*.). The first corridor illustrates by models and diagrams the structure of the atom, with particular reference to uranium. Then come models of an alchemist's laboratory and the Cambridge High Tension Laboratory, suggesting the change of technique employed in the sciences, leading to a model of the uranium pile and photographs of American plant built for making fissionable material. A considerable section of the exhibition is devoted to the effects of the first three bombs, centring around a large model of Hiroshima, on which the affected areas are demonstrated, and including photographs and also specimens of material affected by the 'flash'. On the constructive side, a model and diagrams are shown suggesting how atomic piles can be used for the production of power, and some of the uses of artificial radioactive elements are suggested. In the cinema which concludes the tour of the exhibition, selected films are shown of the explosions of the two atomic bombs at Bikini, and portions of a captured Japanese film illustrating the effect of the flash on human beings. It is difficult to say which will produce the more lasting impression: the demonstration of the means of releasing nuclear energy and its peace-time potentialities, or the terrible effects of the atomic bomb. The latter emphasize the desperate need for international co-operation and understanding in this field. Since most of the material exhibited has come from official sources, one may well ask why the Government itself could not have arranged such an exhibition.

Clay Minerals Group of the Mineralogical Society

THE Mineralogical Society of Great Britain and Ireland has recently approved the formation of a Clay Minerals Group. The study of these minerals not only constitutes a separate branch of mineralogy, but also is of interest to scientific workers in a large variety of departments of pure and applied research. It was felt by the organisers that a Group of this sort would serve an important function in bringing together these workers and allowing them to exchange ideas based on their common interest in clay minerals. For this purpose provision was made for the holding of regular meetings at which accounts could be given of research in progress, and informal discussions could take place. The first meeting of the Group was held on January 24, and invitations to attend it were sent not only to the nucleus of interested persons in the Mineralogical Society itself, but also to a large number of workers in industrial, pure and applied research likely to be interested. The response was most gratifying, and the meeting was held in the rooms of the Geological Society, Burlington House, and was attended by about eighty people. An introductory address was given by Prof. J. D. Bernal. The following speakers gave accounts of their work: Dr. Mackenzie and Mr. Walker (Macaulay Institute for Soil Research, Aberdeen); Prof. C. H. Edelman (Landbouwhoogeschool, Wageningen); Dr. J. White (University of Sheffield); Mr. K. E. Clare (Road Research Laboratory, Harmondsworth); Prof. Nils Hast (Stockholms Högskola); Dr. Barbara Emödi (Fullers Earth Union, Ltd., Redhill); Drs. A. L. Roberts and G. W. Brindley (University of Leeds); Mlle. Caillère (Museum d'Histoire Naturelle, Paris; S. Hénin (Centre de Recherches Agronomiques, Versailles); Dr. R. K. Schofield (Rothamsted Experimental Station, Harpenden); J. Méring and Mlle. Longuet (Laboratoire Central des Services Chimiques, Paris). In addition, accounts were given of the work in progress at the University of Granada (Spain), and of the work of the Comité Belge pour l'Étude des Argiles. A letter of greeting was received from the latter organisation; also a telegram from Academicians Belyankin and Polynov and other workers at the Dokuchaev Soil Institute, Moscow, which was read at the meeting.

The scientific meetings were followed by a business meeting of the Group members and foreign visitors, at which the functions of the Group, and its relations with similar organisations abroad, were considered. Dr. G. W. Brindley (University of Leeds) was elected president of the Group, and Dr. D. M. C. MacEwan, Rothamsted Experimental Station, Harpenden, Herts, was elected secretary. Promises of support were given by scientific workers from Portugal, Spain and Sweden. M. Hénin gave a promise of collaboration on behalf of the analogous French group, which has recently been constituted (this group differs from the British group, however, in having been set up under Government auspices). Work in Holland in this field was also described. The number of visitors from abroad who were able to attend this one-day meeting was particularly gratifying, and their contributions were very valuable. A reception in honour of the foreign visitors was provided in the evening by the British Council, and they were entertained the following day at Rothamsted Experimental Station.

Halifax House, Oxford

ON January 21, the Chancellor of the University of Oxford, Lord Halifax, formally opened the new Graduate Centre, named in his honour Halifax House, which has successfully been running as a club for senior members of the University since August last. This Graduate Centre was formerly an Anglican convent, standing in two acres of land in Woodstock Road, just north of the Radcliffe Infirmary, and not more than five minutes walk from the main block of science laboratories in the Parks. It is proving a good and timely purchase by the University. The University Grants Committee has helped in financing it. The interior has been skilfully adapted for club use by Mr. J. H. Worthington. Its main purpose is to serve as a club for senior members of the University, especially for those who have, as yet, no college affiliation, for graduates from overseas, for professors from abroad on their sabbatical leaves, for Civil servants from the British Empire back in Oxford for refresher courses and for Colonial and forestry probationers and their like. Halifax House, it is hoped, is but the beginning of a series of clubs in Oxford catering for the needs of senior members which cannot be met by the colleges. It provides, at present, eighteen bed-sitting-rooms for resident members, and two large common rooms and a large garden for non-residents. All meals but breakfast may be had there, and the subscription is only £1 a year.

For several years now the University has had on its conscience the social needs of many of its teachers who tend, at least at first, to be neglected by the colleges. Graduates of other universities appointed to University as opposed to College posts below a professorship, especially in medicine, some sciences and modern languages, may easily find themselves neglected by the colleges and so 'out of things' socially. A large and important modern 'university' now exists in Oxford side by side with the older university with its colleges and great social amenities, and the latter have not done all they could to hold out a friendly, social hand to the former. In the School of Engineering, for example, several of the demonstrators and lecturers have had to wait years before a college noticed their social existence. In the thirty years since the chair was founded, only one teacher below the rank of professor has been made fellow of a college. Halifax House, and similar centres for senior members in Oxford, are bound to play a useful part in bringing together graduates and teachers of many kinds in a social and friendly way who, hitherto, have met little outside working hours.

Production of Oil from Coal in Germany

DR. A. PARKER, director of fuel research, Department of Scientific and Industrial Research, speaking on "Oil from Coal in Germany" at the Fuel Luncheon Club on January 23, stated that Germany developed before the War two synthetic processes, hydrogenation and the Fischer – Tropsch process for the production of petroleum from coal, and many large plants were constructed. At the time of maximum production during the early months of 1944, these two processes together provided oil at a rate of nearly four million tons a year. As a by-product from the manufacture of gas and coke from coal, another one million tons were obtained. The quantity obtained from home-produced natural petroleum was only about two million tons. Natural petroleum gave most of the lubricating oil used, but hydrogenation processes provided almost the whole of the high-grade aviation spirit. The synthetic processes were much more costly than natural petroleum, but with Germany's policy of self-sufficiency cost was not of first importance. It has been estimated that with present-day prices of labour, coal and other materials, the cost of obtaining oil from coal in Great Britain by the processes as developed and operated in Germany would be at least two shillings a gallon, as compared with only about sixpence for imported petroleum, excluding import duties. Research should be continued, however, as there are prospects of improving the methods of obtaining oil from coal, and in certain parts of the British Commonwealth there are cheaper supplies of coal than in Great Britain, as well as reserves of brown coal and lignite. Dr. Parker stated that bombing attacks between May and September 1944 caused a reduction in German production of synthetic oil from a rate of nearly four million tons a year to only about 300,000 tons. During the following months, with a reduction in bombing and determined efforts in Germany to repair damage, production again rose to a rate of one million tons a year in November 1944, after which it again fell to 150,000 tons a year at the end of February 1945. It is certain that this systematic destruction of German oil plants was one of the main factors in hastening the defeat of Germany.

Proposed International Exhibition in 1951

The proposal that an International Exhibition should be held in London in 1951, with other matters relating to exhibitions, was referred by the Secretary for Overseas Trade to a representative Committee (the Ramsden Committee), which, in December 1945, recommended that an international exhibition should be held in London in 1951 or as soon as possible afterwards, and that it should be sited in Central London. The Government accepted the suggestion, but there have been difficulties in finding a site, accommodating visitors, etc. The Royal Society of Arts, which as the Society of Arts took the initiative in promoting the International Exhibition held in Hyde Park in 1851, has joined in advocating the holding of another and far greater Exhibition in 1951 to mark the centenary. The Society has accordingly called a conference for February 6, to give fuller consideration to this question and to discuss in particular: (1) whether an International Exhibition on a large scale should be held in London in the near future; (2) if so, whether Hyde Park should be the site; (3) whether every effort should be made to hold it in 1951, the centenary year of the first International Exhibition. Should the conference approve the general proposal, a formal approach would then be made to the London local authorities and to the Government.

Journal of Research of the National Bureau of Standards

With the July issue, which began the thirty-seventh semi-annual volume, the *Journal of Research of the National Bureau of Standards*, a monthly periodical published by the U.S. Department of Commerce and devoted to pure and applied science, appeared in a new typographical style and size. A larger size of page now brings the *Journal* into line with many other American scientific and technical magazines, such as the publications of the American Physical Society, and with that recently adopted for the Bureau's *Technical News Bulletin*. Other improvements in the general format are a light blue cover, a separate 'contents' page, double reading columns, two-point spaces between the lines of text and tabular matter, and modern type for display heads. These changes make the printed page much easier to read. As in former issues, the individual articles are still printed as separate units, and reprints are made available for purchase as 'Research Papers' from the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C., shortly after their appearance in the monthly issue of the *Journal*. In this respect it may be of interest to readers to know that H.M. Stationery Office has recently announced that arrangements have been made for that Office to act as agents for U.S. Government publications, and that orders should be sent to the London Sales Office, York House, Kingsway, W.C.2.

The Research Papers, Nos. 1723–29 inclusive, which appear in the July issue, deal with radio-proximity-fuse design for bombs, rockets and mortars which were mainly developed during the Second World War; laboratory distilling columns for the analysis and purification of hydrocarbons; nickel plating on steel by chemical reduction; the temperature coefficients of proving rings used in the calibration of test machines applying forces to engineering materials and structures; the mutarotation and ring structure of mannuronic lactone; the heats of formation and combustion of certain CH_2 groups; and a description and analysis of the spectrum of uranium between 2900 and 11000 A.

Intrinsic Safety of Electrical Apparatus

The use of electrical appliances in coal mines needs to be safeguarded against the risk that they may be the means of igniting firedamp (or coal dust) and thus starting an explosion. Two methods are commonly employed. One is to provide a suitable enclosure from which flame cannot be ejected. The other method is to make the apparatus and related electrical circuits 'intrinsically safe', which means that any sparking which may occur when the circuit is broken at any point is incapable of causing ignition. One aspect of the latter method is discussed in a report, Paper No. 104, published recently by the Safety in Mines Research Board. It gives the relationship which has been found between the inductance in a circuit when the circuit is rapidly broken between a pointed platinum electrode and a wire and the minimum current capable of igniting firedamp. The effects of two methods of increasing the minimum igniting current have been measured. These are the introduction into the circuit of a shunting resistance or condenser. They can be of considerable value when the inductance is high and the current correspondingly low, as in apparatus such as bells, telephones, signalling and shot-firing systems, but become almost valueless when the working current exceeds about one ampere, or in the case of condenser shunts when a slow break of the circuit can occur. The results reported in this paper will be used at the Safety in Mines Testing Station in the examination of mining electrical apparatus submitted by the makers for approval.

"Faraday's Encyclopædia of Hydrocarbon Compounds"

THIS work and the first replacement-addition for Vol. 1 have already been reviewed in *Nature* (April 21, 1945, p. 467; Dec. 22, 1945, p. 744); the second replacement-addition (C_1–C_5) and one for (C_6 and C_7) are now to hand (Manchester: Chemindex, Ltd. 25*s.* and 19*s.* 6*d.* respectively). These follow much the same lines as the original and complete the subject-matter of the Encyclopædia to January 1, 1946. Certain definite improvements making for easier reference have been introduced, as, for example, the recasting of the list of journals so that abbreviations may be more easily traced; more comprehensive treatment of physical properties and the marking of methods of preparation which may be of value in the laboratory will also increase the utility of the work. As before, the labour of changing the sheets and adding the new ones is simple. The author is to be heartily congratulated in being so close to the 'literature front'. Volume C_8 is being printed, and volumes C_9 and C_{10} are promised shortly; new replacement-additions will not be issued until 1948, when it is hoped that all existing volumes will be completed to January 1, 1948.

University of London Appointments

The following appointments have been announced:

Dr. J. J. C. Buckley, to the William Julien Courtauld chair of helminthology tenable at the London School of Hygiene and Tropical Medicine, as from October 1, 1946. He was appointed demonstrator in helminthology at the School in 1927. In 1931 he was awarded a Wandsworth Scholarship and was engaged on research work abroad until 1938, when he became a lecturer at the School. In 1940 he was sent to investigate human onchocerciasis in Kenya, and in 1944 he carried out a helminthological survey in Northern Rhodesia.

Dr. D. W. Smithers, to the University chair of radiotherapy tenable at the Royal Cancer Hospital as from October 1, 1946.

Mr. G. A. Barnard, to the University readership in mathematics tenable at the Imperial College of Science and Technology as from October 1, 1946. During 1940–42 he worked as a research physicist with the Plessey Co., Ilford, and afterwards he went to the Department of the Controller of Physical Research and Signals Development of the Ministry of Supply. Since 1944 he has been a lecturer in the Department of Mathematics at the Imperial College.

The title of professor emeritus of morbid anatomy in the University has been conferred on Prof. H. M. Turnbull, who held the chair of morbid anatomy at the London Hospital Medical College from February 1919 until his retirement in September 1946. The title of reader in anatomy in the University has been conferred on Dr. R. W. Haines, in respect of the post held by him at St. Thomas's Hospital Medical School. The title of reader in palæontology in the University has been conferred on Dr. Alan Wood, in respect of the post held by him at the Imperial College of Science and Technology.

Colonial Office Appointments

THE following appointments in the Colonial Services have recently been made: G. S. Keeping, to be agricultural officer, Malaya; P. H. Nye, to be specialist agricultural chemist, Gold Coast; D. A. Harkin, to be geologist, Tanganyika; Captain P. C. Bindon, to be surveyor, Uganda; D. G. Glassford, to be surveyor, Sierra Leone; G. Corbett (tobacco officer, Mauritius), to be superintendent of agriculture, Cyprus; G. C. Stevenson (geneticist, Department of Agriculture, Mauritius), to be sugar agronomist and plant breeder, British Guiana.

The Night Sky in February

FULL moon occurs on February 5d. 15h. 50m. U.T., and new moon on February 21d. 02h. 00m. The following conjunctions with the moon take place: Feb. 4d. 20h., Saturn 4° S.; Feb. 13d. 04h., Jupiter 0·02° S.; Feb. 16d. 23h., Venus 5° N.; Feb. 20d. 02h., Mars 4° N.; Feb. 22d. 09h., Mercury 7° N. Mercury rises at 8h. 15m., 8h., and 7h. at the beginning, middle and end of the month, respectively, and attains its greatest easterly elongation on Feb. 21. The stellar magnitude of the planet varies between $-1\cdot1$ and $-0\cdot4$ during the month. Venus is conspicuous as a morning star, rising at 4h. 43m., 4h. 56m., and 5h. 02m. at the beginning, middle and end of the month, respectively, the stellar magnitude varying between -4 and $-3\cdot8$ during February. Mars is too close to the sun to be observed. Jupiter, in the constellation of Libra, rises at 2h. 26m., 1h. 41m. and 0h. 52m. at the beginning, middle and end of the month, respectively, its stellar magnitude being about $-1\cdot6$. Saturn, in the constellation of Cancer, is visible throughout the greater portion of the night, setting a little before the sun at the beginning of the month. The stellar magnitude of Saturn is about 0·2 in February. Only one occultation of stars brighter than magnitude 6 takes place in February: Feb. 1d. 00h. 08·3m., 227 B.Taur. (*D*). The latitude of Greenwich is assumed, and *D* refers to disappearance.

Announcements

PRINCESS ELIZABETH has been elected an honorary member of the Institution of Civil Engineers. Her Royal Highness thus becomes the first lady honorary member. Ladies have been considered eligible for election to corporate membership under the charters in view of the provisions of the Sex Disqualification (Removal) Act, 1919, and the first lady member was elected in 1927.

PROF. T. H. HAVELOCK, lately professor of mathematics at King's College, Newcastle-on-Tyne, in the University of Durham, and W. D. Lambert, chief of the Section of Gravity and Astronomy of the U.S. Coast and Geodetic Survey, have been elected *Correspondants* for the Section of Geography and Navigation of the Paris Academy of Sciences.

PROF. A. V. HILL, Foulerton research professor of the Royal Society, Sir Jasper Ridley, a director of Coutts and Co. and of the National Provincial Bank, and Mr. G. M. Young, a member of the Standing Commission on Museums and Galleries, have been elected trustees of the British Museum.

THE Tilden Lecture of the Chemical Society will be delivered by Dr. A. E. Alexander on "The Application of Surface Chemistry to Colloidal Problems" on February 6 at 7.30 p.m.

IN connexion with the announcement of the award of the Charles Vernon Boys Prize of the Physical Society in *Nature* of January 4, p. 21, we have been asked to point out that the word 'Skiatron' is a trademark registered in the name of Scophony, Ltd., to describe dark trace tubes.

Discovery of Molecular Asymmetry

PASTEUR's two lectures on molecular asymmetry (Paris, 1860[1]) are justly regarded as a supreme example of the characteristic lucidity of the French mind and language. Organic chemists point with pride to the fact that scarcely a word of this classic needs to be altered at the present day.

There is, however, one slight error contained in a speculation over-generalizing the phenomenon which we now call internal compensation, and which Pasteur was the first to encounter in the case of mesotartaric acid. To be more precise, it seems that Pasteur related *dl*-malic acid to mesotartaric acid rather than to racemic acid. This misconception was cleared up by the work of Le Bel and van t'Hoff in 1876 and is of little historical importance. Pasteur also spoke of twisted and spiral molecules and of untwisting them (racemization), but only, in his own words, as a "rough metaphor".

These passages are used by Prof. G. F. Gause[2] in justification of the remarkable pronouncement that "Pasteur did not distinguish sharply the disymmetry of individual molecules from the asymmetry of their aggregates in the sense given above". As the excellent monograph, dated 1941 but only just available in Britain, in which this surprising statement occurs, will be widely read, it is perhaps worth while to place on record an individual opinion that Pasteur did indeed make this distinction, and that he made it in the exact sense in which it is understood at the present time. As the point is so well appreciated by the great majority of chemists and physicists, it would be useless to labour it. Let any doubter read the "Lectures on Molecular Asymmetry" for himself. These lectures are built on the foundation of the conceptions of molecular asymmetry and of the mirror-image forms of molecules, and a clear contrast with such a case as that of a quartz crystal is emphasized. Two citations may be given from the English translation.

"We know, on the one hand, that the molecular structures of the two tartaric acids are asymmetric, and on the other, that they are rigorously the same, with the sole difference of showing asymmetry in opposite senses. Are the atoms of the right acid grouped on the spirals of a dextrogyrate helix, or placed at the summits of an irregular tetrahedron, or disposed according to some particular asymmetric grouping or other? We cannot answer these questions. But it cannot be a subject of doubt that there exists an arrangement of the atoms in an asymmetric order, having a non-superposable image."

"Quartz! you will say at once. We saw in the last Lecture that quartz possesses the two characteristics of asymmetry—hemihedry in form, observed by Haüy, and the rotative phenomenon discovered by Arago! Nevertheless, molecular asymmetry is entirely absent in quartz. To understand this, let us take a further step in the knowledge of the phenomena with which we are dealing. We shall find in it, besides, the explanation of the analogies and differences already pointed out between quartz and natural organic products.

"Permit me to illustrate roughly, although with essential accuracy, the structure of quartz and of the natural organic products. Imagine a spiral stair whose steps are cubes, or any other objects with superposable images. Destroy the stair and the asymmetry will have vanished. The asymmetry of the stair was simply the result of the mode of arrangement of the component steps. Such is quartz. The crystal of quartz is the stair complete. It is hemihedral. It acts on polarized light in virtue of this. But let the crystal be dissolved, fused, or have its physical structure destroyed in any way whatever; its asymmetry is suppressed and with it all action on polarised light, as it would be, for example, with a solution of alum, a liquid formed of molecules of cubic structure distributed without order.

"Imagine, on the other hand, the same spiral stair to be constructed with irregular tetrahedra for steps. Destroy the stair and the asymmetry will still exist, since it is a question of a collection of tetrahedra. They may occupy any positions whatsoever, yet each of them will none the less have an asymmetry of its own. Such are the organic substances in which all the molecules have an asymmetry of their own, betraying itself in the form of the crystal. When the crystal is destroyed by solution, there results a liquid active towards polarised light, because it is formed of molecules, without arrangement, it is true, but each having an asymmetry in the same sense, if not of the same intensity in all directions."

Prof. Gause has identified one of Pasteur's metaphors with the theory that they illustrated.

Mixed Crystal Formation in High Polymers

AN interpolymer of ethylene and vinyl alcohol (prepared by co-polymerization of vinyl acetate and ethylene followed by hydrolysis[1]) has been found to give a crystalline X-ray diffraction pattern different from those of either polythene or polyvinyl alcohol. The fibre repeat distance is 2·5 A., corresponding to a single hydrocarbon chain zigzag. This fact alone indicates that there is no regular succession of the different monomer units along the chain molecules, because such a regular arrangement would have a fibre repeat period of at least twice the observed value. The succession of monomer units is thus apparently random, so that this is an example of the crystallization of high-polymer molecules of geometrically irregular structure. Such a crystal can be appropriately regarded as a mixed crystal. We have here yet another analogy between the crystallography of polymeric substances and that of monomeric chemical compounds.

We have studied this and several other examples of isomorphous replacement in crystals of long-chain molecules; this work will be described and discussed in detail elsewhere.

It is of particular interest to try to discover what differences of size and shape can be tolerated in the replaceable units. Thus a single hydrogen atom on a carbon chain may be replaced by a fluorine or a hydroxyl group, but apparently not by a chlorine or a methyl group; a pair of hydrogen atoms may be replaced by an oxygen atom. It is difficult to discuss the degree of tolerance in quantitative terms, but it would appear that the limits are much wider than for ionic or metallic crystals.

These facts appear to have certain implications. Since a hydroxyl group may replace a hydrogen without destroying the crystallinity in the interpolymer already mentioned, it follows that in polyvinyl alcohol itself the hydroxyl groups might be randomly placed in the alternative space positions on either side of the plane of the carbon chain. It has formerly been assumed that the fibre repeat-distance of 2·5 A. proves that the hydroxyl groups in polyvinyl alcohol are all on the same side of the plane of the carbon chain, in any event within the length of molecule in any one crystallite; and a complete crystal structure based on molecules having this regular configuration has been put forward[2]. The assumption now seems to be not necessarily correct. It has been urged by one of us[3] (for other reasons) that the crystal structure of polyvinyl alcohol should be reconsidered, and we now suggest that alternative structures based on molecules having hydroxyl groups indiscriminately in left- and right-hand positions should be considered.

The second implication affects the theory of crystallinity of chemically homogeneous polymers. We have long considered that those polymers which do not crystallize (for example, polyvinyl acetate and polystyrene) fail to do so because the substituent groups occur indiscriminately in left- and right-hand positions, so that the molecules, though chemically regular, are geometrically irregular; whereas other polymers such as polythene, polyvinylidene chloride and many polyamides and polyesters are crystalline because they have either no substituents or two identical substituents on any one chain carbon atom; these molecules, therefore, are geometrically as well as chemically regular. At the Chemical Society discussion on high polymers held last April, it was pointed out that the properties of polyvinyl alcohol and polyvinyl acetate are difficult to reconcile with this theory. Polyvinyl alcohol and polyvinyl acetate are chemically interconvertible and, therefore, might be supposed to have their substituent groups in precisely corresponding positions; yet polyvinyl alcohol crystallizes well, whereas polyvinyl acetate has never been crystallized. The regularity of polyvinyl alcohol has hitherto been unquestioned, and, on the assumption that polyvinyl acetate must likewise be regular, other explanations of non-crystallization of the latter have been sought. Our present evidence suggests that the argument should be reversed. Thus, we postulate that the acetate, because it is non-crystalline, is irregular; if we assume that the alcohol is likewise irregular, the fact that it crystallizes, which would formerly have seemed a difficulty, is to be attributed to the comparative smallness of the hydroxyl group, which can replace hydrogen in a polymer crystal lattice. Thus, we submit that the above-mentioned theory is essentially sound in correlating crystallinity with geometrical regularity of molecules and non-crystallinity with geometrical irregularity; but that when substituent groups are similar in shape and size, molecules which are chemically irregular may be sufficiently nearly geometrically regular to crystallize.

The third implication is that, even in crystals of chemically regular polymers the molecules of which *can* be geometrically regular, different configurations of monomer units obtainable by rotation around single bonds might occur, provided that the energy contents and the effective external shapes of the alternative configurations are similar. This might possibly occur in rubber; a regular structure which accounts well for the X-ray diffraction pattern has been proposed[4]; but there are two types of configuration, both having about the right fibre repeat-distance, readily interconvertible by rotation around single bonds, and not very different in effective overall shape, and it is not impossible that the two types might be present in the same crystal. Whether a structure comprising comparable proportions of two different molecular configurations is compatible with the X-ray evidence is a matter which can be decided by calculations of the relative intensities of the X-ray reflexions.

Rate of Crystal Growth in Glass

THE shape of the curve relating the rate of crystal growth to temperature of undercooling is familiar as a hump-backed curve. The shape of the low-temperature portion is usually ascribed to viscosity, and that at higher temperatures either to surface tension barriers hindering nucleus formation, or to a rather arbitrary undercooling factor based on the geometry of the phase diagram[1]. The former is inadmissible where the growth of crystals already in existence is being considered, and the latter gives a very poor agreement with the experimental data, due, no doubt, to the arbitrary nature of the assumptions involved.

Examination of the problem in the following manner leads directly to a curve of the right type, though it has proved difficult to substantiate the portion immediately below the liquidus in the example studied.

If a plane glass-crystal boundary is considered, the ions in the glass require a vibrational energy E_1 to enable them to become mobile, while those in the crystal require E_2. Of the glassy ions at the crystal boundary, those which are mobile and have energy less than E_2 will condense, whereas those in the crystal with greater energy will melt, so that the rate of crystal growth (R) will be proportional to

$$\frac{1}{kT}\int_{E_1}^{E_2} \exp - E/kT \,.\, dE - \frac{r}{kT}\int_{E_2}^{\infty} \exp - E/kT \,.\, dE, \quad (1)$$

where r is the ratio of the surface densities of crystal and glass.

Thus,

$$R = A \exp - E_1/kT \left\{1 - (r+1) \exp \frac{E_1 - E_2}{kT}\right\}. \quad (2)$$

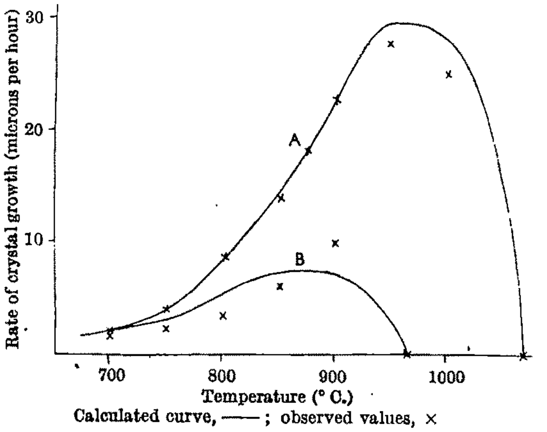

Fig. 1

The curve *A* of Fig. 1 shows the measured and (assuming $r = 1$) calculated crystal growth-rates for cristobalite separating from Pyrex brand glass with liquidus at 1,064° C.

In Fig. 2, log viscosity is plotted against the reciprocal of the absolute temperature (*C*), together with the logarithm of the rate of devitrification (*D*) for points on the left-hand slope of curve *A* (Fig. 1). It is at once seen that the power of this latter exponential (given by the slope of the curve in Fig. 2) is only about a quarter of the value of the corresponding constant for viscosity.

Presumably in the present case the major requirement for crystal growth is the removal of the boron and sodium ions from the Si-O lattice, thereby giving the necessary freedom to collapse to crystal form without any major positional change. The preponderance of cristobalite, considered unstable at this temperature, is then readily explained.

While no information is available for the boron ions, the temperature variation of the mobility of the sodium ions may be inferred from the electrical conductivity measurements. Values for the latter extrapolated from lower temperatures are also shown in Fig. 2 (curve *E*). When the composition of the glass (approximately 80 per cent SiO_2; 12 per cent B_2O_3; 4·6 per cent NaO) is borne in mind, it will be seen that the slope of the low-temperature portion of the curve is in reasonable accord with the above views.

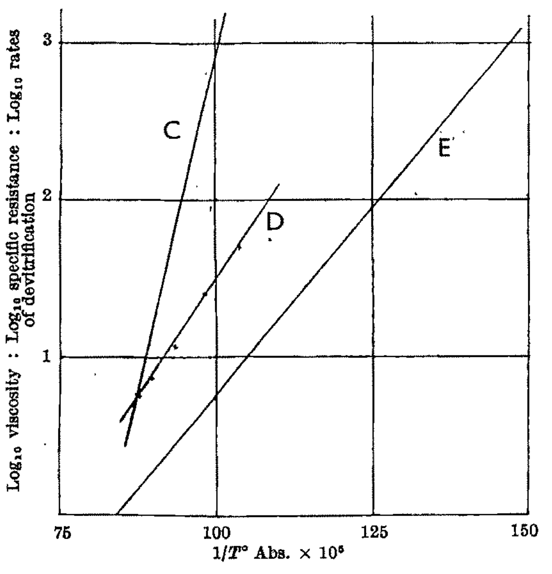

Fig. 2

For other glasses of the same class precipitating cristobalite, the constants *A* and E_2 in the above formula may be considered to remain substantially unchanged; so that, using their determined values and the liquidus temperature for the new glass, one can anticipate the form of the variation of the devitrification-rate with temperature. Thus the curve *B* (Fig. 1) was determined for a glass containing 21·5 per cent B_2O_3, and the crosses are the observed rates.

Ultra-violet Absorption Spectrum of Anhydrous Nitric Acid

Recently, Ingold and co-workers have presented evidence of the existence of the nitronium ion (NO_2^+) in solutions of nitric acid in concentrated sulphuric acid[1,2]. We wish to report some observations on the ultra-violet absorption spectrum and electrical conductance of the system water/nitric acid/nitrogen pentoxide which are of relevant interest.

The absorption maximum of the nitrate ion at 3020 A., present in the spectrum of dilute aqueous solutions of nitric acid, diminishes in intensity as the acid concentration is increased. Above about 60 per cent acid concentration, this maximum is not seen, and there appears instead a maximum near 2600 A.[3,4,5,6]. A maximum at this position was noted also by von Halban and Eisenbrand[5] in the spectrum of a solution of nitric acid in anhydrous ether, and attributed by these authors to the undissociated $HO-NO_2$ molecule. Hantzsch[6] failed to confirm this, and reported that in anhydrous ether nitric acid shows no absorption maximum.

Our measurements have extended over a concentration range from 80 per cent nitric acid – 20 per cent water to 76 per cent nitric acid – 24 per cent nitrogen pentoxide. With 20 per cent of water present there is a well-defined maximum at 2650 A. ($E_{\text{max.}}$ 9·9, see Curve *A* of Fig. 1; molecular extinction coefficients are calculated for HNO_3). As the water content is decreased, this band becomes stronger and reaches a maximum intensity of 11·7 with 7 per cent of water present (Curve *B*, Fig. 1). With further diminution in the water content the intensity of the maximum falls to a lowest value for 5 per cent water ($E_{\text{max.}}$ 9·5, Curve *C* of Fig. 1). With approach to the anhydrous acid the extinction at the maximum rises again, but this second increase is accompanied by considerable flattening of the curve. The spectrum of the anhydrous acid is shown in Curve *D* of Fig. 1.

Comparison with the curves for solutions of nitrogen pentoxide in anhydrous nitric acid show no discontinuity in the neighbourhood of the anhydrous acid. Solutions of nitrogen pentoxide in carbon tetrachloride or acetic anhydride exhibit very intense steeply rising absorption at wave-lengths less than 3000 A.

These data indicate that, in aqueous solutions of nitric acid containing between 5 and 20 per cent of water the spectroscopically predominating species is

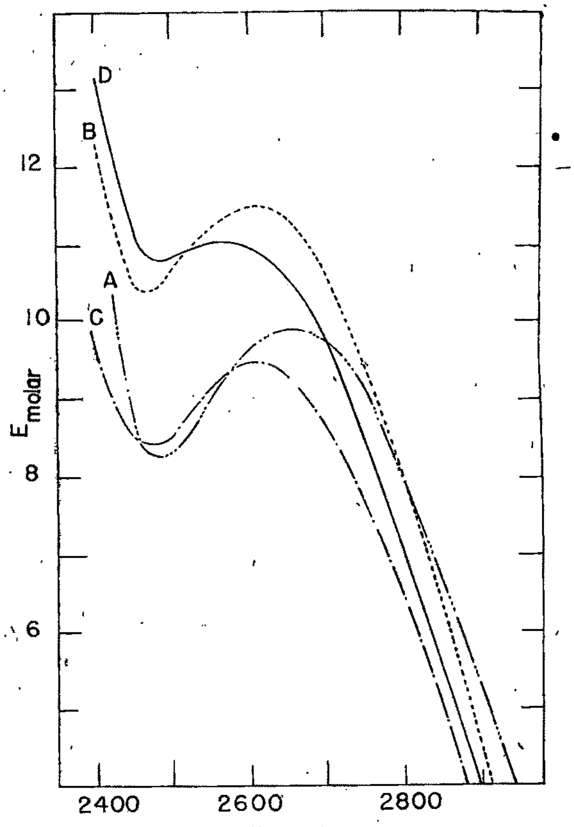

Fig. 1. ULTRA-VIOLET ABSORPTION SPECTRA OF AQUEOUS NITRIC ACID SOLUTIONS. *A*, 20 PER CENT WATER ; *B*, 7 PER CENT WATER ; *C*, 5 PER CENT WATER ; *D*, ANHYDROUS ACID

a molecule or ion designated the '2600A chromogen' which may be the HO–NO_2 molecule. It is in maximal concentration in the presence of 7 per cent of water. When the water content is reduced to less than 5 per cent the spectrum flattens in a manner consistent with the establishment of an equilibrium such as (1) with 'free nitrogen pentoxide' in solution.

$$2\,HNO_3 \rightleftharpoons H_2O + N_2O_5 \quad . \quad . \quad (1)$$

This hypothesis is in accord with the lack of discontinuity noted in passing from the 95 per cent acid to solutions containing excess nitrogen pentoxide (Figs. 1 and 2).

These spectrographic measurements provide no clue as to the condition of the dissolved nitrogen pentoxide, but parallel studies of the electrical conductance of these systems at 25° C. have confirmed the earlier observation of Veley and Manley[7] that the equivalent conductance is minimal for a solution containing about 3 per cent of water and increases as the anhydrous condition is approached. With addition of nitrogen pentoxide to the anhydrous acid the conductance continues to increase, and there is no discontinuity apparent in the neighbourhood of the anhydrous acid.

The sharp increase in conductance with less than 2 per cent water-content is suggestive of the formation of a highly ionized compound and is consistent with the establishment of an equilibrium such as (2).

$$N_2O_5 \rightleftharpoons NO_2{}^+ + NO_3{}^- \quad . \quad . \quad (2)$$

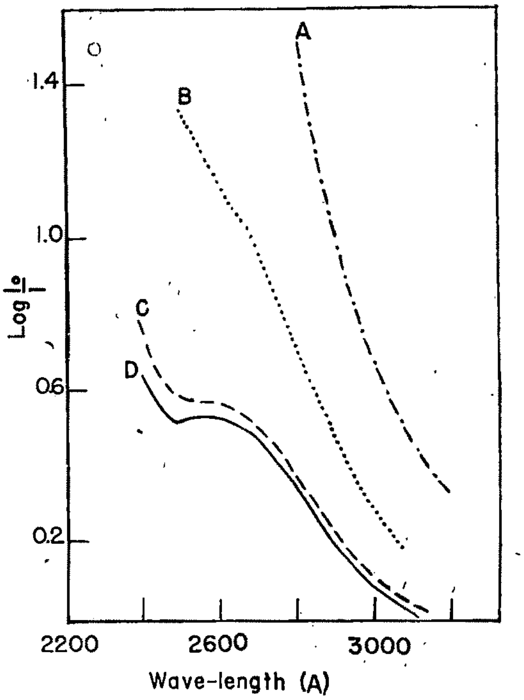

Fig. 2. ULTRA-VIOLET ABSORPTION SPECTRA OF SOLUTIONS OF NITROGEN PENTOXIDE IN ANHYDROUS NITRIC ACID. *A*, 24 PER CENT NITROGEN PENTOXIDE ; *B*, 12 PER CENT NITROGEN PENTOXIDE ; *C*, 3 PER CENT NITROGEN PENTOXIDE ; *D*, ANHYDROUS ACID. (THE OPTICAL DENSITIES HAVE BEEN CORRECTED FOR CHANGE IN THE SPECIFIC GRAVITY OF THE SOLUTIONS)

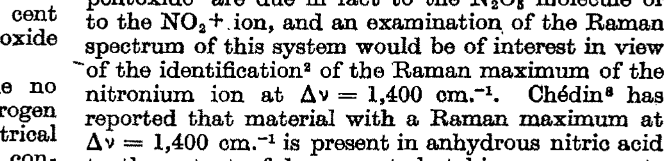
Both the spectrographic and the conductance measurements over the complete concentration range are consistent with a system of equilibria as shown in (3).



(3)

It is uncertain whether the changes in the absorption spectrum attributed to 'free nitrogen pentoxide' are due in fact to the N_2O_5 molecule or to the $NO_2{}^+$ ion, and an examination of the Raman spectrum of this system would be of interest in view of the identification[2] of the Raman maximum of the nitronium ion at $\Delta\nu = 1,400$ cm.$^{-1}$. Chédin[8] has reported that material with a Raman maximum at $\Delta\nu = 1,400$ cm.$^{-1}$ is present in anhydrous nitric acid to the extent of 1 per cent, but his measurements on aqueous solutions of nitric acid were carried out at relatively large intervals of concentration change.

The diminution in the intensity of the 2600 A. maximum between 7 and 5 per cent water content remains unexplained. An association such as is shown in (3) has been proposed by Dalmon and Freyman[9] to account for changes in the near infrared spectrum of the nitric acid–water system over the same concentration range.

The discrepancy between the observations of von Halban and Eisenbrand[5], and Hantzsch[6], on the spectra of solutions of nitric acid in anhydrous ether, can be understood if Hantzsch's acid contained appreciable amounts of dissolved nitrogen pentoxide.

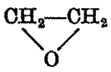
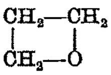
Structures of Ethylene Oxide and Cyclopropane

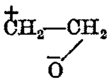
THE formula of ethylene oxide is commonly portrayed as (I), the instability of the compound being ascribed to the existence of strain tending to open the ring. This explanation can scarcely be accepted, for, if it were true, the compound (II), with less angular strain, should be more stable—which it is not. Zimakov[1] has recently directed attention to this point and to the discrepancy between the structure (I) and the observed properties of ethylene oxide. He points out that the latter (for example, polymerization, addition reactions) strongly suggest a resemblance of structure to ethylene, and proposes to replace (I) by a resonance hybrid of (I), (III) and (IV).



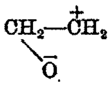
(I)



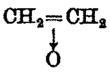
(II)



(III)



(IV)



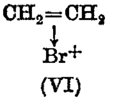
(V)

The concept of the 'co-ordinate link' type of bond is well accepted in chemistry, and is indeed necessitated by the existence of such compounds as $BF_3.NH_3$. It has hitherto been supposed that the 'donated' electrons must be initially non-bonding, but in molecular orbital theory there is nothing to warrant this limitation. In a recent paper[2] we have generalized the concept to include also donation by bonding electrons and have given many illustrations of problems that then receive a simple explanation. Dewar[3] has independently put forward similar ideas, and must be regarded as the first to develop the new theory. It is true that donation by lone pair electrons is more commonly observed, but this is because such electrons are usually more weakly bound than bonding electrons. It is the study of ionization potentials that provides the knowledge that enables one to say which electrons in a molecule are most likely to be donated. For donation by bonding electrons to occur, it is essential that these electrons should have especially low ionization potentials. π-Electrons in olefines fulfil this condition, though there appears to be no need strictly to limit such donation to π-electrons.

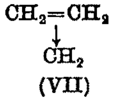
The π-electrons of ethylene lie in an orbital of ionization potential 10·45 V.[4]: the lone pair electrons of ammonia lie in an orbital of ionization potential 10·8 V.[4]. We therefore expect donation of the π-electrons of ethylene, just as donation of the lone pair electrons of ammonia occurs. Just as NH_3 forms NH_4^+, $(C{=}C) \rightarrow H^+$ is expected and plays an important part in acid-catalysed olefine polymerization[2]. $BF_3.C_2H_4$ is expected, just as $BF_3.NH_3$ is known. The formula of ethylene oxide may be portrayed as (V), and an analogy may be drawn between it and the amine oxides. (V) is closely analogous to the complex (VI) that probably plays an important part in the bromination of olefines[2]. The formula means that the two electrons of the original π-bond in ethylene now bind the three nuclei C, C and O. This need cause no surprise when the modern knowledge of conjugated molecules and non-localized bonds is recalled. Each carbon atom is in the trigonal state, forming three planar, hybridized sp^2, σ-bonds at 120°. This is in contrast to (I), where $\angle$ HCH should be close to 109°. The fourth valency of each carbon atom is a pure $2p_z$ orbital of axis at 90° to the plane of the molecule. These $2p_z$ orbitals of the carbon atoms overlap with each other and with the $2p_z$ atomic orbital of an oxygen atom lying alongside with the correct orientation. We therefore construct a non-localized molecular orbital, described in the LCAO approximation as

$$a\,\psi_A(C : 2p_z) + a\,\psi_B\,(C : 2p_z) + b\,\psi(O : 2p_z).$$

The trigonal configuration of the two carbon atoms and the existence of π-electrons account for the striking parallel between the properties of ethylene oxide and those of ethylene. The formula (V) is simpler than the cumbrous resonance description in terms of (I), (III) and (IV), though it may amount to much the same thing in ultimate thought content.



(VI)



(VII)

We have already stressed[2] the importance of the idea of donation of π-electrons to the understanding of the reactions of the methylene molecule. We regard cyclopropane, like ethylene oxide, as having a perturbed ethylene structure (VII). Two very strong pieces of evidence for this view are that (1) substances in which a cyclopropane group is adjacent to a double bond exhibit just those spectroscopic properties which are characteristic of conjugated compounds; (2) the dipole moment of cyclopropyl chloride is 0·3 *D* lower than the value for isopropyl chloride[5]: this is easily understood on analogy with phenyl chloride, but very difficult to understand[5] on the conventional formula for cyclopropane.

Further discussion of these points will be given elsewhere.

Reactions of Organic Halides in Solution

We are sorry to have again to contradict Dr. Evans, but he continues to misrepresent us[1]. He does so now by quoting a limited passage from a paper by one of us[2], and then adding, as though it were a paraphrase, a statement of his own that does not, in fact, reproduce the meaning. The passage is dealing with the relative rates of nucleophilic halogen-substitution in R-Hal, where R = Me, Et, *n*-Pr, *i*-Bu, *neo*Pentyl, and, as quoted, reads : "The rate relationships for the first four members are fairly normal for the bimolecular mechanism, the rate of which is decreased by electron-accession to the reaction centre, but the introduction of the last β-methyl substituent has obviously introduced an effect which is far larger than that to be expected on the basis of its capacity for the release of electrons. . . . This effect is believed to be of steric origin." Dr. Evans continues : "This indicates that steric hindrance was considered to be unimportant in the bimolecular S_N2 reactions of RX when R is methyl or ethyl". On the contrary, it "indicates" what it states, namely, that the total structural effect on rate when R = *neo*pentyl is in fact far greater than in the other cases, that Hughes could not see why the polar effect of methyl should take such a sudden jump as the last methyl is introduced, and that he could see a reason why its steric effect might do so.

Concerning Dr. Evans's historical comment that, although Hughes first estimated[2] the steric compressions involved in S_N2 reactions of RX for R = Me, Et, he did not then (1941) "specifically" consider *i*-Pr and *t*-Bu, it may be remarked that, in the approximation to which we have hitherto worked, the specific consideration which was then lacking consisted only of multiplying by 2 and 3 in the respective cases, that is, duplicating and triplicating the ethyl compressions.

We thought we had previously made it clear that we were aware of the steric effect of the α-methyl group in the bimolecular reactions of α-methylallyl chloride, but regarded Dr. Evans's method of analysis as unsound[3].

As to unimolecular reactions, Dr. Evans's method of treatment appears to be similar to that which led Baughan, Evans and Polanyi[4] to the conclusion, which we believe to be incorrect, that the known inactivity of *neo*pentyl halides in certain substitutions is a property of the ionization mechanism. Hughes established a contrary conclusion[5] in 1941.

Note added in proof. The Editors of *Nature* have allowed us to see Dr. Evans's comment. His new quotation, like the previous one, is divorced from its context : in both, the standard of comparison was the very special group, neopentyl. It should be impossible to construe such comparisons between groups as comparisons of polar and steric effects in the same (ordinary) group, since, in the paragraph now partly quoted, calculations are reported which show appreciable steric compressions in ordinary groups.

[5] Ref. 2. Cf. Dostrovsky, Hughes and Ingold, *J. Chem. Soc.*, 173 (1946).

I submit that the interpretation given above by Profs. Ingold and Hughes for the passage which I quoted[1] is not made clear in the original text[2]. What I see expressed in the paper regarding the bimolecular reactions of R-Hal for the Me, Et, *n*-Pr, *i*-Bu, neopentyl series can be illustrated once more by Prof. Hughes's statement that "It is therefore concluded that in addition to the retarding influence of methyl substitution, which operates throughout the series, and may be attributed essentially to the inductive effect, there is a superposed effect, which may in principle enter in all stages of β-substitution, but which assumes real importance only in the case of the neopentyl halide. This effect is believed to be of steric origin[2]."

Apart from this historical question, I wish to emphasize again that, in my view, the decrease in bimolecular reaction-rate along the Me to *t*-Bu series is due solely to the increase in steric hindrance along this series. This point of view is developed in detail in my forthcoming papers on the subject[3].

A Method of Using Marked Phase Boundaries

When iron is oxidized in air, foreign particles on the original surface of the metal will later be found imbedded in the oxide layer. From this observation Fischbeck[1] concluded that iron, not oxygen, migrates through the reaction product. Starting from this fact, we have worked out the following simple method for ascertaining the direction of migration in reactions between solid substances.

On the original phase boundary a mark is made, using a substance which can be seen (at least with a microscope), does neither lessen the contact between the reaction partners nor react with them, does not act on the reaction product and does not change in any way, physically or chemically, during the process. It should, therefore, be observable after the reaction. The migration of matter is then recorded directly from the position of the mark in relation to the starting materials and the reaction product.

The method has been found suitable when studying the systems magnesium oxide/magnesium pyrophosphate[2], lead oxide/lead silicate[3], lead oxide/lead sulphate[4] and zinc oxide/aluminium oxide[5], using platinum for marking ; and the system silver/sulphur[5], using gold.

An Optical-Acoustic Method of Gas Analysis

DR. M. VENGEROV has described a method of gas analysis under this title[1]. As the method has been in practical use in the chemical industry for about ten years, I should like to direct attention to the self-recording infra-red absorption apparatus, called 'Uras', developed by Dr. Luft-Oppau.

The principle of this analyser is the same as that of Dr. Vengerov, but the arrangement is somewhat better. The radiations of two infra-red sources pass into two gilded glass tubes, after being interrupted periodically by a revolving disk with two sectors, and are absorbed finally in a condenser chamber separated into two parts by a thin metal foil. One glass tube contains a standard gas, and through the other streams the gas to be examined. The condenser chamber contains some of the gas under examination. Both the tubes and the condenser chamber are sealed with rock-salt windows, allowing the infra-red rays to pass through. In front of the separating foil in the condenser chamber is an insulated wire gauze arranged to form a kind of condenser microphone.

If the streaming gas contains an unknown component, this will absorb its characteristic radiation out of the infra-red beam. As the condenser chamber contains the same gas, it also will absorb only this characteristic radiation. The effect will be that the part of the condenser chamber beneath the analyser tube is not so much heated as the standard part, and the condenser foil is deflected less in relation to the wire gauze. The condenser microphone is in the grid circuit of a three-stage amplifier tuned to the frequency of the revolving disk.

The arrangement of two separated beams eliminates any effect of changes in the infra-red source, and the filling of the condenser chamber with a special gas guarantees great selective efficiency of the apparatus. If necessary, tubes containing the disturbing gas components can be placed in front of the analyser tubes. These tubes then act as spectral filters and absorb the characteristic radiations of the extraneous gases out of the two beams. By this device the presence of one of these disturbing gases in the gas to be examined causes no effect on the condenser chamber and the condenser itself.

With the 'Uras' the percentage can be recorded of any organic or inorganic gas having absorption bands within the range of the infra-red source, to which the condenser chamber has been adjusted. The sensitiveness is sufficient to record traces of the gas of the order of magnitude of fractions of a thousandth part.

Experimental Data and 'Sufficient' Accuracy

MR. H. A. HUGHES has pointed out[1] that replication could cease when a required standard of accuracy is attained, and that, from a sample size of n, the estimate, α, of the probable error of its mean ". . . decreases with ascending values of n until the minimum value permitted by the experimental conditions is reached".

Since $\alpha\sqrt{n}$ in general converges in the statistical sense to a finite limit—the probable error of a single observation—clearly α similarly converges to zero. Expressed practically, we may determine a quantity as accurately as we please by adequate replication, provided our measurements are unbiased. The elimination of bias is not, normally, possible. While, therefore, we may reduce α indefinitely, the labour of further replication is unwarranted once the magnitude of α has been reduced to the same order as that of the bias.

A second point: as Mr. Hughes referred to measurements on several systems, I infer he may ultimately have intended to compare them. If this were his sole object in attaining a prescribed accuracy, it would be most economic in replication to apply a sequential test[2]. When sequential tests are impracticable, as in some agricultural and building research when each experiment takes many months, it is possible to plan *a priori* to attain a required certainty of avoiding inadequate replication. It is intended to publish a paper on this in the near future, though it is suspected that reports, probably in the agricultural field, must already exist of prior research on this topic.

Fluid Flow at a Small Hole due to Vibration

I SHOULD like to acknowledge my indebtedness to Prof. Andrade[1] for directing my attention to the work of H. Sell[2]. As a result, I have made a careful examination, by means of strong lateral illumination, of the way in which the smoke particles enter and leave the orifice in the resonator. There is no doubt about the general accuracy of H. Sell's explanation, and this is particularly well demonstrated when the smoke is made to issue in the space between two parallel plates of glass kept apart by a distance piece the thickness of which is approximately that of the diameter of the orifice. The smoke particles can then be seen as bright dots on a dark ground, and their paths easily traced. As well as the back-flow near the surface of the resonator, vortex motion occurs. If, however, the smoke be allowed to issue from a V-shaped mouthpiece formed by sealing two flat pieces of glass between the plates, then, provided the excitation is not too powerful, both the vortex motion and the back-flow cease. There now occurs what appears to the eye as a slow steady motion of the smoke outwards. Examination of the particles with a low-power microscope shows them, however, no longer as dots but as little lines, so that a vibratory motion is superimposed on the general forward motion.

It would appear, therefore, at first sight, that the experiment is now on a more satisfactory basis. When the resonator is constructed of glass, however, vortex motion *inside* the tube in the neighbourhood of the orifice can be seen. Particles within the tube travel normally away from the centre of the orifice, pursue a more or less circular path and return along the base to the orifice once more. Some of these particles, however, move outwards through the orifice, and these constitute the slow steady stream already referred to. The phenomenon is thus of a complicated nature which it is hoped further to investigate.

GILBERT D. WEST

Military College of Science,
Shrivenham,
near Swindon, Wilts.

[1] *Nature*, 159, 132 (1947).

[2] Raleigh, "Sound", 2, 202, describes a somewhat similar phenomenon.

A REPETITION of the demonstration described by Prof. G. D. West in *Nature*[1] showed that it works particularly well with a wide test-tube of length suitable for a 256-fork (even the small laboratory pattern), and having at the closed end a central hole of diameter less than 1 mm., shaped rather like the small aperture of a Helmholtz resonator. By performing the experiment with the aid of a projection lantern, both this effect and a reverse effect not mentioned by Prof. West can readily be shown to a large class. On bringing the tuning fork near the open end of the tube, a puff of smoke is seen to issue from the hole in the closed end, followed by a steady stream of smoke so long as the vibrating tuning fork is held in position. Under the same conditions, a puff of clear fresh air can be seen to enter the tube from outside, followed by a steady stream of fresh air. This is precisely what one would expect, for the closed end of the tube is a pressure antinode, and the so-called 'steady pressure' of sound is in reality a differential effect in which the compressional phase preponderates over the rarefactional phase, the alternating emergence and intake of gas observed at the orifice taking place so rapidly that the eye sees what appears to be a steady stream of gas flowing simultaneously in both directions at the orifice.

The existence of a pressure antinode at the closed end of a resonance tube can also be clearly demonstrated by an arrangement devised by me in 1937 and hitherto unpublished. A glass tube is closed at one end by a clear glass disk about 1 mm. thick. The open end of this tube is attached by 'Plasticene' to the mouth of a loud-speaker (disk type) actuated by an oscillator of variable frequency. The glass disk is found to vibrate perceptibly for certain frequencies of the oscillator, and if a long-focus convex lens is attached by wax peripherally to the glass disk, the resonant states in the tube can be detected by observation in sodium light of the disappearance or enfeeblement of the Newton's rings formed between the lens and disk. With this arrangement, up to eight harmonics of the fundamental frequency of the tube can be detected.

Quite recently another simple device has been found to be very sensitive for the detection of resonance and the existence of an antinode of pressure at the closed end of a cylindrical tube. The closed end is formed by attaching a thin 'Cellophane' sheet to one end of the tube (a 'Cellophane' jam-pot cover serves admirably). The 'Cellophane' is applied wet, and on drying it is quite taut and vibrates vigorously when a suitable tuning fork is held opposite the open end of the tube. If a small quantity of silver sand is dropped on to the 'Cellophane' membrane and the tube is of variable length, the adjustment for resonance can be accurately determined, either by the intensity of the clearly audible patter of the sand on the membrane, or visibly by observation of the movement of the sand. This effect is not to be confused with the corresponding effect in which sand on thin tissue paper attached to a ring is used for detecting antinodes of motion in an organ pipe. The sand on 'Cellophane' detector can be employed effectively in the lantern to demonstrate resonance, when the motion of the sand can be seen and the patter of the sand is audible even in a large lecture room.

In conclusion, it may be mentioned that any of these methods can be used for demonstrating the existence of the 'interference hyperbolæ' around the end of a tuning fork, for the effects described cease as soon as the interference regions fall on the axis of the tube. Either the Newton's rings detector or that using 'Cellophane'-sand can be used with advantage in a laboratory method for the determination of the velocity of sound. The latter detector has been applied successfully for this purpose in this laboratory by my colleague, Dr. E. L. Yates. In the original form of the apparatus, one end of the tube was closed by a loud-speaker element operated by an oscillator at fixed frequency (1,600 cycles per second). The receiver was a hollow cylinder fitting closely in the tube and closed at the near end by a thin copper membrane. The other end of the cylinder was connected to a straight brass tube ending in a rubber listening tube. By noting the position of an indicator on the brass tube for a number of successive resonances, the wave-length of the sound waves could be determined, and hence the velocity. In its modified form, the bottom end of the glass tube is closed by a 'Cellophane'-sand detector and the loud-speaker element (deaf-aid type) is attached to the end of the brass tube. With this arrangement the wave-length can be determined with much greater accuracy, the audible patter of the sand giving sharp response at resonance when the oscillator is operating at minimum output.

"The 'Squares' Method for Potential Problems"

THE review by Prof. G. Temple in *Nature* of November 23 is more than generous to my recently published book on "Relaxation Methods", and with my fellow-workers I am grateful for his praise; but a slip in its penultimate paragraph will, I fear, cause misunderstanding if it is not corrected. It is not the relaxation technique but the technique employed, for example, by Shortley and Weller of Ohio State University (who have attributed it to Liebmann, 1918) that "consists in systematically working over the lattice and everywhere replacing the original approximate values of f by the means of its values at the neighbouring corner points".

For brevity this systematic process may be described as 'scanning', since Wiener (among others) in the United States has suggested that the methods of television might be employed to speed up the mean-value computations. It finds no place in the technique of relaxation methods, in which (excepting in the final presentation of results) values of f are *not* recorded at lattice points. Instead, the values recorded are those of 'residuals' defined (in Prof. Temple's notation) by

$$F_P = f_A + f_B + f_C + f_D - 4f_P$$

(or by convenient multiples), and the F's are brought to negligible values ('liquidated') by operations which have nothing in common with 'scanning', and are *not* performed in an iterative sequence.

It was on this account (I suppose) that Prof. H. W. Emmons wrote in the *Quarterly of Applied Mathematics* (October 1944): "In fact, for the computer (as opposed to those who think only about the logic behind the computation methods) the relaxation method has a spirit lacking entirely from the iteration process. The former challenges one's intellect at each step to make the best possible guess, while the latter reduces one to the status of an automatic computing machine." Working throughout in terms of F's, not f's, a computer is *not* compelled to "alter the value of f only at one point at a time"; nor, when he does so, does he make that alteration (usually) what is given by choosing f_P so as to make $F_P = 0$. That rule, as Prof. Temple shows, defines the best way of altering f_P in a single operation; but economy of time demands the minimum number of operations, and from this point of view the rule can usually be bettered. Herein lies the 'challenge' to the computer.

R. V. SOUTHWELL

Imperial College of Science and Technology,
London, S.W.7.

ECONOMY in space compelled me to focus attention on the most fundamental and elementary process of the 'squares' method, and I could only indicate briefly in the concluding paragraph the higher flights of relaxation technique.

Readers of *Nature* will be grateful for Dr. Southwell's fuller statement of the principles and the spirit of this method.

G. TEMPLE

Effect of Mono- and Divalent Salts on Red Blood Cells

Greville and Lehmann[1] reported that less hæmolysis occurred when human blood was stored with $M/7$ magnesium chloride as an anticoagulant than if isotonic sodium citrate was used. We have investigated this phenomenon for several reasons, one of which was its possible practical bearing on the storage of sheep blood-corpuscles used for the Wassermann reaction in the diagnosis of syphilis.

Fragility Tests. When fragility tests are performed on human blood cells, it can be seen that the osmotic pressure of divalent salts, such as magnesium and calcium chloride and magnesium and sodium sulphate, is about twice that of sodium or potassium chloride (Table 1).

The cells were obtained from citrated blood, washed in the corresponding salt solution and centrifuged. When stored, they were kept at + 4° C. in $M/7$ salt solution in a concentration of 4,000,000 cells per c.mm. For the fragility test, packed cells were suspended to give a concentration of 100,000 cells per c.mm. in 3 ml. of salt solutions diminishing in concentration by 1 per cent of $M/7$ from sample to sample. The highest concentration at which complete hæmolysis was seen was noted after the tubes with the cell suspensions had been allowed to stand for 2 hours at + 4° C.

TABLE 1. HIGHEST SALT CONCENTRATIONS AT WHICH HUMAN RED BLOOD CELLS ARE COMPLETELY HÆMOLYSED. TWO TYPICAL EXPERIMENTS. CONCENTRATIONS OF SALT SOLUTIONS TESTED DIMINISHING BY 1 PER CENT OF $M/7$

Experiment	KCl	NaCl	$MgCl_2$	$CaCl_2$	Na_2SO_4	$MgSO_4$
A	$M/24$	$M/23$	$M/46$	$M/44$	$M/46$	$M/50$
B	$M/26$	$M/25$	$M/58$	$M/50$	$M/48$	$M/46$

Storage of cells in solutions of divalent salts was seen to alter the properties of the cell surface. Compared with $M/7$ sodium chloride, in $M/7$ magnesium or calcium chloride red blood cells became more brittle. They were more easily destroyed by mechanical trauma such as centrifuging, but, at the same time, they became more resistant in hypotonic salt solutions. A similar observation was made by Aub *et al.*[3] when they treated red cells with small quantities of lead. The phenomenon can be observed particularly well in sheep cells, which due to a slight difference in shape from human cells are more easily broken up in hypotonic solutions.

TABLE 2. HIGHEST CONCENTRATIONS OF SODIUM CHLORIDE AT WHICH SHEEP RED BLOOD CELLS ARE COMPLETELY HÆMOLYSED AFTER PREVIOUS STORAGE IN $M/7$ SOLUTIONS OF SODIUM AND MAGNESIUM CHLORIDE

Storage	None	2 days		9 days		16 days	
Salt used for storage	—	NaCl	$MgCl_2$	NaCl	$MgCl_2$	NaCl	$MgCl_2$
Highest NaCl concentration showing complete hæmolysis	$M/14$	$M/13$	$M/17$	$M/13$	$M/28$	$M/14$	$M/39$

It will be seen from Table 2 that the highest concentration of sodium chloride at which sheep red blood cells were completely hæmolysed was the same whether the cells were tested immediately after they were obtained, or whether they had been stored in $M/7$ sodium chloride; storage in $M/7$ magnesium chloride, however, increased the resistance against hypotonic sodium chloride solutions, and the 'toughening' of the cell membrane became more noticeable the longer the storage.

Sensitivity to Hæmolysin. When sheep cells were hæmolysed by antibodies from sensitized rabbits, there was no difference seen when the corpuscles used were stored in $M/7$ sodium or magnesium chloride. The extent of hæmolysis was varied by the addition of various amounts of complement (Wassermann reaction), but the degrees of lysis were the same however long and in whatever isomolecular salt solution the corpuscles had previously been stored (sixty-four experiments).

TABLE 3. AVERAGE MEAN CORPUSCULAR VOLUMES OF TEN SAMPLES OF HUMAN RED BLOOD CELLS SUSPENDED IN VARIOUS SALT SOLUTIONS

Average mean corpuscular volume in plasma: 86 ± 8 cubic μ.

Salt concentration		KCl	NaCl	$MgCl_2$	$CaCl_2$
$M/7$	cubic μ	101 ± 5	105 ± 6	80 ± 15	77 ± 20
$M/14$	cubic μ	124 ± 4	131 ± 6	107 ± 5	104 ± 6

Corpuscular Volume Measurements. Table 3 shows the average of the mean corpuscular volumes found when ten different samples of human red cells were suspended in solutions of potassium and sodium chloride and of magnesium and calcium chloride respectively. Sodium and magnesium sulphate could not be tested as they rendered the cells so brittle that they were destroyed during the centrifuging necessary for the determination of the packed cell volume, and deteriorated even when shaken in the diluting pipette prior to transfer to the counting chamber.

The cells were obtained from plasma oxalated after Wintrobe, washed in the corresponding salt solutions and centrifuged. Packed cells were added to 2 ml. of salt solution to give a final concentration of 2,000,000 cells per c.mm. The suspensions were left for 15 hours at + 4° C., and the mean corpuscular volume was then determined by dividing the packed-cell volume percentage by the cell concentration.

It will be seen in Table 3 that the same size is taken by corpuscles in an *M*/7 solution of mono-valent salt as in half that concentration of divalent salt.

It is noteworthy that the cells increase in volume when transferred from plasma to 'normal saline' (*M*/7 sodium chloride); this is due to the absence of the osmotic pressure of the plasma proteins. This considerable influence of the plasma proteins on the corpuscle-size may underlie the observations of Dyson *et al.*[3] and of Walters *et al.*[4]; the former observed increase of corpuscle-size in blood-loss where tissue water replaced the lost plasma protein, the latter saw shrinking of corpuscles when malnourished individuals received plasma transfusions. Whereas the cells swell in size when transferred from plasma to normal saline, Table 3 shows that they retain their original volume when suspended in *M*/7 solutions of divalent salts. This fact, as well as the 'toughening' influence of divalent ions on the cell membrane described above, may explain the comparative stability of red blood cells observed by Greville and Lehmann[1] when they used *M*/7 magnesium chloride as an anticoagulant.

Our thanks are due to the director of Medical Services in India for permission to publish this communication.

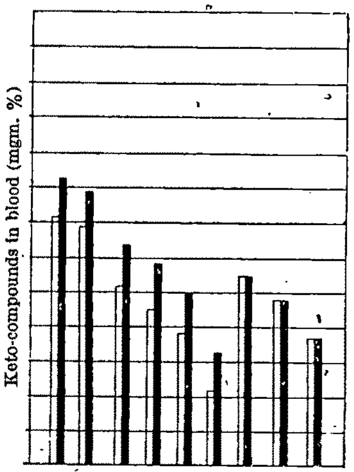
Effect of Proteins on Ketonæmia

The presence of fat is necessary for the increased production of ketone bodies, because they originate from fat. But the part played by the proteins is undecided. Some of the amino-acids are ketoplastic, while others act as antiketoplastic. According to Schaffer[1], fifty-eight per cent of protein is of antiketoplastic effect, while forty-two per cent is ketoplastic; carbohydrates are antiketoplastic in their entirety, while ten per cent of the fats (glycerol) are antiketoplastic, and ninety per cent have a ketone-producing effect. According to Schaffer, ketosis ensues if the amount of ketogene molecules outnumbers that of antiketogenic ones. But Falta[2] could not confirm this attractive explanation. He is of the opinion that proteins exert a specific ketogenic effect, which is not only dependent on the amount of ketoplastic material contained in them; for if he fed much fat and little protein to diabetics, acetonuria was less than if he did the reverse. But this opinion is not shared by such eminent clinicians as Porges and Adelsberg[3] and Noorden[4].



White columns, initial level. Black columns, 6 hr. after administration of fat without protein

The discussion proves that the part played by the proteins in the origin of ketosis is still doubtful, and so the question whether they cause ketosis in ratio to their content of ketoplastic components, or a specific ketoplastic effect of their own beyond that, is still undecided. Further elucidation can only be expected by quantitative investigation, and so far opinion has depended almost exclusively upon clinical observation. Therefore, we undertook the experiments described below.

By the bisulphite-binding method of Clift and Cook[5], we determined the ketone bodies of diabetic and non-diabetic patients in the morning on an empty stomach. Then 150 gm. of oil was administered by stomach-tube (in one case 120 gm. of bacon was ingested) and after six hours the determination was repeated. In another series, fat (120 gm. of bacon) and proteins (in the form of 100 gm. of cheese) were fed.

The table below demonstrates that increase of ketone bodies is insignificant after fat alone; three cases showed no increase at all. This result corresponds to that of Leites, Odinow and Powolowskaja[6], who after ingestion of fat found a ketogenous effect only in some of their cases, while Hoffmann and Anselmino[7] reported an increase in every case. Our results are also in accordance with the findings of Marks and Young[8]. They found that ketonuria was highest in dogs with meta-hypophyseal diabetes when the animals received a diet of raw meat, and lowest with a high-fat diet. Similar results have been obtained by Burn, Lewis and Kelsey[9] with alloxan-diabetic rats.

If fat and protein were administered together, a much more considerable increase followed, with the exception of cases of pregnancy[10], as would have been expected, in proportion to the ketoplastic amino-acid content of the protein. The ketogenic component of proteins being on the average forty-two per cent, after ingestion of fat and protein an increase of one sixth would be expected at the most above fat alone. In our experiments 100 gm. of cheese was ingested besides 120 gm. of fat; the protein content of the cheese being approximately twenty-five per cent. But while after fat the increase amounted on the average to 18·3 per cent, that following combined fat and protein intake averaged 65·2 per cent. If the increase were determined by the ketogenic component exclusively, the ultimate value should be only one sixth larger, that is to say, twenty-one per cent on the average. The difference was statistically significant.

In two cases the blood of the same patients was examined before and after intake of fat, and before and after intake of fat and protein.

INCREASE OF KETONE COMPOUNDS IN BLOOD

	After fat and protein	After fat alone
Diabetes	43 per cent	0 per cent
Cirrhosis of liver	49 per cent	16 per cent

These two cases clearly show the reliability of the conclusion drawn from averages of all cases investigated. In both cases a considerable increase is evident after ingestion of fat and protein; whereas one of them shows no increase at all after fat alone, and the other a slight increase, corresponding to the average of all cases.

Summary. After ingestion of fat and protein, the blood shows a considerably increased content of ketone bodies as compared to fat ingestion alone. This exceeds significantly the amount which could be ascribed to the content of proteins of ketogenic amino-acids, and therefore it may be assumed that proteins exert a specific ketoplastic effect.

Treatment of Keratitis rosacea with Small Doses of Testosterone

IN the course of some investigations on 'endocrine allergy'[1], it was found that patients with keratitis rosacea (six cases) give a positive intracutaneous test to testosterone. Tests with a series of several other steroid hormones, on the other hand, were negative. Testosterone administered intracutaneously in increasing doses for the purpose of desensitization brought about a striking improvement of the ocular condition in all the patients. In cases in which the keratitis rosacea was associated with facial rosacea, a distinct improvement was also observed in the latter condition.

Although therapeutic results in keratitis rosacea must be interpreted cautiously in view of the occurrence of spontaneous remissions, allergy to testosterone appears to be a cause of this condition in at least a high percentage of cases. A detailed study will be published in the *British Journal of Ophthalmology*.

Development of *Ornithodorus moubata* on Normal and Thiamin-deficient Rats

De Meillon and Golberg[1] reported that early nymphs of *O. moubata* when fed on thiamin-deficient rats display a retardation of growth as compared with nymphs fed on rats given a full diet. Since that time, the ticks have been reared to maturity and the following results obtained.

DEVELOPMENT OF *O. moubata* ON NORMAL AND THIAMIN-DEFICIENT RATS

Stages of development		Rats fed on	
		Full diet	Thiamin-free diet
I	No. fully fed	20	24
II	*P*	96	100
	T	9·2 ± 0·4	11·6 ± 1·4
III	*P*	100	90
	T	8·6 ± 0·7	14·0 ± 1·2
IV	*P*	100	100
	T	8·8 ± 1·4	12·5 ± 1·7
V	*P*	100	78
	T	14·5 ± 1·0	26·4 ± 12·0
VI	*P*	—	64
	T	—	15·2 ± 0·8
Mean time (in days) to adult stage		41·1	79·7
Number of moults to reach maturity		4	5

P, percentage of fully fed ticks which moulted.
T, mean and standard deviation of time (in days) from feed to moult.

The evidence presented in the table shows that thiamin deficiency in the host affects the development of *O. moubata* by prolonging the time taken between each feed and the subsequent moult, and by inducing an additional moult before maturity is reached. As a result, the ticks on thiamin-deficient rats take almost twice as long to become adults as do ticks fed on normal rats. Unfortunately, all the ticks from the control group of nymphs were females, so that it is not possible to compare egg production in the two groups.

We have now shown that two unrelated blood-sucking arthropods, *Cimex lectularius* and *O. moubata*, are adversely affected by feeding on thiamin-deficient rats. Experiments with other deficiencies are under way.

We wish to thank Miss F. Hardy, Miss V. B. Arvidsson and Mr. J. M. Thorp for technical assistance.

Seasonal Variations in Vitamin C Content of Tomatoes Grown in Great Britain

RESULTS obtained in the Ovaltine Research Laboratories in 1942[1] suggested that the vitamin C content of tomatoes grown in Great Britain is affected by the degree of exposure to sunshine during cultivation. It is also related to the size of the fruit, position on the plant, date of collection, etc.; but if these and other disturbing factors are balanced by careful sampling, the average vitamin C content might be expected to vary significantly with sufficiently wide differences in climatic conditions in different seasons.

These suggestions have been supported by experimental results obtained at Long Ashton in 1944[2] and 1945[3]. The average vitamin C content of tomatoes grown out of doors in 1945 was only three quarters of that of tomatoes grown under the same conditions in 1944, sufficient samples being taken to ensure a significant difference. The lower vitamin C content in 1945 was correlated with a smaller number of hours of sunshine during August, September and October. Strange to say, this latter factor made only a slight difference to the vitamin C content of tomatoes grown under glass, which in both years averaged rather less than two thirds of the average outdoor figure in 1944.

TABLE 1. SEASONAL VARIATIONS IN VITAMIN C CONTENT OF ENGLISH TOMATOES

Season	Districts where grown	No. of varieties	No. of samples	Mean vitamin C content (mgm./100 gm.*) Cultivation indoor	outdoor	Hours of sunshine during cultivation†
1942	Elstree	mixed	11	15·4	—	—
	King's Langley	mixed	39	—	16·6	—
1944	Long Ashton	2	130	19·5	—	471
		2	80	—	30·3	
1945	Long Ashton	9	49	17·7	—	347
		13	64	—	22·3	
1946	Elstree	mixed	11	15·8	—	—
	Maidstone	5	117	—	16·0	345

* Of edible portion of fresh fruit.

† Included August, September and October until harvested.

Climatic conditions in 1946 have been even worse than in 1945, and the growth and ripening of tomatoes out of doors have been more difficult than usual. Therefore, we think it of interest to compare in Table 1 average figures for the vitamin C content of tomatoes grown indoors and outdoors this year with the average results previously obtained in these conditions at King's Langley and Long Ashton. Whereas our average indoor figure (though based on only a few samples) does not differ significantly from the indoor averages obtained in previous years, our average outdoor figure is much lower than the Long Ashton outdoor averages in 1944 and 1945, though it agrees well with the outdoor average in 1942. Varietal differences cannot explain more than a small part of this difference, because one of the varieties (Premier) which we have tested this season was also tested at Long Ashton, and the ratio of its average vitamin C content to that of all the five varieties we examined was 1 : 1·3, as compared with 1 : 1 obtained at Long Ashton for all their varieties. Fertilizer treatment also will not satisfactorily explain the difference. We tried a variety of fertilizer mixtures containing known amounts of nitrogen, phosphorus, potassium and calcium, and, while some of these did appear to increase the vitamin C content, the results obtained on different samples showed that climatic conditions were still an important factor. The outdoor tomatoes we examined were grown at Maidstone Technical Institute and were of medium size (that is, 60–120 gm.), care being taken to exclude very small and very large fruit in which the difference in size might affect the vitamin C content. Hence this factor also would not seem to explain the lower average vitamin C content found this season.

In order to study the climatic conditions more closely, the mean hours sunshine daily and the mean monthly maximum and minimum temperatures were determined (Table 2). The latter also includes parallel results and averages for a number of previous years at East Malling, near Maidstone (kindly supplied by the Director of the East Malling Research Station). Although there is much evidence that the vitamin C content is affected by exposure to sunshine, and possibly also by warmer climates, the data do not provide clear-cut proof of this, and it is to be hoped that other workers who have been examining tomatoes this season will also compare the effect of climatic factors. We have confirmed previous findings that the vitamin C content is little altered by ripening indoors off the plant instead of outdoors on the plant.

TABLE 2. SUNSHINE AND TEMPERATURE RECORDS DURING TOMAT CULTIVATION

Season	Districts where grown	Mean hours sunshine daily Aug.	Sept.	Oct.	Mean monthly maximum and minimum temperatures (° F.) Aug.	Sept.	Oct.
1944	Long Ashton	6·9	5·0	3·4	—	—	—
1945	Long Ashton	5·1	3·0	2·1	—	—	—
1946	Maidstone	5·7	3·9	3·0*	53–69	50–63	50–62*
1946	East Malling	5·7	4·2	—	51–68	50–65	45–60†
	East Malling. Mean of last 30-33 years	5·8	4·8	—	52–71	48–66	—
	East Malling. Mean of last 10 years	—	—	—	52–71	48–66	45–60†

* Until final harvest.

† First fortnight.

Our results have been obtained on fruit cultivated, collected and stored with greater precautions to increase and conserve vitamin C than can normally be applied to commercial tomatoes, and the figures given in Table 1 for the average vitamin C content must be appreciably higher than the average vitamin C content of similar tomatoes as purchased by the public. It is, therefore, of interest to notice that the average vitamin C contents quoted in this table are considerably lower than the figures of 7 mgm./oz. and 25 mgm./100 gm. recently published from the Ministry of Food[3] and the Medical Research Council[4] respectively. It would be desirable to know how the official figures were obtained, and what allowance was made for climatic and other factors affecting vitamin C content, before deciding whether they can be used as a fair indication of the vitamin C content of British tomatoes in 1946.

We are indebted to Miss E. Finnegan, Miss H. Williams and Miss J. Wyatt for assistance in preparing the extracts and carrying out the estimations.

Full details of these results will be published elsewhere.

FUTURE OF THE SOCIAL SCIENCES

A CONFERENCE of social scientists, convened by the Association of Scientific Workers, was held on December 14 at Gas Industry House, London, S.W.1. Mr. J. R. M. Brumwell took the chair, and the chief speakers were Prof. S. Zuckerman, Dr. G. Wagner, Mr. Dennis Chapman and Mr. R. Innes. The chairman recalled the meeting held in October 1945, at which a Joint Sciences Committee had been set up to foster relations between workers in the natural and social fields of science. The Committee had functioned successfully, and, as a direct result of its activities, an increased awareness of the links between natural and social science had spread throughout the Association of Scientific Workers. In August 1946, the functions of the Committee were assumed by the Science Policy Committee of the Association. This step was taken to avoid duplication of effort because the work of the two groups soon began to overlap. The Joint Sciences Committee was provisionally reconstituted as a Social Sciences Committee to concentrate on problems of organisation and development of the social sciences themselves. Social scientists in the Association had become more conscious of their own problems of recruitment and training. It was now proposed to set up a national section of the Association of Scientific Workers representing social scientists throughout the United Kingdom.

The terms of reference of this group were: first, to advise on policy in regard to the social sciences; second, to advise on conditions of work and employment of social scientists; third, to stimulate the recruitment of social scientists into the Association; and fourth, to suggest ways of ensuring adequate representation of social scientists on committees of the Association.

Prof. Zuckerman spoke of the value of scientific discipline in social affairs and in the objective study of human institutions. He quoted with approval some observations made by Mr. Herbert Morrison in his Hobhouse Memorial Lecture, which revealed a sympathetic appreciation of the potentialities of social science. He went on to discuss the Clapham Report and, while admitting that the Report suffered from certain shortcomings, maintained that they were not so serious as some of its critics seemed to suppose. The Clapham Report marked a step forward though, possibly, a short step and not the great stride desired by the critics. It was the first official recognition of the existence of the social field of research. In Prof. Zuckerman's view the chief obstacle to progress in this field lay in the shortage of trained research workers. Hence he stressed the need for establishing a body to determine priorities for pursuing research in the social sciences. In the present state of knowledge such a body could perform a more valuable service than a Social Science Research Council, if such were set up.

Prof. Zuckerman drew a distinction, in the light of his war-time experience, between the tactics and strategy of social operations. Operational research during the War had its roots in the need to solve tactical problems as exemplified in the field of radar. But as the War advanced, the work of operational research stations, in the Army and Navy as well as in the Royal Air Force, began to impinge upon problems of strategy as well. The needs of peace likewise opened up possibilities of a dual tactical and strategical approach. Tactical problems arose, for example, in the fields of traffic, output per worker, management, incentives, selection of personnel, and building processes, all of which required investigation 'on the spot'. He remarked that in connexion with the building programme, research of this type was proceeding apace, and it was possible to control the chief variables. But such problems should be distinguished from the more fundamental strategical problems involving the selection of alternative policies or courses of action. The task of scientific workers was not merely to 'clean-up' problems arising out of a situation not of their own making, but to play a part in creating the social situation. As yet, natural sciences had not become involved in the strategy of social operations; but research which commenced with a tactical aim might acquire a strategic value. Thus Prof. Bernal's studies of air raid effects began with the aim of assessing the protective properties of shelters. They developed into a basis for offensive strategy by providing data on the dislocation of social and industrial life resulting from air attack. In this way, scientific method came to influence the choice of a major line of policy. In peace-time, economists, in particular, had an important strategical part to play, for policy might be directly determined on the basis of the data provided by them. In the epoch of planning into which we were entering, science had an important strategical function to perform.

Research in the social sciences was, in his view, expensive as, for example, in carrying out social surveys. With the present shortage of trained man-power, however, and the organisational difficulties, it was, in fact, difficult to spend large sums of money on research. Housing surveys were now 'limping along' for lack of trained workers to carry them out. There was an urgent need for more social surveys to illumine policy.

An important factor in stimulating the development of the social sciences was the attitude of administrators. It was essential that administrators should acquire an appreciation of the use of scientific method in human affairs. Experience in operational research had taught that a genuine scientific attitude on the part of the investigator mattered more than training in a particular field of science. On occasion, arts graduates without a specific training in science had proved their worth in this field.

The future for the social sciences, he went on to say, must be viewed in the light of the academic background, the number of trained workers available, the adequacy of the methodology, the various fields of application and the opportunities for *ad hoc* tactical and fundamental strategical approaches.

In summing up, Prof. Zuckerman concluded that the outlook for the social sciences was 'very rosy'. Authorities in the field of social action were more ready now to listen to the advice of men of science. Nothing could therefore prevent further expansion.

Mr. R. Innes outlined the organisation of the Association of Scientific Workers. There were seven national sectional committees, including, for example, chemistry and engineering and metallurgy. It was proposed that the terms of reference of the provisional social sciences committee would carry over to a new national committee. Members of the Association in different parts of Great Britain who were active in the field under consideration would be linked together through the national committee, which should be widely representative of interested members.

Mr. Dennis Chapman made a strong plea for the expansion of social research. The position of the social sciences, he said, had been transformed by the publication of the Clapham Report. There were two main fields of activity. First, there was the field of fundamental research. Here, he thought, the position was lamentably backward. Brilliant generalizations of two or three decades ago by Patrick Geddes, the Webbs, Graham Wallas and others had lain dormant for want of initiative, to follow up with research. Over a wide potential range of social problems research was, at present, non-existent. No inquiries were being undertaken on such subjects as human relations in industry and politics, the family, the church and other institutions or on the social process of education. No studies were being made of the social psychology of morale, civil and industrial, or into the medical and nursing services of Britain. No one had yet attempted to study the curious distribution of civic vitality in different cities. The methods employed to-day in social research needed revitalizing. They had not advanced since the days of Charles Booth and Beatrice Webb. Many of the techniques were thirty or forty years old and needed bringing up to date. In the United States the methods of social measurement had made far more rapid progress.

In the applied field, the position was much the same. Little research was being pursued. Yet every administrative action was a social experiment and threw up problems for investigation. Social processes were constantly changing and creating experimental situations. It was untrue to assert that there were no experiments in the social field. On the contrary, social scientists were overwhelmed by the multiplicity of experiments taking place around them.

The situation as regards the status and salaries of social scientists left much to be desired. In the universities, status was good but the salary of the few engaged in the 'sweated trade' of social research was appreciably below that of a teacher with similar qualifications in the same subject. In Government Departments, on the other hand, there was no settled status for social scientists. Many were regarded as administrators or as statisticians; scope for publishing results of official research was also severely restricted. It would be disastrous, he thought, if all financial support for social research went to the universities. Almost every important advance in social research, so he declared, had taken place outside the universities. There was a strong case for setting up a Social Science Research Council.

During the ensuing discussion, a number of important points came to light. In Government Departments, it was said, personnel work failed to be accorded adequate recognition. It was a neglected service to be run by officers of the clerical grade without appropriate training. Another speaker challenged Prof. Zuckerman's assumption that scientific method influenced administrative decisions in sufficient measure; a great deal more 'pre-decision' analysis was needed. In this connexion, he mentioned that the Social Sciences Committee had set up a special group to study the requirements of a scientific public administration.

A third speaker reminded the meeting that it was not the function of the Association to carry out research for which full-time investigators properly financed were required. But the Association could survey a field so as to indicate the kind of research and scientific organisation that were needed. What the Association had attempted to do for fuel and power could be done for the field of social inquiry. The main weakness at the moment was a deficiency in fundamental knowledge of social phenomena. He did not regard as adequate the suggestion in the Clapham Report that provision for social research in the universities should be determined by a sub-committee of the University Grants' Committee. Opportunities should be left open for the talented individual with an inquiring mind. Universities, Government departments and other institutions should not monopolize research. Anyone who had ideas for research and could convince a small authoritative body of their value should be given sufficient financial aid to carry out the necessary inquiries. If such steps were taken the large number of workers with experience in operational or social research would have an opportunity of proving their worth. This speaker also directed attention to the need for studying the effects of advances in the social and economic research upon the development of technique in the physical sciences. We were well aware of the impact of science on society. What was now needed was a consciousness of the reciprocal influence.

Several speakers criticized the tacit assumption of the Clapham Report that all social research was expensive. It was often implied, it was said, that most social inquiries involved questionnaires on a large and costly scale. The need for 'penetration' studies of the individual, of the kind made in social anthropology, tended to be overlooked. Measurement was not a *sine qua non* of social research. There was a complete absence to-day of really fundamental social research, with the possible exception of industrial psychology.

Before the meeting drew to its close, a national sectional committee of the Association of Scientific Workers was set up with the terms of reference as described above, and the members duly elected.

John Cohen

BRITISH CONTRIBUTION TO RADIOLOCATION

Early in March 1946, the Institution of Electrical Engineers held a Radiolocation Conference at which were presented a large number of lectures and papers by various members and other individuals who had contributed to the development and application of radiolocation during the war years. The Convention was formally opened at an ordinary meeting of the Institution by the Minister of Supply, Mr. John Wilmot, and was followed by a lecture on "The Evolution of Radiolocation" by Sir Robert Watson-Watt. In the course of this lecture it was explained that the object of the Convention was to describe and discuss British activities in this subject, which began in February 1935 and were at first conducted independently of any similar work elsewhere. Following the co-operation established between Great Britain and the United States in the autumn of 1940, later developments were conducted on the basis of a United Nations' system for which the name 'radar' was adopted in 1943, this term being then in current use in the United States.

The opening meeting referred to above was followed by twelve special meetings of the Radio Section of the Institution devoted to lectures and papers on special portions of the technical field of development and their applications. The wide range of subjects dealt with is indicated by the titles adopted for these meetings: "Aerials and Wave Guides"; "Propagation"; "Cathode Ray Tubes"; "Precision Radar"; "Valves"; "Radio Measurements and Test Gear"; "Shipborne Radar"; "Transmitters and Receivers"; "Circuit Techniques for Radiolocation"; "Radar Navigation" (two meetings); and "Naval Gunnery Radar". At most of these meetings one or two papers were first read, giving a general survey of the portion of the field under discussion; and these were followed by a series of brief lectures by experts on particular sections of the subject. Three of the meetings were each devoted to a formal lecture on a phase of the subject to which special attention had been given by the Army, Navy and Air Force respectively. The authors of all these contributions, the total number of which exceeds 160, included members of the staffs of various Government establishments, industrial organisations and universities, who had co-operated in the very large amount of research and development work undertaken during the war years.

The *Proceedings* of this Radiolocation Convention are now being published as nine special numbers of Part 3 of the *Journal of the Institution of Electrical Engineers*, of which the first two, Vol. 93, Part 3 A, Nos. 1 and 2, have recently been issued. The first number comprises a basic record of all the meetings described above, the survey papers and some of the lectures being published in full; while abstracts of the remaining lectures and of the supporting papers, the full texts of most of which will appear in later numbers, are also given, together with some sectional bibliographies of other supporting papers to be published later. This publication thus forms a most useful work of reference to the whole literature so far available describing the British contribution to the technical development of radar or radiolocation.

The second number (Vol. 93, Part 3 A, No. 2) of this special issue of the *Journal* contains the full text of the six papers read at the session on "Naval Gunnery Radar", of the four papers read at the session on "Radar Navigation", and of two papers dealing with certain aspects of the technique of "Precision Radar". This publication will be found of great use to those responsible for detailed research and technical development in these subjects, of which radar as an aid to both aerial and marine navigation is already well advanced in its civil applications.

FORTHCOMING EVENTS

Monday, February 3

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 5 p.m.—Dr. A. Dickson Wright: "The Possibilities of Recent Discoveries in Medical Diagnosis and Treatment" (Cantor Lectures, 2).

Society of Engineers (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5 p.m.—Inaugural Meeting for 1947. Mr. Victor S. Wigmore: Presidential Address; Mr. A. E. Turner will present the Premiums awarded in 1946.

Manchester Literary and Philosophical Society (in the Reynolds Hall, College of Technology, Manchester), at 5.30 p.m.—Mr. Norman Pye: "Hyperbolic Navigational Charts".

Society of Chemical Industry, Food Group (joint meeting with the London Section, at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Dr. E. Griffiths and Mr. F. R. Jones: "Refrigeration—Development and Application".

Tuesday, February 4

Institution of Chemical Engineers (joint meeting with the Road and Building Materials Group of the Society of Chemical Industry, at the Institution of Structural Engineers, 11 Upper Belgrave Street, London, S.W.1).—Conference on "Particle Size Analysis". At 10 a.m.—"Methods of Measurement"; at 2 p.m.—"Industrial Applications".

Wednesday, February 5

Royal Society of Medicine, Historical Section (at 1 Wimpole Street, London, W.1), at 2.30 p.m.—Dr. W. R. Bett: "On Style in Medical Literature—Traditions, Circumstances, Diversions and Lethargies".

Institution of Electrical Engineers, Radio Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. C. Domb and Dr. M. H. L. Pryce: "The Calculation of Field Strengths over a Spherical Earth".

Society of Public Analysts and other Analytical Chemists (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6 p.m.—Scientific Papers.

Thursday, February 6

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 11 a.m.—Conference on "Proposed International Exhibition in 1951".

Royal Society of Arts, India and Burma Section (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Sir Herbert Howard: "The Forests and Forest Resources of India".

Linnean Society of London (joint meeting with the Systematics Association, at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Discussion on "The Teaching of Taxonomy" (Speakers: Sir Clive Forster-Cooper, F.R.S., Prof. James Gray, F.R.S., Dr. W. B. Turrill and Prof. A. R. Clapham).

Institution of Electrical Engineers (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. J. Hacking and Mr. J. D. Peattie: "The British Grid System in Wartime".

Institute of Economic Engineering, Midland Section (at the Chamber of Commerce, Birmingham), at 7 p.m.—Mr. C. D. Pollard: "Time and Motion Study in the Foundry".

Chemical Society (at Burlington House, Piccadilly, London, W.1), at 7.30 p.m.—Dr. A. E. Alexander: "The Application of Surface Chemistry to Colloidal Problems" (Tilden Lecture).

Friday, February 7

Institution of Electrical Engineers, Measurements Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "What has the Electrical Instrument Industry to learn from Developments in Continental Practice?" (to be opened by Mr. F. E. J. Ockenden and Mr. G. N. Harding).

Institution of Mechanical Engineers, Applied Mechanics Group (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Prof. A. Porter: "Basic Principles of Automatic Control Systems".

Geologists' Association (at the Geological Society of London, Burlington House, Piccadilly, London, W.1), at 6 p.m.—Dr. J. M. Bruckshaw: "Application of Geophysics to Geological Problems".

Chemical Society (joint meeting with the Local Sections of the Royal Institute of Chemistry and the Society of Chemical Industry, at University College, Cardiff), at 6.45 p.m.—Prof. W. Wardlaw: "Structural Inorganic Chemistry".

Textile Institute, Dublin Branch (at the Mansion House, Dawson Street, Dublin), at 7.30 p.m.—Mr. E. Waters: "Nylon Textiles—their Properties and Processing".

Royal Institution (at 21 Albemarle Street, London, W.1), at 9 p.m.—Prof. James Gray, F.R.S.: "Vitalism, Old and New".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Gas Examiner—The Town Clerk, Municipal Offices, Bromley, Kent, endorsed 'Gas Examiner' (February 7).

Farm Manager—The Director, Agricultural Research Council, Field Station, Compton, Berks. (February 10).

Head of the Establishment, Survey Production Centre, R.E., Hanwell, under the War Office—The Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 1777 (February 15).

Junior Chemist and a Junior Physicist—The Director, Institute for Industrial Research and Standards, 45 St. Stephen's Green, Dublin (February 15).

Assistant Superintendent (Research), Government Livestock Farm, Hissar, in the Punjab Veterinary Service, Class I—The High Commissioner for India, General Department, India House, Aldwych, London, W.C.2, quoting No. 306 (February 15).

Geologist for the Government of the United Provinces, India—The High Commissioner for India, General Department, India House, Aldwych, London, W.C.2, quoting No. 298 (February 15).

Clinical Chemist to be responsible for tests and investigations of a chemical nature in the Clinical Pathology Department—The Secretary, University College Hospital Medical School, University Street, London, W.C.1 (February 28).

Senior Lecturer (Grade I) in the Department of Electrical Engineering (Electronics)—The Registrar, The University, Liverpool (February 28).

Readership in Physical Chemistry tenable at the Imperial College of Science and Technology—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 4).

Senior Lecturer in Anatomy (Histology)—The Registrar, The University, Sheffield (March 8).

Chair of Chinese Art and Archæology tenable at the Courtauld Institute of Art—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 11).

Official Fellowship in Natural Sciences or Medicine—The Master, St. Catharine's College, Cambridge (March 31).

Lecturer (Grade IIb) in Mechanical Engineering—The Secretary, The University, Edmund Street, Birmingham 3 (March 31).

Senior Lecturer in Anatomy—The Registrar, The University, Sheffield (April 1).

Senior Lecturer in Zoology—The Registrar, The University, Sydney, Australia (April 5).

Speech Therapist—The County Medical Officer, County Hall, Hertford.

Lecturer in Physics (with subsidiary Mathematics)—The Registrar, Merchant Venturers' Technical College, Unity Street, Bristol 1.

Lecturer in Chemistry, a Lecturer in Botany, and an Assistant Lecturer in Science Subjects—The Principal, Kingston Technical College, Kingston Hall Road, Kingston-upon-Thames, Surrey.

Biologist on the staff in Tanganyika Territory—The Secretary, Empire Cotton Growing Corporation, 1a Harrington Road, London, S.W.7.

Senior Bacteriologist to the Royal Sheffield Infirmary and Hospital and Honorary Lecturer in the Bacteriology Department of the University of Sheffield—The General Superintendent, Royal Infirmary, Sheffield 6.

Lecturer in Geology, an Assistant Lecturer in Horticulture, a Lecturer in Social Philosophy, and a Library Assistant—The Registrar, University College, Exeter.

Scientific Liaison Officer, and a Technical Liaison Officer, in the Department of Scientific and Technical Liaison in the London Offices of the Secretariat—The Secretary, International Wool Secretariat, Dorland House, 18–20 Regent Street, London, S.W.1.

Junior Research Officer (with honours degree in Physics or Engineering) for research on the mechanics of cloth formation, and a Research Officer (male) for research on development and application of analytical methods—The Director of Research, British Cotton Industry Research Association, Shirley Institute, Didsbury, Manchester 20.

Hydrographical Surveyors (Grade III), by the Government of Iraq for the Basrah Port Directorate—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.17048.

REPORTS and other PUBLICATIONS

SCIENTIFIC MAN-POWER IN BRITAIN

THE Parliamentary and Scientific Committee has produced a useful report on "Universities and the Increase of Scientific Man-power", which is neither rigid nor excessively weighted by the statistical factor. The general tenor of the report of the Barlow Committee is endorsed, although the view is taken that the relative pre-war weakness of British economy in the application of scientific methods suggests aiming at less than an approximate doubling of our estimated pre-war scientific man-power. In setting a target of 100,000 qualified scientific workers by 1955, the Committee expresses the view that there is room for expansion of the industrial research associations, and refers also to defence research, medical and veterinary science and the Agricultural Advisory Service as likely to call for many more scientific men, apart from the probable increase in industrial requirements. It emphasizes the first-class importance of the question of qualifications, and that quality, as well as quantity, must always be kept in mind. Like *Planning*, in its broadsheet, "Britain's Need for Man-power", it presses for an early inquiry into the probable ultimate demand for each particular category of scientific worker, so as to avoid inducing young men and women into courses of study which do not lead to satisfying careers.

Probably the most important recommendation in this report is that such an inquiry should be set on foot forthwith, and it should engage the active attention of the Ministry of Labour as well as of the professional organisations and the university appointment boards. To achieve even the total of 90,000 qualified scientific workers recommended by the Barlow Committee will scarcely be possible by 1955 unless the output from the universities increases faster than the Barlow Committee proposes; but the Parliamentary and Scientific Committee accepts a doubling of the output as the most that can be asked of the universities in the immediate future. Moreover, it agrees with the Barlow Committee that the increase in the number of scientific graduates should be balanced by a substantial increase in the number of students studying the humanities; and it proceeds to discuss university expansion on the basis of doubling the entire university output of graduates.

The primary and most obstinate difficulty in such expansion is the provision of sufficient and well-qualified teaching and research staff. The Parliamentary and Scientific Committee believes that the present shortage of staff will restrict the expansion of universities until 1949–50, when it should be possible to double the annual intake; and that, at least in the sciences, with which the Barlow and the present reports are immediately concerned, it should be practicable to double the well-qualified academic staff during the next four years, bringing the present total of 4,000 university teachers to 8,000–10,000. The first step is, of course, to ensure that the staff expands at least as rapidly as the student population; and the report also emphasizes what has already been said in many earlier reports with regard to adequate salaries, maintaining a proper balance of teaching and research time and generally making university teaching a sufficiently satisfying career to attract the right kind of people. It directs attention, moreover, to the importance of accommodation, both for teaching and for research, and to the need for the generous grant of priorities by the Government in these respects and also in the matter of hostel accommodation and the like.

So far as the distribution of the proposed expansion between different institutions is concerned, the Parliamentary and Scientific Committee fully endorses the recommendations of the Barlow Committee, but suggests further that difficulties in the expansion of the newer civic universities, where the major expansion must occur, might be overcome by migration of the university from the centre of a city to its outskirts. In London, it is thought there might with advantage be as many as four universities, and the Committee suggests decentralization or actual division, with a target figure of 25,000 students or more. At Oxford and Cambridge, an increase in the annual number of science students might be expected, for at Oxford in 1939 they formed only 10 per cent of the total; and apart from the immediate post-war 'bulge', these two universities might well contribute a total increase of 2,000 science students over the next five to ten years. While, however, some of the existing university colleges, such as Nottingham, should, in the Committee's opinion, now be raised to university status, and other university colleges such as Leicester and Hull should be fostered, the foundation of new universities is regarded as inexpedient, and likely to hinder rather than help the immediate expansion.

The changes visualized in this report would give as the maximum expansion over the next five years a total of 108,000 undergraduates. If the building programme involved is to be accelerated, it is important for the right type of information to be available to the appropriate Government departments in the right form, and the Parliamentary and Scientific Committee directs attention to the value of a schedule setting out the precise amount of accommodation required, faculty by faculty, throughout the country, with a cross-index against universities, expressed in a uniform and easily understood unit of measurement. Early provision of such a schedule would facilitate the integration of university requirements with the rest of the national demand for building labour and materials, and might assist in procuring the priorities which are the first and most urgent need. Incidentally, the need for providing the University Grants Committee with appropriate staff and secretariat is again stressed; and while the Parliamentary and Scientific Committee recognizes that the required expansion should proceed without any loss of independence on the part of the universities, it looks for much more positive action by the University Grants Committee. Not only should this Committee be strengthened, but also at the same time the Vice-Chancellors' Committee should be provided with an adequate permanent secretariat; there is also need for a general forum for the interchange of views between all the universities at all levels and in all the fields concerned, and comprising principals, administrative and teaching staff.

The report does not press quite so firmly for an active and consultative body, such as a universities council, as recommended in its earlier report; but the University Grants Committee, by implication at least, seems to be the body to be charged with the responsibility for planning university expansion. The cost of that expansion is put by the Parliamentary and Scientific Committee in the region of £100 millions for capital expenditure over the next ten years, and it suggests that an appropriate sum should be earmarked for the purpose by the Chancellor of the Exchequer, at least for five years, so as to facilitate planning with confidence. The annual cost of expansion is put at £10 millions, or a total expenditure of £30 millions annually on the universities, a figure which agrees with that given by the *Economist* last year; in particular, it is urged that, so far as possible, no young person of requisite ability should be prevented by financial considerations from participating in these increased facilities for university education.

The proposed expansion of the universities of Britain cannot, of course, be realized without a parallel expansion of the secondary schools; and important as is generous financial assistance from the Government, that alone will not suffice under present conditions. The highest priorities must also be given for the man-power and materials required for building the increased accommodation that expansion involves.

When we have provided the machinery for training the man-power required to meet the needs anticipated in the professions, in industry and in business during the next ten years or so, and have done something to ensure that the standards of management are such that unnecessary wastage is eliminated, there still remains the arrangements for recruitment, which are surveyed in some detail in the second part of the *Planning* broadsheet on "Britain's Need for Brain-power". Such arrangements should endeavour to secure recruits of the highest possible quality, the broad adjustment of supply to the demand, and a reasonable distribution of the most able men and women among the various callings. The latter objective may be the most important at a time of acute shortage of man-power, as without some system of priorities, bottle-necks may be created which hinder the further expansion of man-power; for example, if too many scientific workers are attracted into industry or the Government service, then the universities may be unable to expand their teaching and research staffs appropriately. All three alike involve energetic measures to provide advice and information about careers, to ensure financial assistance to those who, though suitable, would otherwise be unable to undertake the necessary training, to improve methods of selection, to secure that salaries and conditions are reasonably well balanced between the major callings, and to tap all sources of recruitment.

Implementation of the recommendations of the Hankey Committee on Higher Appointments would place the relevant facts at the disposal of young people deciding on a career, although the schools, universities and professional institutions might also make important contributions. Methods of selection, however, are specially important at the present time. Upon their efficiency depends the success of a profession or organisation in obtaining the best recruits available, while upon their reputation for fairness depends to some extent the quality of the young men and women who come forward. *Planning* urges that a proportion of university scholarships should be awarded for outstanding personal qualities combined with good intelligence rather than for purely academic attainments, and that the scientific techniques of selection developed in the Services should be further explored and turned to account. The universities and other training institutions should give attention to the co-ordination of standards of selection, to avoid a situation in which variations in the ratio of applicants for vacancies may lead to one university accepting students of a standard rejected by another. Moreover, in this connexion there must be borne in mind the considerations brought to light in Sir Cyril Burt's study, "Intelligence and Fertility". If the present differential birth-rates are in fact not only lowering the level of innate general intelligence but even threatening to reduce by fifty per cent in the next half-century the number of children of scholarship ability in the schools, the selection of university students as well as the use of graduates will require even closer study by the universities as well as by professional bodies, industry and the Government.

Other factors noted by *Planning* indicate the many ramifications of the man-power problem, and no doubt they are receiving careful study by professional associations. To expand to the full the limited resources in Great Britain of trained man-power, and to ensure that it is reasonably distributed and used with the maximum economy, are matters which demand much more than Government initiative alone. The universities are concerned at both the beginning and end of any scheme, in that they must consider sources of supply, training and the placing of students; and throughout there must be the fullest co-operation with management in industry, commerce and departments of State.

VERNALIZATION AND PHOTOPERIODISM

Crop Production and Environment

By R. O. Whyte. Pp. 372+32 plates. (London: Faber and Faber, Ltd., 1946.) 25*s*. net.

THE scope of this book is much narrower than its title suggests, for it deals with only one aspect of crop production, and only two out of the whole complex of environmental factors. Its subject is the effect of temperature and of light on the 'development' of plants, defined by the author as "the progress towards reproduction by externally recognizable or invisible stages", as distinct from 'growth' in the sense of dry matter accumulation or increase in size. As the author points out, this separation of the two aspects of growth, in the wider sense, is open to criticism, though it may be justified by experimental convenience. 'Development' and growth are not independent, as is very obvious in agricultural practice, where the object of controlling 'development' is to increase 'growth' as measured by the harvested yield.

Developmental physiology was brought into prominence by the discovery of the phenomenon of photoperiodism by Garner and Allard, and of the process of vernalization by Lysenko. Garner and Allard showed that sexual reproduction can be attained by a plant only when it is exposed to a specifically favourable length of day. Lysenko and his colleagues followed up the work of Gassner, who found that winter forms of cereals differ from spring forms in that their flowering is dependent on exposure to low temperature. They showed that the low-temperature treatment was effective at a very early stage of germination, or even during the growth of the grains in the ear of the parent plant. Partially sprouted grains of winter forms, after a period of exposure to low temperature, behaved like spring forms when sown, and were, therefore, said to be vernalized.

These observations have been greatly extended during the past twenty-five years, the developmental physiology of many species has been investigated, and attempts have been made to determine the nature of the internal processes which control the course of development. Much of this work has been done in the U.S.S.R., and unfortunately its design and interpretation have been limited by an uncritical acceptance of Lysenko's theory of phasic development. This postulates that the development of an annual plant proceeds by a sequence of irreversible stages, each of which must be completed before the next can begin, and that different phases require different environmental conditions for their completion. The Russian workers have set out to identify these hypothetical phases, and to determine their duration and environmental requirements, rather than to make an unbiased analysis of the effects of environment on development. The author of this book has not attempted to interpret their results on a broader basis, although he points out that the work of Gregory and Purvis, and others, has provided convincing evidence of the incorrectness of the theory. Nevertheless, he has performed a useful service by abstracting the Russian literature and making it more accessible to English readers.

An account of the effects of temperature and of the duration and intensity of light on development is given in the first eight chapters of the book. The next four chapters discuss changes in the physiological processes of the plant which accompany vernalization, or induction of flowering by adjustment of the photoperiod. Although variation in several physiological attributes, including the carbon → nitrogen ratio, respiration and enzymatic activity, occurs in association with the change from a vegetative to a reproductive state, it is still not clear which, if any, of these variations are causal, and which consequential. The existence of specific flower-forming substances or hormones is suggested by experiments which show, for example, that photo-induction can be transmitted from a single leaf or part of a leaf to the rest of a plant held in a photoperiod unfavourable for flowering, or across grafts, even when union of the cut surfaces is incomplete, but no such hormone has yet been isolated. Hormones have also been invoked to explain the vernalization effect, but the suggestion that the hastening of development is caused by an accumulation of auxin in the embryo during low-temperature treatment has recently been shown to be erroneous. Further work on these lines is very desirable, for until the physiological nature of developmental response is known, it will be difficult to systematize the great mass of empirical data which has accumulated.

The remainder of the book discusses the application of developmental physiology to problems in the geographical distribution of plants, to plant breeding, and to agriculture and horticulture. Direct control of the development of glasshouse crops is fairly easy, and is already being practised; but there seems to be little scope for this in agriculture, because the only environmental factors readily controllable in the field are the supplies of nutrients and water. However, as the author points out, a knowledge of the developmental requirements of crops should assist in the breeding of varieties which will attain the required state of development in whatever environment the crop is to be grown. Treatments involving critical manipulations, such as vernalization, may be of temporary value when the area of cultivation of a crop is being extended, but it seems that they are likely to go out of use when varieties suited to the new conditions become available. This, apparently, is already happening to the vernalization method in the U.S.S.R.

It is regrettable that the style in which this book is written does not do justice to the interest and importance of its subject. Most of the book consists of a succession of abstracts of published papers, often with little obvious connexion between one paragraph and the next. Consequently, the exposition lacks a co-ordinated plan and systematic development. Some of the abstracts include statements which are not relevant to the subject under discussion, so that the reader is misled into seeking a significance where none exists. The conclusions are sometimes so condensed as to be either unintelligible or platitudinous. Another objectionable feature is that many of the fifty-three figures are not referred to in the text, or are inserted at places remote from the text-reference. The legends attached to the figures are rarely sufficiently detailed to make the figures self-explanatory, or to show their significance in relation to the text.

D. J. WATSON

COLOUR VISION

Researches on Normal and Defective Colour Vision

By W. D. Wright. Pp. xvi+383. (London: Henry Kimpton, 1946.) 36*s*. net.

THIS book is primarily an account of the researches on colour vision carried out by the author and various co-workers in the technical optics department of the Imperial College of Science and Technology over a period of twenty years. Most of the work has been published, from time to time, as papers in scientific journals or special reports of the Medical Research Council; but in this book it is re-written as a logically connected story. This adds much to its value, not only by placing the various investigations in their proper perspective relative to each other, but also by collecting between one pair of covers material for which the student has hitherto had to search through many channels.

When Dr. Wright initiated his programme of work on colour vision twenty years ago, he had a very open field in which the problem was not to find something worth investigating but to decide where to start. Not that the field was unexplored. On the contrary, almost any problem on colour vision which one could formulate had already been investigated—generally by many workers—and had considerable literature devoted to it; but, despite this, there was scarcely one to which a satisfactory solution had at that time been found. This was undoubtedly due not to the lack of competent theorists but to the ill-defined and often conflicting data provided by the experimenters. Vision, like other so-called psychophysical subjects, is of interest to the physicist, physiologist and psychologist. All three have contributed to its investigation and discussion, each bringing different qualifications to the task. In many respects this three-directional approach has been beneficial: in fact, it is clearly necessary to a proper understanding of any sensory problem; but in one important respect it has made matters difficult. Much of the experimental work reported in the literature has been carried out by investigators who have lacked the competence in physical experimentation necessary to produce accurate results of clearly defined significance, and because of this the literature contains a great mass of apparently conflicting information which provides a headache for the critical theorist and a plentiful choice of alternative inspirations for the uncritical.

The value of the work of Wright and his colleagues lies in the fact that it is an attempt to re-survey the measurable aspects of visual behaviour under properly controlled experimental conditions—to provide a body of factual information which, however difficult it may still be to correlate and explain by a simple and all-embracing theory, can be stated unambiguously, and with all relevant detail, in clearly defined terms. Considerable as their success has been, their task is by no means completed, and Dr. Wright, in his preface, still describes the subject as one in which "so little is known about so much". The description is just, even at the present day; but the researches described in this book have undoubtedly helped to make the little considerably more than it was twenty years ago.

The book is divided into eight parts, of which the first consists of two introductory chapters dealing respectively with the physiological structure of the visual organ and with visual perception in general. The inclusion of these chapters is useful, as they treat their subject-matter in sufficient detail to fit the general reader for intelligent perusal of the later chapters without a troublesome amount of reference to other works. Part II is devoted to describing and explaining the operation of the author's trichromatic colorimeter, which, on account of its flexibility, can be adapted to a variety of purposes and is the basic instrument with which a considerable proportion of the researches have been carried out. Part III deals with luminosity measurements under various conditions of field size, field brightness and retinal region; Part IV with problems of colour mixture; Part V with problems of visual discrimination; Part VI with problems of adaptation; Part VII with defective colour vision; Part VIII with the interpretation of colour vision phenomena in terms of fundamental response curves. This skeleton summary of the contents, while it gives no idea of the amount and variety of the work recorded in the thirty chapters, will suffice to indicate the extent of the field which has been covered. The discussions of principles which occur throughout the book, and the theoretical explanations generally, are clearly written and should be easily followed by the average reader. For example, in explaining the significance of the spectral luminosity curve, the author manages in a few easy paragraphs to make clear the fundamental difference between the information provided by this curve and by the apparently similar spectral sensitivity curve of a purely physical light-sensitive apparatus such as a photocell. Failure to realize this difference has been the cause of much false reasoning by writers on the psychological implications of experiments on relative luminosities. His account of the principles of trichromatic colour measurement is based on a purely factual approach which strips it of all superfluous physiological or psychological assumptions.

Where so much is good it seems ungracious to complain, but the clarity of thought and diction which characterizes so much of the book seems, to the reviewer at least, to be missing from Chapter 23, on the measurement of subjective brightness. Discussion of the matter would be out of place here; but I am unable to discover what Dr. Wright means by subjective brightness—which he seems to identify with apparent brightness—or what he considers the 'brill' scale measures. The assumption that equality of contrast at different brightness-levels corresponds to equal differences of 'apparent' or 'subjective' brightness seems to underlie the treatment. This has no more justification than many of the other commonly made assumptions about relations between stimuli and sensations which are so ably refuted elsewhere in the book. This chapter is, however, a comparatively trivial interpolation in a volume which must be welcomed as a major contribution to the literature of colour vision. J. G.

WAR AND NATIONS

Human Nature, War and Society

By Dr. John Cohen. (Thinker's Library, No. 112.) Pp. x+193. (London: Watts and Co., Ltd., 1946.) 2*s*. 6*d*. net.

The Idea of Nationalism

A Study in its Origins and Background. By Prof. Hans Kohn. Pp. xiii+735. (New York: The Macmillan Company, 1946.) 36*s*. net.

The Decline of Liberalism as an Ideology

With Particular Reference to German Politico-Legal Thought. By John H. Hallowell. (International Library of Sociology and Social Reconstruction.) Pp. xiii+141. (London: Kegan Paul and Co., Ltd., 1946.) 12*s*. 6*d*. net.

German Youth

Bond or Free. By Prof. Howard Becker. (International Library of Sociology and Social Reconstruction.) Pp. xiii+286. (London: Kegan Paul and Co., Ltd., 1946.) 18*s*. net.

DR. J. COHEN'S stimulating pamphlet, "Human Nature, War and Society", does not claim to present more than a provisional hypothesis of the causes of war, and is in fact concerned rather with negative than with positive conclusions. We have long been familiar with the easy generalizations that evade the whole issue by finding the causes of war variously in human nature, armaments, biological necessity, animal aggressiveness or primitive savagery, and Dr. Cohen adduces ample evidence to dispose of these shirkings of the problem. "Human nature," he says, "is much maligned. It is unjustly held responsible for war and many other troubles which are really due to neglect or ignorance", and he makes a strong plea for 'scientific inquiry' to dispel ignorance, and by revealing the causes of war to render easier its control. But he has little that is constructive to offer. His thesis that war is the mark of civilized rather than of primitive societies is sound enough, but does not get us far, and he accepts rather too readily the common view that nationalism is a cause of war; it can equally be claimed to be a result of it. The remedy for war he finds in education and a 'world order' built in its earlier stages on such functional organisations as U.N.R.R.A. and F.A.O. (both of which, in spite of what he says on p. 176, are surely 'inter-national' rather than 'supra-national'). The choice of U.N.R.R.A. as an example was, perhaps, not altogether a happy one in view of recent events, and throughout his recommendations Dr. Cohen is impatient of current difficulties. There is more in Lord Beveridge's proposals, which he criticizes on p. 163, than he is prepared to recognize, at least at the present stage of world development. Nevertheless, Dr. Cohen has done useful work in sweeping away common fallacies and in directing attention to the need for that 'scientific' investigation of the causes of war that is the task of the historian. Scarcely less valuable, perhaps, would be a study of the wars that were prevented—an aspect of the subject that seems to have been overlooked.

Prof. H. Kohn has applied to the related problem of nationalism the 'scientific' treatment that Dr. Cohen advocates. "The Idea of Nationalism" is a solid compendium of information about the origins and development of the spirit of nationalism up to the time of the French Revolution, and, true to the American academic tradition, is heavily weighted with notes and references, which account for no less than one fifth of its total size. In effect, the work is a survey of the development of the European States system, and of much of the commentary of political thinkers at every stage of its growth. Judgments are sometimes summary, as in the statement on p. 132 that Francis I of France "succeeded in destroying the two pillars of medieval society—the feudal nobility and the Church", which says both too much and too little; but tribute must be paid to Prof. Kohn's industry and width of reading. The present volume is only preparatory, however: the real value of the study can scarcely be estimated until the next volume, dealing with nationalism in action, appears. For the present, we can but note Prof. Kohn's view that "nationalities are the product of the historical development of society"—an answer, if one were needed, to racial myths—and that they "defy exact definition". It would seem, therefore, that in their present form they are scarcely likely to prove permanent institutions, a view which Dr. Cohen will welcome.

Prof. J. H. Hallowell's "Decline of Liberalism as an Ideology" and Prof. H. Becker's "German Youth: Bond or Free" are recent additions to an unequal series. Prof. Hallowell is concerned with the decline of Liberalism in Germany as reflected in politico-legal thought; and in a survey of the writings of German thinkers throughout the nineteenth century he shows how Liberalism degenerated in academic theorizing, which gradually transformed the Liberal concept of the *Rechtsstaat* into an instrument of absolutism, and thereby prepared the way for the acceptance of Nazism by men who should have known better. The book presents a careful analysis of material which is necessary for the understanding of Nazi ideology; but the picture it gives is only a partial one. More needs to be said of the place of this politico-legal thought in the development of modern Germany and of the influence it exerted, before its significance in the tragic story can be correctly estimated.

Prof. Becker has taken another aspect of German life, the youth movements, and his book is claimed by the publisher to be "invaluable to all those concerned with the re-education of Germany". It is to be hoped, however, that the re-educators will know more about Germany and her past than this not very revealing work can tell them. A good deal has already been published about the youth movements that preceded Hitler's; Prof. Becker has little fresh light to throw on them.

MAURICE BRUCE

EXPLORERS OF CANADA

The Discovery of Canada

By Lawrence J. Burpee. Pp. x+280. (Toronto: The Macmillan Co. of Canada, Ltd., 1944.) 12*s*. 6*d*. net.

DR. L. J. BURPEE was well known as an authority on the exploration of Canada, and in this work naturally draws on his own researches. But the book is much more than repetition. It covers a long period, from the rather vague discoveries of the Norsemen to the voyage of Sergeant Larsen through the North-West Passage in 1940–42. It includes biographical notes on one hundred explorers and a detailed bibliography. A useful outline map forms the end papers.

The author's aim is to "let the story of the discovery of Canada tell itself", and this he does by introducing a large number of extracts from the writings of the explorers. These add greatly to the value of the narrative, though some are introduced for their personal appeal rather than for the light they throw on the progress of discovery.

The method adopted is to divide the country into four main areas—the Valley of the St. Lawrence, Hudson Bay and the Plains, the Pacific Slope, and the Far North—and to complete the story of each part. This has some disadvantages. We follow Mackenzie to the Pacific coast before we read of his earlier journey to the north, and we read in two separate sections of the work of David Thompson. There is, however, no easy way of dealing with such a large body of material, and Dr. Burpee does indicate, in his last chapter, some of the broad features which marked the progress of discovery. Of the early explorers, Dr. Burpee has little fresh to say, and wisely refrains from joining in controversy about landfalls of the Norsemen and John Cabot. But he does scant justice to Sebastian Cabot, for although he includes Dr. Williamson's classical study in his bibliography he makes no reference to the voyage of 1508–9. On evidence available at present there seems to be no reason to doubt that Sebastian discovered Hudson Bay on that voyage. Nor is Dr. Burpee entirely happy in his references to Drake and to Cook. Drake is said to have "rounded the Horn in 1578". He may have seen the southern end of South America, but he had sailed through Magellan's Strait and been driven south by storms. As, however, he never saw any part of Canada—and this may be said of several explorers who are included in the book—the error is of small importance. As for Cook he is described as having "explored the north-west coast of North America from Nootka Sound, in Vancouver Island, to Alaska". Actually his instructions, which he carried out faithfully, were to make for New Albion, the land of Drake's discovery, and then sail along the coast without delaying to explore it until he reached 60° N., that is, in the modern Alaska. Hearne had shown, as Dr. Burpee points out, that a passage in any lower latitude was unlikely to be found, and Cook's business was to find a passage rather than to explore a coastline. It was Vancouver as Dr. Burpee shows, who was the real explorer of this coast, and it is a pity that more space has not been given to his accurate, detailed, but often forgotten survey.

The publishers claim this as Dr. Burpee's "greatest contribution to Canadian history". We doubt if the author would have shared this view. None the less his book is full of learning and of human interest and can be read with profit and with pleasure by the serious student and by the general reader.

J. N. L. BAKER

BIOLOGY OF SEX HORMONES

Biological Actions of Sex Hormones

By Dr. Harold Burrows. Pp. x+514. (Cambridge: At the University Press, 1945.) 42*s*. net.

DR. H. BURROWS' volume provides a comprehensive summary of literature on the sex-hormones up to the period 1941–42. It is divided into six parts, which deal, respectively, with the gonadotrophic factors of the pituitary; the gonadal hormones in general; the androgens; the œstrogens; the progestational hormones; and the sex hormones of the adrenal cortex. The author has not excluded any material of importance, and because of the length of the book and his method of presentation, it has necessarily assumed more the character of a summary of what has been written on different topics than a review, the specific purpose of which would be to demonstrate the most fruitful trends of current research and a general synthesis of the subject. As Dr. Burrows himself states, his purpose was to produce "a co-ordinated summary of experimental enquiries" carried out in the laboratory. In this he has undoubtedly succeeded, even though one regrets that he has stopped short of providing the reader with his own general, or special, conclusions about the matters which he has treated.

The War has receded far enough for one to be aware of the debt that is owed to those who have made it possible for others to recapture the thread of fundamental science with speed and ease. The war years not only considerably slowed down the rate of basic research, by interpolating other more practical issues into the everyday life of the man of science; they also diluted the flow of interest in many fields of science, with the result that before resuming work, a great deal has to be done by the individual worker in reconcentrating his sphere of interest. This difficulty is particularly great in the more actively growing fields of science, and all endocrinologists will therefore owe a major debt of gratitude to Dr. Burrows for his painstaking service and solid achievement in pulling together the literature of the subject in so useful a form.

NATIONAL RESEARCH LABORATORIES OF INDIA

INTRODUCTION

By Sir SHANTI BHATNAGAR, O.B.E., F.R.S.
Director, Scientific and Industrial Research, India

THE importance of scientific research and of the application of scientific knowledge to all national reconstruction activities has been fully realized in India in recent years. In order to organise co-ordinated research in the several sciences fundamental to the welfare and progress of the country, it was considered desirable to establish laboratories in which scientific and industrial research could be carried out on a sufficiently large scale commensurate with our future industrial potential, and a proposal to this effect was first initiated by the Director of Scientific and Industrial Research in September 1941.

It will, perhaps, not be out of place to give here a brief account of the early work of the Council of Scientific and Industrial Research, as the present plans for the Laboratories have a direct bearing on it. It may be recalled that a Board of Scientific and Industrial Research was set up by the Government of India in 1940, and this was followed by the setting up of the Council of Scientific and Industrial Research in 1942 to control and co-ordinate the activities of the Board and of the newly created Industrial Research Utilization Committee. This was the first concrete step taken by the Government towards placing industrial research on its feet in India, though the immediate need arose mostly out of demands made by the War. The War provided an effective stimulus to the activities of the Council, which steadily increased even with the limited facilities available, since any large expansion scheme was ruled out by difficulties in obtaining building materials, laboratory equipment, services of experts, etc. The initial experience during the war-period, however, served the useful purpose of bringing to light the inadequacy of the existing organisation and thereby focusing public attention on the necessity for expanding the facilities available for research as an important national problem.

Accordingly, in the following year, the Council approached the Government of India with a post-war plan for the establishment of five national laboratories and research institutions; namely, a National Physical Laboratory, a National Chemical Laboratory, a National Metallurgical Laboratory, a Central Glass and Ceramic Research Institute, and a Fuel Research Institute. The scheme was formally approved by the Government, and active planning work for the five laboratories was started soon after, by the setting up of expert committees for drawing up detailed plans and estimates for each of the laboratories. The Government announced a capital grant of Rs. 1 crore for the establishment of these laboratories, and also allotted a spacious site of more than sixty acres of land in New Delhi for the location of one of the national laboratories. Considerable public interest was evinced in the Council's scheme, and several industrialists came forward with donations towards the cost. The House of Tatas gave Rs. 20 lacs towards two of the laboratories—the National Chemical Laboratory, Rs. 8·3 lacs, and the National Metallurgical Laboratory, Rs. 11·7 lacs. The Indian Steel and Wire Products, Ltd., gave Rs. 1 lac, and the late Mr. D. P. Khaitan and the Indian Metallurgical Association gave Rs. 25,000 and Rs. 10,000 respectively. A prominent landlord, the Raja of Jharia, made a gift of 100 acres of land in Dhanbad —the heart of the coal-fields area—for the location of the Fuel Research Institute.

In planning the National Laboratories, the committees responsible have been fully alive to the immediate needs, and have also tried to meet future requirements by drawing up both short- and long-term programmes of work for each Laboratory. When completed, the Laboratories will cover all aspects of research in their respective fields, and will have semi-process or pilot-plant facilities for determining the value of the investigations to industry.

Standardization is another aspect of work which has not hitherto received sufficient attention in India. The Indian Standards Institution, which has just recently been established, will require considerable scientific assistance in its various technical committees, and the co-operation of the National Laboratories will go a long way towards establishing industrial standards suitable for the needs of the country. In addition, the National Physical Laboratory will have the custody of the fundamental national standards of mass and length.

The subject of fundamental versus applied research has been recently discussed in many quarters. But research can scarcely be divided into water-tight compartments: such division is a purely scholastic distinction which ignores how scientific research develops. What is fundamental to-day may become very much of applied research in a very short while. In actual practice, both the theoretical and practical aspects of science have progressed by an intimate interplay. Any artificial separation will be either theoretically unsound or practically unworkable, and if enforced will render theory arid and practice a petrified routine. It is by the interchange of thought and work that the most fruitful results have emerged. The part which fundamental as well as applied research is likely to play in future developments in India has been fully recognized by the Planning Committees of the various National Laboratories. The scope of work in each Laboratory could, perhaps, be best described to be of "the form of a continuous spectrum, at one end of which research work of the purest academic type and of the highest quality is carried out and at the other, the technical development of processes and equipment proceeds by stages".

One aspect of fundamental research work which can scarcely be neglected in India is that which requires specialized large-scale laboratories. During recent years, and particularly during the Second World War, organisation of scientific work has undergone vast changes. Not only does some of the present type of work require large-scale specialized organisations well outside the scope of university work, but also expenditure of money running into millions which can only be justified if diversified, coordinated and regulated application and professional continuity of work are guaranteed. This is not usually possible in the universities, where teaching and research necessarily go hand in hand and are essentially preparatory. Fundamental research is fast becoming a huge organised industry in itself, and must be planned as such.

It is necessary to stress here the important fact that these National Laboratories are not intended to supplant but to supplement the work of individual or collective industrial concerns or universities in respect of research. They will undertake work of the kind that does not fall ordinarily within the scope of industries. Their approach to industrial problems will be from a broad national point of view, rather than from the narrow outlook of a particular industry. The Laboratories will be in a better position to employ suitable talent and to try alternative approaches to problems simultaneously, without being restricted by any ideas of immediate financial gains. As a general rule, problems which bear on wider social and economic aspects than any individual industry could be concerned with are of necessity subjects of State scientific research, and it is in this spirit that the Laboratories will fulfil their functions.

In concluding this introduction, I may quote the words of Pandit Jawaharlal Nehru when laying the foundation-stone of the National Physical Laboratory: "when I look at the picture of new India that is emerging, I feel sorry that I may not be there to see it in its full glory; nevertheless, it is glory enough to take part in the building of it".

THE NATIONAL PHYSICAL LABORATORY OF INDIA

By Dr. K. N. MATHUR

Assistant Director (Planning), National Physical Laboratory of India

THE National Physical Laboratory of India, the foundation-stone of which was laid at Delhi on January 4, 1947, by Pandit Jawaharlal Nehru in the presence of a distinguished gathering of Indian and foreign men of science, including Sir Charles Darwin, director of the National Physical Laboratory, Teddington, and Sir Harold Spencer Jones, Astronomer Royal, is expected to fill a wide gap in the scientific and industrial organisation of India. At present there is no well-equipped laboratory in India which undertakes standards work, nor does India possess any standards of length or mass which could claim statutory acceptance or which could be reproduced with scientific precision for the use of industry. The foremost function of the new Laboratory will be, therefore, the maintenance of fundamental and derived standards and the undertaking of research with the view of achieving a high degree of accuracy in the measurement and duplication of these standards. This will mean in practice that the Laboratory will have to undertake regular intercomparisons between its standards and those of other countries, which is the accepted method of all of the standards laboratories of the world.

Besides the fundamental standards of length, mass and time, there are direct derivatives of these, such as area, volume, density, velocity, etc., which have numerous industrial applications. In addition, scientific work as well as industry requires standards for a large number of other units, which only indirectly depend upon the fundamental standards, and the realization of which in practice requires scientific work of the highest precision. Some of the most important of these are the International Temperature Scale, over a wide range of temperatures; specific heats; conductivity; colour standards; electrical units such as the volt, ampere, ohm; standards of inductances and capacity; standard radio- and audio-frequencies; standards of luminous flux, etc. The great industrial expansion envisaged in the present plans of the Government of India will place a special responsibility on the Laboratory. This aspect of the Laboratory's work was emphasized by the Hon. Dr. John Matthai, Minister for Industries and Supplies, who is also the president of the Council of Scientific and Industrial Research, at the ceremony of laying the foundation stone of the Laboratory.

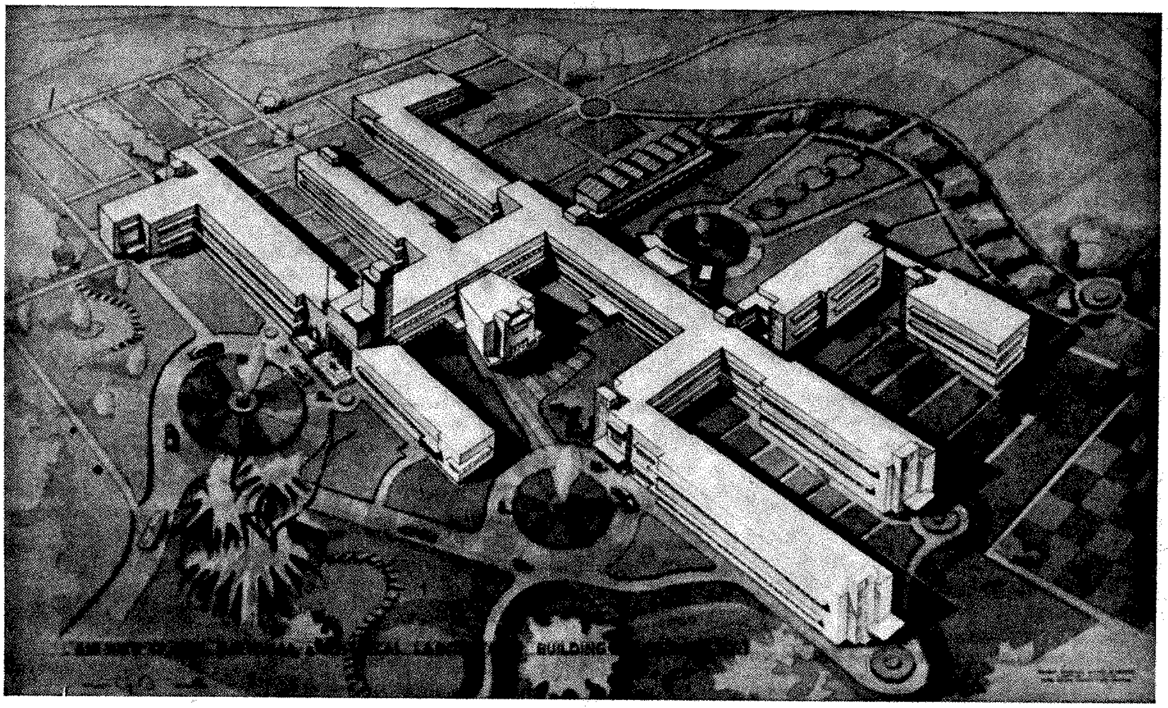

Fig. 1. ARCHITECT'S DRAWING OF THE NATIONAL PHYSICAL LABORATORY, INDIA

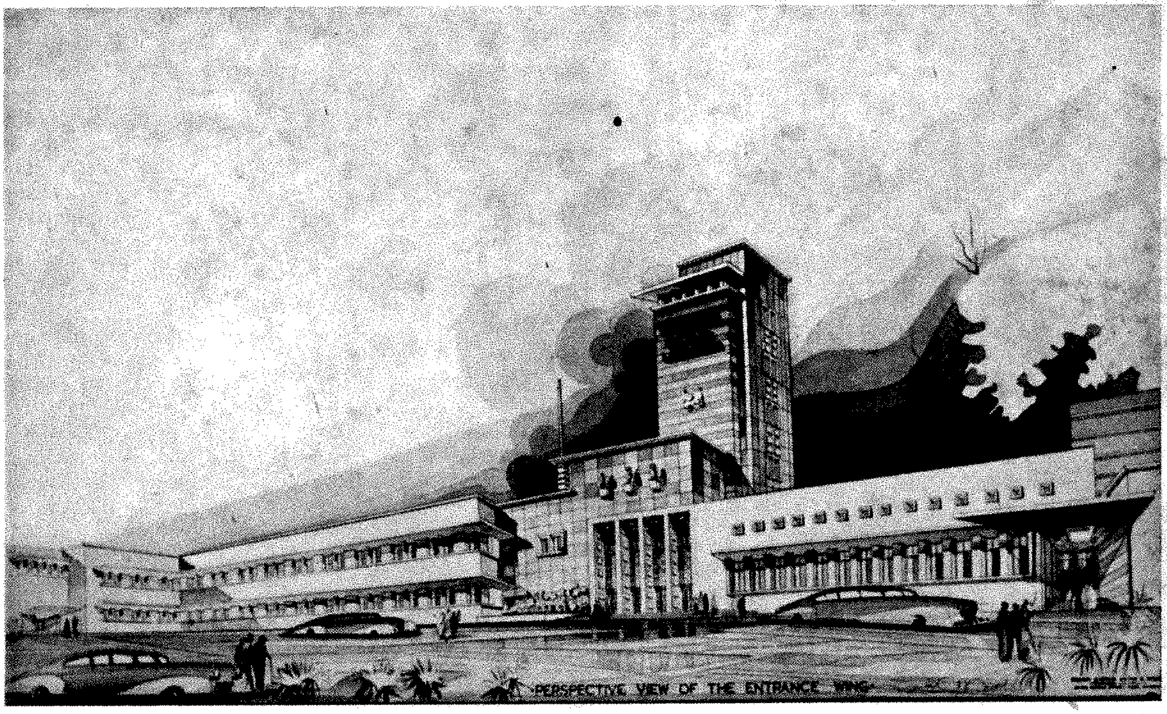

PERSPECTIVE VIEW OF THE ENTRANCE WING

Fig. 2. Entrance wing of the National Physical Laboratory, India

Scheme for the Laboratory

A comprehensive scheme detailing the scope, unctions, organisation, staff, etc., for the Laboratory vas drawn up by a Planning Committee, presided ver by Sir Ghulam Mohammad, and including some f the best-known Indian men of science, and has een published as a "Plan for a National Physical aboratory for India". This report, which was rawn up after consultations with the National hysical Laboratory, Teddington, and the National ureau of Standards, Washington, has been accepted y the Council of Scientific and Industrial Research, nd forms the basis on which the blue-prints of the aboratory have been drawn.

Divisions of the Laboratory

According to the Committee's recommendations, he work of the Laboratory will be carried on through ine Divisions, namely, (1) Weights and Measures ; 2) Applied Mechanics and Materials ; (3) Heat and ower ; (4) Optics ; (5) Electricity ; (6) Electronics nd Sound ; (7) Building and Housing Research ; 8) Hydraulics Research ; and (9) Analytical Chemstry. In addition to the above scientific divisions, he Laboratory will have (*a*) a central library with a ection dealing with research information for indusry, (*b*) central workshops, including glass-blowing nd -working shops, (*c*) general administration.

The Division of Weights and Measures will underake all the metrological work of the Laboratory nd will have the custody of the standards of mass nd length. It will have the responsibility for suplying sub-standards to other testing institutions. tandardization and checking of gauges, tapes, and hains, standard screws, hydrometers, barometers, olumetric glassware, all fall within its scope. This Division will also deal with the checking of watches nd chronometers, and will maintain standard timeeeping gear.

The Division of Applied Mechanics and Materials will be concerned with all problems of interest to engineers—elastic constants and the behaviour of materials under varying conditions of temperature and pressure, vibration and fatigue tests on materials under varying strains and with different types of loads, creep in metals, fluid friction, lubrication, etc.

The Division of Heat and Power will be responsible for all heat measurement and power development work. Testing of thermometers and pyrometers will be an important part of the work of this Division. Power development work will include heat engines, turbines, automobile and aero-engines, jet- and rocket-propulsion engines. Among other subjects which will be dealt with in this Division are low-temperature research, cold-storage problems and refrigeration.

The optical work of the Laboratory, including standardization of optical instruments, testing of lenses and binoculars, standardization of light sources, photometry and testing of lamps will fall within the scope of the Division of Optics.

It is proposed to subdivide the Electricity Division of the Laboratory into three sections dealing with (*a*) Electrical Standards, (*b*) Electro-technics, and (*c*) X-rays and Radiology. The electro-technics section will include also high-voltage tests. Standardization of radioactive sources, radioactive substances and their radiations will be included under section (*c*).

A very important Division of the Laboratory will be that of Electronics and Sound, which will include all aspects of electronic work, including electron microscopy. Investigations on the ionosphere and troposphere, research on micro-waves and development of radar, nature of atmospherics, industrial electronics, etc., are some of the other subjects to be included in this Division. The Sound section will cover all aspects of acoustical measurements and electro-acoustics, including properties of sound-insulating materials.

The Division of Building and Housing Research will be concerned mainly with the physical aspects of building and housing research. This may include investigations on the strength of building materials, acoustics of buildings, heat- and sound-insulation of buildings. Housing in the tropics and air-conditioning are expected to form an important part of this Division's work, as research on this aspect of India's housing needs is most urgently required.

The Division of Hydraulics Research is another engineering division in which the National Physical Laboratory's work will be concerned mainly with the physical aspects of the many problems. The importance of this Division will be very great in view of the large river development schemes which the Government of India is to launch very soon.

The Division of Analytical Chemistry will undertake analytical work for all the Divisions of the Laboratory.

Standardization

A very important aspect of work which has not so far received sufficient attention in India is that of industrial standardization. But with the recent inauguration of the Indian Standards Institution, India, it is hoped, will develop its own industrial standards in accordance with its special requirements. The National Physical Laboratory, it is expected, will be frequently called upon to assist the work of standardization by providing trained personnel and facilities for investigation by technical committees of the Standards Institution. The Council of Scientific and Industrial Research, it may be noted here, has been associated actively with the setting up of the Institution and was represented at the British Commonwealth Standards Conference and the International Conference on Standardization held in London in October last.

Location of the Laboratory

The question of the location of the Laboratory for a vast country like India is a very important one. The Planning Committee examined this question with great care, and made out an overwhelming case in favour of locating the Laboratory at the headquarters of the Central Government. It was realized that in any new constitution which India may have, the importance of contact between science and State will be even greater. Delhi has, in addition, a number of scientific departments of the Government of India, and close contact between them and the National Physical Laboratory will be mutually beneficial. In New Delhi, the Laboratory will be situated on a spacious site of more than sixty-six acres in close proximity to one of India's largest centres for agricultural research.

Very careful thought has been given to the design and lay-out of buildings for the Laboratory. Air-conditioning will be carried out practically throughout the entire Laboratory, and all precautions will be taken to eliminate dust. Since the great problem in India is to exclude heat from buildings as much as possible, the main wings of the Laboratory will run east and west, which will permit the use of natural light through north-facing windows without direct sunlight coming in. Provision is being made for a large lecture theatre and several seminar rooms. In addition to the central workshops, which will be equipped with the best and latest precision machinery, the several Divisions of the Laboratory will be provided with individual workshops for their day-to-day work. Staff amenities like cafeteria, social club and recreation grounds are being provided, as the necessity of human contacts between members of the staff is being constantly kept in view. On the question of internal lay-out and choice of apparatus, we had the benefit of the advice and experience of the National Physical Laboratory, Teddington. In the Division of Metrology, where accurate control of laboratory temperature is vitally necessary, the plans have been discussed at length with the Teddington staff.

Staff and Finance

The Laboratory will be under a director, who will be assisted with nine assistant directors—one in charge of each Division of the Laboratory. Each Division will have its complement of senior and junior scientific officers and scientific assistants, and for a start a scientific staff of ninety-eight has been recommended. The director will be assisted by an administrative officer to look after the routine non-technical work, and by an assistant director to look after routine technical work.

The capital cost of the Laboratory is estimated at four million rupees (£300,000), and a recurring grant of one million rupees (£75,000) annually is recommended for the first five years.

Money for the capital costs of the Laboratory has already been made available by the Government of India, and construction of the Laboratory is commencing very shortly.

NUCLEAR DISINTEGRATIONS PRODUCED BY SLOW CHARGED PARTICLES OF SMALL MASS

By Dr. G. P. S. OCCHIALINI

AND

Dr. C. F. POWELL

H. H. Wills Physical Laboratory, University of Bristol

IN studying photographic plates exposed to the cosmic rays, we have found a number of multiple disintegrations each of which appears to have been produced by the entry of a slow charged particle into a nucleus. Mosaics of photomicrographs of three of these events are given in Figs. 1, 2 and 3. The edges of the individual photographs have not been trimmed so that the components of the mosaics can be distinguished. Three grains of a track in Fig. 1, indicated by three arrows, which were out of focus in the original negatives, have been blackened with ink, but the photographs are otherwise completely unretouched.

It will be seen from Fig. 1 that, associated with the 'star', there is one track, marked *m*, which shows frequent changes in direction. The points of scattering are most frequent near the centre of the 'star', and become progressively fewer in moving away from it along the trajectory. This behaviour suggests that the particle approached the disintegrating nucleus. The conclusion receives additional support from the observation that the number of grains per unit length of the track, which can be taken as a measure of the ionization produced by the particle, is greatest

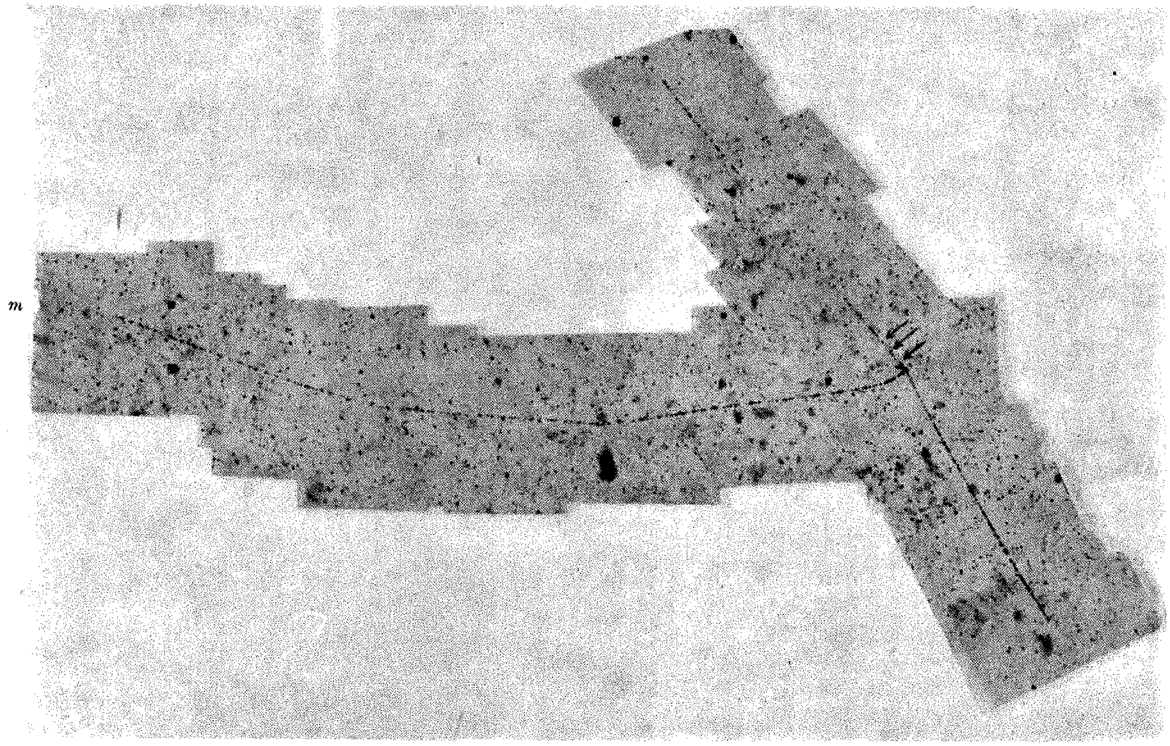

Fig. 1. COOKE × 45 'FLUORITE' OBJECTIVE, × 10 EYE-PIECE, WITH LEITZ PHOTOMICROGRAPHIC ATTACHMENT. C2 EMULSION LOADED WITH LITHIUM

The tracks of three disintegration particles can be distinguished, but only the particle of short-range remains in the emulsion

in the immediate neighbourhood of the disintegrating nucleus and becomes less as we recede from it.

We have now observed six of these events among a total of eight hundred stars. The probability, in any one case, that a charged particle, unrelated to the star, has, by chance, come to the end of its range within 1 micron of the disintegrating nucleus, is less than 1 in 10^5. We must therefore conclude that the particle entered the nucleus and produced a disintegration with the emission of heavy particles. Similar conclusions can be drawn from an inspection of the other photographs in Figs. 2 and 3.

The characteristics of the tracks which allow us to infer the direction of motion of the particles also lead to the conclusion that the particles were either at the end of their range or very near it when they entered the nucleus. **In all cases the particles enter the emulsion from the glass or at the surface.**

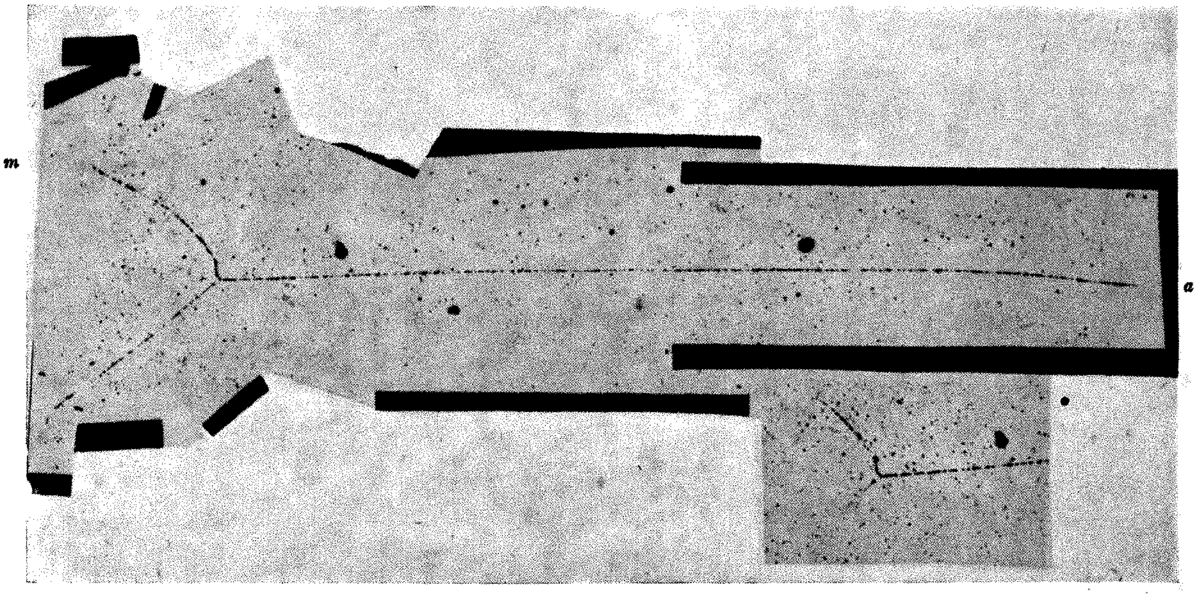

Fig. 2. COOKE × 45 'FLUORITE' OBJECTIVE, × 10 EYE-PIECE: DIRECT PHOTOGRAPHY WITH 'TELE-PANTO' PROJECTION MICROSCOPE. THE LONG TRACK *a* WHICH ENDS IN THE EMULSION IS PRODUCED BY A PARTICLE WITH A CHARGE EQUAL TO THAT OF THE PROTON. C2 EMULSION LOADED WITH LITHIUM

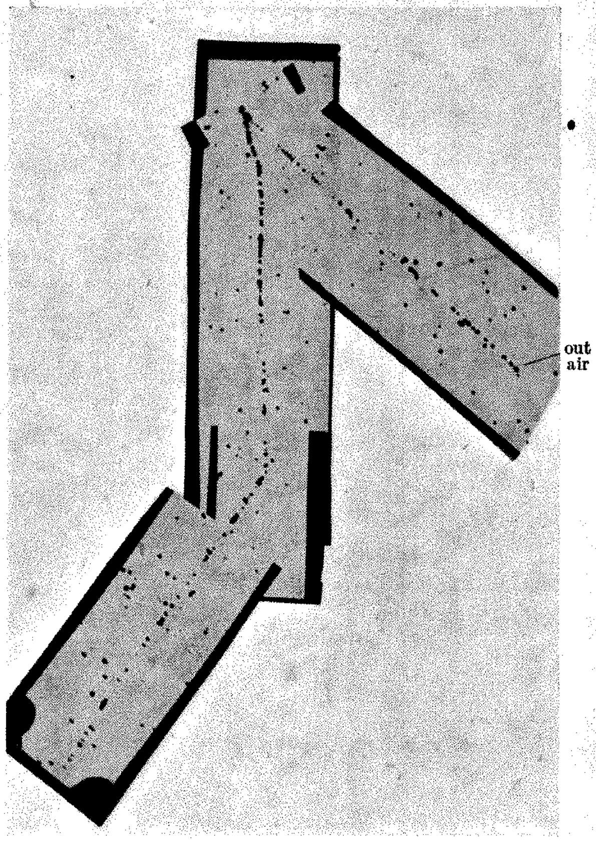

Fig. 3. COOKE × 95 'ACHROMAT' OBJECTIVE WITH × 4 EYE-PIECE. DIRECT PHOTOGRAPHS WITH PROJECTION MICROSCOPE. *C*2 EMULSION LOADED WITH BORON

Observations on the tracks of the slow particles indicated that the Coulomb scattering is more frequent than is to be expected if the particles are protons. Further, in moving along the trajectory, the increase in the grain density in the track, on approaching the centre of the star, is found to take place more rapidly than if the particles were protons. Both these qualitative observations suggested that the particles are of small mass, but more definite evidence is given by grain counts. Mr. Muirhead, in this Laboratory, has made a quantitative study of this subject, which is analogous to the problem of drop-counting in work with the expansion chamber. He has determined the variation of the grain-density along the tracks of protons in the emulsion in order to predict the distribution of grain density to be expected for particles with the same charge as a proton but with different values of the mass. A comparison of his results with the actual distribution of grains in the tracks of the particles producing the disintegration enables an estimate to be made of the mass of each particle. The values so obtained range from 100 m_e to 230 m_e, where m_e is the mass of the electron.

As in the case of drop-counting in experiments with Wilson chambers, any conclusion based on grain counting must be accepted with reserve. The latent image produced by charged particles in the 'Nuclear Research' emulsion is subject to fading, and although this effect is less marked in the types *B*2 and *C*2 than in *E*1 and *C*1, it is very serious in the usual exposures of six months duration. With this in mind we limited our exposures to six weeks; but even so the 'oldest' tracks obtained are subject to some fading. This will lead to an under-estimate of the mass of the particles, and Dr. Wassermann in this Laboratory therefore made observations by an alternative method based on measurements of the frequency of the Coulomb scattering of the particles.

Measurements on the tracks of the slow particles indicated that the number of deflexions which they suffer before being brought to rest is approximately three times greater than that of a proton of the same range. The expected frequency of scattering of particles of different mass, if they are subject only to Coulomb forces in collisions with nuclei of the atoms composing the emulsions, can be calculated. The observed frequency of scattering can thus be shown to correspond to a mass of the particle of 350 m_e ± 100.

The estimates of the mass of the particles by both methods are subject to large statistical errors due to the small number of tracks available for measurement, and they give no basis for assuming that we are dealing with particles of different types. They show conclusively, however, that the particles have a mass less than one fifth of that of a proton.

During the last few years, following the pioneer experiments of Rasetti, a great deal of evidence has been accumulated concerning the fate of mesons, which can be summarized as follows. Positive mesons decay with the emission of an electron which can be detected by delayed coincidence experiments. On the other hand, in accordance with the theoretical predictions of Araki and Tomonaga, negative mesons at the end of their range do not suffer such a β-decay but have a high probability of being captured by nuclei. This process has previously been supposed to involve excitation of the nucleus and subsequent emission of β-particles.

In view of the evidence provided by the present experiments, we believe that the particles producing the observed disintegrations are negative mesons. We consider our photographs as evidence of the fact that the entry of the particle into the nucleus produces excitation, which is followed by the emission

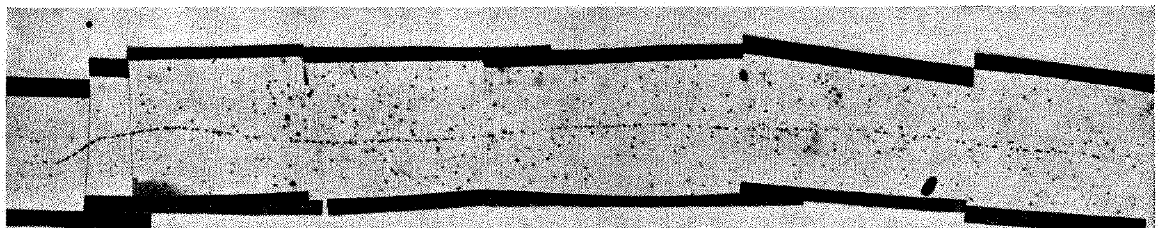

Fig. 4. COOKE × 95 'ACHROMAT' OBJECTIVE, WITH × 4 EYE-PIECE. DIRECT PHOTOGRAPHS WITH PROJECTION MICROSCOPE. UNLOADED *C*2 EMULSION

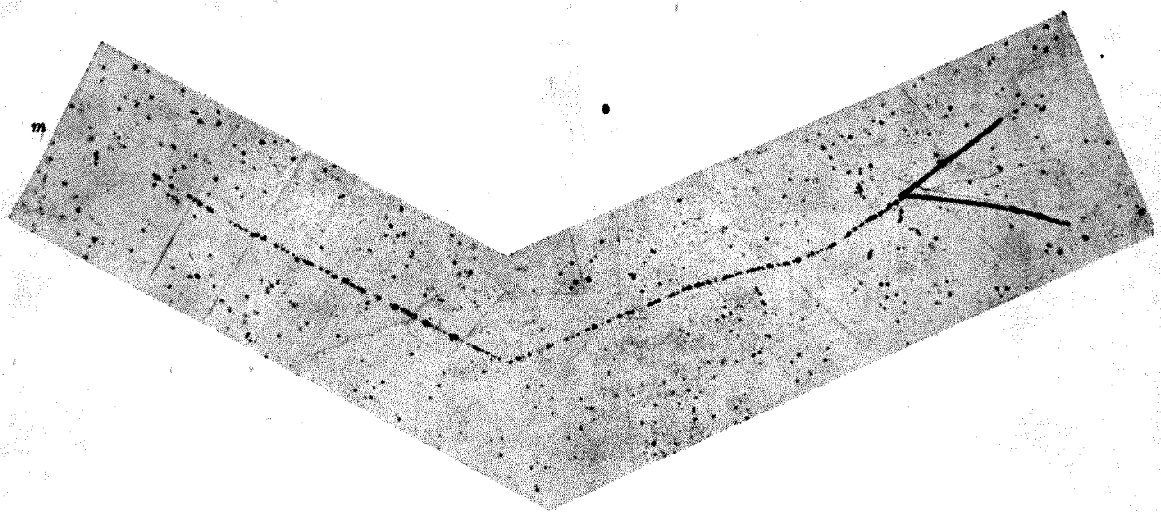

Fig. 5. Cooke × 45 'Fluorite' objective, × 4 eye-piece. Two α-particles and a particle of low range, possibly an electron, are ejected in the disintegration. *C*2 emulsion loaded with boron

of heavy particles. In support of the general picture of the fate of the positive and negative mesons, we find examples of tracks which end in the emulsion and which we identify as positive mesons, an example being shown in Fig. 4. Such tracks are distinguished by inspection, from the much larger number of disintegration protons ending in the emulsion, by the frequency of the small-angle scattering which they display, and up to the present ten examples have been found. Grain counts in every case lead to an estimate of the mass of the particle equal to or less than 230 m_e.

In addition to the determination of the mass of the particle, a second quantity of great interest is the energy released in the disintegration. In the particular disintegration shown in Fig. 1, all but one of the ejected particles pass out of the emulsion before reaching the end of their range. Further, because we regard the momentum of the particle producing the disintegration as very small, the observed directions of ejection of the disintegration particles make it necessary to assume, at least in some cases, that neutrons or other particles unrecorded by the emulsion have also been emitted. In these circumstances we cannot make a precise estimate of the total release of energy in any one of the disintegrations of this type which we have observed, and thus make a comparison of this quantity with the rest-energy of the particles producing the disintegration.

These considerations suggest that the most favourable conditions of observation for the determination of the mass of the particles will be provided in work with thick emulsions loaded with the light elements. It is possible, for example, that reactions such as those represented by the equations

$$\mathrm{Li}^{6}_{3} + m^{0}_{-1} \rightarrow \mathrm{H}^{3}_{1} + \mathrm{H}^{3}_{1} \text{ and } \mathrm{B}^{10}_{5} + m^{0}_{-1} \rightarrow \mathrm{He}^{5}_{2} + \mathrm{He}^{5}_{2}$$

may take place. Reactions of this type would be particularly easy to identify since they would lead to the ejection of two particles of equal range, moving in opposite directions from the disintegrating nucleus.

We are greatly indebted to the director of the Observatory of the Pic du Midi, Prof. J. Baillaud; to Dr. M. Hugon and Prof. Max Cosyns, who made it possible for us to obtain the exposures; to Mr. H. Muirhead and Dr. G. D. Wassermann, for making available to us the results of their work on the determination of the mass of charged particles; and to Mr. C. M. G. Lattes and Mr. P. H. Fowler for a number of discussions.

Note added in proof. Since this article was communicated, D. H. Perkins has published (*Nature*, January 25, p. 126) a photograph of an event similar to those we have discussed, and his conclusions are

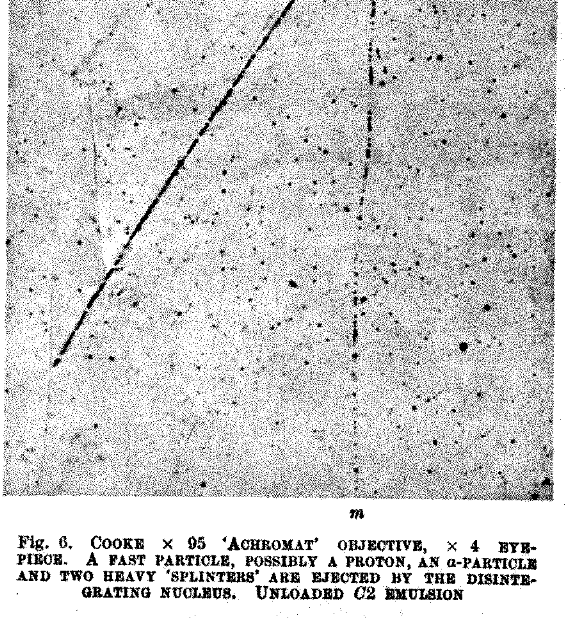

Fig. 6. Cooke × 95 'Achromat' objective, × 4 eye-piece. A fast particle, possibly a proton, an α-particle and two heavy 'splinters' are ejected by the disintegrating nucleus. Unloaded *C*2 emulsion

substantially identical with our own. The observed difference in the grain spacing of the meson tracks, in the *B*1 and *C*2 emulsions employed in the two experiments, is in good accord with expectations based on the known recording properties of the two types. The agreement between the results of observers in two different laboratories, working entirely independently with different experimental material, is a definite proof of the reliability of the photographic method in its present stage of development.

We have recently completed mosaics of two more of the six disintegrations referred to above, and reproductions of them are given in Figs. 5 and 6. We have also observed a number of disintegrations in which particles are emitted which are scattered more frequently than a proton of the same range, but which are more heavily ionizing than a meson of mass 240 m_e.

OBITUARIES

Dr. D. Jordan Lloyd

DOROTHY JORDAN LLOYD was born in 1889, the daughter and grand-daughter of two prominent surgeons in Birmingham. It would appear natural that her early studies at Newnham College were in zoology, later physiological and then physico-chemical studies of muscle. During the First World War, her scientific pursuits were diversified, and under the auspices of the Medical Research Committee she was one of a team which studied substitutes for components of culture media for bacteria which were then in short supply. Then her brilliant short paper on the causes and prevention of ropiness in bread was most appropriate to war-time, and indicated the versatility of her mind. Under the stimulating influences of Gowland Hopkins and particularly of W. B. Hardy, she was led to the long-sustained studies of swelling in colloidal systems, which when carried over to the 'structured' proteins in animal skins gained for her the firmly established international reputation as the authority on the chemistry of leather which she held at her death on November 21, 1946. Thus, zoology in Part II of the Tripos followed by the M.A.(Cantab.), research in physiology followed by the D.Sc.(Lond.), after some interval the fellowship of the Institute of Chemistry in 1922, authorship of a standard work, "Chemistry of the Proteins" (first edit., 1926 ; second, with Ann Shore, 1938) and the directorship of the British Leather Manufacturers' Research Association (1927–46) are the signposts of an exceptional career.

The output of Dr. Jordan Lloyd's published work both in pure and applied chemistry is impressive. Returning after the First World War to her main line of research, she published her earliest papers under the auspices of the Medical Research Committee on the swelling of gelatin ; but most of her work on this subject, and indeed by far the greater part of her scientific publications, was published after she joined the staff of the British Leather Manufacturers' Research Association in 1921. Her early work followed on that of Procter by establishing the swelling curves of gelatin as affected by hydrogen ion concentration, and demonstrating the effect of salts on the swelling. Later she showed how lyotropic effects are superimposed on the swelling effects of the Gibbs-Donnan theory, and illustrated the temperature effects which that theory predicts. She emphasized the importance of the balance between osmotic pressure and cohesion in controlling the degree of swelling. This work was extended to a study of the swelling of protein fibres (collagen, silk, hair) in aqueous systems, in which not only the water uptake but also the changes in length and thickness of the fibres were followed ; these changes are of importance in giving a more detailed picture of the effects of swelling on the individual fibres and on the interwoven structure of hides. These studies of fibres showed the effect of hydrogen ion concentration on swelling, in so far as it produces salt formation by the protein, and also illustrated certain lyotropic effects. The weakening of the structure of the fibres which was observed in certain conditions was linked with the study of the molecular structure of fibrous proteins.

A number of Dr. Jordan Lloyd's papers deal with the closely related subjects of the chemical make-up of the fibrous proteins, and its bearing on their structure, water relationships and swelling properties. She carried out experiments on the amount of water in gelatin which is 'bound', that is, associated with specific groups in the protein molecules, and is to a considerable extent independent of osmotic effects. In addition to these studies of the molecular structure of fibrous proteins, she investigated the fibrous structure of hides and skins, and showed how the swelling properties of collagen fibres are affected by the sheath or network ('reticulin') which surrounds them and can be broken by strong swelling or weakened at very low and very high *p*H values.

The above work dealt with proteins in aqueous systems. In later developments Dr. Jordan Lloyd turned to a study of the effects of non-aqueous liquids (organic solvents and acids), using changes in volume, dimensions and extensibility of fibrous proteins in these liquids, to throw light on the nature of the cross-bonds which hold the protein molecules to one another, and on the orientation of these molecules in the fibres.

Her keen sense of the applicability of this mass of scientific results to the processes of the industry was coupled with a resolution and an unfailing affability towards industrialists and their technicians which was an immense advantage to the Research Association. The long series of her lectures, well attended by its members and their technical personnel, and based on the work in progress in the Association's laboratories, were symptomatic of her hold on the imaginations of those in the industry, and illustrated her wide grasp of the application of science to it. In the industry the measurement of hydrogen ion concentration and buffer index became usual, particularly in heavy-leather tanning ; the use of the microscope and the correlation of photomicrographs with composition and use of tan liquors led to control of quality in leather in general and also in its production for special purposes—a control not hitherto attained ; the disposition of the tanned fibres in leather is now related to its various measurable physical properties, and hence to quality and serviceability—such have been developed largely by her leadership and enthusiasm, which have contributed much to the gradual change of leather production from a chancy industrial art to a sequence of processes scientifically controlled.

Miss Jordan Lloyd was perhaps unique among the scientific women of her time—a vigorous and vivacious leader of her mixed team both in triumph and tribulation (for her laboratories were twice wrecked in the 'blitz' on Bermondsey); a clear thinker and good speaker with a constructive mind; a manager with ability to delegate; a research worker herself who displayed an arresting interest in the investigations of many others; and with a demeanour and practical outlook in the tanneries which appealed to the employers and their technicians. She can have perhaps no more fitting epitaph—and one possibly no more welcome to her—than the impressive volumes now appearing which describe the results of twenty-five years of research for the British leather industry by the British Leather Manufacturers' Research Association under her inspiring leadership.

ROBERT H. PICKARD

WE regret to announce the following deaths:

Dr. F. F. Blackman, F.R.S., formerly reader in botany in the University of Cambridge, on January 30, aged eighty.

Prof. James H. Leuba, emeritus professor of psychology at Bryn Mawr College, Pennsylvania, on December 8, aged seventy-eight.

Prof. L. W. Lyde, since 1928 emeritus professor of geography in the University of London, on January 24, aged eighty-three.

Dr. F. B. Mumford, emeritus dean of the College of Agriculture, University of Missouri, on November 12, aged seventy-eight.

NEWS and VIEWS

Advisory Council on Scientific Policy: Sir Henry Tizard, K.C.B., F.R.S.

MR. ARTHUR GREENWOOD, Lord Privy Seal, has announced in a Parliamentary written reply that it has been decided, in addition to the establishment of the Defence Research Policy Committee, to set up on the civil side an Advisory Council on Scientific Policy to advise the Lord President of the Council in the exercise of his responsibility for the formulation and execution of Government scientific policy. The chairman will be Sir Henry Tizard, who is also chairman of the Defence Committee, and the staffs of the two bodies will work in close association. The Council will include the heads of the principal Government scientific organisations and a number of scientific workers from outside the Government service. The former Scientific Advisory Committee will now cease to exist. The latter, it will be recalled, was set up in October 1940, and consisted of the president and secretaries of the Royal Society, and the secretaries of the chief Government research departments, under the chairmanship of Lord Hankey. In the new Advisory Council the choice of membership has been somewhat extended, but presumably its functions will be roughly the same.

As chairman of the Defence Research Policy Committee and also of the Advisory Council on Scientific Policy, Sir Henry Tizard will occupy a unique position in the scientific life of Great Britain. For this he is admirably fitted. Apart from a distinguished academic record which gave promise of exceptional ability, his work during and after the First World War in aeronautical research and his influence on British aircraft development made him well known in scientific and engineering circles. A short period (1927–29) as permanent secretary of the Department of Scientific and Industrial Research when that Department was becoming established gave him first-hand knowledge of State administrative machinery. From 1929 until 1942 he was rector of the Imperial College of Science and Technology, London, and since 1942 he has been president of Magdalen College, Oxford. Thus he has unusual experience in scientific, engineering and administrative fields such as few can boast, which makes the choice of Sir Henry for the chairmanship of the new bodies for the organisation of defence and scientific research a particularly appropriate one.

Thomas Alva Edison (1847–1931)

THOMAS ALVA EDISON was born in the then village of Milan, Ohio, on February 11, 1847, and died at West Orange, New Jersey, on October 18, 1931, at the age of eighty-four. Many years before Edison's death, Sir Richard Gregory wrote in his "Discovery, or the Spirit and Service of Science", "Thomas A. Edison is the embodiment of the method of specialised research with a practical purpose. By quickness of perception, fertility of resource, and persistent trial of everything until the best means of achieving his end has been found, he has become the leading inventor in the world." It is not far short of seventy years since the journalists of America raised him to the status of a sort of national hero. His first triumph was achieved when as a boy of fifteen he set up, printed and published a newspaper on a running train. By twenty-one he had secured the first of his thousands of patents and resigned an appointment with a telegraph company in order to bring out his inventions. From that time, patent followed patent, and in 1876 he founded the famous laboratory at Menlo Park, New Jersey, where he employed both men of science and men of skill to carry out his ideas. In quick succession came a series of innovations in telegraphy and telephony, the phonograph, photography, and in all that appertained to the generation, distribution and utilization of electricity. All that he did has to be studied with a knowledge of what had been and was being done by others, for he always made the fullest use of contemporary discoveries.

It was largely through the exhibition of Edison's 'Jumbo' dynamos and the incandescent lamp, in the United States and at the Paris Exhibition, that his reputation became world-wide. From his work on these things sprang the plans for the Pearl Street Electric Power Station in New York and the similar station at Holborn Viaduct, London, both of which were put into operation in 1882 for lighting the neighbouring streets and business premises. Some four hundred lamps in the telegraph operating room in the General Post Office, Newgate Street, were supplied with current from Holborn Circus. Edison was only thirty-five at this time, but he was probably at the height of his powers. His work and list of patents taken out afterwards, however, is impressive. In fertility of ideas he was perhaps only rivalled by his countryman Hiram Maxim. In later life he was accorded many honours, but he probably appreciated as much as any the award to him in 1892 of the Albert Medal by the Royal Society of Arts. Only one American, Eads, the great bridge builder, had received it previously. Of Dutch descent on his father's side, Edison came of a long-lived family, and he could tire out any of his staff. His mother, to whom his debt was great, was of Canadian-Scottish descent. He himself was twice married and had six children. The Menlo Park laboratory has now been removed to Mr. Henry Ford's Industrial Museum at Dearborn, Michigan; it is a worthy memorial.

New York Academy of Medicine: Centenary Celebrations

THE first meeting of the New York Academy of Medicine was held on January 6, 1847, when the founders dedicated themselves to the establishment of an institution for the improvement of medical education, the advancement of the public health, the elimination of quackery and malpractice and the instruction of the public on matters of health and hygiene. Centenary celebrations will begin on March 6, with an assembly of the fellowship and the friends of the Academy, when the centennial discourse will be delivered by Prof. John A. Ryle, head of the Institute of Social Medicine at Oxford, who will speak on "Social Pathology and the New Era in Medicine". Following this meeting, a series of activities in the Academy building have been planned which will continue throughout March and April. Each of the eleven sections of the Academy will celebrate the centennial with a dinner of its own members, followed by a meeting in which eminent authorities in the specialty will participate. Each of the Academy's standing committees has arranged for a three-day conference, dealing with post-graduate medical education, public health, social medicine, hospitals and medical libraries respectively.

Various affiliated clinical and scientific societies such as the Harvey Society, the Society for Experimental Biology and Medicine, the New York Academy of Sciences and the New York Chapter of the American Chemical Society have accepted invitations to hold meetings in the Academy building during the period of the celebration. A historical exhibit of the Academy and its role in medical progress over the past one hundred years is being assembled and will be on view in the Academy throughout March and April. An exhibit is also being assembled in collaboration with the New York City Planning Commission and hospital authorities dealing with the history of the older municipal and voluntary hospitals of the city, at which plans for their post-war development will be shown. Special public exhibits on medical and historical subjects are being arranged at the Metropolitan Museum of Art, the New York Public Library, the New York Historical Society, the Museum of the City of New York and at private art galleries which possess famous prints, collections and other *memorabilia* on the medicine of a hundred years ago. Dr. George Baehr, president of the Academy, will broadcast an address on "A Hundred Years of Medical Progress".

Atomic Research in India

IT is reported (*J. Sci. Ind. Res., India*, **5**, 90; Aug. 1946) that the Atomic Research Committee of the Council of Scientific and Industrial Research, India, has recommended an intensive geological and physico-chemical survey of the thorium-bearing minerals in Travancore, and set up a sub-committee to draw up proposals for a similar survey of uranium-bearing minerals in India. The Committee considers that atomic research should be given first priority and encouraged by the Government of India on a large scale. However, as it is likely that only small sums will be available for the purpose, it will be necessary to concentrate research at one centre in the country. The centre recommended is the Tata Institute of Fundamental Research in Bombay, where a 300 MeV. betatron, with a team of ten workers to operate it, is to be established. Grants, to Prof. M. N. Saha for operational expenses of a cyclotron, and to Prof. D. M. Bose for research on the trans-uranic elements, were also recommended by the Committee.

A New Polarizing Light-Filter

DR. BRUCE BILLINGS, of the Polaroid Research Laboratory (Polaroid Corporation, Cambridge 39, Mass.), has recently given to the American Astronomical Society and the American Association for the Advancement of Science an account of a new type of light filter, making use of the familiar process of building up a filter by the use of crystal plates. Dr. Billings has varied the method by using plates the optical characteristics of which change under the influence of an electric field. This admits of much more rapid and easily controlled changes in the wave-lengths transmitted through the filter than was possible with earlier types. No details are given in the account available as to the narrowness of the band of transmitted light; but it is claimed that it allows for changes in the velocity in the line of sight in prominence streamers so as to give a complete record of the motions of parts of a prominence from a series of pictures taken at different wave-lengths in rapid succession. This promises a marked advance in our knowledge of the three-dimensional structure and whirling motions in prominences, just when they are becoming of increased interest to the student of solar and terrestrial phenomena. Further details will be awaited with interest.

Kew Bulletin

IT will be welcome news to botanical systematists that publication of the *Kew Bulletin* has been resumed after a lapse of nearly five years. The last number to appear was No. 3, 1941, which was issued in March 1942, and publication was thereafter suspended until No. 1, 1946, which has just been issued (London: H.M. Stationery Office, Dec. 1946, 2*s*. 6*d*.). It contains a continuation of the additions to the flora of Borneo and other Malay Islands, a part of which was published in 1940, a key to the Carices of Malaysia and Polynesia, notes on some species of the genus *Cryptolepis*, and a description and figure of a new species of *Arisœma* as principal contents.

Spiral Cracks in Glass Tubing

W. P. THISTLETHWAITE, Merchant Venturers' Technical College, Bristol, writes: "A few days after the appearance in *Nature* of October 19 (p. 582) of a letter on this subject, a student brought to me a test-tube exhibiting a perfect spiral crack. The tube was new but notched at the mouth, and was being used to heat a mixture of sand and ammonium chloride. Apparently the crack appeared immediately on contact with a bunsen flame; it originated at the notch in the lip of the tube. That the crack was complete and not merely superficial was shown by the concertina-like behaviour of the tube when pulled."

Summer School in Theoretical Physics and Conference on Mechanical Properties of Solids

The University of Bristol, in co-operation with the Institute of Physics, is arranging a Summer School in theoretical physics, with particular application to cohesive forces in metals and mechanical properties of solids, to take place during July 2–5. Lectures will be given by Prof. N. M. Mott, Dr. H. Fröhlich, and other members of the staff of the Laboratory. The course will be followed by a Conference on the Mechanical Properties of Solids (July 7–9), at which papers on the experimental and theoretical aspects of the subject will be given by research workers from Great Britain and abroad. The Summer School is intended mainly for members of staffs of Government and industrial research laboratories who wish to familiarize themselves with the theoretical aspects of subjects on which they have carried out experimental investigations. Subjects to be treated will include: cohesive forces in metals and elements of the zone theory; properties of Taylor dislocations; the Griffith crack theory; deformation of non-metals and theories of viscosity of liquids. The Conference will deal with the same subjects, and the lectures in the Summer School will be designed to provide the theoretical background for the discussions of the Conference. There will be no fee for the Conference, and it is not envisaged that everyone attending the Conference will wish to attend the Summer School. Accommodation will be reserved for a limited number at the University hall of residence, Wills Hall, Stoke Bishop, Bristol, 9. Particulars as to admission and as to the fees payable for the Summer School can be obtained either from the Secretary of the Institute of Physics, 47 Belgrave Square, London, S.W.1, or from the Director of the Department of Adult Education, University, Bristol

Symposium on Coal, Petroleum and Their Newer Derivatives

The Scottish Sections of the Royal Institute of Chemistry have arranged a symposium on "Coal, Petroleum and Their Newer Derivatives" to be held at St. Andrews during July 7–12. The conveners have received much help from the Principal of the University of St. Andrews, and the staff of the Department of Chemistry of the University. The symposium is designed to give industrial scientists and others a comprehensive idea of developments which have been made in recent years in heavy organic chemistry. The first part of the symposium will deal with the raw materials and their sources, the second part with chemical syntheses, and the third part with physical-chemical problems of polymerization, etc. Both academic and industrial aspects of the problem will be discussed. Each lecture will be followed by a short interval for discussion, and on the last day there will be a general discussion and the position will be reviewed. Those attending the symposium may be accommodated in the students' residences. Arrangements have been made for accommodation from arrival on the evening of July 5, until the morning of July 12. Bookings will commence on March 1, and applications should be forwarded to the Secretary, Royal Institute of Chemistry, 30 Russell Square, London, W.C.1.

Royal Microscopical Society: Officers

The following have been elected officers of the Royal Microscopical Society: *President*: Dr. J. R. Ludford; *Vice-Presidents*: Dr. G. M. Findlay, Mr. C. F. Hill, Dr. James A. Murray, Dr. T. E. Wallis; *Hon. Treasurer*: Mr. S. R. Wycherley; *Hon. Secretaries*: Mr. F. C. Grigg, Dr. H. Moore; *Ordinary Members of Council*: Mr. F. D. Armitage, Dr. L. P. Clarke, Dr. F. Greenshields, Major Maxwell Knight, Mr. Chetwynd Palmer, Mr. R. Ross, Mr. D. J. Scourfield, Mr. J. Smiles, Mr. H. Gilbertson Smith, Mr. E. Wilfred Taylor, Dr. C. Tierney, Mr. J. M. Watson; *Hon. Editor*: Dr. G. M. Findlay; *Hon. Curator of Instruments*: Dr. C. Tierney; *Hon. Curator of Slides*: Mr. N. Ingram Hendey; *Hon. Librarian*: Mr. R. Ross.

Royal Meteorological Society: Officers

The following have been elected officers of the Royal Meteorological Society: *President*, Dr. G. M. B. Dobson; *Vice-Presidents*, W. Dunbar, G. Manley, Sir Charles Normand, J. F. Shipley; *Treasurer*, W. M. Witchell; *Secretaries*, E. L. Hawke, Wing-Comdr. R. M. Poulter; *Scottish Secretary*, A. J. Drummond; *Foreign Secretary*, L. C. W. Bonacina; *Editor*, Dr. R. C. Sutcliffe; *Council*, A. C. Best, G. S. Callendar, J. S. Forrest, Capt. L. G. Garbett, Major H. C. Gunton, W. G. Kendrew, I. T. D. Kirkpatrick, Dr. A. R. Meetham, Dr. F. J. Scrase, P. A. Sheppard, A. E. Slater, Dr. T. W. Wormell.

Announcements

Princess Elizabeth has been elected a Royal Fellow of the Royal Society.

Prof. A. A. Hall, Zaharoff professor of aviation and head of the Department of Aeronautics, Imperial College of Science and Technology, has been appointed a member of the Air Safety Board.

Dr. Franz Weidenreich, of the American Museum of Natural History, is the first recipient of the newly created Viking Fund Medal and Prize in Physical Anthropology, for his many contributions to palæo-anthropology, and especially for his very important recent studies on fossil man in China and Java. Dr. Weidenreich was presented with the Viking Fund Prize of 1,000 dollars at the annual meeting of the American Association of Physical Anthropologists on December 28.

Mr. C. L. Bird, lecturer in dyeing in the University of Leeds, has been appointed editor of the *Journal of the Society of Dyers and Colourists* in succession to the late Prof. F. M. Rowe.

To commemorate the centenary of the Chemical Society, which was founded at a meeting on February 23, 1841, in the rooms of the Society of Arts, a special joint meeting of the two Societies will be held at the Royal Society of Arts, John Adam Street, Adelphi, W.C.2, on February 19 at 5 p.m. Viscount Bennett, president of the Royal Society of Arts, will preside, and Sir Harold Hartley will speak on "A Century of Chemistry". Tickets of admission will be available on request to the Secretary, Royal Society of Arts.

Owing to continued public interest, the "March of Time" film entitled "Atomic Power" will continue to be shown at the Science Museum until February 23, by courtesy of Messrs. 20th Century Fox Film Co., Ltd. It is being shown on weekdays at 2.30 p.m., and on Sundays at 3.15 and 4.15 p.m. Admission is free.

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Nature of Myosin

We have been led to regard 'myosin' as a rather involved system of substances, in spite of the fact that it readily crystallizes and behaves as a homogeneous substance on recrystallization. It consists of a skeleton to which are adsorbed a number of protein-like substances. The skeleton, and also the adsorbed proteins, are, in themselves, inactive, their system being only capable of enzymic reactions and of contraction. The adsorbed substances all seem to belong to the same remarkable group of substances, characterized, in impure condition, by their stability in 0·1 *n* hydrochloric acid at 100° (15 min.). They can be treated with *n* hydrochloric acid or precipitated by trichloro-acetic acid without loss. These substances will be called 'protins', to distinguish them from other proteins. H. M. Kalckar was the first to describe, in muscle, an acid- and heat-stable protein, his 'myokinase'.

So far, we have been able to recognize the existence of 'protins', involved in the following reactions of 'myosin': (1) 'ATP-*P*-protin', involved in the dephosphorylation of adenosine-triphosphate (Banga). (2) 'ATP-*c*-protin', involved in the contraction of myosin, linked to fibrous actin, in presence of adenosine-triphosphate (Guba). (3) 'ATP-*N*-protin', involved in the deamination of adenosine-triphosphate by myosin (Banga). (4) 'ADP-*P*-protin': dephosphorylation of adenosine-diphosphate (Banga). (5) 'ADP-*N*-protin': deamination of adenosine-diphosphate (Banga). (6) 'ADP-*c*-protin'; contraction of myosin, linked to actin, in presence of adenosine-diphosphate (Guba).

(1) and (2) are probably identical. (4) and (5) may be identical since deamination of adenosine-diphosphate always goes *pari passu* with dephosphorylation (Banga). If (4) and (5) are identical, the substance cannot be identical with (6), which is a chromoproteid and can be inactivated by oxidation and reactivated by reduction (Guba); (4) and (5) can be inactivated by oxidation but cannot be reactivated by reduction. (6) may be identical with either (4) or (5) if they are different substances. (3) and (5) are definitely different, and so are (1) and (3).

The 'protins' can be found in free condition in a watery muscle-extract and can be readsorbed to the skeletal substance of myosin, forming an active complex again. The 'protins' involved in the reactions with adenosine-diphosphate can be removed relatively easily from myosin if the latter is poor in actin: it suffices to suspend the myosin over-night in a bigger volume of 0·025 *m* potassium chloride at 0°. The 'protins' involved in the reactions with adenosine-diphosphate can be removed only under special conditions. In this case the myosin must be entirely free of actin. In order to inactivate her myosin for the phosphatase test with adenosine-triphosphate, Banga suspended it (1 mgm. per ml.) in 0·5 *m* potassium chloride, containing 0·2 *m* acetate-buffer of *p*H 6, and stored it for two days at room temperature. Guba suspended his myosin in big volumes of 0·025 *m* potassium chloride of *p*H 6 for 5–36 hours at 0°, depriving it of contractility in presence of adenosine-triphosphate. One of his preparations, which was inactive in the contraction test, was still 50 per cent active as phosphatase. As the 'protins' are washed off, the skeletal substance becomes more and more insoluble and seems to denature. Hydrogen ions favour the dissociation of skeletal substance and 'protins' but at the same time tend to denature, the limits of both processes lying very close together. If the enzymic activity was reduced by more than 85 per cent, Banga was unable to obtain reactivation. On readsorption of 'protin' to the skeletal substance, the solubility of this latter increases.

The skeletal substance of myosin seems to be distinguished by a high adsorption power not only towards 'protins' but also towards different anions, cations, adenosine-triphosphate and other substances as well. Only the full system, containing the skeletal substance, with 'protins', potassium, magnesium, adenosine-triphosphate, possibly other anions and a special cerebroside (Guba and Szent-Györgyi) adsorbed, is active as contractile matter. This system is capable of contraction if linked to fibrous actin.

The conditions described may seem rather extraordinary. It must be remembered, however, that myosin is the first structural protein, analysed to this extent, performing a basic biological function and having two distinct states, characterized by a difference in free energy.

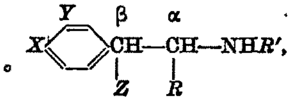
Molecular Asymmetry and Biological Activity

Easson and Stedman[1] have advanced the theory that the differences in biological activity between optical isomers should be considered in exactly the same light as the variations in potency shown by structural isomers. They pointed out that only one optical isomer can come into close contact with the specific receptors, and suggested that the weaker enantiomorph behaves as if one of the active groups is not present at all. In adrenaline, the active groups are: the amino group, the benzene ring with its phenolic hydroxyls, and the alcoholic hydroxyl group. By this view, *l*-adrenaline can come into complete contact with the receptors, and the weaker enantiomorph, *d*-adrenaline, cannot. Desoxyadrenaline (epinine) should, therefore, have the same activity as *d*-adrenaline, except in so far as the activity is modified by changes in physical properties by the presence of the alcoholic hydroxyl group. Easson and Stedman presented evidence that epinine and *d*-adrenaline do, in fact, have the same effect on blood pressure, and they also found support for the concept in drugs of the miotine type. If the theory is generally true, similar considerations should apply among compounds related to adrenaline: compounds containing a lævo-rotatory β-carbon atom should be the more active, and, with the above reservations regarding physical properties, the activity of the dextro-rotatory enantiomorphs should approximate to that of the desoxy-derivatives.

The theory received considerable support from Schaumann[2], who found that *d*-corbasil (dihydroxynorephedrine) has approximately the same activity as desoxycorbasil (dihydroxyphenylisopropylamine), but that *l*-corbasil is about 160 times as active. On the other hand, Alles and Knoefel[3] found that phenylethylamine is much more active than *d*-phenylethanolamine when tested in dogs and cats. Other differences in biological activity were also found, and they concluded that these two compounds are not at all related in their activities as required by the theory of Easson and Stedman.

To examine the theory further, I have collected in the table below the published results on the pressor activities of optical isomers of compounds of the type



where X is OH or H, Y is OH or H, Z is OH or H, R is CH_3 or H, and R' is CH_3 or H. The figures quoted for *d*-adrenaline and for epinine have the advantage over those quoted by Easson and Stedman in that they were both obtained in the same laboratory[4]. Taken in conjunction with the other published figures comparing the activity of these compounds[4,5], it is not unlikely that epinine is significantly more active than *d*-adrenaline. Although strictly comparable results are not available, desoxysynephrine appears to be much more active than *d*-synephrine[6,7].

The problem is rather more complex in compounds related to ephedrine, which have two asymmetric carbon atoms. It has been customary, with compounds of this nature, to compare each isomer with its enantiomorph (that is, *l*-ephedrine with *d*-ephedrine); but this involves a reversal in the configuration of both the asymmetric carbon atoms. For the present purpose, it is more logical to compare the three compounds having identical configuration on the α-carbon atom, but differing in configuration on the β-carbon atom; that is, to compare *l*-ephedrine with *d*-ψ-ephedrine and *d*-desoxyephedrine, and to compare *l*-ψ-ephedrine with *d*-ephedrine and *l*-desoxyephedrine. The former group has a dextrorotatory α-carbon atom, the latter a lævo-rotatory α-carbon atom[5]. In this connexion it is significant that *l*-ephedrine and *d*-ψ-ephedrine are much more powerful mydriatics than *l*-ψ-ephedrine and *d*-ephedrine. Furthermore, the latter two compounds are inactive as pressors in man, *per os*, under conditions in which the former two compounds are active[8]. These results must, therefore, be associated with the configuration of the α-carbon atom.

MOLECULAR ASYMMETRY AND PRESSOR ACTIVITY

Common name	Formula					Optical rotation		Pressor activity relative to *l*-adrenaline
	X	Y	Z	R	R'	βC	αC	
l-Synephrine	OH	H	OH	H	CH_3	—	Nil	1/58[6]
d-Synephrine	OH	H	OH	H	CH_3	+	Nil	1/3480[6]
Desoxysynephrine	OH	H	H	H	CH_3	Nil	Nil	1/108[7]
l-Adrenaline	OH	OH	OH	H	CH_3	—	Nil	1[4]
d-Adrenaline	OH	OH	OH	H	CH_3	+	Nil	1/20[4]
Epinine	OH	OH	H	H	CH_3	Nil	Nil	1/12[4]
l-Propadrine*	H	H	OH	CH_3	H	—	+	1/317[5]
d-ψ-Propadrine*	H	H	OH	CH_3	H	+	+	1/1900[5]
d-Benzedrine*	H	H	H	CH_3	H	Nil	+	1/270[5]
l-ψ-Propadrine*	H	H	OH	CH_3	H	—	—	1/1700[5]
d-Propadrine*	H	H	OH	CH_3	H	+	—	1/473[5]
l-Benzedrine*	H	H	H	CH_3	H	Nil	—	1/282[5]
l-Ephedrine	H	H	OH	CH_3	CH_3	—	+	1/142[5]
d-ψ-Ephedrine	H	H	OH	CH_3	CH_3	+	+	1/735[5]
d-Desoxyephedrine	H	H	H	CH_3	CH_3	Nil	+	1/787[5]
l-ψ-Ephedrine	H	H	OH	CH_3	CH_3	—	—	1/5000[5]
d-Ephedrine	H	H	OH	CH_3	CH_3	+	—	1/420[5]
l-Desoxyephedrine	H	H	H	CH_3	CH_3	Nil	—	1/555[5]

* Tested as *l*-mandelates.

Examination of the figures in the table shows that, if the theory of Easson and Stedman is correct, then the physical properties of the molecule must play a profound part in the biological activity; for the results, on the whole, are in poor agreement with the theory. The most abnormal results are given by the ψ-ephedrines and ψ-propadrines (norephedrines), which are very much less active than expected. It appears that for enhanced activity among compounds of this type, the optical rotation of the two asymmetric carbon atoms should be of opposite sign. This may be compared with the biological results obtained with quinine and related compounds, for Neeman[9] has pointed out that, for enhanced antimalarial activity, the optical rotation of C–8 and C–9 of the quinine derivative should be of the same sign.

THE hypothesis which Easson and I formulated to explain the quantitative differences between the physiological activities of optical enantiomorphs is simple and apparently without an alternative; its examination, moreover, is likely to throw light on obscure features in the general relationship, which undoubtedly exists, between chemical structure and biological activity. I therefore welcome attempts to examine further material with the object of testing its validity more extensively than has hitherto been possible.

The data which Dr. Badger has collected from the literature are, however, at first sight somewhat unsuitable for this purpose; the compounds involved possess, as compared with adrenaline, only small pressor activities; and the interpretation of the data is complicated by the presence in most of the compounds considered of a second asymmetric carbon atom. Nevertheless, despite these disadvantages, there is one striking regularity to be observed in the results: in each of the triads in which Dr. Badger has arranged the compounds, the abolition of the asymmetry of the β-carbon atom by the replacement of the alcoholic hydroxyl by hydrogen results in the production of a compound which has a pressor activity of the same order of magnitude as that of one of the β-hydroxy compounds and widely different from that of the other. This result is, in my opinion, in general accord with the hypothesis in question.

That Dr. Badger has not observed this regularity, or has not noted its significance, but, on the contrary, considers the data to be at variance with the hypothesis, is, no doubt, due to his too limited interpretation of the original hypothesis. As Easson and I pointed out at the time it was formulated, in order to apply the hypothesis to a particular drug, it is necessary to decide which of the four groups linked to the asymmetric carbon atom are concerned with the attachment of the drug molecule to its receptor. In the case of adrenaline, a decision presents no difficulty. But because the alcoholic hydroxyl group in *l*-adrenaline has a very potent influence in determining the large pressor activity of the molecule as a whole, and can therefore be assumed to assist in attaching it to the receptor, it does not follow that the same effect will be produced by a hydroxyl group similarly situated in compounds which, while they may be structurally related to adrenaline, lack certain of its other potent groups and contain substituents which are absent from adrenaline. This is particularly the case when the activities of the compounds range from 1/58 to 1/5,000 of that of *l*-adrenaline and are thus considerably less active than even epinine, which possesses no alcoholic hydroxyl. To ascertain the effect of the hydroxyl on the union between drug and receptor, it is necessary to consider the change in pressor activity when it is replaced by hydrogen.

From the figures quoted by Dr. Badger, it is evident that with *l*-synephrine and *l*-propadrine there is little change, and it must therefore be assumed that in these cases the hydroxyl plays no part in the attachment of the drug and is therefore oriented away from the receptor. On the other hand, the corresponding hydroxy compounds with dextrorotatory β-carbon atoms are far less potent, suggesting that here the hydroxyl, now directed towards the receptor, creates an obstacle to the complete attachment of the drug to it. The triad containing *l*-ephedrine behaves like the adrenaline triad and need not, therefore, be considered further. There remain, however, the *l*-ψ-propadrine and *l*-ψ-ephedrine triads. These differ from the *l*-propadrine and *l*-ephedrine ones in containing a lævorotatory α-carbon atom, which is no doubt responsible for their different behaviour. With these last triads, substitution of the β-hydroxyl by hydrogen causes a large increase in pressor activity when the β-carbon is lævorotatory and practically no change when it is dextrorotatory. With the former, the hydroxyl is evidently oriented in the direction of the receptor, thus creating an obstacle to intimate union between the two; with the latter, it is directed away from the receptor and hence plays a passive part in the activity of the drug.

Since Dr. Badger has referred to the work of Alles and Knoefel on phenethylamine and its β-hydroxy compounds, I should like finally to point out that he does not mention the result, obtained by these authors, that "phenethylamine and *d*-β-hydroxyphenethylamine are rather similar in their pressor effects in the rabbit in certain dosage and both are less active than *l*-β-hydroxyphenethylamine". Evidently, in rabbits at the particular dosage involved, these drugs do follow the hypothesis in much the same way as does adrenaline. The reason why the same relationship is not apparent with higher doses, or when cats and dogs are used, is no doubt connected with Alles and Knoefel's finding that the drugs are in these circumstances also active towards other receptors. If different active groups are involved in the union with these receptors, it is quite clear that no regularity is then to be expected.

Biosynthesis of the Belladonna Alkaloids

DR. W. O. JAMES, in his interesting paper on "Biosynthesis of the Belladonna Alkaloids"[1], states that the embryos and endosperms of the resting seeds of *Atropa* and *Datura* are without alkaloids, but that the latter appear at an early stage of germination.

Dr. Henry, in his "Plant Alkaloids", gives the following average total alkaloid figures for seeds:

Atropa belladonna	0·83 per cent
Datura metel	0·23 to 0·50 per cent
Datura stramonium	0·20 to 0·48 per cent

The results of numerous analyses have, in my experience, confirmed these figures. Since the embryo and endosperm constitute a large part of the bulk of the seed it would be interesting if Dr. James would indicate which part of the seed structure does in fact contain the alkaloids known to be present.

It may be of interest to record here that the juice of the ripe belladonna berry does not contain any alkaloids, and has a pleasant, sweetish but somewhat insipid taste.

[1] *Nature*, **158**, 654 (1946).

A NUMBER of independent investigators have examined the distribution of alkaloids in the tissues of *Atropa*[1,2,3] and *Datura*[1,2,4,5] seeds. They have used a variety of precipitants; but principally iodine in potassium iodide, which, with the technique developed by Errera[6] and his school, is the most dependable for revealing the whereabouts of alkaloids by precipitation within tissues. These workers are agreed that the belladonna and thorn-apple alkaloids are restricted in the ripe seed to the peripheral layers, that is, to the testa itself and especially to a thin layer of cells lying between the testa and the endosperm; probably a perisperm derived from the nucellus. This curious distribution is also found in the seeds of *Hyoscyamus*[1,4]. It has been confirmed in my own laboratory for those of belladonna[3]. Barth[5], examining *Datura stramonium* seeds that were not quite ripe, thought that there might be a little alkaloid also in the embryo and endosperm. Other investigators examining seeds that were fully ripe found none in either of these parts.

At the outset of germination, therefore, both endosperm and embryo are devoid of alkaloids, and Clautriau[1] obtained a completely alkaloid-free germination of *Datura stramonium* seeds by removal of the surface tissues. Normally, these alkaloids diminish[5], possibly on account of leaching out as salts from their exposed position in dead peripheral cells[7,8]. The alkaloids of the seedling plants appear first at the root apices[1,9], and removal of the outer seed tissues does not cause any abnormalities in germination[1]. The formation of quantities sufficient for micro-extraction has been recorded for belladonna only after three weeks; for thorn-apple after eighteen days and for henbane after seven weeks[10]. By a technique recently described[9], I have been able to observe alkaloid formation in *Datura* radicles no more than 3 mm. long, but not in those 2 mm. long or less. Synthesis *de novo* appears, therefore, to set in at the very outset of germination, and is characteristically associated with high metabolic activity. The alkaloids of the ripe seed are survivors from the activity of the post-fertilization stage of the ovule, which at first contains alkaloids in all its tissues. The inner tissues lose their alkaloids during maturation either by breakdown *in situ* or by migration to the periphery.

A Product of *Pseudomonas æruginosa* Active *in vitro* against *M. tuberculosis*

INFORMATION recently to hand in the lay press[1] that Theorell, Davide and Sjögren have developed an anti-tuberculosis remedy from the pyocyanic bacillus has prompted, at this early stage of its investigation, the following record of the isolation and characteristics of what may prove to be a similar organism.

On the assumption that if active antagonists to *M. tuberculosis* exist, they are likely to be found in the sewage tank of a tuberculosis sanatorium, various samples were treated by the Dubos enrichment culture method, tubercle bacilli being added at intervals over a period of five months. At the end of this time, an organism was isolated which showed a marked antagonistic effect to *M. phlei* and *M. tuberculosis*. This organism was identified as a strain of *Pseudomonas æruginosa*. The supernatant fluid of a twenty-day culture of this bacillus is inhibitory to a heavy inoculum of *M. tuberculosis* in a concentration of 1 in 80, and a crude chloroform extract is inhibitory in a concentration of 1 in 128,000. Even low concentrations are bactericidal in fourteen to twenty days. Exposure of *M. tuberculosis* to the action of the organism or its culture fluid extracts over short periods causes thickening, shortening, irregularity and beading, with progressive loss of acid-fastness. After some days, lysis of acid-fast organisms occurs.

The action of the Waterfall strain appears to be specific, as other strains of *Pseudomonas* tested have shown no antagonism to acid-fast bacteria. Further, in testing the activity of this particular strain against certain non-acid-fast types (*Staphylococcus aureus*, *Streptococcus hæmolyticus* and *Escherichia coli*), no antibacterial effect was observed.

The active substance is relatively heat-stable, but passage through a Seitz filter considerably reduces its potency. The most active preparations have so far been obtained from growth on a broth or liquid egg medium, but the antibacterial agent may also be obtained from growth on Youmans' or Dubos' medium. Chloroform extraction does not remove all the active material.

With the crude mixtures so far obtained, toxic effects are apparent in animals. 5 ml. of sterile culture fluid are sufficient to kill a guinea pig in twenty-four hours, while a mouse will survive a single subcutaneous injection of only 3–4 mgm. of a chloroform extract.

It has long been recognized that *Pseudomonas æruginosa* may secrete various antibacterial substances, among which are pyocyanine and its derivatives[2]. That the substance active against acid-fast organisms is not pyocyanine is suggested by the inactivity of ordinary strains, and by the fact that we have found pure *l*-hydroxy phenazine to be inhibitory in, at most, a concentration of 1 in 20,000.

This note is published by permission of the Director-General of Health in New South Wales.

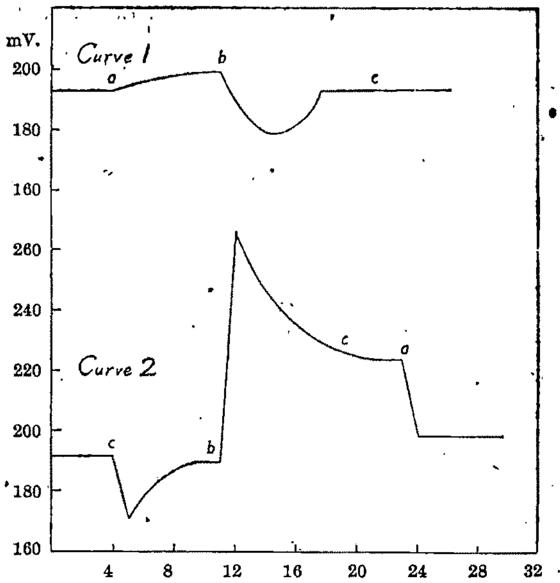
A Correlation between Redox Potentials and Synergisms in Resting Bacteria

THE destruction of nicotinic acid by suspensions of resting *Pseudomonas fluorescens* has been shown to be an enzymatic oxidation[1]. We have found that the oxygen uptake was decreased when methylene blue was added, but was not affected upon addition of sulphapyridine. However, after addition of a mixture of these compounds, a synergistic inhibition was observed.

The bactericidal and bacteriostatic effects of oxidation-reduction indicator dyestuffs have often been correlated to their poising action. It was, therefore, believed that an inhibitory synergism in which such a dyestuff is involved might manifest itself in changes of the oxidation-reduction potential of the system. Accordingly, a test was carried out in which the redox potential of phosphate-buffered and aerated suspensions of resting *Pseudomonas fluorescens* was measured with the Beckman *p*H meter, against a blank platinum electrode.

The changes in the E.M.F. are recorded graphically in the accompanying figure. Curve 1 indicates at point *a* an increase of the E.M.F. upon the addition of methylene blue to a buffered bacterial suspension and nicotinic acid at equilibrium. When sulphapyridine was added, at *b*, a decrease was observed. After equilibrium had been reached again, further addition of nicotinic acid (*c*) did not change the E.M.F. Curve 2 shows an initial decrease of the E.M.F. upon the addition of nicotinic acid (*c*) to the buffered bacterial suspension; after equilibrium was reached, sulphapyridine (*b*) brought about an increase in the



ADDITIONS MADE TO BUFFERED SUSPENSIONS OF RESTING *Pseudomonas fluorescens*: *a*, METHYLENE BLUE; *b*, SULPHAPYRIDINE; *c*, NICOTINIC ACID

E.M.F., which decreased and remained constant even after the addition of more nicotinic acid. When methylene blue was added (*a*), a sharp decrease of the E.M.F. occurred. It was thus found that the sequence of addition of methylene blue and sulphapyridine was significant.

Notwithstanding the difficulty of obtaining reproducible values for redox potentials in biological systems, it is suggested that the synergism of methylene blue and sulphapyridine in resting *Pseudomonas* can at least be partially explained by a change of the redox potential, the sign of the change depending upon the sequence of addition of the components. Guest and Salle[2] have observed that cations of the same element but of different valency show synergism in bactericidal action. The observations recorded here would indicate that synergisms, the factors of which poise the system to different redox potentials, can be partially explained; they give rise to potential differences within the bacterial suspension, which are greater, because of the reversal of sign, than those caused by each component alone, and are hence more effective.

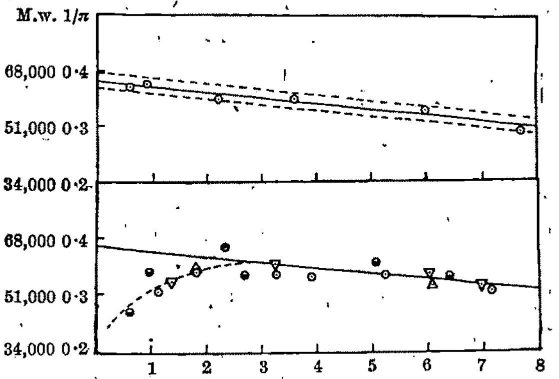
Osmotic Pressure of Fœtal Sheep Hæmoglobin

PREVIOUS osmotic pressure measurements on fœtal and maternal goat hæmoglobin[1] showed no significant differences in the molecular weights, which seemed in close agreement with the value of 68,000 reported for sheep hæmoglobin by Adair[2]. The present communication records some osmotic pressure measurements on the hæmoglobins of sheep fœtuses, aged 80, 92, 98, 102 and 112 days. The period of gestation in sheep averages 147 days.

Hæmoglobin solutions prepared by the method of Adair and Adair[3] were dialysed against $M/15$ phosphate buffer of pH 6·8. Osmotic pressure measurements were carried out by the method of Adair[4], the same buffer being used throughout.

The calculation of molecular weights from the osmotic pressures by a modification of van t' Hoff's law, and the determination by extrapolation of π_0, or the limiting value of the ratio P/C in the infinitely dilute solution, have been described by Adair and Robinson[5].



C = gm./100 ml. of solution. $1/\pi = C/P$.
Age of fœtuses in days: ◐ = 80, ● = 92, △ = 98, ▽ = 102, ⊙ = 112

The upper graph shows the relationship between $1/\pi$ and C obtained on a sample of maternal sheep hæmoglobin. Molecular weights corresponding to different values of $1/\pi$ are also presented. The calculated molecular weight is about 67,000. In the lower graph, data obtained on a number of samples of hæmoglobin from five fœtuses are shown. Extrapolation of the points obtained at higher concentrations indicate a molecular weight of 65,500 ± 2,500. At lower concentrations, however, the values of $1/\pi$ fall below the values expected from such extrapolation. The deviations are of a magnitude difficult to attribute to experimental error alone, and suggest the dissociation of fœtal hæmoglobin into smaller molecules on dilution. Further experimental data, however, are required on this point.

Andersch, Wilson and Menten[6] reported differences in the sedimentation constants of hæmoglobins prepared from human new-born infant and adult bloods. Diffusion constants were not measured, so the molecular weights were not calculated; but if the former are identical, their findings would indicate that human infant hæmoglobin has a molecular size half that of adult hæmoglobin.

Experiments with Different Methods of Isolating Physiological Mutations of Filamentous Fungi

During recent years, I have tried various methods of isolating considerable numbers of X-ray induced physiological mutants in fungi, *Ophiostoma multiannulatum* being the chief organism experimented on[1]. Of some six hundred mutants produced in this fungus, at present 463 are at least preliminarily classified, and thus the material in this case seems to be big enough to permit some general conclusions to be drawn as to the methods employed. 218 of these mutants have been isolated by the aid of some 'concentration method', the other 245 by the so-called 'total isolation method'. Some of the former were obtained from irradiated ascospores; but most of them, as well as all the latter, were produced by irradiating conidia of the (+)-strain No. 11.

The methods first mentioned imply a concentration of the mutants, in so far as the normal mycelia are to a great extent sorted out in some way before the isolation. The best procedure turned out to be the following one, here described quite briefly. The irradiated conidia are soaked with water at a low temperature for three days, and then they are transferred to a minimum nutrient solution at + 25° C. There the physiologically normal conidia germinate rapidly and develop small mycelia; the conidia with mutated nuclei, on the other hand, remain ungerminated, or develop only short hyphæ. Thus most of the former are removed by sieving the culture through a suitable filter, and most of the latter—together with all the conidia killed by the irradiation—are to be found in the filtrate. After washing the filtrate (by centrifuging), the latter part of the procedure is repeated once or twice more. The conidia in the final filtrate are then brought on to agar-plates containing malt-extract and yeast-extract. About 12–15 per cent of the mycelia developing in these plates are physiological mutants.

In using the 'total isolation method', the irradiated conidia are directly disseminated into malt-yeast-extract agar-plates, and all developing mycelia are isolated and tested. Of 13,405 mycelia isolated in this way, 245 turned out to be physiological mutants, that is, 1·83 per cent of the conidia surviving after irradiation and *c.* 0·02 per cent of all the conidia irradiated.

The accompanying table of the physiological properties of the mutants hitherto analysed shows that some types of mutations are obtained to about the same extent in both methods. Thus they are suitable for the parathiotrophic mutants (requiring bivalent sulphur), for the amino-acid-deficient mutants, and for those requiring a nucleotide constituent. As to the last-mentioned group, however, it will be noted that all the four guanine-requiring mutants have been obtained by means of concentration methods. The same holds good for the *p*-aminobenzoic-acid-heterotrophic mutants, among those requiring vitamins, whereas the great majority of the pantothenic acid and inositol-heterotrophic mutants have been obtained by the total isolation method. Possibly with the exception of the inositol-heterotrophic mutants, the mutated material is not yet extensive enough to decide whether the divergences in question are due to the different methods of isolation, or merely due to chance.

Here it may further be mentioned that a part of the irradiation experiments was performed with conidia impregnated with uranium (as uranyl nitrate). In this way a somewhat higher rate of mutations was obtained; but no definitely demonstrable changes in the qualitative composition of the yields of mutants could be observed, whether these were obtained by one or the other method of isolation.

Essential substance	Number of mutants isolated			
	Isolation method			Total
	'Concentration' *a*	'Concentration' *b*	'Total isolation' *b*	
Reduced sulphur	10	30	34	74
An amino-acid:				
Arginine	—	56	42	98
Lysine	—	22	32	54
Methionine	1	7	9	17
Aspartic acid	—	—	1 ?	1 ?
Not identified	—	3	5	8
A nucleotide constituent:				
Uracil	1	14	26	41
Hypoxanthine	4	43	51	98
Adenine	—	3	4	7
Guanine	1	3	—	4
Vitamin A				
Biotin	1	2	2	5
p-Aminobenzoic acid	3	1	—	4
Pantothenic acid	—	—	6	6
Inositol	—	2	18	20
Niacin	—	2	6	8
Unknown factor	1	8	9	18
Total	22	196	245	463

(*a*) Mutants obtained from irradiated ascospores. (*b*) Mutants obtained from irradiated conidia (Strain No. 11).

On comparing the results summed up in the table with those obtained in *Neurospora* by American workers[2], the following differences seem to be particularly striking[3]. Induced amino-acid deficiencies are found comparatively more often in *Neurospora* than in *Ophiostoma*, and many more different amino-acids are concerned. Moreover, in *Neurospora* more types of auxo-heterotrophies (requiring different growth-substances) have been produced, for example, lactoflavine and choline heterotrophies. *Ophiostoma*, on the other hand, is characterized by the numerously occurring parathiotrophic strains, and by the big group of mutants requiring some nucleotide constituent.

The concentration method here described seems to be applicable to other filamentous fungi too, although, of course, the details of the procedure must be worked out specially for each object.

Growth of a Planktonic Green Alga at Various Carbonic Acid and Hydrogen-Ion Concentrations

The use of phosphate buffer mixtures when culturing Algæ has been shown to have several disadvantages. High phosphate concentrations are often injurious to Algæ, and in alkaline solutions precipitates of slightly soluble phosphates are formed, thus withdrawing from the Algæ elements necessary for growth. Nor has it been possible to make growth determinations at *p*H higher than 8·2 on account of absorption of carbon dioxide from the air, which rapidly decreases the pH. In the experiments described here it has been possible partly to avoid these difficulties by using carbonate-bicarbonate buffer mixtures.

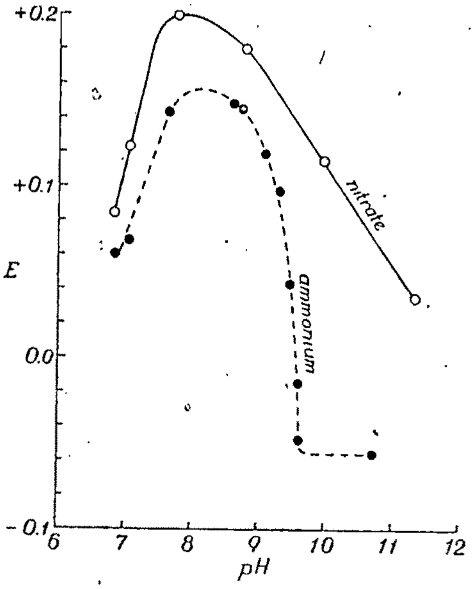
A sterile single cell culture of *Scenedesmus quadricauda* (Turp.) Bréb. has been used. The basic nutrient solution consisted of: $NaNO_3$, 300 mgm.; Na_2CO_3, 2,410 mgm.; K_2HPO_4, 11·2 mgm.; $MgSO_4.7H_2O$, 50 mgm.; $Ca(NO_3)_2.4H_2O$, 30 mgm.; ferric citrate, 2·7 mgm.; citric acid, 2·7 mgm.; $MnSO_4.5H_2O$, 0·05 mgm.; glass distilled water, 1,000 ml. Growth was measured photometrically, and expressed in extinction values. 0·001 E corresponds to some 10 cells per µl. The cultures have been inoculated by material cultivated for four days in this solution, after 50 ml. of 0·544 N hydrochloric acid per litre had been added, thus depressing the pH from 11·1 to about 7·5. This solution was centrifuged, and the cells were washed in sterile water, after which they were used for inoculation. The cultures were illuminated by a 500-watt incandescent lamp and a mercury vapour lamp, HgH· 1,000, together giving a light intensity of 2,200 lux. The temperature was 25° C.

In the experiments the Algæ were cultured in Jena glass tubes with 10 ml. of solution in each. The pH of the basic solution was regulated by adding carbon dioxide to the gaseous phase of the tubes, which were then immediately closed by rubber stoppers, sealed with paraffin. The carbon dioxide was added at about 15 mgm./min. The tubes were shaken for two hours, and then the pH was measured of two of the (usually) four parallel tubes which had been treated with carbon dioxide for the same time. The other two tubes were illuminated for 20 hours and then pH was determined. From the two pH-determinations it was possible to compute the consumption of carbon dioxide during growth, making allowance for the increase in alkalinity that followed from nitrate assimilation, and which was determined as 0·2 milliequivalents per litre at a growth of 0·1 E.

From several determinations one gets the value of 2·27 ± 0·05 mgm. carbon dioxide consumption per tube at a growth of 0·1 E, which corresponds to 0·62 mgm. of carbon. According to my observations, this growth corresponds to 0·856 ± 0·007 mgm. of dry substance, which will consequently contain about 70 per cent of carbon, indicating that fats constitute a great part of it.

From these experiments we get the continuous curve in the accompanying graph. The abscissæ are the mean values of the pH-determinations before and after growth, which never differed more than 1·1–1 pH, usually less. In another experiment the dipotassium hydrogen phosphate was omitted from the nutrient solution, and the same growth curve was then obtained. This shows that the cells have accumulated enough phosphate for optimal growth during 20 hours under these experimental conditions, and that the slight turbidity from precipitated phosphates, obtained at the highest pH-values, is without influence upon growth.

If ammonium is given to the Algæ instead of nitrate, the discontinuous curve in the graph is obtained. The two sets of experiments were inoculated with the same number of cells, and the amounts of nitrate and ammonium were equivalent. The growth in nitrate is always superior, but at pH 9·5 the growth in ammonium falls very rapidly, and at a higher pH, where the concentration of free ammonium hydroxide rises, chlorophyll is destroyed, thus causing a decrease in absorption of light. Both in the case of nitrate and ammonium, pH rises during growth, according to the consumption of carbon dioxide, but somewhat less in ammonium than in nitrate.



GROWTH OF *Scenedesmus quadricauda* AT VARIOUS pH VALUES WITH NITRATE AND AMMONIUM AS SOURCES OF NITROGEN

A preliminary experiment indicates that growth is depressed more by high concentrations of carbon dioxide and CO_3^{--} than by HCO_3^-, and that the maximum of the curves depends on these conditions.

Use of 'Gammexane' Dust against Domestic Cockroaches

MOGADISHU, capital of Somalia (ex-Italian Somaliland), is seriously infested with three species of domestic cockroach, which Dr. B. P. Uvarov of the Anti-Locust Research Centre has kindly identified for me as *Periplaneta americana* (L.), *Blattella germanica* (L.) and *Supella supellectilium* Serv. Almost all houses contain a sufficient number to cause frequent damage to fabrics and tainting of food and cupboards. Constant cleaning or spraying with pyrethrum or D.D.T. produced poor results, and it was decided to attempt control with 'Gammexane' dust. I am indebted to Mr. D. E. Kevan of the Department of Agriculture, Kenya, for suggesting this method to me.

The 'Gammexane' dust was as supplied for use in locust bait, and contained 10 per cent of 'active ingredient'. It was applied with a simple hand-duster which delivered a strong fine jet of dust. During the day-time the cockroaches sheltered mainly on the shaded undersides of horizontal surfaces, such as shelves in cupboards, and the dust was, therefore, only applied to such places and behind articles of furniture. The results far exceeded expectations. Immediately after dusting, the insects showed signs of distress, and most of them left their hiding-places and ran up the walls. Within an hour many were unable to stand, and after twelve hours all *P. americana* were dead or dying, except the largest specimens, and the latter were incapacitated and died later.

Several premises were treated with the same results; but the kill was poor if the dusting was done at night-time, presumably because the insects had left their hiding-places and were generally distributed.

The dust did not affect the eggs, but for a few days after treatment dead first instar nymphs were found; this indicates that there was some residual effect. The eggs of *B. germanica*, which are carried by the females in the oothecæ until they hatch, were swept up with the dead bodies, and could be destroyed by burning. It seems unlikely, however, that nymphs from such eggs would survive, as their first food would presumably be the 'Gammexane'-coated bodies of dead cockroaches. The eggs of the other two species remained behind in the oothecæ attached to the hiding-places, and some of these ultimately produced nymphs that survived. It was, therefore, found advisable to dust again after an interval of three or four weeks.

Premises so treated remained reasonably free of cockroaches for about three months; but they were gradually re-invaded, and after three months it was again possible to find the insects in fair numbers.

It was found that 250 c.c. of dust was an adequate dose for one dusting of a house or flat containing a kitchen and four other rooms, and that this gave the required kill without leaving a noticeable deposit of dust. During dusting, the operator suffered temporary discomfort from irritation of the nostrils and throat, but no after-effects were observed. Treatment produced an unpleasant smell that lasted for about two hours, but in cupboards, etc., the smell lingered for a few days. It was, however, generally considered to be far less unpleasant than the smell of the insects.

This note has been written in the hope that it may be of use to residents in cockroach-infested places, and because it is considered that the method is worthy of further investigation which I am unable now to undertake.

Nuclear Magnetic Resonance at Low Temperatures

Measurements of radio-frequency absorption and dispersion due to nuclear magnetic resonance have been made at liquid hydrogen temperatures using the same experimental arrangement as described in a recent note[1]. We have observed very strong resonant effects due to the protons in liquid and solid hydrogen. On account of the increased Boltzmann factor, the signals were considerably greater than those obtained with substances at room temperature, and were several thousand times the noise voltage. There appeared to be no appreciable change in the phenomena on solidification of the hydrogen. In agreement with the conclusions of Lasarew and Schubnikow[2] from their experiments on the susceptibility of solid hydrogen, we find the relaxation time for nuclear orientation to be less than one second. The absorption line was very sharp, and we estimate the width to be less than 0·5 gauss (2 kc./sec.).

A number of other nuclei have been investigated at liquid hydrogen temperatures. In lithium fluoride both the lithium and fluorine resonance were observed. Neither of these resonances could be detected in this compound at room temperature. Observations on lithium chloride failed to reveal the lithium resonance. A resonance was obtained for sodium in sodium fluoride but could not be found in sodium chloride. The fact that a resonance cannot be observed may be either because the relaxation time is very long or because there is exceptional broadening of the line by spin-spin or spin-lattice interaction. In the latter case it may be possible to obtain measurable effects by working at still lower temperatures and, in order to test this, experiments are now in progress at liquid helium temperatures.

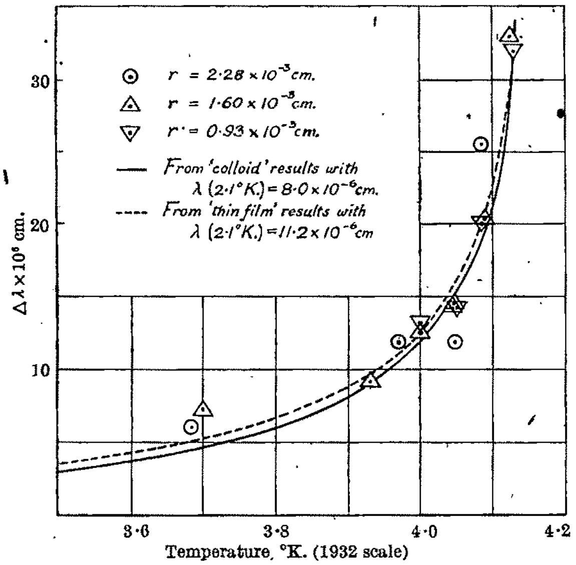
Penetration of Magnetic Field into Superconducting Mercury

It is well known that a magnetic field is almost completely excluded from a superconductor, so that a long cylinder has a diamagnetic susceptibility χ_0 which is $1/4\pi$ for a field parallel to the cylinder axis, or $1/2\pi$ for a transverse field. The magnetic field does, however, penetrate slightly, so that the actual diamagnetic susceptibility χ should be slightly smaller than χ_0, and elementary considerations show that we should have

$$\chi/\chi_0 = 1 - 2\lambda/r, \qquad (1)$$

where λ defines a 'penetration depth' and r is the cylinder radius. Previous experiments by one of us[1] on colloidal mercury, and by Appleyard and others[2] on thin mercury films (in both cases involving specimen size comparable to or smaller than λ), showed that λ is of the order of 10^{-5} cm. and increases several times as the temperature approaches the transition point (4·17° K.). Thus χ for cylinders with radii of order 10^{-3} cm. should vary by a few per cent close to 4·17° K.

We have made accurate relative measurements of χ on three specimens: (*a*) a mercury-filled glass capillary (length 28·9 cm., radius $2{\cdot}28 \times 10^{-3}$ cm.) wound into a spiral so that it is effectively a long cylinder transverse to the field; (*b*) a bundle of 98 mercury-filled capillaries of mean length 1·83 cm. and mean radius $1{\cdot}62 \times 10^{-3}$ cm., with the field parallel to the cylinder axes; and (*c*) a bundle similar to (*b*) but containing 198 capillaries of mean length 1·83 cm. and mean radius $0{\cdot}93 \times 10^{-3}$ cm. The method of measurement was an improved version of that used in the colloid work, and relative values of χ could be measured with an accuracy of about 0·25 per cent in fields as small as 5 gauss, with only 10^{-3} c.c. of mercury (absolute values could be only roughly measured, since the volume of mercury was not very accurately known, and for other reasons). Changes of χ with temperature of the expected order of magnitude were found, which varied with r as



predicted by equation (1), and from the results the variation of $\Delta\lambda = \lambda - \lambda$ (2·1° K.) with temperature shown in the accompanying graph was deduced.

The experimental points agree within the limits of experimental error both with the curve deduced from the colloid work (in which only relative values of λ were accurately measured) if λ (2·1° K.) is chosen to be $0{\cdot}80 \times 10^{-5}$ cm., and with the curve deduced from the thin-film results if λ (2·1° K.) is chosen to be $1{\cdot}12 \times 10^{-5}$. It has been pointed out by Ginsburg[3] that if the surface-energy per unit area, α_n of normal mercury, is appreciably different from α_s, that of superconducting mercury, the thin-film experiments (in which only critical fields were measured) should yield not λ, but $\lambda + \beta$ where $\beta = 8\pi\,(\alpha_n - \alpha_s)/H_c^2$ (H_c is critical field). If then both the colloid and the thin-film results are exactly correct, we can deduce, with the help of the present experiments (which enable the hitherto unknown absolute values of λ of the colloid work to be estimated), that β is of the order $0{\cdot}4 \times 10^{-5}$ cm., and, moreover, that β varies only slightly with temperature. Unfortunately, however, the accuracy of neither the colloid nor the thin-film work is sufficient to make this interpretation of their slightly different results certain, and until more accurate data are available this estimate of β can be regarded only as an upper limit.

Our confirmation of equation (1) is interesting in view of the doubt cast on its validity by experiments of Casimir[4], in which essentially equation (1) was tested for r of order 0·7 cm. by an A.C. method. Casimir found that λ did not appear to vary with temperature by nearly so much as the earlier work predicted, and it seemed that perhaps the same parameter λ could not be used both for $r \gg \lambda$ and $r \gtrsim \lambda$. The present experiments show that such an assumption is unnecessary and suggest that some source of error may have been present in Casimir's experiment. Prof. Casimir has been kind enough to inform us that he has recently found such a possible source of error. The varying bath pressure, acting on the evacuated tube on which the measuring coils were mounted in his experiment, may have caused these coils to expand as the temperature was reduced; he finds from a rough estimate of this effect that it is of the right order of magnitude to remove the disagreement.

A fuller account of this work will be published elsewhere.

Emission of Secondary Electrons from Nickel and Molybdenum by Neutral Atoms of Mercury and Potassium

WE wish to describe briefly some experiments with high-speed neutral atoms produced by the neutralization of positive ions. A homogeneous beam of neutral atoms of mercury, with varying energy, was produced by a method devised by Oliphant[1]. The fast mercury ions which were pulled out of a hot cathode mercury arc were made to pass through a narrow metallic canal, where a large fraction of them collide with its walls almost at grazing incidence and are neutralized but retain their initial speed. The residual positive ions were filtered out of the mixed emergent beam by an electrostatic field applied between two plates placed beyond the canal.

Neutral atoms of potassium were produced by passing an accelerated beam of potassium ions through potassium vapour, where they are neutralized by 'electron exchange' but retain their original kinetic energy. The residual positive ions were filtered out from the beam as in the previous case. These beams of neutral atoms, ranging in energy from 1,200 to 2,500 volts for mercury and from 1,200 to 2,000 volts for potassium, were made to fall on a metal target; under these conditions, the neutral beam ejects electrons both from nickel and molybdenum targets.

The secondary emission, which rises almost in proportion to the energy over the range studied, is greater for a dirty target surface than for a well-degassed one. The energy distribution of the electrons is in all cases Maxwellian, corresponding to the effective temperatures listed below for typical conditions:

MERCURY ATOMS OF ENERGY 1,500–2,500 VOLTS

Undegassed nickel	40,000–45,000° K.
Degassed nickel	29,000–34,000° K.
Undegassed molybdenum ..	40,000–45,000° K.
Degassed molybdenum ..	30,000–33,000° K.

POTASSIUM ATOMS OF ENERGY 1,200 VOLTS

Undegassed molybdenum	35,000° K.
Degassed molybdenum	29,000° K.

It was observed that some of the incident atoms were scattered from the target and were able to release secondary electrons from neighbouring metal electrodes. More mercury atoms were scattered by a dirty molybdenum surface than by a clean one, but the reverse was found with potassium atoms.

The details of this work will be published at a later date.

We wish to express our sincere thanks to Prof. M. L. Oliphant for his helpful advice and encouragement throughout the work.

Self-Recovery of Metals

IN two recent communications in *Nature*[1,2], evidence from X-ray photographs was given on the annealing of filed copper powder at room temperature. Similar observations of other investigators were also mentioned (the authors, however, omitted to mention the detailed investigation on the self-annealing of rolled copper by M. Cook and T. Ll. Richards[3]). Further, attention was directed to the marked effect of impurities on the rate of self-recovery and recrystallization.

It may be remarked that observations closely related to those reported in these communications were made several years ago by other investigators. In this connexion in particular, the experiments of Calvet, Trillat and Paič[4] with aluminium of the highest degree of purity may be mentioned. For example, it was found by these investigators that severely rolled aluminium of 99·9986 per cent purity shows recrystallization, as indicated by the appearance of sharp interference spots, according to the following table:

Temperature		Time of recrystallization		$T_R \log_{10} 4\nu t$ ($\nu = \sim 5{\cdot}6 \times 10^{12}$)
			sec.	
0° C.	$T_R = 273°$ K.	⩾ 48 days	$t = \geqslant 4{,}150{,}000$	⩾5500
25	298	>336 hr.	>1,210,000	>5840
40	313	~40 hr.	~ 144,000	~5840
60	333	6 hr.	21,600	5940
100	373	1 min.	60	5700
150	423	5 sec.	5	6000

In the last column we give the values of $T_R \log_{10} 4\nu t$, where T_R is the temperature (in ° K.) and t the corresponding time of recrystallization, and ν the characteristic frequency for aluminium. The approximate constancy of this expression shows that the recrystallization at all temperatures follows Van Liempt's "law of corresponding states of recovery"[5], according to which corresponding times and temperatures of recrystallization (or recovery) are connected by a formula of type:

$$\nu t \exp -S/kT_R = \text{const. (with log const.} \ll \log \nu t),$$

in which S represents the activation energy for interchange of atoms. The fact that T_R and t satisfy this 'law' means that the self-recovery at room temperature is not essentially different from that at higher temperatures, only its velocity is correspondingly smaller. A similar conclusion was reached by Cook and Richards (loc. cit., p. 169). As to the enormous influence of small amounts of impurities on the course of the recovery, it follows from Calvet's experiments that its rate in rolled aluminium with 99·996 per cent metal is *at least* 2,000 times as slow as in the 99·9986 per cent metal at the same temperature (100° C.).

I have published detailed considerations of these phenomena elsewhere[6].

Application of Similarity Principles to Thermal Transport Systems

THE use of similarity laws is well established for mechanical transport systems, that is, systems in which the dependent variable (A) is the flow or transport of matter. Examples of dimensionless numbers (B) used in such systems are the Froude number for mechanical systems depending solely upon the action of gravity, the Reynolds number (R_e) for mechanical systems depending upon the action of viscosity, and the number introduced by Davis[1] for systems depending upon the action of density changes in hot gases. Although heat transfer is involved in the last of these three examples, it is really a mechanical system, since the heat is conveyed by the mechanical motion of the fluid concerned. The applicability of model results expressed in the form $A = f(B)$ to the original system is based upon the fact that the motion of any element of the fluid obeys the fundamental law of dynamics, $p = mf$, even though the integration of this law for the three-dimensional extended system is too complex for mathematical treatment.

When heat is transferred not by mechanical movement of a fluid but by conduction or radiation, it is often equally impossible to integrate the fundamental laws throughout the three-dimensional system. An example of great practical importance is the transfer of heat by radiation from a flame which changes temperature appreciably as it flows along a furnace system. In such a case, two transport processes are at work: (i) the mechanical flow of gas along the system coupled with energy release by combustion; (ii) thermal transport by radiation from the flame to the surroundings. The dependent variable is the distribution of heat transfer as a function of position along and across the furnace, so that a typical dimensionless criterion of it is the ratio $A = H_n/H_1$, where H_n is the heat transfer per unit area and time at a general section of the surface n, and H_1 that at a standard section, say, that under the centre of the flame.

Since Rummel[2] has shown that the release of energy by combustion in a diffusion flame is purely governed by considerations of gas mixing, the dimensionless criterion for the first transport process is the Reynolds number R_e. This is not, however, a sufficient criterion of similarity since, for example, if the radiation temperatures are very different in the model and in the original, the gas will not in general be cooled by radiation by the same amount in the same proportional distance even though the proportional flame-lengths are made the same by using the same Reynolds numbers. We have, therefore, to express the model law in the form

$$A = f(R_e, N),$$

where N is a suitable thermal transport criterion which must be given the same value in model and original before the model results can be generalized to the full-scale furnace with complete confidence.

In order to find what is the characteristic number N for thermal transport, we have to find a law analogous to Newton's first law of motion, $p = mf = d(mv)/dt$, which expresses the rate of change of momentum of the elementary unit of the system. In the case of thermal transport, the analogous quantity expressing the thermal *vis impressa* is clearly the time-rate of heat transfer H. Now just as in mechanical similarity theory the general force p

is replaced by the special kind of force law involving a physical coefficient such as the viscosity, so here the driving force must be measured by a law such as

$$H = K\,\frac{T_a - T_b}{D} \quad \text{for conduction} \qquad (1)$$

$$\text{or } H = \sigma E\,(T_a^4 - T_b^4) \quad \text{for radiation: finite temperature difference} \qquad (2)$$

$$\text{or } H = 4\sigma E T_1^3 \delta T \quad \text{for radiation: small temperature difference} \qquad (2a)$$

(K is thermal conductivity of conductor; D is thickness of conductor; σ is Stefan's constant; E is combined emissivity of flame and surroundings; T_a, T_b are temperature of flame and surroundings, ° K.)

It follows that in cases where, for example, radiation is the dominant factor, the model law is that the dimensionless number N is given by

$$N = \frac{H}{\sigma E\,(T_a^4 - T_b^4)}; \qquad (3)$$

and must have the same value in the model and in the original. If T_a/T_b is the same in model and original, N can be written

$$N = \frac{H}{\sigma E\,(\theta^4)}, \qquad (4)$$

where θ is the absolute temperature of any portion of model and original. This means that the temperature of the model system, the emissivity of the flame and the linear scale can be changed provided the total rate of heat input (HL^2) is adjusted to give the factor N the same value as in the original system. The model must, of course, be geometrically similar, and the heating gases must burn in a way which is geometrically similar to that of the original system. Clearly, also, the absolute temperatures T_a and T_b must be in the same ratio in the model and the original, unless T_b^4 is negligible compared to T_a^4.

If the working temperature of the model is governed by refractory considerations and its linear dimensions by economic ones, it will not in general be possible to have both R_e and N the same in the model and in the original. Hence it is necessary either to decide whether combustion flame-length or heat-loss cooling of the flame gases is the more important factor for model investigation, or else to make a departure from perfect geometrical similarity such as to give R_e and N the correct values. Thus by using two different length-scales on the model, one for the area of the gas and air inlets (to give correct R_e at the flame inlet) and the other for the combustion chamber (to give correct N), both flame-length and gas cooling can be given the correct proportional values. This is analogous to the use of different horizontal and vertical scales in tidal models.

It should be noted that the formulation of the law of heat transfer in a way analogous to the $p = mf$ equation enables the rate of entropy *increase* dS/dt, or of 'virtue' degradation[3], dV/dt, of the system to be evaluated. Thus

$$\frac{dV}{dt} = \frac{(T_a - T_b)^2}{T_a \times T_b} \times \frac{1}{\rho D} \qquad (5)$$

holds for the conduction law. We have, therefore, a numerical connexion between entropy and time as a special case of the general connexion referred to by Eddington[4].

It is hoped in a later communication to give a more detailed examination along these lines of the work carried out by my colleagues[5] on a model open-hearth furnace.

Surface Tension of Nuclear Matter and the Enumeration of Eigenfunctions of an Enclosed Particle

THE enumeration of eigenfunctions for a bounded continuum to a closer approximation than the Rayleigh asymptotic expression has, in recent years, largely because of its significance in problems of room-acoustics, received considerable attention[1]. The number of eigenfunctions with their wave-numbers equal to or less than K is given by

$$a(K) = g\left\{\frac{4\pi V}{3}K^3 + \theta\,\frac{\pi S}{4}K^2 + \frac{L}{8}K + O(K)\right\}, \qquad (1)$$

where the value of θ depends on the boundary condition which the eigenfunctions (U) have to satisfy; $\theta = -1$ when U vanishes at the boundary, and $\theta = +1$ when $\partial U/\partial n$ (n being the normal to the surface) vanishes at the boundary. We could contemplate other possible boundary conditions for which θ could take values between -1 and $+1$. V is the volume of the enclosure, S its surface area, and L has the dimension of length, which for a rectangular enclosure is the sum of the edge-lengths. That the volume term is independent of the shape of the enclosure was shown by Weyl (1911); for the surface term this is assumed, but a demonstration is lacking. The L-term is still more uncertain. (The order term $O(K)$ is probably of order less than $K^{3/2}$.) The effect of retaining the surface term in equation (1) on Stefan's law of radiation and on Debye's theory of specific heat was dealt with by one of us (D. S. K.) and has also been recently treated by Brager and Schuchowitzky[2]. They have further derived, by applying (1) to a completely degenerate electron gas, the following expression (assuming one free electron per atom) for the surface tension of metals,

$$\sigma = \alpha(\rho/A)^{4/3} \text{ dyne cm.}^{-1}; \quad \alpha \sim 5{\cdot}6 \times 10^4, \qquad (2)$$

where A is the atomic weight and ρ (gm. cm.$^{-3}$) the density of the metal. It is interesting to observe that the above equation, but with the value of α reduced by a factor of about $\frac{1}{2}$, was obtained on certain assumptions from the electron theory of metals by Gogate and Kothari, jun.[3], who found the equation in reasonably good accord with experiment; the experimental values of ρ, σ give α as about $2{\cdot}2 \times 10^4$.

In the present note, we examine the effect of the surface term in (1) on the statistical properties of nuclei, adopting the free-particle model (neutron-proton gas). It is somewhat remarkable that an elementary straightforward calculation (involving no assumptions about nuclear forces, the calculation being based on the free particle model) gives for the surface-dependent term of nuclear energy the value

$$G = \Gamma A^{2/3},$$

where A is the mass number of the nucleus, and Γ is about 20 MV. The value of Γ as deduced from empirical data on nuclear binding energies is about 10 MV.

For a completely degenerate ideal Fermi–Dirac gas, we obtain from (1)

$$\sigma = \frac{g\pi}{16}\frac{h^2}{m}\left(\frac{p_0}{h}\right)^4, \qquad (3)$$

where p_0 is given by the cubic equation

$$\left(\frac{p_0}{h}\right)^3 - \frac{3S}{16V}\left(\frac{p_0}{h}\right)^2 - \frac{3n}{4\pi g} = 0\,; \qquad (3a)$$

p_0 is the maximum momentum characterizing the Fermi distribution, n is the number of particles per unit volume, m the mass and g the weight-factor of a particle: σ is the surface tension. In the case of metals the second term in ($3a$) is negligible, and (3) reduces (taking m = electron mass, $g = 2$) to

$$\sigma = \frac{g\pi}{16}\frac{h^2}{m}\left(\frac{3n}{4\pi g}\right)^{4/3} = 5{\cdot}6 \times 10^4 (\rho/A)^{4/3}.$$

In the case of nuclei, the second term in ($3a$) is also significant. The values of Γ, taking m as the mass of a nucleon and $g = 4$ (as the number of protons and neutrons are nearly equal, we may regard the nucleon gas as consisting of similar particles, A in number, with $g = 4$), are given below for different values of A.

$$\Gamma = 4\pi r_0^2\sigma; \quad (r_0 = 2{\cdot}05 \times 10^{-13}\ \text{cm.})$$

A	20	100	200	∞
Γ (MV.)	48·5	27·5	23·5	13·4

The applications of (1) to a Bose–Einstein gas (liquid He II), where the surface tension becomes negative, to the dependence of magnetic properties on surface area and other allied problems will be treated elsewhere.

Elements of Atomic Numbers 43 and 75

Prof. F. A. Paneth and also Prof. E. Segrè have directed attention (*Nature*, January 4, p. 8 and p. 24) to the unconfirmed claim by I. and W. Noddack to the discovery of element 43 which they named 'masurium'[1]. Apart from a fantastic patent specification[2], they brought forward no chemical evidence to show that they had discovered this element.

It will be recalled that the Noddacks (Mrs. Noddack was then Dr. Ida Tacke) claimed to have found elements 43 and 75, Mendeléef's eka- and dvi-manganese, in columbite and platinum ores. Their claim was disputed at the time by Prandtl[3] and by Zvjagintsev[4] and others. Eventually, however, Feit[5] isolated about a pound of potassium perrhenate (dvi-manganese was called 'rhenium' after Germany's 'Westmark') from molybdenum waste, and from this salt the new element was isolated. The Noddacks' claim was therefore accepted, although since then no reference has been made to any masurium or rhenium having been isolated from either columbite or platinum ores.

Meanwhile, Loring and Druce[6] discovered traces of dvi-manganese in crude manganese salts; Heyrovský and Dolejšek also reported the same discovery[7]. Loring had been looking for 'missing elements' since 1922, and in particular was seeking an element with higher atomic number than uranium. When the Noddacks published their claim, it was decided to publish what evidence there was of the presence of manganese congeners in its ores and crude salts. Soon after, Loring suggested[8] that dvi-manganese would be found associated with molybdenum. It was duly shown that molybdenum glance was the richest known source of this element, thus opening the way for Feit's work.

Loring, who died in 1944 from air raid injuries, intended to call the new element 'londinium' had not the name rhenium apparently been accepted. The name 'technetium' is now proposed for element 43. Will the validity of the claim of rhenium be re-examined in the light of all the evidence?

Study of Ocean Swell

The apparatus for the analysis of waves already described in *Nature*[1] has been used to form spectra of a long series of wave observations made at Pendeen and Perranporth on the north-west Cornish coast.

Comparison of the spectra with the meteorological charts of the North Atlantic shows that the swell arriving from a distant storm shows a more or less narrow band of periods, the minimum period of which decreases with time, in a manner which is consistent with the assumption that the swell travels from the generating area to the coast with a velocity equal to the classical group velocity appropriate to its period on arrival. In one example it is possible to show that the velocity of propagation does not differ by more than five per cent from the theoretical group velocity.

The observations in general suggest that the longest period exhibited by swell due to a distant storm is proportional to the maximum wind velocity in the storm, and does not depend upon the fetch or duration of the wind. This rule may have to be modified in studying generating areas of small size.

The swell is observed to travel great distances. Low swell has been received from a tropical storm off the coast of Florida, 2,800 miles from Cornwall, and from a storm near Cape Horn between 6,000 and 7,000 miles from Cornwall.

It is hoped to publish these results shortly, on behalf of the members of this research group.

SIGNIFICANCE OF TRACE ELEMENTS IN PLANTS AND ANIMALS

THE significance of the presence of trace elements in plants and animals was discussed at a meeting of the Association of Applied Biologists held at the Imperial College of Science and Technology, London, on October 4.

Sir Edward Salisbury, in a brief general introduction, said that he was glad to be present because he had played a part in starting and integrating a series of investigations of mineral deficiencies under the Agricultural Research and Improvement Councils. It may not be generally realized that the crowded plants in a field of wheat are subject to competition and therefore to various deficiencies, which are enhanced if weeds are present. He pleaded for the researches to be pursued along broader lines than immediately practical ones. As an example, he mentioned the weeds that are known to be efficient in extracting manganese from the soil, and raised the question whether the next crop would benefit from the decomposition of such weeds, or would the deficiency be enhanced as a result of the depletion of the soil of its reserves of available manganese.

Prof. T. Wallace, Long Ashton Research Station, University of Bristol, dealt with the visual diagnosis of mineral deficiencies. The applicability of the method depends on the fact that plants which are deficient in any mineral nutrient develop well-defined and characteristic signs of the shortage in various organs, particularly in the leaves. To provide a basis for using the visual method on crop plants, it is necessary as a first step to produce the visual effects in the various crops and to record the results in a suitable manner. This is done by growing plants under controlled conditions of nutrient supply, usually in sand cultures, to produce the various effects, and afterwards checking the results under field conditions. The visual effects are suitably recorded as colour photographs, the negatives of which can be preserved without appreciable deterioration for several years.

In applying the method to field crops, cognizance is taken of soil conditions, such as texture, drainage, *p*H, dryness and cultural conditions, as the information is often helpful in ruling out certain deficiencies and in pointing to others. The presence of certain pests and diseases may complicate symptoms, and in extreme instances may even rule out the use of the method. Use is also made of indicator plants, that is, plants which are highly susceptible to particular deficiencies and also show characteristic signs of them, such as oats for manganese, sugar beet for boron, potatoes for potassium. Indicator plants may be used, combined with fertilizer and spray treatments, in special indicator plots to determine the likelihood of deficiencies occurring on land of unknown cropping potentialities.

The visual method has the great advantage of requiring no special equipment and is thus particularly suited to survey work, for which it has been widely used. It is also valuable in recording nutrient conditions in field experiments, especially with long-term crops such as fruit. Recently it has been successfully applied to the problem of resolving the injurious factors concerned in the failure of plants on acid soils.

For advisory purposes, visual diagnosis and the chemical tissue test method used together provide a very rapid and effective procedure for solving a wide variety of crop nutritional problems. Details of the method and its use in the field are given in Wallace's "The Diagnosis of Mineral Deficiencies in Plants" (with supplement 1944) (London: H.M. Stationery Office).

American workers have shown that qualitative chemical tests carried out on fresh plant material can be used in the study of fertilizer needs. A technique devised at the Long Ashton Research Station to test quantitatively a number of the easily soluble nutrients in fresh tissues within a short time was described by D. J. D. Nicholas. The method has been successfully used in the diagnosis of mineral deficiencies and toxicities in crop plants, and has served as an invaluable confirmatory test to the visual method. Its value as a diagnostic method is based on the fact that the extractable nutrients from healthy, as compared with unhealthy, plants usually show significant differences for the limiting mineral elements. In this way straightforward deficiencies of potassium, magnesium, calcium, phosphorus, nitrogen and manganese, and excess levels of manganese, chlorine and zinc can be readily confirmed in a short time. The tissue test method is being extended to include other trace elements.

The method involves a special field-sampling technique and preparation of test samples, followed by the extraction of the nutrients from the macerated tissues. Two reagents used for the extraction are (1) Morgan's reagent (glacial acetic acid buffered by means of sodium acetate at *p*H 4·8; this reagent is specially purified for the sensitive manganese test), (2) hydrochloric acid used in special instances for the extraction of iron and zinc.

The chemical tests used comprise well-known turbidity and colour tests, and assessment is made initially by eye. This enables the status of each element to be grouped into high, medium and low categories. These can be fixed more precisely by the use of the Lovibond comparator and standardized colour disks. Nutrient standards have been fixed for a range of economic plants, and a working knowledge of these is essential for accurate diagnostic work. Threshold values for deficiencies have been determined for the various nutrients, which generally coincide with the points of onset of visual signs of the particular deficiencies. In many instances tissue test values give a clue to an impending mineral deficiency or toxicity prior to the onset of visual signs.

A critical study has been made of the seasonal cycle of the extractable nutrients in a variety of crop plants grown under various manurial treatments, in order to determine critical sampling dates in the seasonal cycles of the various nutrient elements.

The correlations obtained between the tissue test results and the nutrient treatment, visual diagnosis and full chemical analysis of the foliage are good. On long-term manurial plots, soil analysis data are usually in accord with tissue test results; but survey work over wide areas has shown that agreement is not always close and further work is necessary.

The tissue test method has proved invaluable for rapid diagnostic work and has played an important part in resolving nutrient disorders in farm and garden crops. It should also be of value in ecological studies and in determining the distribution and translocation of nutrients in various plant organs.

The mineral-deficiency team at the East Malling Research Station, near Maidstone, Kent, the work of which was described by Dr. W. A. Roach, has concentrated mainly, but not exclusively, on leaf analysis and plant injection as preliminary methods of diagnosis. But to be of practical value a diagnosis must include a measurement of the effect of curative treatment on yield and quality of crop.

The analytical method is based on a comparison of leaves from unsatisfactory plants with corresponding leaves from plants that are satisfactory from the growers' point of view. At least six elements (iron, manganese, zinc, boron, copper and nickel) occurring in minute amount must be determined in the presence of relatively large amounts of the major nutrient elements. The special methods necessary for this purpose are being evolved. Plant injection methods make possible the treatment of a selected portion of a plant with any desired element, a similar neighbouring part being left untreated for comparison. The part may be of almost any size, from a single inter-veinal area of a leaf to a whole tree. The effect is seen in the course of a week or so.

The first big achievement of the injection method was to find a cure for various 'corky' troubles in apples. These caused the death of whole plantations in western Canada and rendered useless vast amounts of fruit there, in New Zealand and elsewhere. The proof by injection methods that the cause was boron deficiency led in a year to commercial methods of cure by spraying the trees and by applications to the soil. Serious deficiencies of copper in apple and pine trees in Australia and of manganese in cherries in Britain were diagnosed in a similar manner.

Plants are commonly deficient of more than one trace element at a time. Fruit trees in South Africa were deficient of both manganese and zinc. Many trees were dying and still more were barren. The cure of both deficiencies was necessary to restore the trees to full productivity.

Trace-element deficiency may not only accompany potassium deficiency, but also curing the trace-element deficiency seems sometimes to lead to a partial cure of the potassium deficiency, even without the addition of any potassium.

During the War, the methods were used for increasing the yields of arable crops. The cure of symptomless deficiencies of calcium and magnesium diagnosed in potatoes growing on freshly ploughed moorlands in Devon led to an increase of 3,000 tons of potatoes in the following season.

Multiple symptomless deficiencies of manganese, iron, zinc, boron, copper and nickel were proved to be of economic importance in the three crops tested, namely, potatoes, wheat and broad beans, in the marshlands of south Kent. The importance of complete diagnosis was illustrated by the fact that spraying potatoes according to diagnosis by symptoms, that is, with manganese, led to no increase in crop, whereas sprays containing manganese and zinc increased the crop from seven to eleven tons per acre, and spraying with all six elements diagnosed by injection led to still greater increases in crop.

The plant in absorbing essential mineral nutrients from the soil also takes up numerous other elements merely because they are brought into solution by the action of its roots, and since plant food is the basis of animal life, the same elements are found in animal tissues. Dr. H. H. Green (Veterinary Laboratory, Ministry of Agriculture, Weybridge) discussed trace elements in relation to the health of livestock.

If an element is found to be locally concentrated in some particular tissue, as, for example, iodine in the thyroid gland, the tendency is to assume a function for it, although it may be long before precise knowledge of that function is gained; but when the quantity of the element is not only exceedingly small but also is distributed throughout the tissues with no known sites of predilection, the impulse is to treat its presence as fortuitous until some instance of apparent absence is met in the form of an obscure deficiency disease, such as the 'pining' of lambs caused by lack of cobalt, or until the effects of unusual excess are shown in the form of a toxicosis such as the 'teart' of cattle in Somerset caused by excess of molybdenum.

Many of the trace elements found in living tissues are apparently inert; for example, nickel, although always present in soil-grown vegetation, does not appear to be an essential animal micro-nutrient, and relatively large amounts are harmless to animals. Some are important to plant physiology but of little consequence in animal economy. Boron is a limiting factor in plant health but, if essential for animal life at all, the smallest amounts ever found in plants are sufficient in the sense that no boron-deficiency disease has ever been recorded in animals. Zinc is certainly required by both plants and animals, and in the case of the latter it is the metallic component of the enzyme 'carbonic anhydrase' found in considerable concentration in the red blood corpuscles and other tissues; but the quantities in plant food exceed animal requirements, and no naturally occurring zinc-deficiency disease has been encountered.

With other trace elements the position is reversed, and their significance in animal physiology is much greater than in plant economy. Cobalt, if of any significance in plants at all, is required in such small amounts that a pasture may be growing luxuriantly and yet induce emaciation and death in grazing ruminants; while selenium can be tolerated by growing plants in amounts which are exceedingly harmful to animals consuming them.

Trace elements of proved economic importance are: iodine, copper, cobalt, manganese, selenium, molybdenum and fluorine. Lead and arsenic are neither biologically essential nor absorbed through plant roots in quantities injurious to animals. As for arsenic, the danger of cumulative poisoning is much exaggerated. Substantial sub-toxic doses repeatedly administered to sheep are rapidly eliminated, and the amounts naturally present in oysters and flat fish, although well above the limit sanctioned by health authorities concerned with arsenic as a food contaminant, are consumed without detriment to human health.

Prof. F. G. Gregory, of the Imperial College of Science and Technology, opened the discussion. He said that the work of the Research Institute of Plant Physiology on the subject under discussion fell between the field-work described by Dr. Roach and the very fundamental work of Dr. Hill. Use is being made of Dr. Roach's injection methods to provide material on which could be studied the effects of trace elements on various physiological functions of the plant. A start is being made with manganese and the potato, and results so far obtained are encouraging.

Dr. W. G. Ogg, of Rothamsted Experimental Station, said that his experience suggested that Dr. Roach's conclusion, that symptomless deficiencies of economic importance are common, might well apply to nine fields out of ten.

COAL UTILISATION RESEARCH IN GREAT BRITAIN

On December 12, Mr. R. W. Foot gave the presidential address to the British Coal Utilisation Research Association, his last before the vesting date of the nationalization of the coal industry in Great Britain. This Association worked for eight years under the control of the Mining Association, which had contributed for maintenance during this period more than eight million pounds. The Mining Association had envisaged the development of a permanent institution, more particularly since the possibility of nationalization of the coal industry was recognized. In that event it was hoped that the National Coal Board would agree to take over the activities of the Association. In anticipation, and in order to prevent the slackening which might arise during a period of uncertainty as to the future, the Mining Association continued its financial support without reservation until the vesting day, January 1, 1947. The National Board has accepted the principle mentioned, and on that day stepped into the shoes of the Mining Association so far as the British Coal Utilisation Research Association is concerned, and was able to find the organisation in a state of full activity.

During its existence, most of which had been during a period of war, the Association concentrated on certain major operations of coal utilization. Mr. Foot, referring to the last three years, mentioned in particular the work of Mr. J. S. Hales on domestic coal-burning appliances—a subject touching almost every householder—and described it as a 'landmark' in space heating. So far as Great Britain is concerned, there is some justification for the term. In countries where colder conditions are common, people appreciate the advantages of dispersing available heat throughout their dwellings; in Britain, practice has led to the localization of warmth and its insulation from the rest. Efforts to cope with the effects have of necessity tended to be improvisations. The work of the British Coal Utilisation Research Association has shown how, by more rational design of domestic grates, the effective use of coal heat can be increased, and at the same time can be more widely dispersed through a dwelling. Such principles can be applied generally, and already appliances have been designed whereby a single unit fed by smokeless fuel can be made to serve a whole house. This may lead to a radical change in household practice.

On the industrial side, the use of coal in the generation of steam is the largest outlet; and was given pride of place. Priority was given to the so-called 'shell' boilers—the smaller fire-tube units in common use. Although everywhere in use, it was believed that familiarity had led to neglect in some respects; it was thought that carefully conducted research with modern resources would promote improvements in design and increases in efficiency. The work of a section of the Association under Dr. E. G. Ritchie has confirmed these anticipations. The larger water-tube boilers have been developed under more scientific conditions, mainly stimulated by the needs of electrical industry. In modern practice these encounter extremely severe conditions of operation. It has become a major problem to keep such plant in continuous service, owing to the destructive action of acid and other inorganic materials present in the products of combustion. The work of the Association has already made contributions to improve the 'availability' for service of large steam generators.

Mr. Foot referred to the 'down-jet furnaces', which arose from work done, during the War, on gas producers. It has led to the construction of a furnace no bigger than a filing cabinet, but capable of producing per hour 200 lb. of steam at 200 lb. pressure. It is thought that such a furnace may enable solid fuels to be used to operate gas turbines.

The Association prosecutes a considerable range of more fundamental scientific work under the direction of Dr. D. H. Bangham. For all these branches there is now a staff of three hundred of all grades, under the control of the director, Dr. D. T. A. Townend. To provide for the necessary accommodation of all kinds, the Association is carrying out at Leatherhead a very extensive programme of building and equipment. It is planned to cope effectively with the great problems of coal utilization which the future promises to bring.

H. J. HODSMAN

CHEMOTHERAPY

The Linacre Lecture, 1946, delivered by Sir Alexander Fleming, on "Chemotherapy, Yesterday, Today and Tomorrow" (Cambridge University Press, 1946. 2*s*.), has now been published. Opening his lecture with the warning that the title chosen was too ambitious and would require a series of lectures, Sir Alexander limited his remarks to chemotherapy of which he has had first-hand knowledge. He refuses to confine the meaning of the term 'chemotherapy' to the administration of chemical substances by way of the blood; he extends it to include any form of treatment which enables a chemical substance to exert directly an injurious effect upon bacteria. This definition includes antiseptic treatment, two cardinal principles of which are the avoidance of chemical substances which are too toxic to the host or to the tissues, and the effective diffusion of the therapeutic agent into the infected tissues. Discussing the antiseptic methods of Lister and the practice of asepsis which followed them, Sir Alexander demonstrates, by reference to experience gained during the First World War, how important it is that diffusion of the local chemotherapeutic agent into the infected area should occur and, by reference to the mode of action of Dakin's solution, how important is the drainage of the infected lesion by the exudation of fluid from it. Important also is the action of local chemotherapeutic agents upon the phagocytes which attack the bacteria. Sir Alexander's own work on this problem is well known, and he here shows how essential it is to consider the speed of action of the chemical substance on the bacteria and on the phagocytes respectively. If the phagocytes are killed by it before it kills or appreciably inhibits the growth of the bacteria, the tissues are left without one of their main means of defence.

Sir Alexander points out that scientific chemotherapy began with Ehrlich. He then discusses the aniline dyes, and thus comes to the sulphonamide of chrysoidine (prontosil), with which Domagk began the remarkable series of researches by many workers which have produced the sulphonamides now in use. The relative advantages and disadvantages of the sulphonamides are briefly indicated, and thus we come to the year 1940, when penicillin, discovered by Sir Alexander in 1928, four years before the first sulphonamide was prepared and seven years before Domagk demonstrated the effective antistreptococcal action of prontosil, became available in sufficient quantity to enable practical therapeutical tests of it to be made. It is now well known how Sir Howard Florey and his collaborators in Oxford and in the United States made penicillin available and demonstrated its remarkable properties. It is, Sir Alexander says, the most powerful chemotherapeutic drug yet produced, for it will inhibit the growth of *Staphylococcus* even when it is diluted eighty million times. Adding still further to the discoveries of this fertile recent period, Sir Alexander outlines the properties of gramicidin and tyrothricin, obtained by Dubos in 1939 from a soil bacillus, *Bacillus brevis*, and those of streptomycin, obtained from *Streptomyces griseus* by Waksman in 1943.

Finally, Sir Alexander discusses briefly the possible chemotherapeutic developments of the future. This part of his lecture will perhaps disappoint those readers who expect dramatic prophecies; but, if they are disappointed, they have only themselves to blame, for no man could correctly forecast what may develop from the many possibilities opened up by recent work. Sir Alexander ends with a plea for the establishment of a central Institute of Microbiology, in which all the work now being done could be co-ordinated. The Royal Society called for the establishment of such an institute in 1945. If, says Sir Alexander, we had had such an institute in 1928, when he discovered penicillin but lacked the chemical facilities to develop his discovery, we could have had all the benefits of penicillin much earlier. A small fraction of the money spent upon our national medical, veterinary and agricultural services would endow such an institute. It would be difficult to conceive a project more essentially humane or a better long-term investment for the relatively small funds required.

G. Lapage

FORTHCOMING EVENTS

Monday, February 10

Society of Instrument Technology, North-West Section (at the College of Technology, Manchester), at 7.15 p.m.—Dr. H. W. Thompson: "Infra-Red Absorption Methods for Gas Analysis".

Tuesday, February 11

Society of Chemical Industry, Plastics Group (joint meeting with the Faraday Society, at the Royal Society of Tropical Medicine, Manson House, 26 Portland Place, London, W.1), at 2.30 p.m.—Mr. G. Gee: "The Influence of Molecular Structure on the Elasticity and Tensile Strength of Rubber".

Institution of Post Office Electrical Engineers (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2), at 5 p.m.—Mr. R. M. Chamney: "Development of Telephone Transmission over Lines in the last 40 Years".

Zoological Society of London (at Regent's Park, London, N.W.8), at 5 p.m.—Scientific Papers.

Royal Institution (at 21 Albemarle Street, London, W.1), at 5.15 p.m.—Prof. E. K. Rideal, F.R.S., and Dr. P. Johnson: "Colloids". (Subsequent lectures on February 18, 25 and March 4.)

Illuminating Engineering Society (at the Royal Society of Arts, John Adam Street, Adelphi, London, W.C.2), at 6 p.m.—Mr. J. S. Smyth: "The Brightness and Legibility at Night of Road Traffic Signs".

Society of Public Analysts and other Analytical Chemists, Physical Methods Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6 p.m.—Short papers on "Fluorimetric Analysis".

Sheffield Metallurgical Association (joint meeting with the Refractories Association of Great Britain and the Sheffield Branch of the National Association of Clayworks Managers, at Mappin Hall, Sheffield), at 7 p.m.—Mr. W. T. Hale: "A Statistical Sampling Plan for Refractory Products".

Wednesday, February 12

Institute of Physics, London Branch (at the Royal Institution, Albemarle Street, London, W.1), at 2.15 p.m.—Annual General Meeting. Symposium on "New Optical Materials".

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 5 p.m.—Dr. F. A. Freeth, F.R.S.: "Economic Reconstruction; 3, Materials".

Institute of Physics, Manchester and District Branch (joint meeting with the Sheffield Physical Society, in the Physics Department, The University, Sheffield), at 5.15 p.m.—Dr. C. Sykes, F.R.S.: "Physics and Steel Making".

Institute of Petroleum (joint meeting with the Royal Aeronautical Society, at Manson House, 26 Portland Place, London, W.1), at 5.30 p.m.—Dr. C. G. Williams: "Fuel and Lubricants for Aero Gas Turbines".

Institution of Electrical Engineers, Transmission Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. G. T. Harwood: "The Operational Characteristics of Modern H.V. Wood-Pole Lines".

Manchester Metallurgical Society (at the Engineers' Club, Albert Square, Manchester), at 6.30 p.m.—Dr. L. F. Pfeil: "Metals and Alloys for Service at High Temperatures".

Television Society (joint meeting with the British Kinematograph Society, at Film House, Wardour Street, London, W.1), at 7.15 p.m.—Mr. Marcus F. Cooper: "The Film in relation to Television".

Society of Dyers and Colourists, Northern Ireland Section (at the Queen's Hotel, Belfast), at 7.30 p.m.—Dr. T. Richardson: "The Abbot-Cox Process of Yarn Dyeing as Applied to Cotton".

Society for Visiting Scientists (at 5 Old Burlington Street, London, W.1), at 7.30 p.m.—Discussion on "The Outlook in Psychology" (Speakers: Dr. E. B. Strauss, Dr. C. G. L. Pratt and Dr. J. Cohen).

Manchester Geological Association (at the Manchester Geographical Society, 16 St. Mary's Parsonage, Manchester).—Dr. F. M. Trotter: "Structures in the North-Western Part of the South Wales Coalfield".

Thursday, February 13

Chemical Society (in the Chemical Department, The University, Woodland Road, Bristol), at 2.15 p.m.—Discussion on "Protein Chemistry".

Society of Dairy Technology (at the Imperial Hotel, Temple Street, Birmingham), at 2.15 p.m.—Dr. S. K. Kon: "The Effect of Heat-Treatment on the Nutrient and Chemical Properties of Milk and Milk Products".

Chemical Society (joint meeting with the Sheffield University Chemical Society, in the Chemistry Lecture Theatre, The University, Sheffield), at 5.30 p.m.—Prof. J. Monteath Robertson, F.R.S.: "Bond Lengths in Aromatic Hydrocarbons".

Institution of Electrical Engineers, Installations Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. F. Widnall and Mr. R. Newbound: "Protective Finishing of Electrical Equipment".

Institution of Electronics, N.W. England Section (joint meeting with the Manchester Centre of the Illuminating Engineering Society, in the Reynolds Hall, College of Technology, Manchester), at 6.30 p.m.—Dr. H. Meyers and Mr. G. A. R. Tomes: "Recent Advances in Luminescent Materials for Electronic Devices".

Women's Engineering Society, Manchester Branch (at the Engineers' Club, Albert Square, Manchester), at 6.30 p.m.—Members' Night—"Our Jobs and Problems".

Pharmaceutical Society (at 17 Bloomsbury Square, London, W.C.1), at 7 p.m.—Dr. H. Davis: "Some Chemical and Pharmaceutical Aspects of Anæsthesia".

Royal Photographic Society (joint meeting of the Scientific and Technical Group and the Colour Group), at 7 p.m.—Mr. Percy W. Harris: "Practical Colour Processes" ("How It Works in Colour Photography", 4).

Society of Dyers and Colourists, West Riding Section (at the Great Northern Victoria Hotel, Bradford), at 7.15 p.m.—Dr. H. P. Staudinger: "Polymer Chemistry".

Chemical Society, Manchester Section (joint meeting with the Local Section of the Royal Institute of Chemistry, in the Chemistry Department, The University, Manchester), at 7.30 p.m.—Prof. M. Stacey: "Some Aspects of the Chemistry of Fluorocarbons".

Pharmaceutical Society, Manchester, Salford and District Branch (in the Council Chamber, Houldsworth Hall, Manchester), at 7.45 p.m.—Prof. H. Brindle: "Penicillin".

Friday, February 14

British Electrical and Allied Industries Research Association (at the Connaught Rooms, Great Queen Street, London, W.C.2), at 11.30 a.m.—Annual General Meeting.

Textile Institute (at 16 St. Mary's Parsonage, Manchester), at 1 p.m.—Mr. P. R. Masheder: "Lubrication—its Application and Control in the Textile Industry".

Oil and Colour Chemists' Association, Manchester Section (at the Engineers' Club, Albert Square, Manchester), at 2 p.m.—Mr. D. H. Hewitt: "Further Developments in Styrene Co-Polymers".

Physical Society, Optical Group (in the Physics Department, Imperial College of Science and Technology, Imperial Institute Road, London, S.W.7), at 3 p.m.—Mr. L. V. Chilton, Dr. H. H. Hopkins and Mr. J. S. Preston: "Physical Optics and Technical Applications"; Dr. W. S. Stiles: "Visual Photometry, Colorimetry and Physiological Optics" (Reports on the Réunion d'Opticiens, Paris, October 1946).

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Prof. H. H. Plaskett, F.R.S.: "Astronomical Spectroscopy". Annual General Meeting.

Society of Chemical Industry, Chemical Engineering Group (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Mr. G. Eyssen: "Polyvinyl Chloride and its Co-Polymers".

Paper Makers' Association, Northern Division (at the Engineers' Club, Albert Square, Manchester), at 7 p.m.—Dr. W. W. Barkas: "The Sorption and Swelling of Cellulose under Naturally Imposed Restraints".

Textile Institute, Bolton Branch (at the Municipal Technical College, Bolton), at 7.30 p.m.—Mr. F. Scholefield: "A Service by the Dyer to the Manufacturers".

Royal Institution (at 21 Albemarle Street, London, W.1), at 9 p.m.—Mr. F. Ian G. Rawlins: "Natural Science and the Fine Arts".

Saturday, February 15

Biochemical Society (at the London School of Hygiene, Keppel Street, London, W.C.1), at 11 a.m.—Symposium on "The Relation of Optical Form to Biological Activity in the Amino-Acid Series".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Senior Lecturer in Physics at the Leeds College of Technology—The Director of Education, Education Department, Calverley Street, Leeds 1 (February 15).

Lecturers and Teachers in Chemistry and Metallurgy (Graduate), Mechanical Engineering (Graduate), Civil and Structural Engineering (Graduate), and Automobile Engineering, at the Chance Technical College—The Chief Education Officer, 215 High Street, Smethwick (February 15).

Senior Lecturer in Mathematics in the Training Department—The Warden, Goldsmiths' College, New Cross, London, S.E.14 (February 15).

Lecturer in Chemistry—The Clerk to the Governors, South-East Essex Technical College, Longbridge Road, Dagenham, Essex (February 17).

Assistant Agricultural Economist (male)—The Secretary and Registrar, The University, Bristol (February 18).

Lecturer (part-time) in Psychology—The Secretary, King's College of Household and Social Science, Campden Hill Road, London, W.8 (February 20).

Lecturer or Assistant Lecturer in Electrical Engineering—The Secretary, King's College, Strand, London, W.C.2 (February 21).

Senior Assistant Physicist in the Department of Physics Applied to Medicine—The Dean, Middlesex Hospital Medical School, London, W.1 (February 28).

Lecturer in Geography—The Registrar, The University, Manchester 13 (February 28).

Chemist to be trained for Spectrographic Analysis—The Secretary, West of Scotland Agricultural College, 6 Blythswood Square, Glasgow (February 28).

Lectureship in Materia Medica and the Robert Pollok Lectureship in Pharmacology—The Secretary of the University Court, The University, Glasgow (February 28).

Educational Psychologist—The Director of Education, Education Office, College of Technology, Belfast, endorsed 'Educational Psychologist' (February 28).

Director of Research—The General Secretary, British Hat and Allied Feltmakers' Research Association, 12 St. Peter's Square, Stockport, Cheshire (March 1).

Lecturers (2) in Chemistry (one with special qualifications in Organic Chemistry, and the other in Physical Chemistry)—The Registrar, The University, Reading (March 3).

Technical Officer to undertake technical service and liaison visits to member firms of the Association—The Director of Research, Research Association of British Rubber Manufacturers, 105 Lansdowne Road, Croydon (March 8).

Lecturer in Botany at the Imperial College of Tropical Agriculture, Trinidad—The Secretary, Imperial College of Tropical Agriculture, Grand Buildings, Trafalgar Square, London, W.C.2 (March 10).

Chair of Physics—The Principal, Heriot-Watt College, Edinburgh (March 10).

Official Fellow and Tutor in Chemistry—The Principal, Jesus College, Oxford (March 15).

Harrison Chair of Mechanical Engineering—The Registrar, The University, Liverpool (March 15).

Chair of Physiology tenable at Bedford College—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 25).

Chair of Physiology tenable at St. Bartholomew's Hospital Medical College—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 25).

Chair of Political Science in Victoria University College, Wellington, New Zealand—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1 (April 7).

Entomologist with a special interest in and knowledge of the coleoptera, and an Entomologist with a special interest in and knowledge of the hymenoptera—The Director, Imperial Institute of Entomology, 41 Queen's Gate, London, S.W.7 (June 1).

Laboratory Steward for Electrical Measurements Laboratory—The Head of the School of Engineering, The Polytechnic, 309 Regent Street, London, W.1.

Graduate (young, female) with a degree in zoology for research in anthropometric studies—The Secretary, The University, Edmund Street, Birmingham 3.

Teacher of Physics and Mathematics at the Doncaster Technical College—The Chief Education Officer, Education Offices, Doncaster.

Lecturers in Mathematics, Physics and Chemistry—The Secretary, Northampton Polytechnic, St. John Street, London, E.C.1.

Laboratory Assistants (2, male) for work in the Medical Research Council Unit for Bacterial Chemistry—The Secretary, Unit for Bacterial Chemistry, Lister Institute, Chelsea Bridge Road, London, S.W.1.

Chemical Engineer (graduate) for furnace research and development—The Assistant Secretary, British Coal Utilisation Research Association, 13 Grosvenor Gardens, London, S.W.1.

Research Officer with good qualifications in physical chemistry and with research experience, a Junior Research Officer, and a man with the Higher National Certificate in Physics (or equivalent qualification) to assist with the development, calibration and servicing of industrial electrical instruments—The Director of Research, British Cotton Industry Research Association, Shirley Institute, Didsbury, Manchester 20.

Lecturer in Applied Mechanics at the Royal Naval College, Greenwich—The Director, Education Department, Admiralty, Whitehall, London, S.W.1.

Professorship of Pure and Applied Mathematics in the Royal University of Malta—The Secretary, Universities Bureau of the British Empire, 24 Gordon Square, London, W.C.1.

Assistant Controllers of Telecommunications (Engineering), and Assistant Controllers of Telecommunications (Wireless), in the Telecommunications Department of the Malayan Union—The Director of Recruitment, Colonial Office, 15 Victoria Street, London, S.W.1.

THE FOOD AND AGRICULTURE ORGANISATION

RELATIVELY little publicity has been given in the Press or elsewhere to the activities of the Food and Agriculture Organisation, though from the various reports that it has issued a great deal of essential preliminary work has evidently been accomplished. A staff of highly competent experts has been temporarily on loan from Government departments and other international bodies for the purpose, though now a nucleus of permanent personnel is established, to which recruitment is to be made on as broad a geographical basis as possible. At the time of its inauguration in November 1945, responsibility for dealing with the immediate post-war world shortage of food was in the hands of international organisations such as the United Nations Relief and Rehabilitation Administration, the Combined Food Board and the Food and Agriculture Sub-committee. By the time that these bodies were due to go out of existence under the arrangements already made, it was hoped that the worst of the food shortage would be over, and that the new authority would start to develop its plans under conditions approximating to those of 1939. Its first task was, therefore, to assess the pre-war position in as many countries as possible as a guide to working out future policies. During the winter of 1945–46, however, serious deterioration in the world's food supplies set in, and following an appeal for help, the Director-General agreed that the Food and Agriculture Organisation should undertake responsibility for relieving the situation. A special meeting was called at Washington in May 1946, at which recommendations were made to Governments as to the best use of the 1946 harvest and the ways in which still larger harvests could be secured in 1947. Allocation of foodstuffs, based on information and statistics provided by the Organisation, was delegated to a new agency, the International Emergency Food Council. An inquiry was then called for to ascertain the adequacy of existing international institutions to meet long-term problems of production, consumption and distribution, including surpluses.

Two important publications were the outcome of this meeting, "World Food Survey" and "Proposals for a World Food Board"*. The first is a study of the pre-war food consumption figures for seventy countries, comprising 90 per cent of the world's population. It includes targets drawn up by nutrition experts with the view of providing everyone with an adequate balanced diet, together with a budget of world requirements in 1960 if such targets are to be reached, due allowance being made for population increase in the meantime. The figures are inevitably incomplete, but are probably accurate to within 5 per cent for countries with a high calorie intake and 10 per cent for areas where the consumption is low. The extent of the malnutrition can be estimated from the finding that more than half the world's population had a pre-war calorie intake of only 2,250 a head a day; less than one third had available 2,750 or more calories. The deficiency was greatest in Central America and most of Asia, whereas the high-calorie groups occurred chiefly in North America and European countries; though it is realized that average figures inevitably conceal sharp variations owing to uneven distribution.

---

* Food and Agriculture Organisation of the United Nations. First Annual Report of the Director-General to the F.A.O. Conference. Pp. iv+45.
World Food Survey. Pp. 39.
Proposals for a World Food Board. Prepared for submission to the Second Session of the Conference of the Food and Agriculture Organisation, Copenhagen, Denmark, 2 September, 1946. Pp. iii+12.
(Washington, D.C.: U.N. Food and Agriculture Organisation, 1946.)

Further, the proportion of the various types of food yielding a similar total in calories may depend on national diet. Denmark and New Zealand, for example, are both countries with a high average food intake and a well-balanced diet; but though their consumption of cereals was equally low and that of milk equally high, wide differences were shown in regard to intake of animal protein and fat. Abundance of supplies and adequate purchasing power, however, resulted in a satisfactory diet in each case. In some of the countries in the low-calorie group, such as Java, the malnutrition was worse than the total figures suggest, since the proportion of cereals consumed was too high and the protein and fat consumption quite inadequate to maintain health. As a basis on which to work, estimates of the various foods needed by the world in 1960, if the calorie intake per head per day in the low-calorie groups is to be raised to 2,550–2,650, have been put forward by nutrition experts. The proportions of the different types of food comprising this total are roughly indicated, as the primary aim is to improve the balance between the various components of the unsatisfactory diets rather than attempt to alter the habits of any country.

For such a target to be achieved, production will need to be raised considerably, though the actual increases required vary widely with the different commodities, ranging from 12 and 21 per cent respectively in the case of sugar and cereals, to 100 per cent for milk and 163 per cent for fruit and vegetables. Increased production in its turn implies improvement in agricultural methods. More fertilizers and machinery will be wanted, irrigation and drainage schemes must be carried out, and deteriorated areas reclaimed. The application of science to agriculture, however, does not necessarily provide the solution; it may even create its own problems, as, for example, the accumulation of local surpluses, so that proper distribution becomes the major difficulty. Economic and social changes are also called for, such as the large-scale development of industry and trade, educational services, and some machinery for supplying credit to farmers. Positive action on an international scale to plan and organise production, marketing and finance would be needed to implement these recommendations, and in a further report the formation of a World Food Board was proposed. This body was envisaged as a central authority, empowered to hold reserve stocks of the more important commodities, to provide funds for financing the disposal of surpluses, and to co-operate with organisations concerned with international credits for industrial and agricultural development. Later discussion, however, rejected the scheme i this form, and proposals of an alternative natu were put forward.

In September 1946, the second meeting of th Food and Agriculture Organisation was held Copenhagen. Five new member nations we admitted, bringing the total to forty-seven. Th principal concerns of this conference were to apprai the Organisation's work during the previous month and to make a start with the major problems of long-range world food policy. One special featu was the approval of the report of the Commission t Greece, which at the request of the Greek Gover ment had carried out a survey of the agricultur forestry and fisheries of the country, and mad recommendations for future improvements an development. It was the first of this type of enter prise undertaken by the Organisation, though th extension of such services to other countries, a requested, is likely to be a feature of its activities i the future.

Though the Copenhagen conference did not los sight of the fact that there is still an urgent need fo maximum food production, avoidance of loss during storage and continued controls and economies in th use of all basic foods, the chief interest was naturally centred on the long-range programme. For this purpose a Preparatory Commission was set up to develop proposals for inter-governmental action to prevent the occurrence of both shortages and surpluses o food and other agricultural products, and, in particular, to consider the proposal already put forward for a World Food Board. The Commission consisted of representatives from sixteen member nations, three non-member nations with major or specialized food resources also being asked to participate. In addition, co-operation was invited from various inter-governmental organisations connected with trade, health and finance. The principal findings of this Commission have now been announced. Though entirely in agreement with the essential features of the plan put forward by Sir John Boyd Orr in his proposal for a World Food Board, it has recommended that, in place of an international authority itself holding reserves of food and purchasing power, co-operation should be worked out between the nations on a voluntary basis. Reserves of food should be built up nationally, but they should be operated internationally; orderly marketing policies should be framed and price-levels for a term of years fixed by international agreement. A World Food Council representing eighteen nations is suggested, which would work in close liaison with the Food and Agriculture Organisation, and meeting if required at intervals between the conferences of the latter. The proposals fit into the general scheme of the United Nations Organisation, and allow of close co-operation with existing agencies, among which the International Bank may be specially mentioned.

A policy of expansion is the keynote of the programmes suggested, both as regards food production and the development of industry and social services in rural areas. The carrying out of the proposals, however, depends on the various Governments conerned ; for they will have to provide the necessary acilities and co-operation if the aims of the Food nd Agriculture Organisation are to be realized, and dequate food, at a fair price, be made available to ll. The scientific and technical views, based on a ritical examination of the data available, have been et out ; it is now the task of the statesmen of the world to frame their policies to fit the facts of the ituation.

EARLY SURVEYS IN INDIA

Historical Records of the Survey of India
Vol. 1 : 18th Century. Collected and compiled by Colonel R. H. Phillimore. (Published by order of the Surveyor General of India.) Pp. xx+416+21 plates. (Dehra Dun : Survey of India, 1945.) 30 rupees ; 47*s*. 3*d*.

AT a time when Britain is trying to terminate her responsibility for the government of India, it is well that her services to that country should be placed on record. And there is no field of activity in which the British are better entitled to take pride in what they have done for India than that of surveying ; for the Survey of India has built up a reputation for enterprise and efficiency which is unsurpassed. The achievements of the Survey of India are for the most part well known, but not all of them have been placed on record. Regular publication of reports of its work only began some years after the Sepoy mutiny of 1857, and little information is available of the survey work done before that time. The Survey is now planning to fill in this blank.

Fortunately, the blank is not due to any failure to keep records of what was done. On the contrary, it seems to have been due rather to a superabundance of records which are so voluminous (those of the Great Trigonometrical Survey at Dehra Dun alone comprise seven hundred volumes) that, apparently, it has not been possible previously to find anyone who could give the time needed for their examination. This difficulty has now been surmounted. Colonel Phillimore, an officer of the Survey of India who retired from the Service a few years before the War, offered to undertake the task ; and, in spite of the interruption caused by the War, has carried it out with praiseworthy speed and thoroughness. This volume is the first of a series which will embody the results of his work. It deals with a period which the author calls "the age of romance and adventure in India". The next one "will cover a short but important period, 1800–1815, during which Colin MacKenzie brought regular organisation and system to the surveys of the Madras Presidency, and William Lambton laid the foundations of the trigonometrical survey". A third volume, "1815–1830, will tell of the co-ordination of all surveys under one Surveyor General of India, the extension of Lambton's survey . . . to be the Great Trigonometrical Survey of India . . . of the birth of a Revenue Survey Department . . . and the start of the Great Atlas of India . . . based on the G.T. Survey". Presumably the series will eventually be completed by a fourth volume covering the remaining thirty years or so until the date when the publication of regular reports began.

This volume opens with a short chapter entitled "General Narrative", which starts in the year 1719 when "a Jesuit missionary, Father Boucher, sent home to Paris a rough map of India and some sketches from which Bourgignon d'Anville published his first map of India in 1739", and ends at the capture of Seringapatam "with Mackenzie making preparations for the first great topographical survey, and Lambton yet to propound his scheme for a trigonometrical survey to extend right through the peninsula".

After the general narrative, each Presidency is dealt with in turn. Bengal gets three chapters, Madras two, and Bombay one. The surveys recorded were all the work of individuals, for this was before the days of systematic State-controlled survey work, which did not begin, even in Great Britain, until nearly the end of the century. Some of the surveyors worked on their own initiative, others did their work under orders, when an opportunity to survey some route or district happened to occur. This being the case, it is not possible to present the record as a continuous narrative. The chapters dealing with the surveys of the Presidencies are more like a catalogue of work done, but are enlivened by extracts from the journals kept by the surveyors ; extracts which are interesting in themselves, at any rate to those who have an interest in India, and, together, give a good impression of the conditions under which the surveyors had to work. Of more general interest are the chapters on Himalayan exploration, and on the preparation of atlas maps. It seems that the question of the identity of the Tsang-Po River of Tibet with the Brahmaputra of India, which was to cause so much discussion and controversy among geographers a century or so later, had been virtually settled by eighteenth-century explorers.

Most of the surveys were route sketches, generally compass traverses with distances measured by 'perambulator'. The Madras pattern perambulator, said to be the best, had a wheel nearly 7 ft. in diameter. "It was difficult to manage in a high wind, requiring two men to work it," and, worse still, it was always breaking down ! District maps were made by compiling route sketches, often a matter of some difficulty, for few of the sketches can have been accurate, and there were few well-fixed points. Many surveyors took observations for latitude to check their work, but the difficulty of determining longitude, until chronometers came into use towards the end of the century, limited the value of these fixes.

The records are not confined only to surveys ; there is a chapter on "Professional Methods" and another on instruments, while four or five chapters are devoted to personnel and conditions of service. The record concludes with a chapter on "Inhabitants and Officials" which supplements the 'general narrative' at the beginning of the book.

The account of the surveys is followed by nearly a hundred pages of "Biographical Notes" on the surveyors. These are arranged in alphabetical order and include references to more than two hundred individuals. If half a dozen of those who made outstanding contributions to the mapping of India were to be picked out, the choice might fall on the following : Alexander Dalrymple, Hydrographer to the E.I.C. 1779–1808 ; Robert Kelly, killed in a duel in 1790, and described as "a striking instance of a zealous and practical surveyor who was at the same time a distinguished soldier" ; Colonel Colin MacKenzie, Madras Engineers, Surveyor General, Madras, 1810–15, and Surveyor General, India, 1815–20 ; Major James Rennell, Bengal Engineers, Surveyor General, Bengal, 1767–77, an ancestor of the present Lord Rennell, who, after a life packed with work, hardship and adventure, including wounds which nearly ended his life at the age of twenty-four, lived to be nearly ninety, and is buried in Westminster Abbey; Lieut.-General Charles Reynolds, Surveyor General, Bombay, 1796–1807; and finally Michael Topping, Surveyor and Astronomer, Madras, 1785–96, who is described as "the most intriguing figure amongst all our surveyors of the 18th century".

The volume is illustrated with twenty-one plates, fifteen of them extracts from maps of the period, and four portraits of surveyors who made noteworthy contributions to the mapping of the peninsula.

M. N. MacLeod

FRENCH BOOKS ON AERONAUTICS

Considérations sur la conduite et l'exploitation des essais de qualités de vol des avions

Par Maurice Cambois. (Les essais en aéronautique, 1.) Pp. xv+126. (Paris: Libr. Dunod, 1945.) 240 francs.

Les essais de performances en aéronautique

Par Francois Hussenot. (Les essais en aéronautique, 2.) Pp. x+151. (Paris: Libr. Dunod, 1946.) 455 francs.

Les vibrations sur les avions

Calculs, essais, remèdes. Par Maurice Berthaume. (Guide du calculateur d'avous.) Pp. xii+79. (Paris: Libr. Dunod, 1946.) 275 francs.

THE first two of these books are respectively the first and second of a series entitled "Tests in Aeronautics". Other books in the same series in preparation or about to be published are: "Kinematics of Aircraft: Instruments in Flight Testing"; "The Technique of Piloting for Flight Testing"; "Engine Testing in Flight"; "Flight Testing of the Radio Equipment".

The first book covers the study of static stability and the damping of small-amplitude oscillations. It is the result of pioneering work at Villacoublay, before the War, of a small group of scientific workers to which M. Cambois belonged. Most of the experimental work described was made before the War, which postponed the publication of the book. Because of the progress made in aeronautics during the War, some of the technique described appears already out of date, and no doubt the book is not always representative of present-day French technique. The book is in two parts. In the first, methods and results are discussed, and the second contains the mathematical treatment which is the basis of the flight tests. Longitudinal and lateral stability are treated separately, and it is interesting to note that stability is considered strictly from the pilot's point of view, and is therefore assessed by measuring stick forces or movements only instead of the actual control movements as is more the practice in Great Britain. Deformations in the control circuit and of the aircraft structure under load are therefore embodied in the measurements and are an unknown portion of them. The rapidly increasing importance of aero-elasticity effects with speed has long made a knowledge of at least their order of magnitude essential. Also comparison with wind tunnel tests is more difficult. The various factors influencing stability are discussed, and from them a typical flight test programme for a prototype is deduced. The investigation of small-amplitude oscillations in flight is purely qualitative and is limited to checking that the oscillations are damped. The study of the controls is also qualitative and is limited to checking that the controls are adequate for all the normal evolutions of the aircraft. The book unfortunately does not contain a description of the instruments used, as these are to be the subject of another book in the same series.

"Performance Tests in Aeronautics", by F. Hussenot, deals with measurements associated with the ordinary evolutions of aircraft, namely, take-off and landing, climbs, level speeds, range, etc. In the first two chapters, general methods are discussed, and the particular methods favoured by the French are gone into in detail, except for the description of the instruments for the same reason as before. The methods described involve the extensive use of cameras both on the aircraft and on the ground. These, together with accelerometer and speed measurements, make the reconstruction of flight paths possible. Similar methods are used even for the measurement of level speeds at altitude with the help of local survey maps. Flight measurements on the power plant are then discussed, and the author points out once more the need for reliable and simple torque and thrust meters. The measurements actually made are those of airscrew r.p.m., boost pressure, various temperatures and fuel consumptions. All measurements are recorded simultaneously and centrally on photographic paper. The reduction of flight measurements to the standard atmosphere is gone into in detail, and various ways of presenting the data are suggested. Stress measurements in flight are briefly surveyed, but these have been found too difficult to be included in routine tests. The last chapter deals with special performance measurements, and these include measurements on flying-boats, autogyros, jet-propelled aircraft, towed gliders, etc. The book ends with some appendixes on sign conversions, reductions of fuel consumption measurements to the standard atmosphere, range measurements and on the use of logarithmic diagrams for propellers.

"Aircraft Vibration", by M. Berthaume, gives an elementary account of methods for the theoretical determination of the natural vibration frequencies of aircraft components and of the wing flexure-torsion flutter speed, and of the experiments required in connexion with them.

The theoretical methods make use of the concept of 'semi-rigidity' which has been adopted as the basis of flutter calculations in Great Britain. The usual method used in Britain for the theoretical determination of natural frequencies of vibration consists in replacing the aircraft component (or the complete aircraft) by a discrete mass system. The method given in this book, which replaces the wing, for example, by a semi-rigid structure possessing only two degrees of freedom in flexure and torsion, will give only the fundamental frequencies in flexure and torsion, the accuracy being dependent on the choice of deflexion modes which do not differ too greatly from the modes occurring in practice. It is also important to obtain a reasonably close estimate of some of the overtone frequencies; a larger number of degrees of freedom would be required in the calculations for this purpose. The values given for the inertia coefficients which occur in the equations of § 10 are not strictly correct. For a semi-rigid body it is not correct to take the moments about the root; the correct expressions are obtained from the principle of virtual work. (The quantities f_1, f_2 in the expressions for the inertias are then replaced f_1^2,

$_1f_2$; f_2^2, and the two mutual inertia coefficients J_1, J_2 then become equal.)

The treatment of the flutter problem is far from satisfactory, since the aerodynamic damping coefficients are completely ignored. The so-called flutter peed found by the method given may bear little relation to the true flutter speed, and will always be higher. The discussion on flutter is limited to flexure-torsion wing flutter, which involves two degrees of freedom only. Although methods for preventing control surface flutter by mass-balancing are reviewed, the determination of control surface lutter speeds is not discussed.

A brief account is given in Chapter 4 of methods of performing resonance tests. The wing is forced to vibrate by means of rotationary exciters; it is preferable to use linear-exciters consisting of a pair of out-of-balance masses, to avoid exciting lateral motion. The possibility of anti-symmetrical vibration has not been considered; by exciting at one wing tip only, as is recommended in this book, the resulting vibration will be a mixture of symmetric and anti-symmetric vibration. The piezo-electric detectors which are used have been found unsatisfactory in Britain, since the range of amplitude for which they give a satisfactory response is limited.

ROSIN AND ITS PRODUCTS

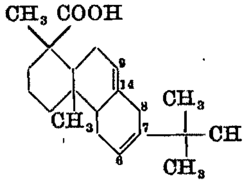
Produits résineux

Gemmes, colophanes et dérivés. Par Dr. René Lombard. (Matériaux de synthèse.) Pp. xv+316. (Paris: Libr. Dunod, 1946.) 385 francs.

ALTHOUGH France is the second largest producer of rosin and turpentine, she has practically no literature on the subject. Dr. R. Lombard, who has studied under Prof. DuPont and Prof. Brus of the Bordeaux Institut du Pin, seeks to remedy the defect, for the benefit of the many technical users of rosin and products from it. He has collected and correlated the available information and deals particularly with the fundamental study of pine rosin acids.

This book comes at a time when chemists are more occupied with synthetic resins than natural resins, and emphasizes the relative simplicity of the former compared with the latter. It also brings to mind Ruzicka's suggestion that known terpenes could be built up from isoprene. The book draws on "Die Harze" of Tschirch and Stock; but, as the author warns us, does not have the botanical background of that classical work. The book gives a good account of the brilliant researches of Ruzicka and other workers, such as Prof. R. D. Haworth, which have done much to elucidate the structure of many of the rosin derivatives.

The chapter on abietic acid is good, and so is the description of the work on the elucidation of the structure of *l*-pimaric acid and *d*-pimaric acid. It is unfortunate that these names are retained, since the two acids are not optical isomers. Dr. Lombard prefers the following formula for abietic acid



because it accounts for the direct transformation of *l*-pimaric acid to abietic acid, while the normally accepted Fieser formula, which has the double bond between the 7 and 8 carbons, necessitates an intermediate step. The generally accepted formula, however, is adopted throughout the book.

Dr. Lombard has given us a very useful volume. Rosin is the cheapest and most abundant source of organic acids, and rosin acids, because of their salt-forming properties, find industrial uses in the soap and paper trades; their ester-forming properties render them valuable in the varnish trade. This book is therefore helpful to many engaged in these industries. The bibliographies at the end of each chapter are very useful, but the reader will find the lack of an index in the book somewhat annoying.

INDIAN FOLK-TALES

Folk-Tales of Mahakoshal

By Dr. Verrier Elwin. (Specimens of the Oral Literature of Middle India: Published for "Man in India".) Pp. xxv+523. (London: Oxford University Press, 1944.) 25*s*. net.

DR. VERRIER ELWIN has rendered a great service to anthropology in his monographs upon the peoples of the Central Provinces. In this volume he sets out to "preserve for English-speaking readers specimens of *their* oral literature". The phrase is not very happy. His purpose is scientific, for he censures certain works as being "published purely for entertainment". Yet he admits that he has published this volume without reference to Thompson's "Motif-index of Folk-Literature". It is therefore not surprising that the reader finds his chapter-headings hard to follow. For example, "the boy whose brother was a bull" theme appears both under "The Quest for Love and Treasure" and "The 'Magic Articles' Motif". Moreover, Dr. Elwin does not attempt to distinguish between the basic folk-tales of the several peoples he reports and the ancient and very highly finished wares of India's professional story-tellers. There are several traces of the purely literary and foreign Persian "Sad Hikayat" among these stories.

It would have been helpful if the author had given the name and some details of each of his informants. The usefulness of the book as a crude quarry of material is also diminished by the absence of the dialect terms. On p. 397 the original is quoted but not translated. Elsewhere, no attempt is made to provide a clue to the many obscurities such tales necessarily contain. The "Hare Ram" on p. 383 is quite unintelligible, while on p. 386 the glossary gives correctly *Shorea robusta* for the sarai tree of the story, which in the text is later specifically called a mango. On p. 211 rather abrupt reference is made to a catapult, which must be modern, for the catapult is nowhere else indigenous in India. The glossary might well have been expanded; for example, no reference is made to the well-known caste of pack-carriers, the Lamani (not, surely, Lamana ?), or to the interesting examples of Acts of Truth, which occur more than once. The bibliography contains no entries from the Royal Anthropological Institute's journal *Man*. Some of the author's comments upon certain quite unpretentious works would seem to be a little more acid than is called for.

K. DE B. CODRINGTON

THE PAN-AFRICAN CONGRESS ON PREHISTORY

THOSE who are not well acquainted with the fields of prehistory and allied studies will scarcely be aware of the great developments which have recently taken place in these subjects in different parts of Africa. It is true to say, however, that as the result of the enthusiastic work of archæologists, palæontologists and geologists throughout that Continent, a vast mass of evidence has now been collected having the most important bearing on fundamental problems of human evolution and the development of early cultures. But much of this evidence has been assembled independently in widely separated regions of the Continent, and for some time it has been recognized that further progress might be seriously impeded if the relative isolation of prehistorians in different parts of Africa were to continue. It was mainly for this reason that the idea of a Pan-African Congress on Prehistory was conceived and put into effect by Dr. L. S. B. Leakey, curator of the Coryndon Memorial Museum in Nairobi. In spite of transport and other difficulties, the Congress has met with very considerable success, for it was attended by more than sixty delegates representing all the African territories as well as many European countries.

The Pan-African Congress was formally opened in the Town Hall of Nairobi on January 14 by the Governor of Kenya, Sir Philip Mitchell, and the proceedings were broadcast. The Abbé Breuil was unanimously elected president of the Congress, and Dr. R. Broom the vice-president. Meetings were held in the Town Hall and were continued from January 14 until January 23, during which many papers were read and discussed. For convenience, the business of the Congress was divided into three sections: (1) Geology, Climatology, and General Palæontology (chairman, Prof. A. L. du Toit); (2) Archæology (chairman, Dr. L. S. B. Leakey); and (3) Human Palæontology (chairman, Prof. R. Dart).

In the first section, interest tended to be focused largely on chronological problems, and particularly on the relation of early man in Africa to climatic fluctuations, faunal sequences, relative changes of land- and sea-levels, and geological events such as the formation of the Great Rift Valley. The Quaternary fauna of the African Continent was discussed in illuminating papers by Prof. C. Arambourg and Dr. B. S. Cook, and interesting points in the faunal correlation between Pleistocene Africa and Ceylon were made by Prof. P. Deraniyagala. The problem of the Plio-Pleistocene boundary was raised by Prof. F. Zeuner—an important problem in any attempt at a correlation of quaternary sequences in the African Continent with those in other parts of the world. Other papers dealing with the relation of geology to prehistory included a study of the development of the Sudan Plain in the quaternary by Mr. G. Andrew, a discussion of the recent physiographic history of the Lower Nile Valley in relation to pluvial oscillations in Abyssinia by Dr. S. A. Huzayyin, and an account of the high-level beaches of the Tanganyika lakes by Dr. D. R. Grantham. An interesting symposium was also held on the relation of pleistocene marine terraces to Stone Age cultures, with the main contributions by the Abbé Breuil, Prof. Zeuner and Dr. A. Ruhlmann, and a general discussion was held on the whole question of the Pleistocene in Africa with special reference to the dating of deposits and the devising of a unified terminology for describing the Pluvial Periods.

In the section on archæology, a number of delegate from different parts of Africa contributed an accoun of Palæolithic culture sequences in their own particular areas as a preliminary to a general discussion on terminology. Mr. A. J. Arkell dealt with the Lower Palæolithic of the Anglo-Egyptian Sudan Mr. A. J. Wayland with the Stone Age in Bechuanaland, Mr. Neville Jones with the Stone Age in Southern Rhodesia, Mr. Desmond Clark with the chronology of the Stone Age in Somaliland and Northern Rhodesia, Dr. Ruhlmann with Moroccan Palæolithic cultures, Prof. C. Van Riet Lowe with the development of the Great Hand Axe culture in South Africa, Dr. B. D. Malan with the Middle Stone Age culture in South Africa, and Dr. Leakey with the Tumbian culture of East Africa. One morning's session was also devoted to a series of papers on rock paintings.

In the section on human palæontology the papers included an important survey by Dr. L. H. Wells on the human remains of the Middle Stone Age in South Africa, but interest was mainly focused on the fossi Australopithecine apes from South Africa and the Miocene apes from Kenya. Prof. Le Gros Clark (who immediately before the Congress had been able to visit South Africa in order to examine the important Australopithecine material in the Transvaal Museum at Pretoria and the University of the Witwatersrand at Johannesburg) gave an account of the results of his studies. The main points of this communication were as follows. There is no evidence that the Australopithecinæ bear any close relationship to the African anthropoid apes of to-day, other than that which is implied by the fact that they are both hominoids[*] of comparable size. The suggestion that the Australopithecinæ are to be regarded as anthropoid apes which, in certain anatomical features, had undergone a parallel or convergent evolution leading to a secondary but independent development of certain human resemblances must almost certainly be ruled out, for the morphological similarities to the Hominidæ in the skull, dentition, and limbs seem far too numerous, detailed and intimate to permit of such an interpretation. These similarities include the pattern, proportions and disposition of the teeth, the detailed construction of the supraorbital region, zygomatic bone, temporo-mandibular articulation and auditory region, the position and size of the foramen magnum, the contours of the maxilla and mandible, and the details of certain small foramina in the skull. Other remarkable points are the degree of wear of the milk molars in *Australopithecus*, and the fact that in the type *Plesianthropus* skull the sagittal and coronal sutures were still completely patent although the third permanent molars had fully erupted and already showed signs of wear. These points seem to indicate quite clearly a prolongation of the growth period in the Australopithecinæ comparable to that of man. The fragments of the limb skeleton which have so far been discovered present surprising features, for the lower end of the humerus and upper end of the ulna ascribed to *Paranthropus*, and the lower end of the femur and the capitate bone ascribed to *Plesianthropus*, would by themselves have been unhesitatingly ascribed to *Homo sapiens* (though a detailed metrical analysis might reveal slight differences in comparison with modern races of man). On the other hand, the talus (astragalus) of *Paranthropus* provides evidence of a degree of mobility of the front part of the foot considerably exceeding that found in *Homo*. The femoral fragment ascribed to *Plesianthropus* clearly indicates a completely erect posture and gait, probably associated with a rather wide pelvis.

---

[*] The term 'hominoid' is here used in reference to Simpson's superfamily Hominoidea, which includes man and the anthropoid apes (see his recently published "Classification of Mammals").

The combination of limb bones so human in their anatomical details with a brain development scarcely exceeding that of the gorilla or chimpanzee (so far as this can be determined from endocranial casts) must inevitably raise the question whether the limb bones are correctly to be associated with the fossil remains of the skulls. But the circumstances in which they were found, together with the similar degree of fossilization, and Dr. Broom's affirmation of the complete absence of any signs of human occupation from the deposits at Sterkfontein and Kromdraai, as well as the complete absence of any remains of skulls or teeth of *Homo*, seem to leave no doubt about the correctness of the association. If this is really the case (and any possible doubts that may remain are likely to be settled soon by excavations now in progress), the conclusions to be drawn are of the greatest significance for the study of human evolution. It must be inferred, for example, that in the evolutionary sequence, limbs approximating to a human type had already been acquired at a time when the brain was still of simian proportions. At this phase of development also, the dentition had a definitely human appearance rather than that characteristic of the recent anthropoid apes. The Australopithecine material, indeed, supports the inferences drawn from the indirect evidence of comparative anatomy that many of the diagnostic characters of the recent large anthropoid apes, such as the powerful canines and the large incisors (accompanied by the 'simian shelf' in the mandible), the exaggerated development of the supra-orbital torus, the construction of the powerful brachiating arms, and certain features of the hind-limbs, are to be regarded as aberrant specializations peculiar to these apes and not as primitive features to be sought for in human ancestry. Finally, the morphological evidence of the South African fossils makes it tolerably certain that the point of divergence of the human line of evolutionary development from the line leading to the modern large anthropoid apes must be assigned to a geological date considerably earlier than many palæontologists have hitherto been prepared to accept.

In the course of his report, Prof. Le Gros Clark paid a tribute to the pioneer work of Prof. Raymond Dart of the University of the Witwatersrand, who, in 1925, was the virtual discoverer of the type specimen of the Australopithecinæ, and to Dr. R. Broom, who was responsible for the further discoveries, the results of which have been published in his recent monograph (see *Nature*, June 29, 1946, p. 863). There appeared no room for doubt that Dart and Broom had certainly not over-estimated the significance of the Australopithecinæ, and that their interpretations of these fossil remains were entirely correct in all essential details. However, the allocation of the Australopithecine fossils to an early Pleistocene, or even to a late Pliocene, date would mean that they could not themselves represent the ancestral stock from which the Hominidæ were derived. But they were almost certainly to be regarded as late, and only slightly modified, survivals of that ancestral stock.

The remains of Miocene Hominoidea in Kenya (particularly at Rusinga and Songhor) are interestingly complementary to the South African fossils, for while the latter have a specific reference to the evolution of the human line of development, the Kenya material provides important evidence for the evolution of the Hominoidea as a whole, that is, the zoological group of which the human line represents but one offshoot. Dr. Leakey's discovery of further remains of *Proconsul*, including an almost complete mandible, makes it clear that this extinct form (in spite of some remarkably primitive characters) was closely allied to the Dryopithecine apes. Far more interesting, though perhaps less spectacular, are his discoveries of the teeth and jaws of *Xenopithecus* and *Limnopithecus*. The former helps to bridge the morphological hiatus which has hitherto separated the large from the small anthropid apes, and the latter serves to link up the Kenya assemblage of Miocene hominoids with *Propliopithecus* from the Oligocene of Egypt. Much of this important fossil material has already been described and discussed in an important memoir by Dr. D. G. MacInnes.

A point of great importance which has emerged from the Pan-African Congress is that the deposits in South Africa yielding the Australopithecine material and those in Kenya yielding Miocene hominoids are exceedingly rich in fossil remains, and that systematic excavation in both these regions is practically certain, in a relatively short time, to provide the evidence required to reconstruct much that is still obscure in man's evolutionary history. It was announced at the Congress that an expedition has been organised from the University of California with the purpose of excavating far more thoroughly than hitherto the Sterkfontein and Kromdraai sites in South Africa. A complementary expedition to the Miocene deposits of Kenya in co-operation with Dr. Leakey, financed from Great Britain, was very seriously urged by the British delegates.

The Pan-African Congress on Prehistory included several excursions of great archæological interest. One excursion (lasting two days) was made to the Great Rift Valley as far north as Nakuru. Delegates were taken to the top of the Kinangop plateau, 2,000 ft. above the present level of Lake Naivasha, and were able to pick out for themselves from lacustrine deposits on the plateau obsidian points and scrapers of late Middle Pleistocene date. They also visited the obsidian mines (about forty miles distant on the other side of the Great Rift Valley) from which early man obtained his raw material. At the Kariandusi River site (near Lake Elmenteita) they inspected what was evidently a factory of hand-axes of the Acheulean type, and a visit was made to Gamble's cave, on the Mau escarpment, where remains of Aurignacian man had been found. On January 19 an excursion was made to the Acheulean site at Olorgesailie, discovered by Mrs. Leakey in 1942. Here the delegates were astonished to see hundreds of hand-axes and cleavers strewn over the eroded slopes of Pleistocene lacustrine deposits. Trenches had been cut which showed that several camp sites had here succeeded each other on a series of ancient land surfaces (interbedded between lake clays). In these deposits were found large numbers of implements, groups of 'bolas' stones, and remains of the giant baboon (*Simopithecus*), giant pig, and other extinct mammals. The whole of this site has been fenced off and partly roofed over to provide a local field museum. On the occasion of this excursion, the museum was formally opened to the public by Sir Gilbert Rennie, Chief Secretary of Kenya. Finally, at the end of the Congress, a seven-day tour was made to Arusha, Ngorongoro and the Olduvai Gorge.

It has already been mentioned that the Pan-African Congress on Prehistory was a success. It was, in fact, an outstanding success in several ways. Apart from the value of the actual scientific meetings and the interchange of ideas between prehistorians from different parts of Africa and elsewhere, the discussions led to some very important agreements with regard to terminology and also with regard to plans for co-ordinated research in the future. Finally, it was decided to set up a permanent organisation and to hold a Pan-African Congress on Prehistory every four years. At the invitation of Field-Marshal Smuts, the next Congress is to be held in South Africa in 1951.

At the final meeting of the Congress, votes of thanks were passed to the Governor of Kenya and the Kenya Government for their sponsorship of the Congress, to the people of Nairobi who had given hospitality to the delegates, and to the organising secretary, Dr. Leakey—as the result of whose enthusiasm and energy the idea of the Congress had been initiated and so successfully carried out

PALÆOLITHIC HUMAN REMAINS IN ASIA

THE discovery of the skeleton of a child, reported to be a representative of the "Neanderthal" type, in a deposit in the Teshik-Tash Cave, near Bokhara, in Southern Uzbekistan, is a matter of considerable interest to anthropologists. The age of the individual is said to have been about eight or nine years, and the discovery was made in the course of systematic excavation by archæologists. They refer to the deposit as "middle palæolithic", and this would presumably include a Mousterian subdivision. The discovery is particularly interesting, since if confirmed it will extend very considerably eastwards the area of geographical distribution of the Neanderthal type.

Apart from discussion of the immediate surroundings and their antiquity, the characters of the skeleton are in themselves noteworthy. Dr. Weidenreich, of the American Museum of Natural History, has conferred a great benefit on students who are unable to consult the original version of the description (in Russian), by means of his critical account in the *American Journal of Physical Anthropology* (N.S. 3, No. 2, June 1945). The net result is a plea for re-examination of the skeleton, and if that be granted, the facts submitted by Dr. Weidenreich will necessarily claim further attention.

Actually Dr. Weidenreich states that he "is not convinced that the Uzbek skull is an immature Neanderthal skull belonging to the European variation", nor, he adds, "of the Mousterian European type"; and he sets out the data on which th
opinion is based.

At this point it should be noted that the child
skull is said to have been "smashed into more tha
150 fragments", from which it has been reco
structed. Moreover, the Russian observers are n
quite unanimous in their opinions, though examinati
of the original documents in Russian might reduce an
seeming discrepancy. But in consideration of t
information available, it is to be noted that D
Weidenreich cites a brief report in *Science*[1] b
the late Dr. Aleš Hrdlička on the discovery of t
skeleton in 1938 by Prof. Okladnikoff. In th
report Dr. Hrdlička is said to state that the sku
was identified by the discoverers as a "Neanderth
child". Finally, Hrdlička had the opportunity
examining the skull and concluding that some fi
or six important characters which he cited "a
denote unequivocally a Neanderthal specimen".

In the following year the Uzbekistan Section
the Academy of Sciences of the U.S.S.R. devoted a
entire fascicle to the Uzbek skull (1940). The *VOK*
Bulletin No. 9/10 for 1945 contains a report o
"Recent Work on Soviet Anthropology" by Prof.
Bunak. In this, Prof. Bunak refers to a compr
hensive monograph "now in press", which ma
represent an extension of the fascicle of 1940 me
tioned above. However that may be, Prof. Buna
reports that he has taken part in the investigatio
having been engaged in examining the brain-cas
In his opinion, the skull is "Neanderthaloid", but h
adds that while "this conclusion is beyond doub
from the modern point of view it is insufficient'
and "the extreme youth of the relic renders it difficul
to draw a definite conclusion". He concludes that i
provides valuable material for "the investigation
the variations of the 'Neanderthaloid' type".

In advocating a revision of the rather dogmati
opinion expressed by the late Dr. Hrdlička, D
Weidenreich is not unreasonable. His most effectiv
criticism relates to the form of section of the mandibl
at the chin. He notes the large 'capacity' assigned t
the skull, but on this ground he is less convincin
Reconstruction from so many fragments may b
partly responsible, and the same factor may affec
a detail to which Dr. Weidenreich might hav
pointed effectively. This is the more forwardl
directed plane of the foramen magnum as exhibite
in the tracing of the skull in the sagittal plane.

The main object of this communication is to direc
attention to the discussion and to indicate th
interest of the specimen to which it is related. D
Weidenreich's plea for re-examination is also com
mended.

In the memoir published in the *American Journa*
of Physical Anthropology (cited above), Dr. Weiden
reich renews his support (1928) of the claims mad
on behalf of the Podkumok skull (Caucasus) fo
recognition as showing a transition from the Neande
thal type to that of the modern *Homo sapiens*, an
expresses regret at the rejection by Sir Arthur Keit
of those claims. In this connexion, reference may b
made to *Nature* of October 15, 1938, p. 694, wher
there is an account of the Podkumok skull, and o
Sir A. Keith's opinion. The whole article, whic
deals, however, with European Russia, demand
reference in this place, more particularly in con
nexion with Prof. Bunak's report in *VOKS* (1945)

W. L. H. DUCKWORTH

NATIONAL CHEMICAL LABORATORY OF INDIA

By Dr. BASHIR AHMAD
Assistant Director of Planning, National Chemical Laboratory

IN pursuance of the recognition of the need for the organisation of scientific and technical research on an extensive scale for the larger objective of economic and industrial development of the country, it has been proposed to establish a National Chemical Laboratory in India. A tentative scheme for the Laboratory was drawn up in 1943 and circulated to a large number of scientific organisations and ndividuals in India and abroad. A final plan has now been formulated after a careful consideration of the suggestions received, the lines along which similar laboratories in other countries have been established, and taking into consideration also the special needs of India. This plan, therefore, incorporates the views and recommendations of a large number of leading men of science and scientific organisations all over the world.

Functions

The Laboratory will be devoted to problems of both fundamental and applied research in different ields of chemistry, and will also concern itself with developing the means for the application of scientific knowledge to practical problems of industry. The Laboratory will bridge the gulf between science and ts application to industry and will provide a link between the universities, the State and other scientific nstitutes on one hand, and industry on the other. The fundamental work undertaken by the Laboratory will be devoted to extending the frontiers of knowedge in directions likely to prove useful to the ndustrial progress of the country. The applied and developmental work will take the form of improving old processes in the light of newer scientific knowedge, and discovering new processes. This work will be carried to the pilot-plant scale in the Laboratory, after which it will be passed on to industry. The Laboratory will maintain close and continual contact with industry, the difficulties and problems of which may be referred to the Laboratory for solution. In this manner the link between the National Chemical Laboratory and industry will be vital and effective, and so will be its link with the universities and other scientific institutes in the country.

Some of the most important scientific discoveries during the last half a century, which have been of the greatest benefit to mankind, have resulted from arge organisations both of workers and of materials, and have involved expenditure beyond the means of an average research laboratory. The National Chemical Laboratory hopes to be in a position to undertake such important and expensive research.

Keeping in view the fact that problems of industry, or in the wider perspective, those of human welfare, require the co-operation of experts in different fields of science, the scope of the National Chemical Laboratory has been kept sufficiently wide. The Laboratory will include not only chemistry, but also physics, mineralogy, engineering and biology in so far as they relate to chemical problems and the chemical utilization of the national resources. The Laboratory will also provide a place for the training of research workers in specialized fields of chemistry and technology, particularly with reference to those for which there is no provision available in the existing scientific laboratories of India.

The scientific work of the National Chemical Laboratory will be divided into seven main divisions: (1) Inorganic Chemistry, including Analytical Chemistry; (2) Physical Chemistry, including Electrochemistry; (3) Chemistry of High Polymers; (4) Organic Chemistry; (5) Biochemistry, including Biological Evaluation; (6) Chemical Engineering; (7) Survey and Intelligence. In addition to these, two more Divisions are contemplated, one for Fermentation Technology, and another for Cellulose and Related Products.

Location and Staff

Poona, which enjoys a moderate climate all the year round, and is within easy reach of Bombay and its industries, has been selected for the location of the Laboratory. A site of about 470 acres on the Pashan Road on a beautiful, breezy and healthy plateau, in close proximity to educational institutions of the city, has been selected for the Laboratory.

The staff requirements of the Laboratory have been carefully considered. They are summarized below:

1. Scientific staff:	
(*a*) Director, Assistant Directors, Senior Scientific Officers, Junior Scientific Officers	51
(*b*) Research Assistants	64
2. Administration staff	42
3. Technical staff for workshop and various services	35
4. Stores, Laboratory Assistants and Attendants	86
5. Other staff	42
Total ..	320

Buildings and Finances

The floor-space requirements of buildings to house the different activities of the Laboratory have also been carefully worked out. These are as follows:

1. Main building, housing various divisions	150,000 sq. ft.
2. Ten auxiliary buildings ..	30,000 ,,
Total ..	180,000 ,,

The establishment of the Laboratory will involve a capital expenditure of 3·5 million rupees and an annual budget of 1·16 million rupees when the Laboratory is working at full strength.

NATIONAL METALLURGICAL LABORATORY OF INDIA

By Dr. G. P. CONTRACTOR
Assistant Director of Planning, National Metallurgical Laboratory

THAT India possesses great natural advantages for the production of iron and steel there is no doubt. She has rich and vast deposits of iron ore, exceeding both in quality and quantity the ores found in many States of Europe and America. These ores are reckoned to be more than sufficient for the requirements of India herself for nearly a thousand years. In spite of this, India's yearly production of steel ingots and castings in 1939 was only one million tons. The United States are producing $\frac{1}{2}$ ton of steel per man, the United Kingdom about $\frac{1}{3}$ and Japan $\frac{1}{5}$ ton per man. In India, if the target is kept as low as $\frac{1}{50}$ ton per man, she will have to produce about eight million tons of steel a year. This comparison indicates beyond a shadow of doubt that India's iron and steel industry is in an extremely backward state. Only the systematic and thorough development of the iron and steel industry, which is a basic and key industry as well as a defence industry, can facilitate the transition of India from the agricultural to the industrial stage by stimulating the growth of a number of associate or allied industries.

In order to ensure the progress and expansion of India's metallurgical industries, it was decided by the Council of Scientific and Industrial Research in 1942 that a National Metallurgical Laboratory should be established in India. Accordingly, a Laboratory Planning Committee, under the chairmanship of Sir J. J. Ghandy, director of the Tata Industries, Ltd., was constituted to formulate a scheme. A tentative scheme was prepared and circulated to technical experts, industrialists, and others in 1945. This scheme was later altered on the basis of the suggestions and comments received, and principally on the basis of the funds available. The final scheme recently prepared was approved on September 17, 1946, by the governing body of the Council of Scientific and Industrial Research.

Location

The Laboratory will be situated at Jamshedpur, which is the centre of the modern metallurgical industries in India. The Tata Industries, Ltd., have generously placed at the disposal of the Council a very suitable site for the construction of the Laboratory. Services, such as electricity, water, gas, sewage and effluent disposals are available close to the site.

Functions

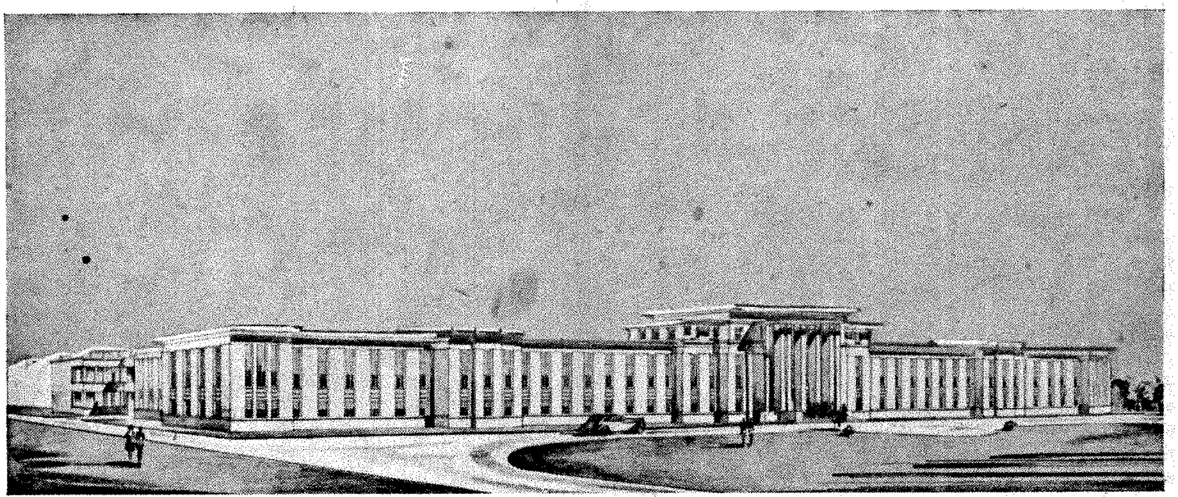
The Laboratory when completed will cover all aspects of metallurgical research, both fundamental and applied, and will carry out research on ores, minerals and refractories as applied to metallurgy. The preparation of minerals and ores and the smelting of the latter are so definitely a part of the development of the country's metallurgical industries that facilities for minerals research have been provided at the Laboratory, complete with pilot-plant equipment for semi-commercial development.

As the metallurgical industry is one of the biggest consumers of refractories, research on this subject has also been included with that on metallurgy; work on metallurgical furnace design will also be undertaken. Work on refractories will be greatly facilitated by the presence of the ore-dressing and minerals research section, with its specialized laboratory and pilot-plant assemblies.

Plans

Provision has been made in the final plans of the National Metallurgical Laboratory for administration, including statistics, library, museum, lecture theatre, etc.; chemical analysis; physical chemistry; physics as it affects metallurgical problems; the examination, preparation and smelting of metallic ores; the melting, heat treatment and working of metals and alloys; research into the structure and physical properties of metals and alloys; the electrodeposition and surface treatment of metals; and research on refractories. Facilities will be provided for the application of research results to commercial operating conditions, and for the study of such conditions as they affect the quality of the products, and the efficiency and economy of commercial production. The National Metallurgical Laboratory will work in close collaboration with the other Laboratories of the Council, particularly on long-term research of a fundamental nature.

The Laboratory is meant to function as an up-to-date research centre where knowledge of the fundamental sciences of physics, physical and inorganic chemistry, metallography, engineering, etc., will be utilized to solve the problems which confront the ferrous and non-ferrous metal industries to-day, and are expected to confront them even more in future, when competition from foreign countries will have to be met. The Laboratory is also meant to function as a clearing-house for information. It will give facilities for the training of a number of students in the application of scientific methods to the metallurgical industries, so as to enable them to take charge of technological duties in the works. To help and encourage industrialists in the solution of



ARCHITECT'S DRAWING OF THE NATIONAL METALLURGICAL LABORATORY, INDIA their problems, facilities will be provided at the Laboratory through a system of industrial fellowships.

Buildings

The Laboratory when completed will consist of a main building containing administrative offices, research laboratories, museum, lecture theatre, etc., and a separate technological block comprising large workshop-type laboratories with associated control rooms for practical semi-commercial scale operations. The main building will have three floors, the height of each floor being about 12 ft. clear underside of slab. Efficiency and convenience of operation coupled with the required degree of flexibility and adaptation to future needs were borne in mind in designing the Laboratory. The sizes of rooms were carefully planned with regard to the requirements for benches and aisles, especially for the chemical laboratories, and for natural illumination. Chemical laboratories and other rooms on the north were planned to be 32 ft. wide, this being considered the maximum depth which could be illuminated from windows on the outside wall and from the clerestory above the fume hoods on the corridor wall.

The location of the laboratories for different types of work has been carefully considered. Fume-producing laboratories have been kept to the east of the main building, while the physical and metallurgical sections, housing complicated and delicate instruments, have been placed to the west. The laboratories have been arranged, however, so as not to interfere with the convenience of working. The position of individual laboratories has also been given considerable thought. For example, laboratories where heavy objects are tested, such as the macro-room and radiography laboratory, have been placed on the ground floor. Similarly, X-ray laboratories have been planned to be located in the corner of the main building, with a lighting area on one side. The location of the museum and the lecture theatre is such that direct access can be had through the entrance without disturbing the work being carried on in the other parts of the building. The administrative section is centrally located on the second floor. In this section, facilities for statistical investigation, not only for compiling metallurgical trade figures but also for the use of statistics as a research tool in investigations on practical production and operational problems, will be provided. The library has been planned to run through two floors, with adequate provision for book-stacks and working space for book-binding, copying, etc., on the ground floor. The actual working floor area on the first floor is approximately 26,000 sq. ft., with an equivalent space on the ground floor, and about 8,600 sq. ft. on the second floor. The laboratories and the administrative section in the main building will be air-conditioned by a refrigeration system.

The technological block, providing a working floor area of about 28,000 sq. ft., has been situated to the south of the main building and, connected to it by corridors in the form of covered ways. The block consists of four main workshops or bays which are situated two on each side of the electrical power distribution station, which is in the centre. This arrangement permits the installation of generators, controls, etc., for a furnace bay on the left, and motors, etc., for a mechanical treatment bay on the right. Furthermore, this arrangement ensures the central power distribution station against dirt, dust, fumes, etc. The north end of the technological block is occupied by a mezzanine floor forming upper and lower suites of rooms for offices of the operating staff, for inspection and control laboratories, for drawing offices and for specialized apparatus in connexion with pilot-plant work.

Staff and Finance

The initial basic staff of the Laboratory is summarized as follows :

1. Scientific staff :	
(*a*) Director, Assistant Directors and Research Officers	27
(*b*) Research Assistants	26
2. Technical staff (mechanics, etc.)	25
3. Laboratory assistants	24
4. Administration	18
5. Laboratory 'Bearers'	33
Total	153

The total cost of construction and equipment of the Laboratory is estimated at Rs. 4,280,000 (£325,000). Buildings, services, air-conditioning, heavy electric plant, etc., are estimated to cost Rs. 25,00,000 (£190,000), and for equipment, provision has been made for Rs. 17,80,000 (£135,000). The recurring expenses in the initial stages are estimated at Rs. 6,00,000 (£45,000).

The foundation stone of the National Metallurgical Laboratory was laid by the Hon. Mr. C. Rajagopalachari, Minister for Education and Arts in the Interim National Government, on November 21, 1946.

CRITERIA OF HYBRIDITY

By Dr. H. G. BAKER

Department of Botany, University of Leeds

THE importance of the study of natural hybridization is obvious in view of the large part it plays in the process of evolution. There have been considerable differences of opinion, first as to the possibility of recognizing natural hybrids and, secondly, as to the status of the parents once the possibility of hybridization has been established. We are not concerned here with the second controversy, for it must be recognized, now, that the existence of hybrids both within and between species is well substantiated. Although hybrids are one of the banes of the taxonomist, their frequent occurrence in Nature makes it important that they should be recognizable without doubt. Further, when such recognition is possible they cease to be a bane.

Decline of Experiment

In 1895, Kerner[1] performed a very useful service by exposing many of the spurious criteria upheld by some of the unscientific horticulturists of his day, and he performed many crosses for himself in support of his belief that hybridization was the basis of the origin of new species. Although his pioneer technique led him to draw several conclusions which we know, to-day, to be generally incorrect, such as the true-breeding nature of hybrids (pp. 580–1), he was insistent that while some of the characters of hybrids were derived from one parent and some from the other parent, other characters were intermediate and others, again, were 'new' characters which could not be attributed to inheritance from those parents. His lists of characters of the last type are interesting. The basis of Kerner's conclusions was the experimental production of hybrids and observation of the resulting characters of the hybrids. Subsequent workers[2,3,4,5,6] have laid less and less emphasis upon this approach to the problem and have drawn up lists of criteria which may be applied to natural hybrids without the necessity of making crosses. This outlook appears to have attained such a hold that in one case where a supporter of natural hybridization[7], himself, doubted whether certain naturally occurring plants were hybrids, he did not investigate the matter by making a cross but by collecting the seed from plants of the putative parents and hybrids growing together in Nature and sowing them. There was no means of knowing which were the pollen-parents of the seedlings raised.

Huskins[8] has emphasized "that there is no one satisfactory criterion of 'hybridity' in the commonly accepted sense of the term, and that arguments based upon any one of the supposed criteria . . . must lack general validity". Even Allan[6], an enthusiastic field-observer, after repeating Cockayne's[3] criteria, is forced to admit (p. 595) "that all these may fail him, and that repeated studies are necessary for definite conclusions"; and, further, he warns that Nilsson's synthetic studies[9,10,11] on *Salix* "show the need for great caution in interpreting field-evidence".

In the United States, the index method of scoring hybrids in natural populations was introduced by Anderson[12] in 1936, and has been used by subsequent workers. Here, selected characters are assigned an index value according to their resemblances to those obtaining in the two parents, and each naturally occurring plant is scored. Very high and very low scores typify the pure species, while hybrids are intermediate. In the majority of the cases known to me where this method has been employed[12,13,14,15,16,17], its use has not been preceded by an artificial cross between the putative parent-species, differences between those species being all that were known before the natural populations were investigated. The work of Goodwin[18] with *Solidago* is an exception. There is a suspicion of a circular argument in following the assumption that certain characters are those of hybrids by their use to prove the hybrid nature of the plants bearing them. Any character which shows a number of intermediate conditions is weighted to the extent of the number of intermediates which the observer happens to be capable of distinguishing. Particularly alarming, in view of the absence of experiment, is the statement[12] "when, for instance, certain of the categories (characters) are *thought* to be more or less reliable than the others they can be appropriately weighted in combining the index". (The italics are mine.)

It is easy to overcome the faults in these methods by making it a rule that, wherever possible, artificial crosses between the forms involved (giving evidence of the mode of inheritance of the characters) should *precede* investigations of natural populations. Determined in this way, natural hybridization can never be denied. Only in the case of trees and other plants where a long period must elapse between crossing and observing the results should it be necessary to relax this rule and, even here, it is probable that the *possibility* of hybridization may be determined by observing whether the production of viable seeds follows crossing. In addition, cytological investigations may give indications of relationship.

Selection and Use of Suitable Characters

Even after the performance of such crosses, all the characters involved will not be of equal value. For taxonomic purposes, Wernham[19] divided characters into two primary categories, the 'fortuitous' and the 'biological', respectively. He defined 'fortuitous' characters as those which have "no relation to the environment nor to any biological function". 'Biological' characters were "such as are in direct relation to some vital function or advantage". Diels[20] disapproved of this terminology and substituted 'constitutive' and 'non-constitutive' for 'fortuitous' and 'biological', respectively. Then, he subdivided 'non-constitutive' characters into 'functional', 'epharmonic' and 'adaptive' characters. 'Functional' characters are connected intimately with some special function but are uninfluenced by external conditions. 'Epharmonic' characters, while being connected, apparently, with the mode of life of the plant, remain constant under varying external conditions. 'Adaptive' characters vary according to the external conditions. Sprague[21] suggested that 'plastic' would be a better term for Diel's last sub-category, and this suggestion will be adopted here.

An ideal distinguishing character must fulfil several conditions. To begin with it should be unaffected or, less preferably, affected to a known extent by the environment. A character which is affected may be of use when comparing two plants growing alongside or in exactly comparable conditions, but is unlikely to be of general use for natural populations. Obviously, the character should not vary during the course of the season in which comparative measurements are made.

The breeding behaviour of the character needs to be known. It is insufficient to know the typical condition in the two parents. The condition in the F_1 must not be a mere expression of hybrid vigour; it must be recoverable from the F_2 generation. It will be of much greater use if it is cumulatively determined by several genes, so that gradations are measurable. A simple dominant-recessive relationship is of more limited use. The occurrence of matrocliny, whatever its cause, is a possible hindrance and must be allowed for when it is known to occur. Theoretically, it might be possible for all the characters of one form to be dominant over the corresponding characters of the other, so that only in the F_2 generation would recombinations be visible. It is doubtful if this will ever be found in the case of fully differentiated species, however. Wilmott[22] suspected this to have occurred in possible spontaneous hybrids between *Geranium robertianum* L. and *G. purpureum* Vill. which occurred in his garden. However, he did not actually see the F_1 generation, so there is no proof of this.

Preferably, the ideal character should be 'constitutive' in the sense of Diels, or at least neutral so far as the ecological distinction between the forms is concerned. If it is 'non-constitutive' the action of natural selection will tend to cover up the hybridization. The character should not be closely linked with any that is 'non-constitutive', for in this case, again, natural selection will exert a covering action.

The mutation-rates of the genes controlling the character must be low. The character should be uniform over the whole distribution area of the forms so far as pure populations are concerned. Probably this is the hardest of all the conditions with which to determine agreement. Herbarium specimens and published descriptions must be consulted in most cases, and the judgment of the individual is called for in assessing the degree of agreement with the condition. An investigation of this nature is very necessary for a 'constitutive' character for, not being subject to natural selection, it may show great variability within a species. However, it must be remembered that by excessive variation such a character would cease to be 'constitutive'.

The character must be capable of easy and accurate measurement, the gradations of a colour, for example, being inferior to those of a character which can be measured with a ruler. The value of a character which can be treated more nearly objectively is that other investigators can use it with comparable results, that results obtained at different times can be compared and that an average value for a population is expressed more easily. It is a great advantage if this facility and accuracy of measurement are applicable to preserved as well as fresh material. Such material may be pickled or dried and mounted, and the changes which may occur during these processes must be taken into account. Again, the character should be measurable without removing the material from the mount or damaging it in any way.

After the most suitable characters have been selected, if it is desired to construct and use an index in the study of a population, it is preferable that characters unlikely to be affected by natural selection (that is, 'constitutive' characters) should be kept separate from those with positive or negative selection-value. Whereas the former will indicate truly the *extent* of hybridization, the latter, considered in conjunction, will indicate the severity of natural selection.

An examination of two interbreeding species (*Melandrium dioicum* Coss. and Germ. and *M. album* Garcke) has been made already[23,24], using characters selected in this way, and the method is being applied to species of *Geranium*, *Armeria* and *Arum*.

OBITUARIES

Prof. H. P. Lewis

HERBERT PRICE LEWIS, professor of geology in the University College of Wales, Aberystwyth, died suddenly at his home at Borth, Cardiganshire, on January 22 in his fifty-second year. He was a son of the late Mr. and Mrs. Francis Lewis of Llangollen, and was a pupil of Llangollen County School, going thence to University College, Bangor. He served in the War of 1914–18 and was severely wounded. Proceeding to Downing College, Cambridge, he took the course in natural science, studying geology under the late Prof. J. E. Marr. He was for a short time a master at Oundle School, and in 1921 went to the University of Sheffield where, as a lecturer in geology, he was closely associated with Prof. W. G. Fearnsides. In 1922 he was awarded the Daniel Pidgeon Fund by the Geological Society of London, and in 1931 the J. B. Tyrrell Fund. As holder of the latter he spent some months in Canada studying the fossil faunas of the Devonian and Carboniferous rocks. In the same year he was appointed to the professorship at Aberystwyth. He was awarded an Sc.D. of the University of Cambridge in 1940; and he served on the council of the Geological Society during 1942–44.

Prof. Lewis was an all-round geologist. He was an untiring enthusiast in the field, and organised and led some of the longer field-meetings of the Geologists' Association, and attended several of their excursions to different parts of the European Continent. In spite of a permanent disability caused by his war service, he was remarkably skilful in preparing material for the microscope and in all branches of laboratory technique. He had an exceptionally wide knowledge of geological literature, and he was always most ready with expert guidance to others, whether colleague, student or occasional inquirer.

These various interests are reflected in Prof. Lewis's published papers, which include works on petrology, stratigraphy and structural geology; but it was as a palæontologist that he carried out his more extensive and detailed researches, specializing on fossil corals and the more difficult and obscure groups such as the calcareous Algæ, various kinds of micro-fossils and the problematical *Bolopora undosa*. He had for some years been mapping the geology of the Aran mountains in Merionethshire, but very little of this work has been published. Both in his research and in his teaching, his careful attention to accuracy and detail was a marked characteristic.

Prof. Lewis took an active part in the academic and administrative life of the College and the University of Wales, and held a responsible position in one of the churches at Aberystwyth. He was a man with the highest standards of duty and conduct, and his untimely death will be deeply felt. His wife, with two sons and one daughter, survive him.

JOHN CHALLINOR

WE regret to announce the following deaths:

Dr. David Hooper, formerly of the Wellcome Historical Medical Museum, on January 31, aged eighty-eight.

Dr. H. M. Tory, formerly president of the National Research Council of Canada, aged eighty-three.

NEWS and VIEWS

Advisory Council on Scientific Policy

THE Lord President of the Council, Mr. Herbert Morrison, has appointed the following to serve on the Advisory Council on Scientific Policy which has been set up to advise him in the exercise of his responsibility for the formulation and execution of Government scientific policy: Sir Henry Tizard (chairman); Sir Edward Appleton, secretary, Department of Scientific and Industrial Research; Sir Alan Barlow, Treasury; Sir Howard Florey, professor of pathology, University of Oxford; Sir John Fryer, secretary, Agricultural Research Council; Sir Claude Gibb, managing director, C. A. Parsons and Co., Newcastle-upon-Tyne; Sir Edward Mellanby, secretary, Medical Research Council; Sir Edward Salisbury, director, Royal Botanic Gardens, Kew, and secretary, Royal Society; Sir Ewart Smith, Imperial Chemical Industries, Ltd.; Sir Reginald Stradling, chief scientific adviser, Ministry of Works; Prof. A. R. Todd, professor of organic chemistry, University of Cambridge; Dr. A. E. Trueman, deputy chairman, University Grants Committee; Prof. S. Zuckerman, professor of anatomy, University of Birmingham. The Council will be served by a small scientific secretariat in liaison with the secretariat of the Defence Research Policy Committee.

Owing to Government restrictions on printing, publication of this issue of *Nature* may be delayed. Future issues will be dated as usual and published as quickly as possible after the restrictions have been removed

Australian Aboriginal Art

THE Australian aborigine, like most of the world's primitive peoples, is increasingly affected by the influence known to anthropologists as 'culture-contact'. The spread of industrial civilization brings many problems of adjustment with it, whether in the form of the 'loss of nerve' which precedes final extinction, or of that dilemma of all distinguishable minorities—the choice (whether taken by themselves or by others for them) between retention of their own special values and way of life, to the enrichment of human culture, and the easier way of assimilation into the civilization and economy of the majority. The exhibition of aboriginal cave paintings arranged by the News and Information Bureau at Australia House, London, and opened by the High Commissioner on January 15, does great credit to the Commonwealth Government at a time when there has been some anxious questioning of the probable effects upon native life of the proposed establishment of a rocket-testing range to traverse the Central Aboriginal Reserve (see *Nature*, December 28, p. 939), though there is every reason to hope that adequate safeguards are to be provided.

The exhibition is devoted mainly to an impressive series of large-scale reproductions painted in the Kimberley district during 1938–39 by members of a German anthropological expedition organised by the Frobenius Institute at Frankfort (by courtesy of the director of which the reproductions became available for exhibition): they represent a remarkable feat of recording, although the main work of describing and studying the originals over many years had been carried out, with great distinction, by Australian anthropologists. Many of the pictures show high artistic merit and a power to stir even European emotions: they have still a deep social and religious significance in the lives of the less 'Europeanized' aborigines (by whom they are regularly repainted) and are closely bound up with their mythology and dream-experience. Equally interesting is a small series of reproductions of rock paintings of a quite different character, probably dating from more ancient times; there is a striking similarity of feeling and form between these and some of the ancient paintings found, among other places, in Spanish caves and in various parts of South and East Africa, with their elongated and distorted human figures. This exhibition, which will remain open for some time, in itself refutes any suggestion that the Commonwealth Government is indifferent to the life and fate of this lowly but not ignoble people: and it can scarcely fail also to communicate to the viewer some of that fragile spirituality, so hard to crystallize in scientific terms, which is characteristic of the pure aboriginal culture and explains the disquiet felt by some anthropologists at any new encroachment of civilization upon them.

Chemistry at the University of Sydney

THE Senate of the University of Sydney has recently appointed Drs. T. Iredale, F. Lions and D. P. Mellor to three newly created readerships in chemistry. They are all well known in Britain, both by direct contact and through their work; and occupy prominent places in the scientific life of Australia. Dr. Iredale has been, for several years, the Australian local representative of the Chemical Society; Dr. F. Lions is president this year of the Royal Society of New South Wales, in which Dr. D. P. Mellor has also held various offices, being, since 1943, honorary editor of its journal, and in 1941, president.

Dr. Iredale obtained his first degree at the University of Sydney in 1918. In 1921, with an 1851 Exhibition, he began three years work on physicochemical aspects of surface tension and adsorption at University College, London, in Prof. F. G. Donnan's Department. After periods as a research officer in the Department of Scientific and Industrial Research, and as lecturer in chemistry at Armstrong College (now King's College), University of Durham, he returned to the University of Sydney. His research activities have lain chiefly in the fields of colloids, photochemistry and chemical kinetics. In 1921, he demonstrated that adsorption is the controlling factor in the inhibitive effect of protective colloids on the catalytic decomposition of hydrogen peroxide by colloidal platinum. Later, in 1923, he commenced a series of investigations of adsorption from varying vapour phases on liquid-gas interfaces. More recently, he has concerned himself with the kinetics and photodecompositions of alkyl and alkylene iodides, acetone, acetaldehyde, etc.

Dr. Lions is also a graduate of the University of Sydney. In 1923, he proceeded, as an 1851 Exhibitioner, to work with Sir Robert Robinson at Manchester, and later, in 1925, with Prof. W. H. Perkin at Oxford. In 1926 he was appointed lecturer in chemistry at Sydney. His researches have been extensive within the field of organic chemistry, particularly among nitrogen-containing heterocyclic compounds, natural products and the alkaloids. The examination of gmelinol (a crystalline substance from the 'Colonial beech') is a valuable approach to the fundamental understanding of timber faults. In addition, he has made useful contributions to stereochemistry of the diphenyl type, and in his studies of co-ordination compounds, containing copper, zinc, nickel and cobalt from nicotinylacetone, he has provided an ingenious extension of the now classical work of Mills and Gotts.

Dr. Mellor obtained his first degree and later his D.Sc. at the University of Tasmania. After periods with the Electrolytic Zinc Co. and the Commonwealth Solar Observatory, he was appointed in 1929 to the staff of the Chemistry Department, University of Sydney. He has conducted extensive investigations on complex inorganic compounds, notably those of palladium, rhodium, platinum and iridium, utilizing optical, X-ray diffraction, magnetochemical and polarographic methods. His results have greatly extended our knowledge of the stereochemistry of square complexes. During 1937–39 he worked at the Californian Institute of Technology and later at the Cavendish Laboratory, Cambridge.

Challenger Society and Staffs of Marine Laboratories: Joint Meetings

For a number of years before the War it was customary to hold meetings of the Challenger Society for the Promotion of Oceanography conjointly with the members of staffs of marine biological and fisheries laboratories in Great Britain. Three of these meetings were held each year, one of which was in London, the others being at marine laboratories or universities. These meetings were arranged under a scheme inaugurated by the Development Commissioners whereby members of the staffs of marine biological laboratories were encouraged to attend meetings at which general discussions could be held on problems of interest to them and to members of the Challenger Society. Two such meetings have been held since the end of the War, one at the Marine Biological Station at Millport under the chairmanship of Mr. Richard Elmhirst, and the other in London in the offices of the Zoological Society under the chairmanship of Dr. Edward Hindle. These meetings were well attended, and a variety of papers were given on different subjects. At Millport, papers were read under the three headings of seaweed research, plankton and productivity, and anti-fouling research. In London, contributions were made on the subjects of locomotion in marine animals and factors affecting productivity in the sea. A few papers were also given on other subjects, and arrangements were made by the secretary of the Zoological Society for a visit to the Aquarium. These joint meetings are of great value to those interested in the study of all problems connected with life in the sea, and biologists owe much to the generosity of the Development Commissioners for making them possible. It is to be hoped that such meetings will again be held regularly.

Palæontographical Society

The Palæontographical Society was founded on March 23, 1847, and the hundredth anniversary will be celebrated on March 31. The hundredth annual general meeting will be held in the conference room at the Geological Survey and Museum, South Kensington, London, at 11.0 a.m., when a commemorative address will be delivered by the president, Prof. H. L. Hawkins. In the afternoon, a public lecture on "The Story of Fossils" will be given at 2.30 p.m. by Mr. C. P. Chatwin (chief palæontologist to H.M. Geological Survey) in the demonstration room. An exhibition dealing with various aspects of palæontology will be arranged for members, and tea will be served in the Reserve and Study Gallery. Members will dine that evening in the hall of the Worshipful Company of Tallowchandlers, Dowgate Hill, E.C.4. Those wishing to attend should notify the secretary, Dr. C. J. Stubblefield, Geological Survey and Museum, Exhibition Road, London, S.W.7, not later than March 1.

Brevity in Zoological Nomenclature

Prof. J. C. Faure, of the University of Pretoria, has published a paper entitled "A Plea for Brevity—and Sanity—in Zoological Nomenclature" (*J. Ent. Soc. S. Africa*, 9, 39; 1946). He discusses the length and unwieldiness of generic and specific names with special reference to the work of Dybowski (*Bull. internat. Acad., Cracovie* (B), 1926), wherein various new generic names for Gammarids are published. In Prof. Faure's view, such cumbrous and unpronounceable products as *Gammaracanthuskytodermogammarus* (31 letters) should never have been published. He goes on to add that apparently some authors coin long names thinking that the glory devolving upon the proposer varies in direct proportion to the ponderosity of the name. Others may choose long names in the attempt to find truly descriptive names. The habit of adding prefixes or suffixes to existing names also tends to produce long and cumbersome names. Short and easily pronounceable names formed by an arbitrary combination of letters are preferable to long and cumbersome descriptive names derived from the purest classical sources.

Prof. Faure recommends that international congresses should consider whether the time has not arrived to insert into the "Rules" a provision limiting the length of names. He suggests that "No generic, subgeneric, specific or subspecific name proposed as new after ......(= a given date) shall have any status of validity or availability under the Rules if it consists of more than *fifteen* letters". But even without any such provision in the "Rules", he thinks that editors of scientific journals could exert a wholesome influence by not accepting for publication any new names that exceed a 'reasonable' length of, say, fifteen letters or that are objectionable for other reasons such as unpronounceability.

High-speed Camera

K. M. Baird (*Can. J. Res.*, 24, 41; 1946) has described, in outline, an ultra high-speed motion-picture camera, embodying new principles, which, it is expected, will enable pictures of good resolving power and illumination to be taken at rates as high as 200,000 per second. A set of lenses, mounted in a row, forms a set of images which are projected by a lens system on to rotating reflecting prisms, one prism for each lens in the row, and thence to the film which is wound in a single layer on a drum. A rotating sector placed in front of the set of lenses acts as a shutter. The sector has equidistant radial slots, so spaced that after a given slot has just passed the last lens in the row, the next slot comes opposite the first lens. Thus, the camera takes several pictures while the film moves the distance of only one, with corresponding advantage over the conventional type of camera. Intense illumination is required, but this need be of only very short duration, since any event requiring a high-speed camera naturally lasts only a very short time. To test the practicability of the design of the proposed camera, an experimental model was constructed, in which the lens system and rotating prisms were not included. In spite of these omissions, quite good pictures were obtained at rates of 70,000 a second, and a series of pictures, taken at the rate of 64,000 per second, of a rifle bullet fired at and piercing an electric light bulb, is included in the paper, illustrating very clearly the capabilities of the camera.

South African Museum: Report for 1945

The Trustees' report of the South African Museum, Pretoria, stresses the unsatisfactory financial position of the Museum, and it is pointed out that this greatly handicaps the development of its educational and cultural services. An interesting analysis of attendance figures appears in the acting director's report. This shows that during the year, 118,103 white, 56,402 coloured, and 10,499 native adult members of the population visited the Museum. The same report makes note of a special exhibit illustrating soil erosion, and pleads for similar educational propaganda in other African museums. The report of the Department of Fishes and Marine Invertebrates records the catching in South African waters (for the first time) of an adult deal-fish (*Trachypterus*) 7½ ft. in length. In the Department of Botany, Mr. G. J. Lewis carried out work in connexion with plants and allergic diseases in the Cape Peninsula. He also published illustrated descriptions of two new species of Iridaceæ (*J. S. Afr. Bot.*, **11**, 108 and 117).

Lady Tata Memorial Trust

The Trustees of the Lady Tata Memorial Fund invite applications for grants and scholarships, open to workers of any nationality, for research in diseases of the blood, with special reference to leukæmia, in the academic year beginning on October 1, 1947. Grants of variable amount are made for research expenses or to provide scientific assistants to senior workers. Scholarships are awarded as personal remuneration; their normal value has been £400 a year for whole-time research. Applications must be submitted, before March 31, to the secretary of the Scientific Advisory Committee, c/o Medical Research Council, 38 Old Queen Street, Westminster, London, S.W.1

Conference on Industrial Research

The Federation of British Industries is arranging a series of regional conferences on industry and research, the first of which will be held at Birmingham on March 25. The principal speakers will be Sir Edward Appleton, secretary of the Department of Scientific and Industrial Research; Sir William Larke, chairman of the Industrial Research Committee of the Federation of British Industries; and Sir Peter Bennett, chairman of the Midland Regional Council of the Federation. The general subject to be discussed will be the application of science by industry, and the part research can play in promoting industrial efficiency, exports, and a higher standard of living, with special reference to industrial problems in the Birmingham area. Special attention will also be given to the smaller manufacturing concern. Further information may be obtained from the F.B.I. Industrial Research Secretariat, 21 Tothill St., S.W.1.

Announcements

The Linnean Medal for 1947 of the Linnean Socie of London has been awarded to Prof. Maurice Caulle of the University of Paris. The actual presentati of the medal will take place on May 24.

The London, Midland and Scottish Railw announces that Mr. G. E. Wilson, chemist, Scienti Research Department, Glasgow, has been appoint chemist, Scientific Research Department, Crewe, succession to the late Mr. W. Darcy. Mr. E. A. Morr senior assistant chemist, Scientific Research Depar ment, Glasgow, will succeed Mr. G. E. Wilson Glasgow.

The following appointments have been made in t Colonial Services: J. L. Congdon, to be agricultur officer, Aden; C. A. Lister, to be plant pathologis Gold Coast; W. E. M. Logan (assistant conservat of forests, Gold Coast), to be assistant conservator forests, Kenya.

Dr. C. C. Addison, lecturer in inorganic chemist at University College, Nottingham, has been award the degree of D.Sc. of the University of Durham for thesis on "A Study of Soluble Films at Liquid Surfaces

Appointments to not more than four Imperi Chemical Industries Fellowships in the University Cambridge will be made in the Easter Term, wi tenure from October 1, 1947. The Fellowships ha been established for original research in physic chemistry, biochemistry, engineering, metallurg pharmacology, chemotherapy, or in a subject relate to one of these subjects. Persons of either sex may elected, and the annual stipend of a fellow wi normally be £600. Applications must reach th Registrary, at the University Registry, Cambridg by April 20.

The Worshipful Company of Founders of the Cit of London awards fellowships, usually one a year, t provide facilities for advanced education to men wh have already completed a course of training university standard in chemistry, physics, metallurg (more especially in connexion with molten meta and allied sciences. There is no limitation to th nature of the course which may be selected; it migh include research, a period in works or foreign e perience. The normal value of the fellowship is £3 a year, and it will be renewable for a second yea and in special cases for a third year. Candidate should not be less than twenty-one years of age o September 1 of the year of application. Application must be received not later than May 1 by the Cler of the Worshipful Company of Founders, Founder Hall, 13 St. Swithin's Lane, E.C.4, to whom a inquiries should be addressed.

Messrs. Elliott Brothers (London), Ltd., 7 Victoria Street, London, S.W.1, have transferre their research laboratory from Century Work Lewisham, to Elstree Road, Borehamwood, Hert where they have a modern building of 50,000 sq. ft floor area. A new organisation is being built u which will undertake the development of industria and laboratory instruments and specialized equipment; also it will develop new techniques for th control of manufacturing processes. The laboratorie are in the charge of Mr. J. F. Coales, formerly of th Admiralty Signal Establishment, where he wa engaged on research into radio direction finding an later on the development of radar for gunnery purposes in H.M. ships.

An Example of Meson Production in Lead

WE have recently obtained a clear example of meson production in lead in an experiment in which counter-controlled, cloud-chamber photographs of penetrating showers were taken in a magnetic field of 3,400 gauss. There was a layer of lead 6·8 cm. in thickness above the chamber, and the counter arrangement was such that at least two particles in the shower had to penetrate 20 cm. of lead below the chamber. The chamber was filled to a pressure of 1·5 atmospheres with a mixture consisting of 80 per cent argon and 20 per cent oxygen.

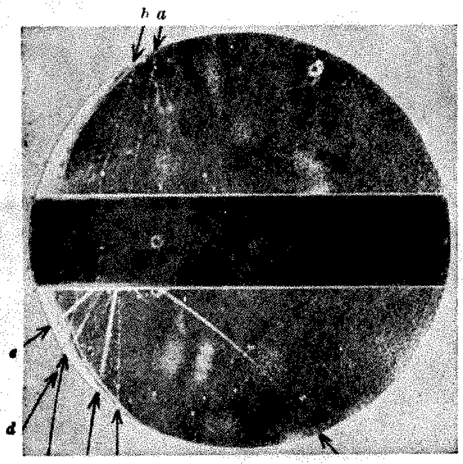

Fig. 1

The shower is shown in Fig. 1. Two fast particles *a* and *b* enter a lead plate of thickness 30·5 mm., covered above and below with brass reflecting plates each 1·8 mm. in thickness, and at least six particles, *b′*, *c*, *d*, *e*, *f* and *g*, emerge from the plate. The particles, *c*, *d*, *e*, *f* and *g*, all appear to come from a point 0·9 cm. above the bottom of the lead plate. Measurements of the curvatures of the tracks and the probable identification of the particles are given in the table. Three other particles which seem to be connected with the shower emerge from the plate, but such short lengths of track are observable that identification is not possible. The values of the momenta of the particles *a* and *b* are somewhat uncertain because of gas distortion above the plate. Only slight distortion is observable below the plate.

Particle *a*, which presumably initiates the shower, is classified as a proton or a meson, because an electron of this momentum would ionize twice the minimum and would have a high probability of producing a cascade shower in the plate. Particle *bb′* is identified as a meson or a proton. It is scattered 5° in the plate.

Of the other particles, both *c* and *e* have momenta $\sim 10^8$ eV./c. and are clearly heavily ionizing. These are presumably protons, for protons of momentum 10^8 eV./c. would ionize twenty times minimum and would have ranges of approximately 100 cm. in the chamber.

Particle *d* is positive and has a momentum of $2 \cdot 4 \times 10^7$ eV./c. Its light ionization shows that it cannot be a meson or a proton. A meson of this momentum would ionize ten times minimum, and a proton approximately two hundred times minimum. It must therefore be a positive electron.

Particle *g* is the most interesting particle in the shower, for it is undoubtedly a slow meson. Its ionization is estimated at between four and ten times minimum, and its range in the chamber is greater than 8 cm. Its momentum has been found to be $2 \cdot 2 \times 10^7$ eV./c. from measurements on two stereoscopic photographs. A meson of mass 200 m_e (where m_e is the mass of the electron) with this momentum would have a range in the chamber of 30 cm. and an ionization 10·5 times minimum. It is therefore probable that this particle is a meson. However, since the velocity of the particle is low ($\beta \sim 0 \cdot 2$), it is important to examine how much of the observed curvature could have been due to multiple scattering in the gas. Williams[1] has given an expression for the spurious curvature to be expected in such a case, and inserting the data of the experiment in his expression it is found that the radius of curvature of the track due to scattering is 123 cm. Thus the error due to scattering should be of the order of 17 per cent. The data are thus still consistent with the particle being a slow meson. A proton of this momentum would ionize 150 times minimum and would have a range of less than 0·5 cm. in the chamber.

Confirmation of the identification of particle *g* as a negative meson is given by a knock-on electron which appears on the track at a point immediately below the lead plate (see Fig. 2). (We are indebted to Dr. J. G. Wilson for helpful advice on this point.) The

Track	Ionization (× minimum)	Momentum (300 $H\rho$ eV./c.)	Remarks	Identification
a	1	$\gg 10^8$		meson or proton
bb′	1	$\gg 10^8$	Particle scattered 5° in plate. Momentum from scattering = $3 \cdot 8 \times 10^8$ eV./c.	meson or proton
c	>10	$\gg 10^8$	Observed length of track in chamber = 2·2 cm.	proton
d	1	$2 \cdot 4 \times 10^7 \pm 20\%$	Positive particle: radius of curvature 23·3 cm. error does not include error due to scattering. Ionization slightly greater than minimum. Observed length of track in chamber = 3·2 cm.	electron
e	>10	$\gg 10^8$	Observable length of track in chamber = 3·6 cm.	proton
f	1		Has curvature of negative particle, but kink in track makes momentum measurement uncertain	meson or proton
g	7	$2 \cdot 2 \times 10^7 \pm 25\%$	Negative particle. Radius of curvature 21·2 cm. Error includes error due to scattering. Curvature uniform along length. Range in chamber >8 cm.	meson

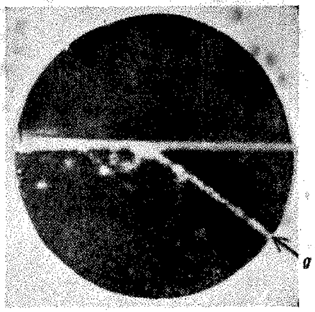

Fig. 2

momentum of this electron is $1 \cdot 51 \times 10^5$ eV./c. and its kinetic energy is $2 \cdot 3 \times 10^4$ eV. Assuming a 'head-on' collision and a particle of mass 200 m_e, the energy of the electron would be $4 \cdot 8 \times 10^4$ eV. The corresponding figure for a proton would be 570 eV. Moreover, the actual kinetic energy of the knock-on electron may be greater than the observed value because it is not certain that the electron has been knocked on in the gas. If it be assumed that the electron has been knocked on in the gas, the mass of the particle g is found to be 290 $m_e \pm 50$ per cent. In the statement of the error account has been taken of the errors of measurement and the scattering of particle g and the knock-on electron in the gas.

The shower seems, therefore, to be a clear example of the production of at least one meson (of mass 200 m_e), one electron and two protons at a point in a lead plate.

The total kinetic energy lost by the particles a, c, d, e, f and g in the lead plate is of the order of 2×10^8 eV.

Unambiguous photographs showing the production of mesons in a cloud chamber are exceedingly rare. Anderson and Neddermeyer[2] obtained in 1936 a striking photograph of a disintegration in a lead plate which showed a heavily ionizing particle projected upwards. They were unable to identify the particle with any particle then known. It may well have been a meson. Powell[3] and Hazen and Fretter[4] have inferred the presence of mesons in disintegrations by range and ionization density measurements.

The present photograph seems to conform in general type to the process of meson production proposed by Hamilton, Heitler and Peng[5], with the addition suggested by Jánossy[6]. Interpreting the shower according to this theory, particle a would be a proton which has already produced a meson (bb') and which produces another meson, an electron, and recoil protons. On this theory the electron results from the decay of an extremely short-lived meson. The life-time of 10^{-8} sec. used by Hamilton, Heitler and Peng is, however, much too long: a life-time of the order of 10^{-11} sec. is required.

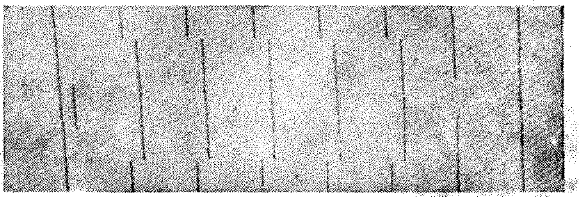
Interferometric Determination of Apparent Thickness of Coatings

THE thickness of deposit from an atomic beam is measured as follows. The film (X) is deposited on a high-grade flat through a grid-like mask of thin metal held in close contact. Then the mask is removed from the flat, and a highly reflective opaque coating (Y) is evaporated over the whole. The steps on the surface of the flat, which are the edges of X, appear in the surface of Y. A second flat with a highly reflective but slightly transparent coating (Z) is then brought close up, and the interferometer thus formed is examined by the reflected system of multiple beam precision fringes of equal thickness[1]. The accompanying reproduction, which was taken in a parallel beam of green light from a filtered mercury arc, shows the appearance of the fringes with a thickness of $X = 569$ A.



POSITIVE PRINT OF REFLECTED SYSTEM OF FRINGES OF EQUAL THICKNESS

During reflectivity experiments with evaporated metal films a similar technique was adopted for determining the apparent thickness, except that the interferometer was examined with white light and a spectrograph to obtain channelled spectra[1]. This does not require so perfect a pair of optical flats and removes any ambiguity from the determination due to integral order fringe displacements. In such a system the flat carrying film Z must be optically isotropic to eliminate spurious polarized fringes.

By adopting the reflected fringe system for measurements, the following advantages over the transmitted system are secured: (i) The transmission properties of layer X become unimportant. (ii) It is possible to deposit Y to an opaque thickness and so eliminate the dependence of the phase-change at reflexion on the underlying material. (iii) Layer Y attains its maximum reflectivity when it is just opaque. (iv) Subsidiary defects tend to sharpen the fringes; for example, (a) lack of parallelism in the incident light, (b) intensity-curve distortion due to the blackening characteristic of the photographic plate. In the latter case microphotometer records show that, for the same pair of silverings, the photographic image of the reflected fringe system can be about one third the width of that of the transmitted system.

Silver was used for Y and Z in our experiments. The accuracy attained was ± 3 A.

To ensure that the thicknesses of Y deposited above X and the base are equal, it would seem desirable to bake the base *in vacuo* and then cool it during the evaporation. As high-grade optical flats cannot well be treated in this manner, the part of the base on which the measurements are to be made is first covered with a substrate of the material X. Then during the deposition of layer Y, the outgassing will be presumably uniform over the whole surface and no error in thickness should occur. Furthermore, any changes of structure in X or Y will be identical on both sides of the boundary.

The mass of metal contained on an area of film of measured thickness was determined by a colorimetric chemical method[2] capable of giving an accuracy of ± 3 per cent. From this the apparent density of the film of silver was derived. Typical results are:

Thickness (A.)	122	214	448	518	520	735
Density (gm./c.c.)	10·4	10·5	10·5	10·2	10·2	10·5

The density of solid silver is 10·5.

The reflectivities of the silver films were measured and the resulting curves compared with those of Goos[3], who used a micro-balance to estimate the mass of silver per square centimetre. The thicknesses he gives *assume* a density equal to that of solid silver in all cases. After correcting for differences in reflectivity at opacity, his curves and ours are in good agreement, also showing qualitatively that the apparent density of our silver films is 10·5.

Measurements of the electrical conductivity[4] of metal films show that the film continuity at a given thickness depends essentially on the cleanness of the surface and the degree of vacuum during evaporation. Our conditions are such that the films used for the thickness measurements probably have the fine-scale discontinuous structure revealed in electron microscope photographs[5]. This being the case, the 'thickness' of the film is a difficult quantity to define. We refer to the thickness deduced from the procedure described above as the 'apparent thickness'. Our measurements on silver show that this figure corresponds to that which would exist if the grains were smoothed to a uniform film having the density of the solid metal. It can be argued that the density of 10·5 found for these films is a necessary result if the opaque film *Y* is continuous in structure.

It may be that our conclusion does not hold if *X* and *Y* are not of the same material, and experiments on this are now being performed.

The atomic beam measurements were made by A. Khamsavi, the reflectivity by W. K. Donaldson.

Note added December 30.—Since the submission of the above account another letter has been published[6] which includes some common details. The necessity of eliminating the effects of the phase change at reflexion was early realized by us, and we thank Mr. Plessner for his acknowledgment of the information.

Measurement of Out-of-Phase Magnetic Fields in Betatrons

Fig. 1 gives a plot (Curve *A*) of the magnetic field at the orbit (19 cm. radius) of a 20-MeV. betatron for the first thirty minutes of arc of the quarter period during which the electrons are accelerated. The peak field is 3,600 gauss, reached at 90°, corresponding to 20 MeV. Fig. 1 also shows, again for Curve *A*, the equivalent injection voltage as a function of time; for 20-kV. injection the pulse, assumed infinitely short for simplicity, should be applied to the electron gun at some 25–26 minutes of arc, that is, about 8 microsec. after the instant of zero field. The magnetic field at injection will then be about 25 gauss.

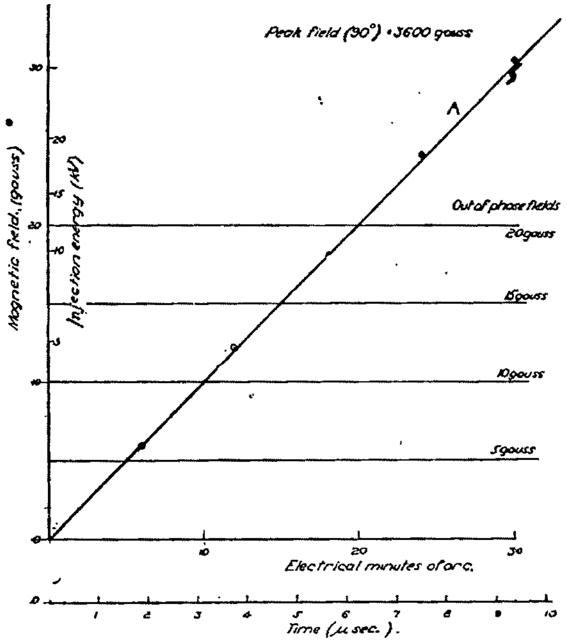

Fig. 1

Kerst[1] mentions that out-of-phase magnetic fields due to eddy currents in the magnet, etc., reduced the X-ray output in his betatron by a factor of 1·5–2, and corrected for them by passing D.C. through his expander coils. This implies that the out-of-phase fields were not serious in his case, and to a first approximation were uniform round the orbit circum-

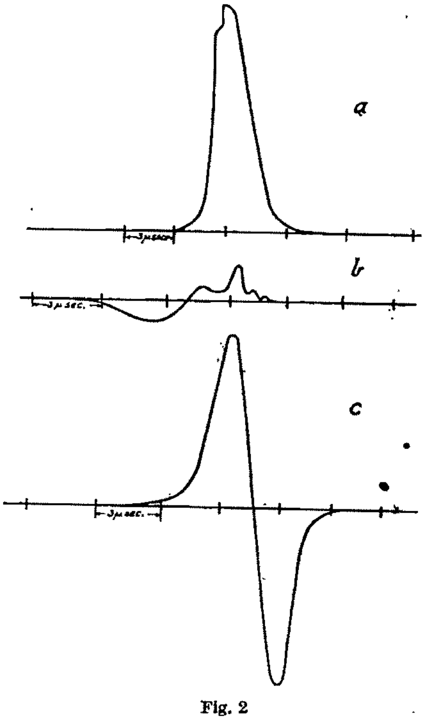

Fig. 2

ference. No data or measurements on these fields were given by Kerst in his paper.

We have recently had occasion to devise a method for detecting and measuring approximately out-of-phase fields in a betatron. Consideration of the horizontal lines of Fig. 1, which are in fact parts of sine waves (90° out of phase with the main accelerating field), representing out-of-phase fields varying from 5 to 20 gauss, explains the method. We use two peaking transformers (the cores of which are each made of five short strips of 2·5 mil 'Permalloy *C*') which provide short voltage pulses very near the point of zero field (such as those at the intersections of the horizontal lines and the inclined line in Fig. 1). If, for example, the resultant fields at two points are in phase, the two-peak pulses would cancel out, if in opposition. Examination of the resultant diagram obtained in this way on a cathode-ray oscillograph enables an estimate to be made of the local out-of-phase magnetic fields.

Typical records are shown in Fig. 2. Fig. 2*a* shows the pulse from a single-peaking transformer; Figs. 2*b* and 2*c* show the resultant pulse obtained from two similar peaking transformers in opposition showing, in the case of Fig. 2*b*, a difference in the out-of-phase fields between the two positions of the peaking transformers of less than 0·8 gauss. In Fig. 2*c* the difference in out-of-phase fields is about 6·3 gauss. We have in this way mapped the out-of-phase fields around the pole-pieces of the betatron magnet.

Since the above tests were made, an abstract of a paper has appeared[2] in which a very similar method is described in brief outline.

We acknowledge the invaluable help given by Mr. S. W. Redfearn of these laboratories, and thank Sir Arthur P. M. Fleming, director of research and education here, and Mr. B. G. Churcher, manager of the Research Department, Metropolitan-Vickers Electrical Co., Ltd., for permission to publish this note.

Crystallization of Supersaturated Solutions by Means of Electric Current

According to a paper by Ubbelohde[1], when electrolysing supersaturated solutions of some electrolytes, for example, copper sulphate, crystallization takes place on the copper anode. Some possible causes are mentioned, as, for example, colloidal particles or ionic clusters approaching the anode and then causing crystallization.

The same phenomenon had already been observed in concentrated solutions of copper sulphate, and various explanations were put forward[2]. Only one investigator[3] mentions as the possible cause the increase of concentration taking place at the anode due to the electrolysis. The following experiments with supersaturated solutions make it probable that this indeed may be the only cause.

If, on electrolysing, the increase of concentration was prevented, no crystallization took place; on the other hand, if an increase of concentration was caused in a different way, then crystallization took place even without electrolysis. Increase of concentration at the anode was hampered in three ways:

(1) By stirring. In some cases crystallization was prevented; generally not, probably because sufficiently intensive stirring could not be realized in the supersaturated solution.

(2) By using other materials for the anode. Current-densities equal to and considerably stronger than those causing crystallization on a copper anode did not produce crystallization on platinum, carbon, tungsten or silver, but did on brass.

(3) By using alternating current. In this case an increase of concentration in the first half-period is neutralized in the second half-period. Indeed, no crystallization took place on copper electrodes with frequencies of 1–15,000 per sec., the current densities being a multiple of those that in the same time clearly caused crystallization with continuous current (3–15 mA./cm.^{2}). (It should be noted that in our experiments crystallization was not observed for current densities so small as those applied by Ubbelohde (1 mA./cm.^{2}).)

With still lower frequency (1/18 per sec.), however, crystals appeared on the anode at normal current density. It was evident that at this frequency the increase of concentration in a half-period was sufficient to form crystallization nuclei.

A calculation of the concentrations occurring at the anode is given by Nernst and Schoenfliesz[4]. With an initial concentration c_0 gm.equiv./l. and a current density of i amp./cm.^{2}, the concentration of the electrolyte after t sec. is:

$$c = c_0 + \frac{2vi}{\sqrt{\pi D}}\sqrt{t},$$

where v is quantity of $CuSO_4.5H_2O$ produced in 1 sec. by a current of 1 amp. on the electrode surface.

A supersaturated solution of copper sulphate with $c_0 = 0{\cdot}50$ gm./cm.^{3} crystallized within 10 minutes at a current density i of 0·060 amp./cm.^{2}. Extrapolation of the transference number and coefficient of diffusion to a concentration of 0·5 gm./cm.^{3} from data given by Thovert and Wille[5] gives $n_{an} = 0{\cdot}74$ and $D = 19 \times 10^{-7}$ cm.^{2}/sec. From the formula given we calculate for c after 10 minutes 1·7 gm./cm.^{3}. Now it was found that a supersaturated solution, $c = 0{\cdot}8$ gm./cm.^{3}, crystallized within 10 minutes.

It also appeared that on changing i, the time necessary for starting the crystallization to some extent satisfied the relation $i\sqrt{t} =$ constant, as was to be expected from the above equation. The quantitative observations were, however, not readily reproducible.

Finally, the following is of importance. Simple reasoning from the ionic transference shows that, when electrolysing a solution of barium hydroxide, an increase of concentration occurs at the cathode. In agreement with this, electrolysis of a supersaturated solution of barium hydroxide caused crystallization to start at the cathode.

Summary. When electrolysing supersaturated solutions of electrolytes, it is possible that by the transference of ions at one of the electrodes, such a high concentration occurs that spontaneously crystallization nuclei are formed, which then grow in the supersaturated solution.

This investigation was suggested by Prof. W. G. Burgers.

Stress-Optical Properties of Rubber

CONSIDERABLE progress in the quantitative description of the mechanical properties of rubber has taken place in recent years by the consideration of a rubber as a network of statistically kinked long-chain molecules. A treatment of the optical properties of strained rubber on this basis, assuming the links of the molecular chain to be themselves optically anisotropic, has been developed by Kuhn and Grün[1] for the special case of a simple elongation, and by me[2] for the general homogeneous strain. In the latter case, the rubber has three principal refractive indices, n_1, n_2 and n_3, corresponding to the three principal axes of the strain ellipsoid.

For light propagated along a principal axis, the birefringence is found to be

$$n_1 - n_2 = C_1 N(\lambda_1^2 - \lambda_2^2), \tag{1}$$

where N is the number of chains per c.c. of the network, and λ_1, λ_2, λ_3 are the principal extension ratios. The stresses t_1, t_2 and t_3 are related to the principal extensions by equations of the type

$$t_1 - t_2 = NkT\ (\lambda_1^2 - \lambda_2^2). \tag{2}$$

Hence the birefringence in a principal plane is proportional to the difference of the principal stresses, and to the difference of the squares of the principal extension ratios.

By stretching a rubber sheet in two perpendicular directions in such a way as to produce a homogeneous strain, it has been possible to test these theoretical predictions. The closest agreement was obtained when the rubber was swollen with a solvent. Fig. 1, which refers to a pure gum natural rubber swollen in paraffin to about twice its original volume, confirms equations (1) and (2) fairly precisely.

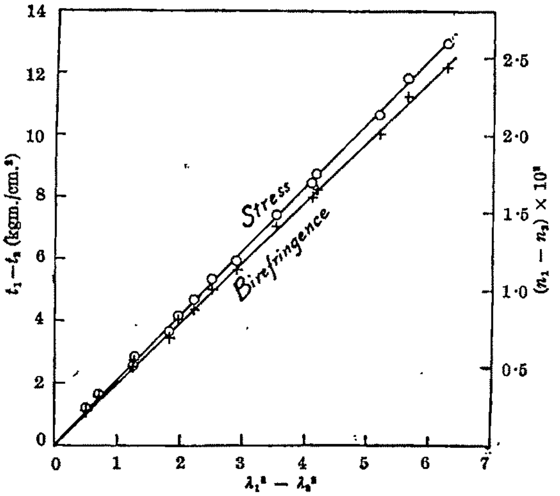

Fig. 1. DEPENDENCE OF DIFFERENCE OF PRINCIPAL STRESSES AND BIREFRINGENCE ON DIFFERENCE OF SQUARES OF PRINCIPAL EXTENSION RATIOS

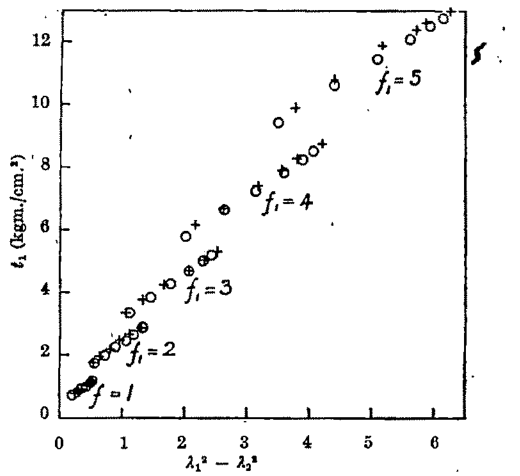

Fig. 2. CROSSES, EXPERIMENTAL RESULTS; CIRCLES, CALCULATED FROM MOONEY'S THEORY, WITH $G = 2{\cdot}0$, $K = 0{\cdot}2$

In these experiments the stress (t_3) normal to the sheet was zero. In this case, the stress t_1 in the direction corresponding to λ_1 is, according to the theory,

$$t_1 = NkT\ (\lambda_1^2 - \lambda_3^2), \tag{2a}$$

where λ_3 is the extension ratio in the direction normal to the surface of the sheet. However, on plotting t_1 against $(\lambda_1^2 - \lambda_3^2)$, the points fall, not on a straight line, but on a series of arrays (Fig. 2). In any one of these arrays one *force* f_1 (corresponding to the stress t_1) is constant, while the other force f_2 varies.

A physical explanation of this departure from the behaviour predicted by the molecular theory has not been found. It is, however, exactly the type of behaviour to be expected from the more general theory of elasticity developed by Mooney[3], on the assumption that Hooke's Law is obeyed in shear. From Mooney's theory, the principal stresses are found to be related to the extension ratios by equations of the type

$$t_1 - t_3 = (G + K\lambda_2^2)\ (\lambda_1^2 - \lambda_3^2). \tag{3}$$

With a suitable choice of the constants G and K, the graphical solution of these equations leads to results which, when plotted as in Fig. 2, agree remarkably well with the experimental data.

For the dry rubber, on the other hand, Hooke's Law was not obeyed in shear, and neither the molecular theory nor Mooney's theory accounted quantitatively for the experimental data, though Mooney's theory provided the closer approximation.

Luminescent Decomposition of Nitrous Oxide

THE thermal dissociation of nitrous oxide has received considerable attention in the past in connexion with the collision theory of unimolecular and bimolecular reactions[1], and it is known that oxygen atoms can be produced as a result of the primary dissociation $N_2O = N_2 + O$. This dissociation was considered to be the chain-initiating process in the H_2—N_2O reaction by Melville[2], and in the CO—N_2O reaction by Bawn[3]. In view of the production of atomic oxygen in the decomposition of nitrous oxide, some work has been carried out on the N_2O—SO_2 system in order to obtain some basic information on the association reaction $SO_2 + O = SO_3$, a process believed to be of some importance in relation to the oxidation of sulphur dioxide in flames[4]. This work will be reported in detail elsewhere; but it is the purpose of this note to describe some observations on the nature of the luminescence accompanying the decomposition of nitrous oxide at temperatures of the order of 900° C., and the effect of various additions on this. Zeldovitsch and Jakovlev[5] have studied briefly the explosive decomposition of nitrous oxide at high temperatures, and the appearance of yellow-green flashes in the combustion of carbon in nitrous oxide at 600–800° C. has been recorded by Shaw[6] and Arthur[7].

A flow method was used in which nitrous oxide was passed at a steady rate through an electrically heated quartz tube, 3 cm. in diameter and 20 cm. in length, at one end of which was a quartz window. The temperature of the tube was raised at a steady rate of 10° C. a minute, and no luminescence was observed in the decomposing gas for temperatures up to 850° C., although above 750° the exit gases were tinged brown, due to the formation of oxides of nitrogen. At 850° a very pale yellow-green haze was seen in the tube, and the rate of increase of temperature was reduced to 5° C. a minute. The intensity of the glow gradually increased, and at 900° a vivid luminescence was given. At a flow-rate corresponding to a time of contact of 3 sec. a series of flashes occurred, and by adjusting the rate to correspond to a time of contact of 1 sec. it was possible to maintain a steady glow of high intensity.

When 1 per cent by volume of chlorine was added, the intensity of the glow was very much reduced, and with 2 per cent chlorine the glow disappeared. On the addition of a similar quantity of sulphur dioxide the intensity of the glow was apparently unaltered, although visual observation was complicated by the formation of a dense cloud of sulphur trioxide. Formation of the latter, detected by the formation of sulphuric acid mist on bubbling the exit gases through water and simultaneous measurement of the dew-point of the exit gases[8], in the N_2O—SO_2 system was found to take place at temperatures so low as 550–600°, where the decomposition of nitrous oxide as revealed by ordinary manometric methods is exceedingly slow.

The spectrum of the glow was recorded on a Hilger medium quartz spectroscope and was found to consist of a continuum extending from the visible to the ultra-violet with a maximum intensity in the yellow-green. With long exposures it was possible to observe faint emission bands superimposed on the continuum, and these were found to be due to nitrous oxide. In its general characteristics the glow accompanying the high-temperature dissociation of nitrous oxide is very similar to that given when nitric oxide reacts with atomic oxygen in a discharge tube, or is added to flames containing oxygen atoms; it can be attributed to the association reaction $NO + O = NO_2 + h\nu$ (continuous), a process which has been described in detail by Gaydon[9].

The formation of nitric oxide in the decomposition of nitrous oxide is usually considered to arise from the attack of atomic oxygen on it: $N_2O + O = 2NO$; although at temperatures of 900–1,000° C. the possibility of the primary dissociation $N_2O = N + NO$ also arises. Both these reactions require a high energy of activation[10], and sufficient nitric oxide; a visible glow with the atomic oxygen present is not given until high temperatures are attained.

A Novel Method of Making Aerosols

THE phenomena occurring when a closed vessel containing a simple liquid is heated to a temperature above the critical temperature of the liquid are well known. What happens when a solution, and more especially a solution of a substance having a very small vapour pressure, is treated in the same way is perhaps less familiar, although the findings of several investigators are on record[1]. In some binary systems a partial separation of the components takes place as the critical point is approached; in others, no heterogeneity can be detected even when the liquid phase has vanished. In this connexion we have made some observations in small-scale experiments in which sealed capillary tubes (1 mm. bore, with thick walls) partly filled with aqueous solutions of potassium chromate were slowly heated. Even when the concentration of potassium chromate was increased to 50 gm. per 100 ml., no separation of solid occurred when the critical temperature (in this case, about 430° C.) was attained, and the whole of the system passed into the vapour state, the colour of the solute becoming uniformly distributed throughout the tube. On cooling, liquefaction took place and the original solution was spontaneously re-formed.

In our view, the most remarkable feature of these events was that a refractory solid had been completely vaporized at a temperature some 500° C. below its melting point, and it occurred to us that this method of bringing substances of very low volatility into the vapour state might be used for the production of aerosols of these materials, provided a rapid expansion of the vapour, accompanied by dilution with air, could be arranged (cf. the formation of smokes by condensation). We therefore repeated the experiment of heating a sealed tube containing a 50 per cent solution of potassium chromate in water, but on this occasion heating was continued until the tube burst. The explosion took place in a small room, and we were able to show that an aerosol of potassium chromate had been formed. Most of the particles in a cloud sample, obtained by means of a thermal precipitator, were of the order of 1 μ diameter, but a small number of more massive particles (about 10 μ diameter) were also found. Although this cloud compared unfavourably, as a dispersion, with the smokes that can be made by conventional methods, we are of the opinion that a more uniformly and more finely dispersed system could be obtained by more careful control of the expansion and dilution of the vapour mixture than was attempted in the test we have described.

These observations were made in 1941, and we are grateful to the Director-General of Research (Defence), Ministry of Supply, for permission to publish this account. One of us (B. A. T.) is no longer in the service of the Ministry.

Absolute Axes and Tidal Forces

IT has been shown[1] that at any point of space-time, whether empty or occupied by matter, it is possible to define a system of absolute axial directions, independently of the Ricci tensor, and, in general, uniquely. The method makes use of a tensor which has since been proved by Ruse[2] to be identical with the conformal curvature tensor of Weyl. It may be supposed that this system of axes is of mathematical interest only, but it appears possible to give it a simple physical interpretation.

The complete Riemann – Christoffel tensor B_{ijkl} can be expressed in terms of the Ricci tensor G_{ij}, and the conformal curvature tensor C_{ijkl} by the formula[1,2]

$$B_{ijkl} = C_{ijkl} - \tfrac{1}{2}(g_{ik}\,G_{jl} + g_{jl}\,G_{ik} - g_{il}\,G_{jk} - g_{jk}\,G_{il}) + \tfrac{1}{3}(g_{ik}\,g_{jl} - g_{il}\,g_{jk})G. \qquad (1)$$

Since G_{ij} and C_{ijkl} have each ten, and B_{ijkl} has twenty, independent components, it follows that G_{ij} and C_{ijkl} are algebraically independent.

Thus, the conformal curvature tensor represents certain properties of the field which are independent of the Ricci tensor and, therefore, of the stress-and-energy tensor derived from it. These properties must be independent of the nature and motion of the matter at the point, since the latter are fully described by the stress-and-energy tensor. They must, therefore, represent effects of the outside world on conditions at the point.

The idea, therefore, suggests itself that the conformal curvature tensor represents the tidal forces, these forces being due to external gravitating bodies and showing themselves in a distortion of the shape of a deformable body placed at the point. That this interpretation is probable may be shown by considering a weak static field, which can be represented by a Newtonian potential.

Thus, in the Schwarzschild field of an isolated particle, the components of C_{ijkl} reduce effectively to two, which may be written[1]

$$C^{23}_{23} = C^{14}_{14} = -\frac{2m}{r^3},\; C^{31}_{31} = C^{24}_{24} = C^{12}_{12} = C^{34}_{34} = \frac{m}{r^3}. \qquad (2)$$

The Newtonian potential is

$$V = \frac{m}{r}; \qquad (3)$$

and we have

$$C^{23}_{23} = -\frac{\partial^2 V}{\partial {x_1}^2},\; C^{31}_{31} = -\frac{\partial^2 V}{\partial {x_2}^2},\; C^{12}_{12} = -\frac{\partial^2 V}{\partial {x_3}^2}; \qquad (4)$$

x_1, x_2, x_3 being Cartesian co-ordinates coinciding locally with the spherical polars.

In this case, therefore, the solid harmonic of the second order which represents the disturbing potential of the tidal field is given by the quadratic form

$$C^{23}_{23}\,dx_1^2 + C^{31}_{31}\,dx_2^2 + C^{12}_{12}\,dx_3^2. \qquad (5)$$

By superposition we can generalize this form for all Newtonian fields. To obtain a tensor form we must replace the linear elements dx_1, dx_2, dx_3 by the orthogonal surface-elements dS^{23}, dS^{31}, dS^{12}. We are thus led to consider the quadratic form

$$C_{ijkl}\,dS^{ij}\,dS^{kl}, \qquad (6)$$

which is the basis of the system of absolute axes referred to[1].

In a general Newtonian field the tidal forces at any point may be explored by placing there a small, freely falling, non-rotating fluid planet. This will then, in general, take up an ellipsoidal shape, under the joint influence of its own gravitation and the external tidal forces. The directions of the principal axes of the ellipsoid depend only on the external field and may be taken as the directions of a system of absolute local Cartesian co-ordinates.

In a general Einstein field, which may be strong and rapidly changing, the appropriate generalization of this system is given by the system of local Galilean axes with directions defined by the conformal curvature tensor.

Stabilization of Penicillin in Aqueous Solutions by Low Concentrations of Phosphates

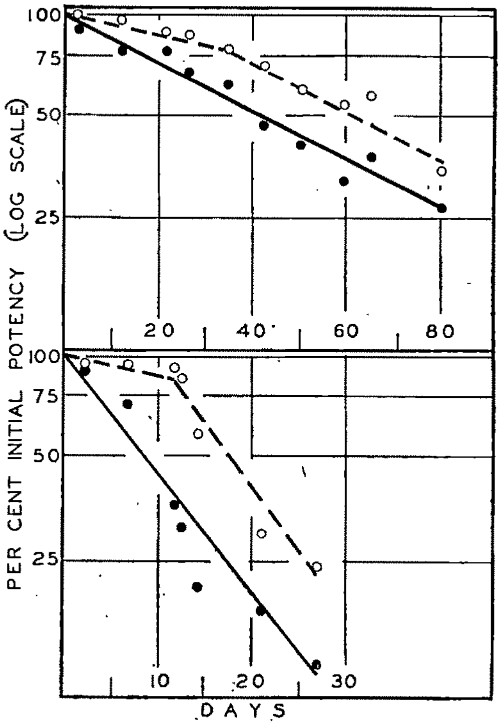
THE practical problems presented by the instability of penicillin in aqueous solution are well known, and much attention is being focused on their solution. The importance of these problems is intensified by the current trend toward commercial production of penicillins of increased purity, since it is now well recognized that, under comparable conditions of storage, sterile aqueous solutions prepared from crystalline penicillin *G* lose their antibacterial potency more rapidly than do solutions prepared from partially purified penicillin of somewhat lower purity.

Following clues suggested by the results of fermentation experiments[1], it has been observed repeatedly in these Laboratories that addition of small amounts of phosphate, in the form of suitable mixtures of monobasic and dibasic potassium or sodium phosphates, markedly retards the destruction of penicillin in aqueous solutions. Less phosphate is required to 'protect' partially purified penicillin than crude liquor. When the present work was well under way, a publication[2] appeared which tended to corroborate these observations. The presence of sodium chloride (physiological saline U.S.P.) in the solution does not interfere with the protective action of the phosphate. The effect is probably independent of, or at least is not dependent primarily upon, the buffer action of the phosphates on the hydrogen ion concentration of the solution, since the same effect has been noted in different experiments set up with initial *p*H values from 5·7 to 6·8. In none of these did the *p*H change more than 0·1 unit during the period of observation. Furthermore, the *p*H values of control solutions in saline containing no phosphate have been very close to the *p*H of the solutions containing phosphate, yet the latter have repeatedly been shown to be more stable.

Experiments have been carried out with solutions of penicillin varying in initial concentration from about 2,000 to about 20,000 units per millilitre and stored at temperatures from 2° C. to 50° C. Values outside these limits have not been studied except in the case of crude liquors. The observations have been duplicated many times during the last two and a half years using crude liquors*, solutions prepared from commercial penicillin from numerous production lots ranging in purity from 846 to 1,156 units per milligram and a preparation of crystalline penicillin *G*.

The optimum concentration of phosphate for solutions prepared from partially purified sodium or calcium penicillin is about 0·005 M. The optimum concentration-range with respect to unitage of penicillin is relatively wide for the sodium salt, being in the order of 0·0525–0·184 millimoles phosphate per 10^5 units of penicillin; but is much more critical for the calcium salt. The useful life of sterile solutions of sodium penicillin in physiological saline is increased three- to five-fold, depending upon the temperature, when phosphate is present in a concentration of five millimoles per litre and 0·0525 millimoles per 10^5 units. The three- and five-fold increases are for solutions stored at 2° C. and at room temperature (*c.* 25° C.), respectively. The useful life has been taken as the time required for loss of 15 per cent of the antibacterial potency. This figure was chosen because under the present regulations of the Food and Drug Administration 15 per cent leeway is permitted in the potency of penicillin preparations. If desired, the sodium chloride content of the saline may be reduced slightly in such solutions so that the solution is isotonic with normal saline. This seems unimportant, however, since calculations[3] show that introduction of the phosphates in the concentrations employed increases the lowering of the freezing point only 0·018° C., the equivalent of less than 0·3 gm. NaCl/l.

The phosphate may be incorporated in the saline solution to be used as a diluent for the dried penicillin or may be added to the concentrated aqueous solution of penicillin prior to lyophilization† in such quantities that, upon solution of an aliquot of the dried penicillin in a suitable volume of saline, the desired concentrations of phosphate with respect to molarity and to unitage of penicillin will be obtained. For routine work we have used 60/40 mixtures of equ molar stock solutions of monobasic and dibas phosphates. The exact concentrations that we hav used most extensively in our phosphate-saline mi tures are NaCl, 0·14 M. (8·18 gm./l.); $NaH_2PO_4.H_2O$ 0·003 M. (0·41 gm./l.); and Na_2HPO_4, 0·002 M (0·28 gm. anhydrous salt/l.). This solution, havin a calculated freezing point lowering of 0·56° C., isotonic with blood serum. The results obtained i typical experiments with a sodium salt of penicilli are shown graphically in the accompanying figure.



Per cent initial antibacterial potency remaining in sterile solutions of sodium penicillin in physiological saline U.S.P. (solid curves) and in saline containing 5 millimoles phosphate per litre (dashed curves) after different periods of storage at 2° C. (upper pair of curves) and at room temperature, that is, about 25° C. (lower pair of curves). In this set of experiments initial concentration of phosphate with respect to penicillin = 9,525 units per millilitre; initial concentration of phosphate with respect to penicillin = 0·0525 millimoles per 10^5 units; and *p*H = 6·7

It should be emphasized that, as was pointed ou above, the relative concentrations of phosphate an of penicillin are critical with calcium penicillin. Whil remarkable success has universally attended attempt to stabilize solutions of sodium penicillin with phosphates, only about half the trials with the calciu salt have been successful. The optimum concentration of phosphate for preserving calcium penicilli is probably about 0·005 M., and the optimum concentration of phosphate with respect to penicilli is probably in the vicinity of 0·15 to 0·18 millimole of phosphate per 10^5 units. Concentrations of phosphate that are satisfactory with one lot of calciu penicillin, however, may be unsatisfactory with another lot, indicating perhaps that the qualitativ and/or quantitative nature of the impurities presen is important in determining the effectiveness of th phosphate treatment for a given lot of the calciu salt. A tendency for a white precipitate (presumabl calcium phosphate) to form has been noted whe certain lots of calcium penicillin were treated wit the mixture of phosphates, whereas solutions prepare from other lots have remained clear.

---

* The initial concentrations of penicillin activity in the crude liquors varied from 50 to 200 units per millilitre and the *p*H at harvest varied from 6·7 to 7·4.

† This technique may be used entirely satisfactorily with sodium penicillin, but has not been tried generally with the calcium salt.

The mechanism responsible for the protective action of phosphates on penicillin is not clear at present, but it may well be effected through an esterification of part of the molecule similar to that reported for a number of other compounds of biological interest[4], and a consequent blocking of an enzyme system involved in the processes of destruction.

New Substances Exerting a Combined Bacteriostatic and Respiration-inhibiting Effect on Tubercle Bacilli

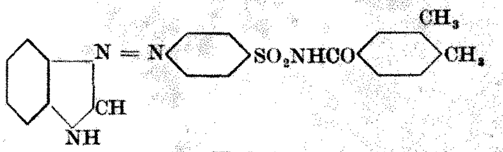
MOST of the preparations with a chemotherapeutic effect against tubercle bacilli which have hitherto been tested have been bacteriostatic. The reactions occurring between chemotherapeutic substances of this type and the bacterial cell are of a reversible character. A considerably better effect should be achieved if a preparation producing irreversible changes could be discovered. The simple sulphanilamides, that is, those the effect of which is counteracted by *para*-aminobenzoic acid, are typical of such bacteriostatic substances. They give a good effect *in vitro*, and in animal experiments they show a definite though weak effect[1]. Derivatives of the simple sulphanilamides, for example, promin, have given better results in *in vivo* experiments[2].

It seems probable that the value of the sulphanilamides as chemotherapeutic agents would be greatly increased if, in some way, they could be made to interfere with bacterial metabolism directly. Simple sulphanilamides and promin certainly can interfere in bacterial metabolism. Thus measurements of the respiration of pathogenic human tubercle bacilli in a Warburg respirometer show a reduction in oxygen consumption under the influence of sulphanilamide, sulphathiazole, sulphanilylmethylpyrimidin, promin and other substances[3]. This effect can, however, only be detected when very high concentrations, for example, 0·2–1·0 per cent of the substances are used.

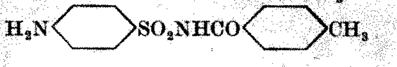
In ordinary therapeutic concentrations, the sulphadrugs have no action in inhibiting respiration even if the cultures have been treated with them for several days or weeks previous to the test with the respirometer. It is possible that the desired effect might be achieved if bacteriostatic substances were coupled with substances inhibiting respiration. These experiments have therefore been aimed at finding out whether chemical combination of two such substances would give a compound which retained its capacity for interference in bacterial metabolism. It is possible in some cases to produce compounds having such an effect, as has been shown by Dr. H. Willstaedt, Wenner-Gren's Institute, Stockholm, who very kindly placed them at my disposal[4,5].

The effect of such compounds in inhibiting the growth of tubercle bacilli on Löwenstein's medium was studied, as well as their effect on respiration, in order to find out whether they would show the same or better bacteriostatic effect than that of the components. It had been shown that with a mixture of the components the effect was merely additive.

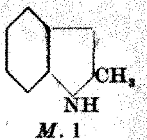
In the accompanying table are given the results of tests on [2-methyl-indole-(3-azo-4)-benzene-1-sulphonyl]-3,4-dimethylbenzamide (*W.* 134)[6], and its components *p*-amino-benzenesulphonyl-3,4-dimethylbenzamide('Irgafen') and 2-methylindole (*M.*1). Their effect was tested on pathogenic human bacilli.



W. 134



'Irgafen'



M. 1

Substance	Elementary formula	Mol. wt.	Total inhibition			Inhibition of respiration as % of that in the control	
			Dilution	gm./l.	Millimol./l.	20 mgm. %	40 mgm. %
M. 1	C_9H_9N	131	1/8,000	0·125	0·96	35	85
'Irgafen'	$C_{15}H_{16}O_3N_2S$	304	1/10,000	0·100	0·33	0	10
*W.*134	$C_{24}H_{22}O_3N_4S$	446	1/16,000	0·063	0·14	45	65

It appears from the table that inhibition of growth occurred with a concentration of 1/8,000, 1/10,000 and 1/16,000 respectively for the substances methylindole, 'Irgafen' and their combination product. The concentration in millimol./litre of the substances is 0·96, 0·33 and 0·14 respectively.

One of the substances coupled, 'Irgafen', has little or no effect on the oxygen consumption of the tubercle bacilli, but methylindole and the finished product diminish it appreciably.

It is thus possible to produce a compound which can interfere with bacterial metabolism by combining two growth-inhibiting substances, of which one is a powerful inhibitor of respiration, and by these means obtain better bacteriostatic power than with either of the substances coupled.

Experiments with many other similarly constructed compounds are in progress. Reports on these will be given later.

[6] The synthesis of this substance will be described elsewhere by Willstaedt.

Influence of *dl*-Methionine and Other Substances on the Nephrotoxic Action of *dl*-Serine

dl-SERINE introduced either by stomach tube or by intraperitoneal injection causes severe kidney damage in young rats[1,2]. In view of the probable interaction of serine and methionine in the rat[3,4], the influence of methionine on the serine effect was studied. Male rats weighing approximately 100 gm. were given 100 mgm. *dl*-serine by stomach tube and killed 24 hours later. Litter mates received the same amount of serine, and in addition *dl*-methionine in amounts varying from 100 to 600 mgm. subcutaneously in several injections preceding and following the administration of serine. 24 rats given serine alone showed extensive renal necrosis localized in the region of the cortico-medullary junction (see Fig. 1). Of 39 animals given methionine in addition, 30 showed no lesions or only minute lesions (see Fig. 2). Only in two rats was no protective effect seen.

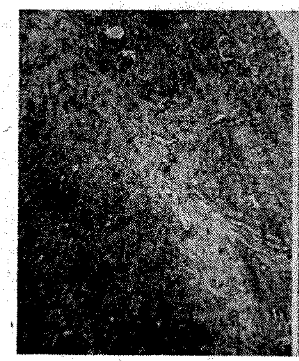

Fig. 1

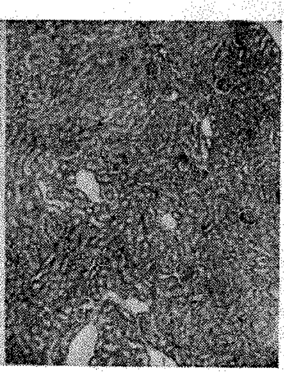

Fig. 2

Fig. 1. NECROSIS IN THE KIDNEY OF A RAT ON A PROTEIN-DEFICIENT DIET FREE FROM VITAMIN B COMPLEX SACRIFICED 24 HOURS AFTER THE ADMINISTRATION OF 100 MGM. *dl*-SERINE BY STOMACH TUBE. (× *c.* 50)

Fig. 2. COMPLETE PROTECTION AGAINST THE NEPHROTOXIC ACTION OF SERINE BY TWO INJECTIONS OF 100 MGM. *dl*-METHIONINE IS SEEN IN THE KIDNEY OF A LITTER-MATE FURNISHING FIG. 1. (× *c.* 50)

Of other sulphydryl compounds tested, *l*(+) cysteine hydrochloride was considerably less effective, while glutathione (glutaminylcysteinylglycine) regularly afforded complete protection. *l*(+) Glutamic acid had a slight influence, but glycine exerted considerable protection. Similarly *dl*-alanin, glycolic acid (hydroxyacetic acid) and *dl*-threonine prevented the nephrotoxic action of *dl*-serine. *l*(+)Histidine monohydrochloride, *l*(+) arginine monohydrochloride, lactic acid, pyruvic acid and butyric acid afforded some protection, while sodium chloride and sodium acetate were without any influence.

These experiments are being extended and will be published in detail.
